Projects that emit more than **1.25 lbs/day** of DPM need to implement on-site Best Available Control Technology measures. If sensitive receptors are within 1,000 feet of the project site, a Health Risk Assessment (HRA) may also be required. Sections 3.5.1 and 3.6.4 of this Handbook provide more background on HRAs in conjunction with CEQA review. Guidance on the preparation of a HRA may be found in the CAPCOA report *HEALTH RISK ASSESSMENT FOR PROPOSED LAND USE PROJECTS* which can be downloaded from the CAPCOA website at [www.capcoa.org](http://www.capcoa.org).

#### 3.5.4 Fugitive Particulate Matter (Dust) Emissions

Projects which emit more than **25 lbs/day** or **25 tons/year** of fugitive particulate matter need to implement permanent dust control measures to mitigate the emissions below these thresholds or provide suitable off-site mitigation approved by the APCD. Operational fugitive dust emissions from a proposed project are calculated using the CALEEMOD model discussed in Section 3.6.1. Typical sources of operational emissions included the following:

- Paved roadways:** Vehicular traffic on paved roads that are used to access large residential, commercial, or industrial projects can generate significant dust emissions.

- Off and/or on-site unpaved roads or surfaces: Even at low traffic volume, vehicular traffic on unpaved roads or surfaces that are used to accesses residential, commercial, or industrial operations or that accesses special events, etc. can generate significant dust emissions
- Industrial and/or commercial operations: Certain industrial operations can generate significant dust emissions associated with vehicular access, commercial or industrial activities.

Any of the above referenced land uses or activities can result in dust emissions that exceed the APCD significance thresholds, cause violations of an air quality standard, or create a nuisance impact in violation of APCD Rule 402 *Nuisance*. In all cases where such impacts are predicted, appropriate fugitive dust mitigation measures shall be implemented.

### 3.5.5 Carbon Monoxide (CO) Emissions

Carbon monoxide is a colorless, odorless, tasteless gas emitted during combustion of carbon-based fuels. While few land use projects result in high emissions of CO, this pollutant is of particular concern when emitted into partially or completely enclosed spaces such as parking structures and garages. Projects which emit more than 550 lbs/day of carbon monoxide (CO) and occur in a confined or semi-confined space (e.g., parking garage or enclosed indoor stadium) must be modeled to determine their significance. In confined or semi-confined spaces where vehicle activity occurs, CO modeling is required. If modeling shows the potential to violate the State CO air quality standard, mitigation or project redesign is required to reduce CO concentrations to a level below the health-based standard.

### 3.5.6 Greenhouse Gas Emissions

GHGs (CO<sub>2</sub>, CH<sub>4</sub>, N<sub>2</sub>O, HFC, CFC, F6S) from all projects subject to CEQA must be quantified and mitigated to the extent feasible. The thresholds of significance for a project's amortized construction plus operational-related GHG emissions are:

- For land use development projects, the threshold is compliance with a qualified GHG Reduction Strategy (see Section 3.3); OR annual emissions less than 1,150 metric tons per year (MT/yr) of CO<sub>2</sub>e; OR 4.9 MT CO<sub>2</sub>e/service population (SP)/yr (residents + employees<sup>2</sup>). Land use development projects include residential, commercial and public land uses and facilities. Lead agencies may use any of the three options above to determine the significance of a project's GHG emission impact to a level of certainty.
- For stationary-source projects, the threshold is 10,000 metric tons per year (MT/yr) of CO<sub>2</sub>e. Stationary-source projects include land uses that would accommodate processes and equipment that emit GHG emissions and would require an APCD permit to operate.

The APCD's GHG threshold is defined in terms of carbon dioxide equivalent (CO<sub>2</sub>e), a metric that accounts for the emissions from various greenhouse gases based on their global warming potential. If annual emissions of GHGs exceed these threshold levels, the proposed project would result in a cumulatively considerable contribution of GHG emissions and a cumulatively significant impact to global climate change. More detailed information on the greenhouse gas thresholds can be found in the APCD's *Greenhouse Gas Thresholds and Supporting Evidence* document (March 28, 2012) that is available at [www.slocleanair.org](http://www.slocleanair.org).

## 3.6 SPECIAL CONDITIONS

Projects may require additional assessments as described in the following section.

<sup>2</sup> For projects where the employment is unknown, please refer to Appendix 4.7 "Employees per 1000sf" to estimate the number of employees associated with any project.

### 3.6.1 Toxic Air Contaminants

#### Health Risk Assessments

If a project has the potential to emit toxic or hazardous air pollutants, or is located in close proximity to sensitive receptors, impacts may be considered significant due to increased cancer risk for the affected population, even at a very low level of emissions. Such projects may be required to prepare a risk assessment to determine the potential level of risk associated with their operations. The SLO County APCD should be consulted on any project with the potential to emit toxic or hazardous air pollutants. Pursuant to the requirements of California Health and Safety Code Section 42301.6 (AB 3205) and Public Resources Code Section 21151.8, subd. (a)(2), any new school, or proposed industrial or commercial project site located within 1000 feet of a school must be referred to the SLO County APCD for review. Further details on requirements for projects in this category are presented in Section 4.1.

In April of 2005, the California ARB issued the *AIR QUALITY AND LAND USE HANDBOOK: A COMMUNITY HEALTH PERSPECTIVE* (Land Use Handbook). The ARB has determined that emissions from sources such as roadways and distribution centers and, to a lesser extent gas stations, certain dry cleaners, marine ports and airports as well as refineries can lead to unacceptably high health risk from diesel particulate matter and other toxic air contaminants (TACs). Groups such as children and the elderly, as well as long-term residential occupants, are particularly at risk from toxic exposure.

In July 2009, the California Air Pollution Control officers Associations (CAPCOA) adopted a guidance document *HEALTH RISK ASSESSMENTS FOR PROPOSED LAND USE PROJECTS* to provide uniform direction on how to assess the health risk impacts from and to proposed land use projects. The CAPCOA guidance document focuses on how to identify and quantify the potential acute, chronic, and cancer impacts of sources under CEQA review. It also outlines the recommended procedures to identify when a project should undergo further risk evaluation, how to conduct the health risk assessment (HRA), how to engage the public, what to do with the results from the HRA, and what mitigation measures may be appropriate for various land use projects.

As defined in the CAPCOA guidance document there are basically two types of land use projects that have the potential to cause long-term public health risk impacts:

- Type A Projects: new proposed land use projects that generate toxic air contaminants (such as gasoline stations, distribution facilities or asphalt batch plants) that impact sensitive receptors. Air districts across California are uniform in their recommendation to use the significance thresholds that have been established under each district's "Hot Spots" and permitting programs. The APCD has defined the excess cancer risk significance threshold at **10 in a million** for Type A projects in SLO County; and,
- Type B Projects: new land use projects that will place sensitive receptors (e.g., residential units) in close proximity to existing toxics sources (e.g., freeway). The APCD has established a CEQA health risk threshold of **89 in-a-million** for the analysis of projects proposed in close proximity to toxic sources. This value represents the population weighted average health risk caused by ambient background concentrations of toxic air contaminants in San Luis Obispo County. The APCD recommends Health Risk screening and, if necessary, Health Risk Assessment (HRA) for any residential or sensitive receptor development proposed in proximity to toxic sources.

If a project is located near a sensitive receptor (e.g., school, hospital, dwelling unit(s), etc.), it may be considered significant even if other criteria do not apply. The health effects of a project's emissions may be more pronounced if they impact a considerable number of children, elderly, or people with compromised respiratory or cardiac conditions.

#### **Diesel PM**

In October of 2000, the ARB issued and adopted the Diesel Risk Reduction Plan to reduce particulate matter emissions from diesel-fueled engines and vehicles. This plan identified that 70% of the airborne toxic risk in California is from diesel particulate matter.

The plan called for a 90% reduction in this Toxic Air Contaminant by 2020 through:

- a. Adoption of new regulatory standards for all new on-road, off-road, and stationary diesel-fueled engines and vehicles;
- b. Requiring feasible and cost-effective diesel PM reducing retrofit requirements for the existing fleets and stationary engines; and,
- c. Reducing the sulfur content in diesel-fuel sold in California to 15 parts per million.

At a minimum, fleets must meet the diesel emission reduction requirements that have been adopted in the State's Diesel Risk Reduction Plan. These fleets may also be required to provide additional mitigation depending on the project's emissions and location.

#### **Asbestos / Naturally Occurring Asbestos**

Naturally occurring asbestos (NOA) has been identified by the state Air Resources Board as a toxic air contaminant. Serpentine and ultramafic rocks are very common throughout California and may contain naturally occurring asbestos. The SLO County APCD has identified areas throughout the County where NOA may be present (see Technical Appendix 4.4). Under the ARB's Air Toxic Control Measure (ATCM) related to quarrying, and surface mining operations, a geologic evaluation is required to determine if NOA is present prior to any grading activities at a project site located in the candidate area.

If NOA is found at the site the applicant must comply with all requirements outlined in the Asbestos ATCM for Quarrying, and Surface Mining Operations. These requirements may include but are not limited to:

- a. Development of an Asbestos Dust Mitigation Plan which must be approved by the APCD before operations begin, and,
- b. Development and approval of an Asbestos Health and Safety Program (required for some projects).

If NOA is not present, an exemption request must be filed with the Air District. More information on NOA can be found at <http://www.slocleanair.org/business/asbestos.asp>.

#### **3.6.2 Agricultural Operations**

##### **Wineries, Tasting Rooms and Special Events**

Reactive organic gas emissions (ethanol) generated during wine fermentation and storage, as well as emissions from equipment used in wine production, can cause significant air quality impacts. Thus, the emissions from new or modified winery operations and activities should be evaluated and appropriate mitigation specified when necessary. New or expanding wineries with storage capacity of 26,000 gallons per year or more may also require a Permit to Operate from the APCD.

Wine production facilities can also generate nuisance odors during various steps of the process. Proven methods for handling wastewater discharge and grape skin waste need to be incorporated into the winery practices to minimize the occurrence of anaerobic processes that mix with ambient air which can result in offsite nuisance odor transport. Odor complaints could result in a violation of the SLO County APCD Rule 402 *Nuisance*.

#### **Agricultural Burns**

Agricultural operations must obtain an APCD Agricultural Burn Permit to burn dry agricultural vegetation on Permissive Burn Days. The ARB provides educational handbooks on agricultural burning (English and Spanish) to growers which are available at the following websites:

- [www.arb.ca.gov/cap/handbooks/agburningsmall.pdf](http://www.arb.ca.gov/cap/handbooks/agburningsmall.pdf)
- [www.arb.ca.gov/cap/handbooks/agburningspanishsmall.pdf](http://www.arb.ca.gov/cap/handbooks/agburningspanishsmall.pdf).

#### **3.6.3 Fugitive Dust**

Fugitive dust can come from many sources, such as unpaved roads, equestrian facilities and confined animal feeding operations. Dust emissions from the operational phase of a project should be managed to ensure they do not impact offsite areas and do not exceed the 20% opacity limit identified in SLO County APCD Rule 401 *Visible Emissions*. A list of approved dust control suppressants is available in Technical Appendix 4.3. The approved suppressants must be reapplied at a frequency that ensures dust emissions will not exceed the limits stated above. Any chemical or organic material used for stabilizing solids shall not violate the California State Water Quality Control Board standards for use as a soil stabilizer. Any dust suppressant must not be prohibited for use by the US Environmental Protection Agency, the California Air Resources Board, or other applicable law, rule, or regulation.

#### **Equestrian Facilities**

Another potential source of fugitive dust can come from equestrian facilities, which may be a nuisance to local residents. To minimize nuisance impacts and to reduce fugitive dust emissions from equestrian facilities the following mitigation measures should be incorporated into the project:

- Reduce the amount of the disturbed area where possible;
- Use water trucks or sprinkler systems in sufficient quantities to prevent airborne dust from leaving the site. Increased watering frequency whenever wind speeds exceed 15 mph. Reclaimed (non-potable) water shall be used whenever possible;
- Permanent dust control measures shall be implemented as soon as possible following completion of any soil disturbing activities;
- All disturbed soil areas not subject to revegetation shall be stabilized using approved chemical soil binders, jute netting, or other methods approved in advance by the Air District;
- All access roads and parking areas associated with the facility shall be paved to reduce fugitive dust; and,
- A person or persons shall be designated to monitor for dust and implement additional control measures as necessary to prevent transport of dust offsite. The monitor's duties shall include holidays and weekend. The name and telephone number of such persons shall be provided to the Air District prior to operation of the arena.

#### **Dirt Roads and Unpaved Areas**

When a project is accessed by unpaved roads and or has unpaved driveways or parking areas, a  $PM_{10}$  emission estimate needs to be conducted using the CALEEMOD model. When the model's emission estimate demonstrates an exceedance of the 25 lbs of  $PM_{10}$ /day or 25 tons of  $PM_{10}$ /year APCD thresholds, the following mitigation is required:

For the unpaved road leading to the project location, implement one of the following:

- a. For the life of the project, pave and maintain the driveway; or,
- b. For the life of the project, maintain the private unpaved driveway with a dust suppressant (See Technical Appendix 4.3 for a list of APCD-approved suppressants) such that fugitive dust emissions do not impact off-site areas and do not exceed the APCD 20% opacity limit.

To improve the dust suppressant's long-term efficacy, the applicant shall also implement and maintain design standards to ensure vehicles that use the on-site unpaved road are physically limited (e.g., speed bumps) to a posted speed limit of 15 mph or less.

If the project involves a city or county owned and maintained road, the applicant shall work with the Public Works Department to ensure road standards are followed. The applicant may propose other measures of equal effectiveness as replacements by contacting the APCD Planning Division.

#### Special Event Mitigation

When a special event is accessed by unpaved roads and/or has unpaved driveways or parking areas, a PM<sub>10</sub> emission estimate must be conducted using the CAAEMOD model. If the model shows an exceedance of the 25 lbs/day of PM<sub>10</sub> significance threshold, the following mitigation is required on the day(s) of the special event:

- a. Designated parking locations shall be:
  1. Paved when possible;
  2. Sited in grass or low cut dense vegetative areas; or,
  3. Treated with a dust suppressant such that fugitive dust emissions do not impact offsite areas and do not exceed the APCD 20% opacity limit (see Technical Appendix 4.3).
- b. Any unpaved roads/driveways that will be used for the special event shall be maintained with an APCD-approved dust suppressant such that fugitive dust emissions do not impact offsite areas and do not exceed the APCD 20% opacity limit.

The applicant may propose alternative measures of equal effectiveness by contacting the APCD Planning Division.

#### 3.6.4 Air Quality Nuisance Impacts

If a project has the potential to cause an odor or other nuisance problem which could impact a considerable number of people, then it may be considered significant. A project may emit a pollutant in concentrations that would not otherwise be significant except as a nuisance. Odor impacts on residential areas and other sensitive receptors warrant the closest scrutiny, but consideration should also be given to other land uses where people may congregate, such as recreational facilities, work sites and commercial areas.

When making a determination of odor significance, determine whether the project would result in an odor source located next to potential receptors within the distances indicated in Table 3-3. The Lead Agency should evaluate facilities not included in Table 3-3 or projects separated by greater distances than indicated in Table 3-3 if warranted by local conditions or special circumstances. The list is provided as a guide and, as such, is not all-inclusive.

If a project is proposed within the screening level distances in Table 3-3, the APCD Enforcement Division should be contacted for information regarding potential odor problems. For projects that involve new receptors located near an existing odor source(s), an information request should be submitted to the SLO County APCD to review the inventory of odor complaints for the nearest odor emitting facility(ies) during the previous three years. For projects involving new receptors to be located near an existing odor source where there is currently no nearby development, and for new odor sources locating near existing receptors, the information request and analysis should be based on a review of odor complaints for similar facilities.

Table 3-3: Project Screening Distances for Nuisance Sources

PROJECT SCREENING DISTANCES	
Type of Operation	Project Screening Distance
Asphalt Batch Plant	1 mile
Chemical Manufacturing	1 mile
Coffee Roaster	1 mile
Composting Facility	1 mile
Fiberglass Manufacturing	1 mile
Food Processing Facility	1 mile
Oil Field	1 mile
Painting/Coating Operations (e.g. auto body shops)	1 mile
Petroleum Refinery	2 miles
Rendering Plant	1 mile
Sanitary Landfill	1 mile
Transfer Station	1 mile
Wastewater Treatment Plant	1 mile

Note: This list is provided as a guide and is not all-inclusive.

For a project that will be located near an existing odor source the project should be identified as having a significant odor impact, if it will be as close or closer to the any location that has experienced: 1) more than one confirmed complaint per year averaged over a three year period, or 2) three unconfirmed complaints per year averaged over a three year period.

If a proposed project is determined to result in potential odor problems, mitigation measures should be identified. For some projects, add-on controls or process changes, such as carbon absorption, incineration or an engineering modification to stacks/vents, can reduce odorous emissions. In many cases, however, the most effective mitigation strategy is the provision of a sufficient distance, or buffer zone, between the source and the receptor(s).

The SLO County APCD should be consulted whenever any of these additional special conditions may be applicable for a proposed project.

#### 3.7 METHODS FOR CALCULATING PROJECT OPERATIONAL EMISSIONS

Operational phase air pollutant emissions from urban development can result from a variety of sources, including motor vehicles, wood burning appliances, natural gas and electric energy use, combustion-powered utility equipment, paints and solvents, equipment or operations used by various commercial and industrial facilities, construction and demolition equipment and operations, and various other sources. The amount and type of emissions produced, and their potential to cause significant impacts, depends on the type and level of development proposed. The following sections describe the recommended methods generally used to calculate emissions from motor vehicles, congested intersections and roadways, non-vehicular sources at residential and commercial facilities, and industrial point and area sources. Calculation and mitigation of construction emissions are described separately in Chapter 2.

Submittals describing project assessments must include spreadsheets with project calculations and a description of calculations so that the APCD can verify project quantification. **Calculations must be based on San Luis Obispo County default conditions unless the default settings are not representative of the project** (see below). The project report must detail assumptions made and provide sample calculations. Prior to finalizing the calculations, contact the APCD Planning and Outreach Division to review assumptions that do not have solid evidential support.

##### 3.7.1 Determining Motor Vehicle Emissions

Motor vehicles are a primary source of long-term emissions from many residential, commercial, institutional, and industrial land uses. These land uses often do not emit significant amounts of air

pollutants directly, but cause or attract motor vehicle trips that do produce emissions. Such land uses are referred to as indirect sources.

Motor vehicle emissions associated with indirect sources should be calculated for projects which exceed or are within 10 % of the screening criteria listed in Table 1-1. Calculations should be performed using the latest version of CALEEMOD; this software incorporates the most recent vehicle emission factors from the EMFAC model (i.e., Emission FACTors) provided by the California Air Resources Board (ARB), and average trip generation factors published by the Institute of Transportation Engineers (ITE). The latest version of this program should always be used and can be downloaded free of charge at [www.caleemod.com](http://www.caleemod.com).

CalEEMod is a planning tool for estimating vehicle miles travel, fuel use and resulting emissions related to land use projects throughout California. The model calculates emissions of ROG, NO<sub>x</sub>, CO, and CO<sub>2</sub> and other GHGs as well as dust and exhaust PM<sub>10</sub> from vehicle use associated with new or modified development such as shopping centers, housing, commercial services, industrial land uses, etc.

CALEEMOD includes many default values for parameters such as

- Seasonal Average Temperature;
- Humidity;
- Wood and gas stoves in a residential development and their usage;
- Fleet mix;
- Average vehicle speed and age;
- Average urban, rural, commute, shopping, and other trip type distances; and,
- Average trip rates for each land use.

When modeling project emissions, the user must specify that the project is located in SLO County so that the appropriate default values are used for the modeling. Motor vehicle-related defaults should not be changed without justification for doing so; solid documentation of rationale for any changes made need to be provided to APCD as part of the air quality report. Defaults that need to be evaluated and modified based on the project location and specifications include:

- **Trip Length:** For projects that are located in rural areas of the county where commercial services are not readily available, the trip length default values in the Operational – Mobile Vehicle Trips CalEEMod tab need be set at 13 miles for all trip distances; this happens automatically if the “Rural” Land Use Setting.
- **Fleet Mix:** Projects that attract a mix of vehicles which clearly differs from the default vehicle fleet in SLO County should make the appropriate changes to the FleetMix fraction section on the Annual, Summer, and Winter subtabs under the CalEEMod Operational – Mobile Vehicle Emissions Tab. Some examples include large commercial retail with heavy on-road truck use and heavy industry.
- **Dirt and Roads:** Projects which include on- and off-site dirt access roads should modify the default Road Dust component to accurately assess the project’s PM<sub>10</sub> emissions. For general traffic, SLO County APCD recommends using the ARB’s unpaved road emission factor of 2 pounds of particulate matter emissions per one mile of unpaved vehicle mile traveled ([www.arb.ca.gov/ei/areasrc/fullpdf/FULL7-10.pdf](http://www.arb.ca.gov/ei/areasrc/fullpdf/FULL7-10.pdf)). This value is not appropriate for heavy duty diesel truck travel on unpaved roads.

The following are the APCD recommended values to use in CalEEMod’s Operational – Mobile Road Dust tab to yield PM<sub>10</sub> emissions using variable values that emulate the ARB’s above identified unpaved road emission factor:

- Under the “Paved Road Dust” section:

- Change the “% Pave” value to define your project’s paved road component by entering the results of the following calculation:
  - In general, the total distance of paved road driving (miles) is determined with:
    - $[1 - (A/B)] \times 100\%$
    - Where A = The unpaved road distance to access the project
    - Where B is typically = to the county average one way trip distance of 13 miles)
- Under the “Unpaved Road Dust” section:
  - Use a value of 9.3 for “Material Silt Content (%)”
  - Use a value of 0.1 for “Material Moisture Content (%)”
  - Use a value of 32.4 for “Mean Vehicle Speed (mph)”

If the project has a total distance of unpaved road greater than 13 miles, the actual distance of the unpaved road should be compared to the total one-way trip length to determine the percentages of paved and unpaved road distances. In addition, the Trip Length in the Operational – Mobile Vehicle Trips tab needs to be updated by entering the total length of a one way trip for the project.

CalEEMod reports submitted as part of a CEQA evaluation need to include the following:

- a. A winter, summer, and annual report;
- b. The model files associated with the reports;
- c. The SLO County APCD CEQA operational criteria pollutant thresholds should be compared to the Overall Operational winter total emissions (Note: ROG and NO<sub>x</sub> emission values are combined and compared to the 25 lb/day threshold);
- d. The SLO County APCD CEQA operational GHG numerical threshold should be compared to the Overall Operational annual total CO<sub>2</sub>e emissions;
- e. When summarizing modeling results in a CEQA document summary table always list the pollutants in the order they are listed in the model for ease of review; and,
- f. Changes to any SLO County defaults need to be identified and a solid defensible explanation for those changes need to be provided to the APCD.

### 3.7.2 Non-Vehicular Emissions from Residential and Commercial Facilities

Non-vehicular emission sources associated with most residential and commercial development include energy use to power lights, appliances, heating and cooling equipment, evaporative emissions from paints and solvents, fuel combustion by lawnmowers, leaf blowers and other small utility equipment, residential wood burning, household products, and other small sources. Collectively, these are referred to as “area sources” and are important from a cumulative standpoint even though they may appear insignificant when viewed individually. The CALEEMOD model provides emissions estimations from area sources based on land use types; however it underestimates all emissions associated with electricity use and water consumption.

One CALEEMOD default area source value which has a significant impact on project emissions and may need to be changed is hearth fuel combustion – it is enabled by default and should be disabled or modified if the project excludes wood-burning devices.

### 3.7.3 Industrial Emission Sources

From an emissions standpoint, industrial facilities and operations are typically categorized as being “point” or “area” sources. Point sources are stationary and generally refer to a site that has one or more emission sources at a facility with an identified location (e.g., power plant, refinery, etc.). Area sources can be:

- Stationary or mobile and typically include categories of stationary facilities whose emissions are small individually, but may be significant as a group (e.g., gas stations, dry cleaners, etc.);
- Sources whose emissions emanate from a broad area (e.g., fugitive dust from storage piles and dirt roads, landfills, etc.); and,
- Mobile equipment used in industrial operations (e.g., drill rigs, loaders, haul-trucks, etc.).

Emissions from new, modified or relocated point sources are directly regulated through the APCD Rule 204 *New Source Review* requirements and facility permitting program. A general list of the type of sources affected by these requirements is provided in Section 4.1. New development that includes these source types should be forwarded to the SLO County APCD for a determination of APCD permitting and control requirements. Through the CEQA analysis, all air quality impacts are evaluated including the stationary point, area and mobile sources. While a specific piece of equipment or process may be covered by an APCD permit it is not excluded from the CEQA evaluation process.

### 3.7.4 Health Risk Assessment

Health risk is a common metric used by air quality and health scientists to describe the potential for an individual or group of people (population) in a given area to suffer serious health effects from long-term or short-term exposure to one or more toxic air contaminants (TACs). In July 2009, the California Air Pollution Control officers Association (CAPCOA) released a guidance document titled HEALTH RISK ASSESSMENT FOR LAND USE PROJECTS, which is available for download at [www.capcoa.org](http://www.capcoa.org). Attachment 1 of the CAPCOA document provides specific guidance on how to model emissions of toxic substances from various source types to determine the potential cancer risk as well as acute and chronic non-cancer health risks for nearby receptors.

A screening-level and/or refined health risk assessment (HRA) may be required for projects which may result in the exposure of sensitive receptors (e.g., school, hospital, dwelling unit(s), etc.) to TACs. Projects which involve the siting of **either** the TAC source itself **or** sensitive receptors in close proximity to a TAC should be evaluated for risk exposure. Various tools are available to perform a screening analysis from stationary sources impacting receptors (Type A projects).

For projects being impacted by existing sources (Type B projects), a distance table screening tool is available in the ARB Land Use Handbook which provides recommended buffer distances associated with types of most common toxic air contaminant sources (see Technical Appendix 4.2).

If a screening risk assessment shows that the potential risk exceeds the APCD’s thresholds, then a more refined analysis may be required. The assessment should include the evaluation of both mobile and stationary sources. Risk assessments are normally prepared in a tiered manner, where progressively more input data is collected to refine the results. The refined analysis for the project should provide more accurate information for decision makers.

### 3.7.5 Greenhouse Gas Emissions

To quantify GHG emissions from a proposed development, the APCD recommends using CalEEMod for mobile sources and a partial characterization of area source impacts. In certain cases (e.g., drive-through restaurants), the use of alternative methodologies to quantify GHG impacts will be required. Please consult APCD Planning Division staff for current calculation methods.

### 3.8 OPERATIONAL EMISSION MITIGATION

Emissions from motor vehicles that travel to and from residential, commercial, and industrial land uses can generally be mitigated by reducing vehicle activity through site design (e.g., transit oriented design, infill, mixed use, etc.), implementing transportation demand management measures, using clean fuels and vehicles, and/or off-site mitigation. In addition, area source operational emissions from energy consumption from land uses can be mitigated by improving energy efficiencies, conservation measures and use of alternative energy sources. The mitigation measures in this section are intended to reduce emissions of ROG, NO<sub>x</sub>, Diesel PM (DPM), Dust PM, and GHGs. The following three categories best capture the types of mitigation measures that can reduce air quality impacts from project operations:

- **Site Design Mitigation Measures:** Site design and project layout can be effective methods of mitigating air quality impacts of development. Land use development that incorporates urban infill, higher density, mixed use and walkable, bikeable, and transit oriented designs can significantly reduce vehicle activity and associated air quality impacts. As early as possible in the scoping phase of a project, the SLO County APCD recommends that developers and planners refer to the document CREATING TRANSPORTATION CHOICES THROUGH DEVELOPMENT DESIGN AND ZONING and Appendix E of the APCD Clean Air Plan LAND USE AND CIRCULATION MANAGEMENT STRATEGIES. APCD Planning Division staff is available to discuss project layout and design factors which can influence indirect source emissions and reduce mobile source emissions.
- **Energy Efficiency Mitigation Measures:** Residential and commercial energy use for lighting, heating and cooling is a significant source of direct and indirect air pollution nationwide. Reducing site and building energy demand will reduce emissions at the power plant source and natural gas combustion in homes and commercial buildings. The energy efficiency of both commercial and residential buildings can be improved by orienting buildings to maximize natural heating and cooling.
- **Transportation Mitigation Measures:** Vehicle emissions are often the largest continuing source of emissions from the operational phase of a development. Reducing the demand for single-occupancy vehicle trips is a simple, cost-effective means of reducing vehicle emissions. In addition, using cleaner fueled vehicles or retrofitting equipment with emission control devices can reduce the overall emissions without impacting operations. In today’s marketplace, clean fuel and vehicle technologies exist for both passenger and heavy-duty applications.

#### 3.8.1 Guidelines for Applying ROG, NO<sub>x</sub> and PM<sub>10</sub> Mitigation Measures

In general, projects which do not exceed the 25 lb/day ROG+NO<sub>x</sub> threshold do not require mitigation. For projects which exceed this threshold, the SLO County APCD has developed a list of mitigation strategies for residential, commercial and industrial projects. Alternate mitigation measures may be suggested by the project proponent if the APCD-suggested measures are not feasible. Project mitigation recommendations should follow the guidelines listed below and summarized in Table 3-4:

- Projects with the potential to generate 25 - 29 lbs/day of combined ROG + NO<sub>x</sub> or PM<sub>10</sub> emissions should select and implement at least **8** mitigation measures from the list;
- Projects generating 30 - 34 lbs./day of combined ROG + NO<sub>x</sub> or PM<sub>10</sub> emissions should select and implement at least **14** mitigation measures list;
- Projects generating 35 - 50 lbs./day of combined ROG + NO<sub>x</sub> or PM<sub>10</sub> emissions should implement at least **18** measures from the list;

- d. Projects generating 50 lbs/day or more of combined ROG + NO<sub>x</sub> or PM<sub>10</sub> emissions should select and implement **all feasible** measures from the list. Further mitigation measures may also be necessary, including off-site measures, depending on the nature and size of the project and the effectiveness of the mitigation measures proposed; and,
- e. Projects generating 25 tons per year or more of combined ROG + NO<sub>x</sub> or PM<sub>10</sub> emissions will need to implement **all feasible** measures from the list as well as **off-site** mitigation measures, depending on the nature and size of the project and the effectiveness of the onsite mitigation measures proposed.

Table 3-4: Mitigation Threshold Guide

Combined ROG+NO <sub>x</sub> or PM <sub>10</sub> Emissions (lbs/day)	Mitigation Measures Recommended	
	Residential, Commercial or Industrial	Off-Site Mitigation
< 25	None	None
25 – 29	8	*
30 – 34	14	*
35 – 50	18	*
≥ 50	All Feasible	*
≥ 25 ton/yr	All Feasible	Yes

\* Will be dependent on the effectiveness of the mitigation measures, location of project and high vehicle dependent development. Examples of projects potentially subject to off-site mitigation include: rural subdivisions, drive-through applications, commercial development located far from urban core.

### 3.8.2 Standard Mitigation Measures

The recommended standard air quality mitigation measures have been separated according to land use (i.e., residential, commercial and industrial), measure type (i.e., site design, energy efficiency and transportation) and pollutant reduced (i.e., ozone, particulate, diesel PM, and GHGs). Any project generating 25 lbs/day or more of ROG + NO<sub>x</sub> or PM<sub>10</sub> should select the applicable number of mitigation measure as outlined above from Table 3-5 to reduce the air quality impacts from the project below the significance thresholds. This table also provides recommended mitigations for diesel PM and GHG emissions. For projects that exceed the DPM threshold (i.e., 1.25 lbs/day) due to significant diesel vehicle activity (e.g., mining operations, distribution facilities, etc.), project emissions must be recalculated to demonstrate that the project emissions are below the APCD DPM threshold of significance when mitigation measures are included.

Table 3-5: Mitigation Measures

Table 3-3: Mitigation Measures			POLLUTANT REDUCED
LAND USE  Residential (R) Commercial (C) Industrial (I)	Measure Type	MITIGATION MEASURE	Ozone (O) Particulate (P) Diesel Particulate Matter (DPM) Greenhouse Gas (GHG)
R, C, I	Site design, Transportation	Improve job / housing balance opportunities within communities.	O, P, GHG
R, C, I	Site design	Orient buildings toward streets with automobile parking in the rear to promote a pedestrian-friendly environment.	O, P, GHG
R, C, I	Site design	Provide a pedestrian-friendly and interconnected streetscape to make walking more convenient, comfortable and safe (including appropriate signalization and signage).	O, P, GHG
R, C, I	Site design	Provide good access to/from the development for pedestrians, bicyclists, and transit users.	O, P, GHG
R, C, I	Site design	Incorporate outdoor electrical outlets to encourage the use of electric appliances and tools.	O, P, GHG
R, C, I	Site design	Provide shade tree planting in parking lots to reduce evaporative emissions from parked vehicles. Design should provide 50% tree coverage within 10 years of construction using low ROG emitting, low maintenance native drought resistant trees. <sup>3</sup>	O, P, GHG
R, C, I	Site design	Pave and maintain the roads and parking areas	P
R, C, I	Site design	Driveway design standards (e.g., speed bumps, curved driveway) for self-enforcing of reduced speed limits for unpaved driveways.	P
R, C, I	Site design	Use of an APCD-approved suppressant on private unpaved roads leading to the site, unpaved driveways and parking areas; applied at a rate and frequency that ensures compliance with APCD Rule 401, visible emissions and ensures offsite nuisance impacts do not occur.	P
R, C	Site design	Development is within 1/4 mile of transit centers and transit corridors.	O, P, GHG
R, C	Site design	Design and build compact communities in the urban core to prevent sprawl.	O, P, GHG
R, C	Site design	Increase density within the urban core and urban reserve lines.	O, P, GHG
R, C	Site design	For projects adjacent to high-volume roadways or railroad idling zones, design project to include provide effective buffer zone between the source and the receptor.	DPM
R, C	Site design	For projects adjacent to high-volume roadways, plant vegetation <sup>4</sup> between receptor and roadway.	DPM, P
R	Site design	No residential wood burning appliances.	O, P, GHG
R, C, I	Site design, Transportation	Incorporate traffic calming modifications to project roads, such as narrower streets, speed platforms, bulb-outs and intersection designs that reduce vehicle speeds and encourage pedestrian and bicycle travel.	O, P, GHG
R, C, I	Site design, Transportation	Increase number of connected bicycle routes/lanes in the vicinity of the project.	O, P, GHG
R, C, I	Site design, Transportation	Provide easements or land dedications and construct bikeways and pedestrian walkways.	O, P, GHG
R, C, I	Site design, Transportation	Link cul-de-sacs and dead-end streets to encourage pedestrian and bicycle travel to adjacent land uses.	O, P, GHG
R, C, I	Site design, Transportation	Project is located within one-half mile of a 'Park and Ride' lot or project installs a 'Park and Ride' lot with bike lockers in a location of need defined by SLOCOG.	O, P, GHG
C, I	Site design, Transportation	Provide onsite housing for employees.	O, P, GHG

<sup>3</sup> Trees must be maintained for life of project

<sup>4</sup> Certain types of vegetation provide maximum effectiveness. Vegetation must be maintained over the life of the project.

LAND USE Residential (R) Commercial (C) Industrial (I)	Measure Type	MITIGATION MEASURE	POLLUTANT REDUCED Ozone (O) Particulate (P) Diesel Particulate Matter (DPM) Greenhouse Gas (GHG)
C, I	Site design, Transportation	Implement on-site circulation design elements in parking lots to reduce vehicle queuing and improve the pedestrian environment.	O, P, GHG
C, I	Site design, Transportation	Provide employee lockers and showers. One shower and 5 lockers for every 25 employees are recommended.	O, P, GHG
C, I	Site design, Transportation	Parking space reduction to promote bicycle, walking and transit use.	O, P, GHG
R	Site design	Tract maps resulting in parcels of one-half acre or less shall orient at least 75% of all lot lines to create easy due south orientation of future structures.	GHG
R	Site design	Trusses for south-facing portions of roofs shall be designed to handle dead weight loads of standard solar-heated water and photovoltaic panels. Roof design shall include sufficient south-facing roof surface, based on structures size and use, to accommodate adequate solar panels. For south facing roof pitches, the closest standard roof pitch to the ideal average solar exposure shall be used.	O, GHG
R, C, I	Energy efficiency	Increase the building energy rating by 20% above Title 24 requirements. Measures used to reach the 20% rating cannot be double counted.	O, GHG
R, C, I	Energy efficiency	Plant drought tolerant, native shade trees along southern exposures of buildings to reduce energy used to cool buildings in summer. <sup>5</sup>	O, GHG
R, C, I	Energy efficiency	Utilize green building materials (materials which are resource efficient, recycled, and sustainable) available locally if possible.	O, DPM, GHG
R, C, I	Energy efficiency	Install high efficiency heating and cooling systems.	O GHG
R, C, I	Energy efficiency	Orient 75 percent or more of homes and/or buildings to be aligned north / south to reduce energy used to cool buildings in summer.	O GHG
R, C, I	Energy efficiency	Design building to include roof overhangs that are sufficient to block the high summer sun, but not the lower winter sun, from penetrating south facing windows (passive solar design).	O, GHG
R, C, I	Energy efficiency	Utilize high efficiency gas or solar water heaters.	O, P, GHG
R, C, I	Energy efficiency	Utilize built-in energy efficient appliances (i.e. Energy Star <sup>®</sup> ).	O, P GHG
R, C, I	Energy efficiency	Utilize double-paned windows.	O, P, GHG
R, C, I	Energy efficiency	Utilize low energy street lights (i.e. sodium).	O, P, GHG
R, C, I	Energy efficiency	Utilize energy efficient interior lighting.	O, P, GHG
R, C, I	Energy efficiency	Utilize low energy traffic signals (i.e. light emitting diode).	O, P, GHG
R, C, I	Energy efficiency	Install door sweeps and weather stripping (if more efficient doors and windows are not available).	O, P, GHG
R, C, I	Energy efficiency	Install energy-reducing programmable thermostats.	O, P, GHG
R, C, I	Energy efficiency	Participate in and implement available energy-efficient rebate programs including air conditioning, gas heating, refrigeration, and lighting programs.	O, P, GHG

<sup>5</sup> Trees must be maintained for the life of the project

LAND USE Residential (R) Commercial (C) Industrial (I)	Measure Type	MITIGATION MEASURE	POLLUTANT REDUCED Ozone (O) Particulate (P) Diesel Particulate Matter (DPM) Greenhouse Gas (GHG)
R, C, I	Energy efficiency	Use roofing material with a solar reflectance values meeting the EPA/DOE Energy Star <sup>®</sup> rating to reduce summer cooling needs.	O, P, GHG
R, C, I	Energy efficiency	Utilize onsite renewable energy systems (e.g., solar, wind, geothermal, low-impact hydro, biomass and bio-gas).	O, P, GHG
R, C, I	Energy efficiency	Eliminate high water consumption landscape (e.g., plants and lawns) in residential design. Use native plants that do not require watering and are low ROG emitting.	O, GHG
R, C, I	Energy efficiency	Provide and require the use of battery powered or electric landscape maintenance equipment for new development.	O, GHG
C, I	Energy efficiency	Use clean engine technologies (e.g., alternative fuel, electrification) engines that are not subject to regulations.	O, DPM, GHG
R, C, I	Transportation	Provide and maintain a kiosk displaying transportation information in a prominent area accessible to employees and patrons.	O, P, GHG
R, C, I	Transportation	Develop recreational facility (e.g., parks, gym, pool, etc.) within one-quarter of a mile from site.	O, P, GHG
R, C, I	Transportation	If the project is located on an established transit route, provide improved public transit amenities (i.e., covered transit turnouts, direct pedestrian access, covered bench, smart signage, route information displays, lighting etc.).	O, P, GHG
R, C, I	Transportation	Project provides a display case or kiosk displaying transportation information in a prominent area accessible to employees or residents.	O, P, GHG
R, C, I	Transportation	Provide electrical charging station for electric vehicles.	O, P, GHG
R, C, I	Transportation	Provide neighborhood electric vehicles / car share program for the development.	O, P, GHG
R, C, I	Transportation	Provide bicycle-share program for development.	O, P, GHG
R, C, I	Transportation	Provide preferential parking / no parking fee for alternative fueled vehicles or vanpools.	O, P, GHG
R, C, I	Transportation	Provide bicycle lockers for existing 'Park and Ride' lots where absent or insufficient.	O, P, GHG
R, C, I	Transportation	Provide vanpool, shuttle, mini bus service (alternative fueled preferred).	O, P, DPM, GHG
C, I	Transportation	Provide secure on-site bicycle indoor storage, lockers, or racks.	O, P, GHG
C, I	Transportation	For large developments, provide day care facility on site.	O, P, GHG
C, I	Transportation	Provide on-site bicycle parking both short term (racks) and long term (lockers, or a locked room with standard racks and access limited to bicyclist only) to meet peak season maximum demand. One bike rack space per 10 vehicle/employee space is recommended.	O, P, GHG
C, I	Transportation	On-site eating, refrigeration and food vending facilities	O, P, GHG
C, I	Transportation	Implement a Transportation Choice Program to reduce employee commute trips. The applicant shall work with Rideshare for free consulting services on how to start and maintain a program.	O, P, GHG
C, I	Transportation	Provide incentives (e.g., bus pass, "Lucky Bucks", etc.) to employees to carpool/vanpool, take public transportation, telecommute, walk bike, etc.	O, P, GHG
C, I	Transportation	Implement compressed work schedules (i.e., 9-80s or 4-10s).	O, P, GHG
C, I	Transportation	Implement a telecommuting program.	O, P, GHG
C, I	Transportation	Implement a lunchtime shuttle to reduce single occupant vehicle trips.	O, P, GHG

LAND USE Residential (R) Commercial (C) Industrial (I)	Measure Type	MITIGATION MEASURE	POLLUTANT REDUCED Ozone (O) Particulate (P) Diesel Particulate Matter (DPM) Greenhouse Gas (GHG)
C, I	Transportation	Include teleconferencing capabilities, such as web cams or satellite linkage, which will allow employees to attend meetings remotely without requiring them to travel out of the area.	O, P, DPM, GHG
C, I	Transportation	If the development is or contains a grocery store or large retail facility, provide customers home delivery service in clean fueled vehicles	O, P, DPM, GHG
C, I	Transportation	At community event centers (i.e., amphitheaters, theaters, and stadiums) provide valet bicycle parking.	O, P, GHG
C, I	Transportation	Implement a "No Idling" program for heavy-duty diesel vehicles, which includes signage, citations, etc.	DPM, GHG
C, I	Transportation	Develop satellite work sites.	O, GHG
C, I	Transportation	Require the installation of electrical hookups at loading docks and the connection of trucks equipped with electrical hookups to eliminate the need to operate diesel-powered TRUs at the loading docks.	DPM, GHG
C, I	Transportation	If not required by other regulations (ARB's on-road or off-road diesel), restrict operation to trucks with 2007 model year engines or newer trucks.	O, DPM, GHG
C, I	Transportation	If not required by other regulations (ARB's on-road or off-road diesel), require or provide incentives to use diesel particulate filters for truck engines.	DPM
R	Transportation	Provide storage space in garage for bicycle and bicycle trailers, or covered racks / lockers to service the residential units.	O, P, GHG
R	Transportation	Provide free-access telework terminals and/or wi-fi access in multi-family projects.	O, P, GHG
C	Transportation	Develop core commercial areas within 1/4 to 1/2 miles of residential housing or industrial areas.	O, P, GHG

### 3.8.3 Off-Site Mitigation

Operational phase emissions from large development projects that cannot be adequately mitigated with on-site mitigation measures alone will require off-site mitigation in order to reduce air quality impacts to a level of insignificance if emissions cannot be adequately mitigated with on-site mitigation measures alone. Whenever off-site mitigation measures are deemed necessary, it is important that the developer, lead agency and APCD work together to develop and implement the measures to ensure successful outcome. This work should begin at least six months prior to issuance of occupancy permits for the project.

The first step in determining whether off-site mitigation is required is to compare the estimated operational phase emissions to the APCD significance thresholds. If the sum of ROG + NO<sub>x</sub> emissions exceeds 25 tons/year, off-site mitigation will be required. Off-site mitigation may also be required for development projects where emissions exceed the 25 lb/day threshold. Examples of projects potentially subject to off-site mitigation include rural subdivisions, drive-through facilities and commercial development located far from the urban core.

If off-site mitigation is required, potential off-site mitigation measures may be proposed and implemented by the project proponent following APCD approval of the appropriateness and effectiveness of the proposed measure(s). Alternatively, the project proponent can pay a mitigation fee based on the amount

of emission reductions needed to bring the project impacts below the applicable significance threshold. The APCD shall use these funds to implement a mitigation program to achieve the required reductions. The following outlines how to calculate the amount of off-site mitigation fees required for a given project:

- Calculate the operational phase emissions for the project using CALEEMOD, or an equivalent calculation tool approved by the APCD; include the emission reduction benefits of any onsite mitigation measures included in the project. Any project emissions calculated to be above the APCD significance thresholds are defined as excess emissions and must be reduced below the emission thresholds by off-site mitigation.
- Project emissions above the lbs/day threshold must be converted to tons/year and divided by the daily-to-annual equity ratio value of 5.5 to obtain an equivalent tons/year value.
- The excess tons/year emissions are then multiplied by the project life (i.e., 50 years for residential projects and 25 years for commercial projects) and the most current cost-effectiveness<sup>6</sup> value as approved for the Carl Moyer grant program.

Off-site emission reductions can result from either stationary or mobile sources, but should relate to the on-site impacts from the project in order to provide proper "nexus" for the air quality mitigation. For example, NO<sub>x</sub> emissions from increased vehicle trips from a large residential development could be reduced by funding the expansion of existing transit services in close proximity to the development project to reduce NO<sub>x</sub> emissions. An off-site mitigation strategy should be developed and agreed upon by all parties prior to the start of construction.

The off-site mitigation strategies include but are not limited to the list provided below:

- Develop or improve park-and-ride lots;
- Retrofit existing homes in the project area with APCD-approved natural gas combustion devices;
- Retrofit existing homes in the project area with energy-efficient devices;
- Retrofit existing businesses in the project area with energy-efficient devices;
- Construct satellite worksites;
- Fund a program to buy and scrap older, higher emission passenger and heavy-duty vehicles.
- Replace/repower transit buses;
- Replace/repower heavy-duty diesel school vehicles (i.e. bus, passenger or maintenance vehicles);
- Fund an electric lawn and garden equipment exchange program;
- Retrofit or repower heavy-duty construction equipment, or on-road vehicles;
- Install bicycle racks on transit buses;
- Purchase Verified Diesel Emission Control Strategies (VDECS) for local school buses, transit buses or construction fleets;
- Install or contribute to funding alternative fueling infrastructure (i.e. fueling stations for CNG, LPG, conductive and inductive electric vehicle charging, etc.);
- Fund expansion of existing transit services;
- Fund public transit bus shelters;
- Subsidize vanpool programs;
- Subsidize transportation alternative incentive programs;
- Contribute to funding of new bike lanes;
- Install bicycle storage facilities; and,

<sup>6</sup> Cost-effectiveness is a measure of the dollars needed to reduce a ton of emissions. The cost-effectiveness used to calculate off-site mitigation is based on the Carl Moyer Grant Program and is updated on a periodic basis. The Carl Moyer cost effectiveness value as of 2009 is \$16,000 per ton. There will be a 10% administration fee charged for grant administration.

- Provide assistance in the implementation of projects that are identified in city or county Bicycle Master Plans.

### 3.9 EVALUATION OF PROJECT CHANGES

If the scope or project description is modified after final project approval, the project will need to be re-evaluated by the APCD to determine if additional air quality impacts will result from the proposed modifications. If additional impacts are expected, the cumulative impacts from the total project must be evaluated.

### 3.10 MITIGATION MONITORING

In order to ensure the operational phase air quality mitigation measures and project revisions identified in the EIR or mitigated negative declarations are implemented, the APCD may conduct site visits to ensure that the mitigation measures are fully implemented. The lead agency may also review project mitigation for consistency with project conditions. Beyond verifying mitigation implementation, this monitoring can result in compliance requirements if mitigation measures are not sufficiently being implemented.

## 4 TECHNICAL APPENDICES

### 4.1 BUILDING PERMIT REQUIREMENTS FOR FACILITIES POTENTIALLY SUBJECT TO AIR DISTRICT PERMITS

#### WHAT IS THE SAN LUIS OBISPO COUNTY AIR POLLUTION CONTROL DISTRICT?

The San Luis Obispo County Air Pollution Control District (APCD) regulates stationary sources of air pollution such as factories, industrial sites, and gasoline stations. APCD regulations apply to many manufacturing and industrial procedures as well as such things as evaporative compounds, gasoline, paint, odors, incineration, smoke and open burning.

Government Code section 65850.2 identifies certain air pollution information that cities and counties are required to collect for new building and development projects. Sections 42301.6 to 42301.9 (AB 3205) of the California Health & Safety Code address the release of hazardous air contaminants near schools, and discuss requirements for air district permits for new or modified facilities.

The following overview describes how the law may affect you.

#### NEW BUILDING PERMIT REQUIREMENTS

**Under the law, final certificates of occupancy may not be issued unless certain requirements are met.** One of the requirements is that all applicants must comply with APCD permit regulations, or make a showing to the APCD that the permit regulations do not apply to their particular project.

A questionnaire will accompany all building permit application packets distributed by City and County Planning and Building Departments. This questionnaire pertains to facility location and equipment, processes, and materials which may require an APCD permit. This questionnaire should be completed and returned to the Planning and Building Department for initial screening and processing. If an APCD permit is required, and if air emissions occur within 1000 ft. of a school,

focused notification of nearby residents and student's parents may be required.

All planning and building departments have a description of typical facility types, processes, and equipment that require an APCD Permit to Operate. The table at the back of the attached questionnaire provides a list of these facilities. Operations which usually require an APCD Permit include:

- Solvent cleaners (degreasers)
- Coating of metal parts and products
- Printing and coating operations
- Auto body shops
- Paint spray booths
- Storage of organic liquids
- Wood furniture and cabinet coating
- Air pollution control equipment
- Gasoline stations or any gasoline dispensing facility
- Sandblasting
- Equipment which handles asbestos, beryllium, benzene, hexavalent chromium, mercury, or vinyl chloride.
- Other solvent uses

*It should be noted that all residential construction is exempt from these requirements.*

If you are unsure whether or not your project is subject to permit requirements, the necessary information can be obtained by contacting the APCD and describing the proposed project. APCD staff can then determine if an application must be filed.

#### REQUIREMENTS FOR EXISTING OR PROPOSED PROJECTS NEAR SCHOOLS

Under the California Health and Safety Code, there are specific requirements which must be met by both the APCD and existing or proposed commercial or industrial facilities near a school.

Upon receipt of the facility operations questionnaire, the APCD will evaluate it for equipment or processes requiring a permit and for proximity to sensitive receptors. This initial screening will occur within fourteen (14) days of

receipt of the questionnaire. The APCD will notify the applicant and the planning agency if further action is necessary under the law and/or the APCD permit process. If no further action is required, then the APCD will sign off on the questionnaire and return it to the Planning Agency. If hazardous materials may be used at the facility, APCD will also forward it to the Environmental Health Department or, for projects located within the City of San Luis Obispo, the San Luis Obispo Fire Department. If additional action is required under the law or the APCD permitting process, a description of required actions will be included in the letter sent to the planning department and the applicant.

#### CONSTRUCTION OF NEW SCHOOLS

For construction of new schools, **any person or agency preparing an Environmental Impact Report for a proposed school site must consult with the city, county, and the APCD to identify facilities within one-quarter mile of the proposed school site which may emit hazardous air emissions, or have the potential to explode or catch fire.** The city, county, and APCD have 30 days to provide this information to the person or agency seeking it. This requirement is spelled out in the Public Resources Code Sec. 21151.8, Subd.(a) (4).

#### FORESEEABLE THREAT OF RELEASE OF HAZARDOUS AIR CONTAMINANT

Under certain conditions, the law requires the APCD to take action when there is a reasonable threat of release of a hazardous air contaminant. APCD action is required if:

1. The release is predicted from a facility located within 1000 feet of a school; and
2. The release has the potential to impact persons at the school to the extent that a public health threat or nuisance could result.

When the release of a hazardous air contaminant is forecast, the APCD must notify the agency responsible for administering the hazardous materials policy. In addition, the APCD may respond to this reasonable threat of release by:

1. Issuing an immediate order to prevent the release; or,
2. Mitigating the foreseeable threat of a release, pending a hearing; or,
3. Applying to the APCD Hearing Board for issuance of an Order of Abatement.

Furthermore, if the principal of a school contacts the APCD to request an investigation of odors or possible air pollution sources as the cause of illness among school children, within 24 hours the APCD must respond and notify the city or county official responsible for administering hazardous materials policy and the fire department having jurisdiction over the school.

#### FOR HELP

This handout provides answers to commonly asked questions about new building permit and occupancy requirements. If you need additional information regarding these requirements, please call (805) 781- 5912.

Air Pollution Control District  
San Luis Obispo County

## FACILITY OPERATIONS QUESTIONNAIRE

For the Incorporated and Unincorporated Areas of San Luis Obispo County

State law (AB 3205) requires an applicant for a commercial/industrial development project, building permit or occupancy permit to provide information to the Air Pollution Control District (APCD) indicating whether hazardous materials or certain equipment or processes will be used in or at the facility. Such uses may require a permit from the APCD and/or a Hazardous Materials Business Plan. **This law prohibits a City or County from issuing a final certificate of occupancy until the applicant or future building occupant has complied with the provisions of the law.** The law may also impose certain public noticing requirements for a facility that handles hazardous materials and is located within 1,000 feet of the outer boundary of a school (kindergarten through 12th grade). Additional information explaining the requirements of this law is attached to this form.

#### TO DETERMINE WHETHER YOUR BUSINESS IS SUBJECT TO THESE REQUIREMENTS, PLEASE COMPLETE THIS QUESTIONNAIRE:

Business Name (Doing Business As):		Contact Person:	Phone ( )
Mailing Address:		City	State Zip
Nearest Cross Streets:			
1.	WILL THE INTENDED OCCUPANT(S) INSTALL OR USE ANY PIECE OF EQUIPMENT LISTED ON THE ATTACHED LIST? <i>(If YES forward to Air Pollution Control District.)</i>	YES <input type="checkbox"/>	NO <input type="checkbox"/>
2.	WILL THE INTENDED OCCUPANT(S) STORE, HANDLE OR USE ANY HAZARDOUS MATERIALS LISTED ON THE ATTACHED LIST? <i>(If YES forward to Air Pollution Control District.)</i>	YES <input type="checkbox"/>	NO <input type="checkbox"/>
Briefly Describe Nature of the Intended Business Activity:

## PERMIT CATEGORIES

Businesses with the following equipment, operations or materials will require clearance from the Air Pollution Control District before obtaining a Certificate of Occupancy. Businesses which store, handle, or use hazardous materials will require clearance from the San Luis Obispo City Fire Department or San Luis Obispo County Environmental Health before obtaining a Certificate of Occupancy.

### CHEMICALS

Ethylene Oxide Sterilizers  
Acid Chemical Milling  
Evaporators, Dryers, and Stills  
Processing Organic Materials  
Dry Chemical Mixing and storage

### COATINGS AND SURFACE

#### PREPARATION

Abrasive Blasting Equipment  
Coating and Painting (not house-  
painting)  
Paint, Stain, and Ink Manufacturing  
Printers

### COMBUSTION

Piston Internal Combustion Engines  
(50 hp or larger)  
Incinerators and Crematories  
Boilers and Heaters (2 million BTU/hr  
or larger)

### ELECTRONICS

Solder Levelers  
Wave Solder Machines  
Vapor Degreasers  
Fume Hood Scrubbers  
Electrolytic Plating  
Silicone Chip Manufacturing

### FOOD

Smokehouses  
Feed and Grain Mills  
Coffee Roasters  
Bulk Flour and Grain Storage

### METALS

Metal Melting Devices  
Hot Dip Galvanizing  
Cadmium or Chrome Plating  
Chromic Acid Anodizing

### PETROLEUM FUELS MARKETING

Gasoline and Alcohol Bulk Plants  
and Terminals  
Gasoline and Alcohol Fuel Dispensing

### ROCK AND MINERAL

Hot Asphalt Batch Plants  
Sand, Rock, and Aggregate Plants  
Concrete Batch, Concrete Mixers,  
and Silos  
Brick Manufacturing

### SOLVENT USE

Vapor and Cold Degreasing  
Solvent and Extract Dryers  
Dry Cleaning

### OTHER

Asphalt Roofing Tanks  
Aqueous Waste Neutralization  
Landfill Gas Flare or Recovery  
Systems  
Waste Disposal and Reclamation  
Units  
Grinding Booths and Rooms  
Oil Field Exploration or Production  
Plastic/Fiberglass Manufacturing  
Soil Aeration/Reclamation  
Storage of Organic Liquids  
Powder Coating  
Fiberglass Chopper Guns  
Waste Water Treatment Works

### EXAMPLES OF HAZARDOUS MATERIALS

Ammonia  
Acids and Bases  
Chlorine  
Compressed Gases  
Corrosives  
Cryogenic Fluids  
Explosives  
Fertilizers  
Flammable Liquids and Solids

Gasoline  
Hazardous Material Mixtures  
Herbicides  
Industrial Cleaners  
Infectious/Biological Materials  
Oxidizing Materials  
Paint Thinners  
Paints  
Pesticides

Petroleum Products  
Poisons  
Pyrophoric/Hypergolic Materials  
Radioactives  
Solvents  
Waste Oils  
Water Reactives  
Welding Gases

NOTE: Other equipment not listed here that is capable of emitting air contaminants may require a San Luis Obispo County Air Pollution Control District Permit. If there are any questions, contact the APCD at (805) 781-5912. For information on Hazardous Materials located within the City of San Luis Obispo contact the San Luis Obispo Fire Department at (805) 781-7380. All other areas contact County Environmental Health at (805) 781-5544.

**IF YOU INSTALL AND/OR OPERATE EQUIPMENT WITHOUT A REQUIRED PERMIT, YOU MAY BE SUBJECT TO LEGAL ACTION AND PENALTIES OF UP TO \$50,000 PER DAY FOR EACH DAY OF VIOLATION**

## TIMELINE AND IMPLEMENTATION PROCESS

### I. Outside Agency (Planning Department) Responsibilities

- A. Planning Department distributes Development Plan (DP) Application Packet to applicant. This packet includes AB3205 information.
- B. Applicant completes the DP packet, and returns it to the Planning Department.
- C. Planning Department conducts **initial screening** of Hazardous Materials Questionnaire (hereafter referred to as the Questionnaire). This screening consists of reviewing the Questionnaire for answers to the following questions:
  1. Will the intended occupant(s) install or use any of the equipment listed on attached list ("San Luis Obispo County APCD Permit Categories").
  2. Will the intended occupant store, handle, or use hazardous materials in any quantity?
- D. The Planning Department performs one of the following actions, based on the response to the questions listed in Section I.C. above:
  1. If the answers to Questions #1 and #2 are **NO**, then this project is exempt from AB3205 requirements, and from APCD permitting action. The Planning Department can sign off on the Questionnaire, indicating that the project is exempt from further action under AB3205. This questionnaire is then retained as part of the project file maintained by the Planning Department.
  2. If the answer to either Question #1 or Question #2 is **YES**, the questionnaire is forwarded to the APCD for further review.

### II. APCD Responsibilities

APCD reviews the Questionnaires received from the Planning Department. Within 14 days, one of the following determinations will be made:

- A. If the answer to question 1 on the Facility Operations Questionnaire is **NO** and the APCD agrees, complete the appropriate boxes on the rest of the form and return to the Planning Department.
- B. If the answer to question 1 on the Facility Operations Questionnaire is **NO** but the APCD disagrees, continue to sections C and D below.
- C. APCD Permit Required/Exempt from AB3205 Requirements.

**O-MBA20L7**  
2012

If the answer to Question #1 is **YES**, and the facility is not located within 1000 feet of a school, then the project is exempt from further processing under AB3205, but **IS** subject to APCD permitting requirements. As a result, the APCD will take the following actions:

**Within 7 days** of receipt of the questionnaire from the Planning Department, the APCD will:

- Review the Questionnaire to determine if the source stores, handles or uses hazardous materials (Question #2 on the form). If the answer to that question is **YES**, then APCD completes the appropriate sections of the questionnaire and forwards it to either the City of San Luis Obispo Fire Department (if project is within the City limits), or Environmental Health (all other areas). A memo to County Planning will be sent summarizing action taken.
- If Hazardous Materials storage, usage or handling is not proposed on-site, APCD Planning Staff will indicate that on the questionnaire. The "APCD Permit Required" box will be checked "YES", and the form returned to the Planning Department.

The APCD Engineering Staff sends a letter to the project applicant indicating that this project **IS** subject to APCD permit. Accompanying this letter will be an ATC (Authority to Construct) application, and other explanatory information.

Upon receipt of an ATC application, the APCD has 30 days to determine if the application is complete. A letter of completeness (or incompleteness) is sent to the applicant prior to the end of the 30-day period. If the application is incomplete, the APCD will request additional information in the aforementioned letter. If the application is complete, then the APCD will issue a completeness letter indicating that they have 180 days to issue an ATC.

After project construction is complete, the applicant must indicate in writing to the APCD that construction is complete. A field inspection will then be conducted by APCD staff to determine compliance with applicable APCD Rules and Regulations. Upon verification of compliance, a Permit-to-Operate (PTO) for the subject facility is issued by the APCD.

D. APCD Permit Required/Subject to AB3205 Requirements

If the answer to Questions #1 is **YES**, and the facility is within 1000 feet of a school, the proposed project will be subject to the APCD permitting process and AB3205 Public Noticing Requirements. The APCD will perform the following actions:

**Within 7 days** of receipt of the questionnaire from the Planning Department, the APCD will:

- Review the Questionnaire to determine if the source stores, handles or uses hazardous materials (Question #2 on the form). If the answer to that question is **YES**, then APCD completes the appropriate sections of the questionnaire and forwards it to either the City of San Luis Obispo Fire Department (if project is within the City limits), or Environmental Health (all other areas). A memo to County Planning will be sent summarizing action taken.
- If Hazardous Materials storage, usage, or handling is not proposed on-site, APCD Planning Staff will indicate as such on the questionnaire.

The APCD Engineering Staff sends a letter to the project applicant indicating that this project **IS** subject to APCD permit and AB3205 Public Noticing requirements. Accompanying this letter will be an ATC application, a description of public noticing requirements and other explanatory information.

Upon receipt of an ATC application, the APCD has 30 days to determine if the application is complete. A letter of completeness (or incompleteness) is sent to the applicant prior to the end of the 30-day period. If the application is incomplete, the APCD will request additional information in the aforementioned letter.

**O-MBA20L7**  
2012

When the APCD has deemed the ATC application complete, the applicant will then be required to comply with the public noticing requirements of the California Health and Safety Code, Section 42301.6. Compliance with the public noticing requirements must be demonstrated prior to APCD action on the ATC application. These requirements are as follows:

- The Air Pollution Control Officer (APCO) shall, **at the expense of the permit applicant**, distribute (or mail) a public notice to the parents or guardians of children enrolled in ANY school that is located within 1/4 mile of the proposed project site, and to each address within a 1000 ft. radius of the proposed source. An assessor's parcel map will be used to determine the area encompassing addresses within the 1000 ft. radius of the proposed project.
- The public noticing period extends for 30 days, and **MUST** begin at least 30 days prior to the APCD taking final action on the ATC application for the proposed project. This notice may be combined with any other notice on the project or permit, which is required by law. The APCO shall review and consider all public comments received during the 30 days after the notice is distributed, and shall include written responses to the comments in the permit application file prior to taking final action on the application.

State law requires the APCD to approve or deny the ATC within 180 days of the date on which the A/C application was deemed complete. The public noticing period and the APCD response to public comments **MUST** occur within this time period. The APCD cannot issue the ATC until public noticing requirements for AB3205 have been satisfied.

After project construction is completed, the applicant must indicate **in writing** to the APCD that construction is complete. A field inspection will then be conducted by APCD staff to determine compliance with applicable APCD Rules and Regulations. Upon verification of compliance, a PTO or the subject facility is issued by the APCD.

4.2 ARB'S RECOMMENDATIONS ON SITING NEW SENSITIVE LAND USES <sup>7</sup>

Table 4-1: Siting New Sensitive Land Use

Source Category	Advisory Recommendations
Freeways and high-traffic roads	<ul style="list-style-type: none"><li>Avoid siting new sensitive land uses within 500 feet of a freeway, urban roads with 100,000 vehicles/day, or rural roads with 50,000 vehicles per day.</li></ul>
Distribution centers	<ul style="list-style-type: none"><li>Avoid siting new sensitive land uses within 1,000 feet of a distribution center (that accommodates more than 100 trucks per day, more than 40 trucks with operating transport refrigeration units (TRUs) per day, or where TRU unit operations exceed 300 hours per week).</li><li>Take into account the configuration of existing distribution centers and avoid locating residences and other new sensitive land uses near entry and exit points.</li></ul>
Railyards	<ul style="list-style-type: none"><li>Avoid siting new sensitive land uses within 1,000 feet of a major service and maintenance rail yard.</li><li>Within one mile of a rail yard, consider possible siting limitations and mitigation approaches.</li></ul>
Ports	<ul style="list-style-type: none"><li>Avoid siting of new sensitive land uses immediately downwind of ports in the most heavily impacted zones. Consult the Air District or the ARB on the status of pending analyses of health risks.</li></ul>
Refineries	<ul style="list-style-type: none"><li>Avoid siting new sensitive land uses immediately downwind of petroleum refineries. Consult with local air districts and other local agencies to determine an appropriate separation.</li></ul>
Chrome platers	<ul style="list-style-type: none"><li>Avoid siting new sensitive land uses within 1,000 feet of a chrome plater.</li></ul>
Dry cleaners using perchloroethylene	<ul style="list-style-type: none"><li>Avoid siting new sensitive land uses within 300 feet of any dry cleaning operation. For operations with two or more machines, provide 500 feet. For operations with 3 or more machines, consult with the local air district.</li><li>Do not site new sensitive land uses in the same building with perchloroethylene</li><li>dry cleaning operations.</li></ul>
Gasoline dispensing facilities	<ul style="list-style-type: none"><li>Avoid siting new sensitive land uses within 300 feet of a large gas station (defined as a facility with a throughput of 3.6 million gallons per year or greater). A 50 foot separation is recommended for typical gas dispensing facilities.</li></ul>

<sup>7</sup>

- These recommendations are advisory. Land use agencies have to balance other considerations, including housing and transportation needs, economic development priorities, and other quality of life issues.
- Recommendations are based primarily on data showing that the air pollution exposures addressed here (i.e., localized) can be reduced as much as 80% with the recommended separation.
- The relative risk for these categories varies greatly. To determine the actual risk near a particular facility, a site-specific analysis would be required. Risk from diesel PM will decrease over time as cleaner technology phases in.
- These recommendations are designed to fill a gap where information about existing facilities may not be readily available and are not designed to substitute for more specific information if it exists. The recommended distances take into account other factors in addition to available health risk data (see individual category descriptions).
- Site-specific project design improvements may help reduce air pollution exposures and should also be considered when siting new sensitive land uses.
- This table does not imply that mixed residential and commercial development in general is incompatible. Rather it focuses on known problems like dry cleaners using Perchloroethylene that can be addressed with reasonable preventative actions.
- A summary of the basis for the distance recommendations can be found in the ARB Handbook.

O-MBA20L7

2012

4.3 APCD-APPROVED DUST SUPPRESSANTS

The following list of dust control suppressants are approved by the SLO County APCD. The approved suppressants must be reapplied at a frequency that ensures that fugitive dust emissions are adequately controlled to below the 20% opacity limit identified in the APCD Rule 401 *Visible Emissions* and to ensure that dust is not emitted offsite. If fugitive dust is not adequately controlled, emissions could result in complaints and a violation of APCD Rule 402 *Nuisance*. The APCD will consider products that are not listed on a case-by-case basis; provide product specifics to APCD by contacting the APCD Planning Division at (805) 781-5912.

Suppressants are often used in combination with other APCD recommended control methods to minimize fugitive dust emissions. Other methods include:

- 1) Paving and then maintaining to applicable standards thus replacing need for suppressants and other control methods;
- 2) Implementing and maintaining design standards to ensure vehicles speeds on unpaved areas are physically limited to a posted speed limit of 15 mph or less; and
- 3) For special events, site parking areas in grass or low cut dense vegetative areas that are adequately irrigated to minimize fugitive dust emissions.

SLO County APCD used a 2002 San Joaquin Valley APCD [1] list of dust suppressants as the starting point for the list presented below. Products that could not be readily found were removed from the list. This SLO County APCD list also streamlines the SJVAPCD list by removing hygroscopic products and all but one of the petroleum based products from the SJVAPCD list. A petroleum based method (chipseal) and three polymer products (Dust Binder, Gorilla-Shot, and Soiltec) were added to the list.

Any chemical or organic material used for stabilizing solids shall not violate the California State Water Quality Control Board standards for use as a soil stabilizer. Any dust suppressant must not be prohibited for use by the US Environmental Protection Agency, the California Air Resources Board, or other applicable law, rule, or regulation.

[3] Though chipseal is typically used as a sealant for paved roads, it can also be an effective dust suppressant on unpaved private roads. Project proponents accept liability of potential vehicle or property damage associated with this dust control method.

4-10

SLO County APCD CEQA Air Quality Handbook 2012 O-MBA20L7

#### 4.4 SLO COUNTY NATURALLY OCCURRING ASBESTOS MAP

4-11

#### 4.5 CONSTRUCTION ACTIVITY MANAGEMENT PLAN GUIDELINES

A Construction Activity Management Plan (CAMP) may be required by the Air Pollution Control District (APCD) for construction projects that will result in significant particulate matter (PM) and/or nitrogen oxide (NO<sub>x</sub>) emission impacts, such as potentially high emissions of fugitive dust or NO<sub>x</sub>, or emissions in areas where potential nuisance concerns are present. The purpose of the CAMP is to specifically define the mitigation measures that will be employed as the project moves forward, in order to ensure all requirements are accounted for in the project budget, included in the contractor bid specifications, and are fully implemented throughout project construction.

The following information is provided as a guide for development of the CAMP. Specific implementation of mitigation measures will vary from project to project. **The CAMP is a comprehensive mitigation plan and will need to specifically identify all of the mitigation measures to be implemented for the project.** The following is a list of potential mitigation measures to include in the CAMP. The CAMP must be submitted to the APCD for approval prior to the start of the project.

Prior to commencement of any construction activities (e.g., site preparation, grading or construction activities) the applicant will notify the appropriate planning agency and the APCD, by letter, of the status of the air quality measures outlined in the CAMP. The letter will state the following: 1) the controls that will be implemented; 2) the reasons why any unimplemented measures are considered infeasible and the measures incorporated to substitute for these measures; 3) when scheduled construction activities will be initiated to allow for APCD inspection of the mitigation measures.

- **SENSITIVE RECEPTORS (NO<sub>x</sub> and PM)**

The proximity of the project to the nearest residence and to the nearest sensitive receptor (e.g. school, daycare, hospital or senior center) needs to be documented and the mitigation measures outlined in the CAMP need to be tailored accordingly to provide adequate protection to any nearby sensitive receptors. (e.g. of mitigation measures: Locate construction staging areas away from sensitive receptors such that exhaust and other construction emissions do not enter the fresh air intakes to buildings, air conditioners, and windows).

- **MITIGATION MONITORING (NO<sub>x</sub> and PM)**

A person or persons must be designated to monitor the CAMP implementation. This person will be responsible for compliance with the CAMP. Their duties shall include holidays and weekend periods when work may not be in progress. Depending on the site location, a certified visible emissions monitor may be required. The name and telephone number of such persons shall be provided to the APCD prior to the start of any construction activities.

- **DUST CONTROL (PM)**

Construction activities can generate fugitive dust, which could be a nuisance to local residents and businesses in close proximity to the proposed construction site. Dust complaints could result in a violation of the APCD's 402 "Nuisance" Rule. The following is a list of measures that may be required throughout the duration of the construction activities:

- a. Reduce the amount of the disturbed area where possible.
- b. Use of water trucks or sprinkler systems in sufficient quantities to prevent airborne dust from leaving the site. An adequate water supply source must be identified. Increased watering frequency would be required whenever wind speeds exceed 15 mph. Reclaimed (non-potable) water should be used whenever possible.
- c. All dirt stockpile areas should be sprayed daily as needed, covered, or an APCD approved alternative method will be used.
- d. Permanent dust control measures identified in the approved project revegetation and landscape plans should be implemented as soon as possible following completion of any soil disturbing activities.

- e. Exposed ground areas that will be reworked at dates greater than one month after initial grading should be sown with a fast-germinating non-invasive grass seed and watered until vegetation is established.
- f. All disturbed soil areas not subject to revegetation should be stabilized using approved chemical soil binders, jute netting, or other methods approved in advance by the APCD.
- g. All roadways, driveways, sidewalks, etc. to be paved should be completed as soon as possible. In addition, building pads should be laid as soon as possible after grading unless seeding or soil binders are used.
- h. Vehicle speed for all construction vehicles shall not exceed 15 mph on any unpaved surface at the construction site.
- i. All trucks hauling dirt, sand, soil, or other loose materials are to be covered or should maintain at least two feet of freeboard (minimum vertical distance between top of load and top of trailer) in accordance with CVC Section 23114.
- j. Install wheel washers where vehicles enter and exit unpaved roads onto streets, or wash off trucks and equipment leaving the site.
- k. Sweep streets at the end of each day if visible soil material is carried onto adjacent paved roads. Water sweepers with reclaimed water should be used where feasible.

All PM<sub>10</sub> mitigation measures required should be shown on grading and building plans. In addition, the contractor or builder should designate a person or persons to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust offsite. Their duties shall include holidays and weekend periods when work may not be in progress. **The name and telephone number of such persons shall be provided to the APCD prior to land use clearance for map recordation and finished grading of the area.**

- **CONSTRUCTION PHASE GREENHOUSE GAS (GHG) EMISSION REDUCTIONS**

**The Attorney General requires GHG impact evaluation and the implementation of feasible mitigation at the project level.** As such, the project's Mitigated Negative Declaration should evaluate the project's carbon dioxide (CO<sub>2</sub>) emissions as well as other GHG sources converted to carbon dioxide equivalents and should identify feasible mitigation that the project shall implement. The project's overall GHG impact evaluation should include:

- a. The short term GHG impacts from the construction phase amortized over the life of the project (50 years for residential or residential support facilities and 25 years for commercial or industrial facilities) to provide a mechanism for the project to mitigate these impacts by adding these amortized impacts to the operational phase impacts; and
- b. The project's operational phase GHG impacts.

**For the construction phase (operational phase as well) feasible GHG mitigation measures to be implemented should be identified from the California Air Pollution Control Officer Association's (CAPCOA) January 2008 published document entitled "CEQA and Climate Change" or from other proven energy efficiency measures. The document is available online at: [www.capcoa.org/CEQA/CAPCOA%20White%20Paper.pdf](http://www.capcoa.org/CEQA/CAPCOA%20White%20Paper.pdf) In some cases where the available measures are marginally effective, off-site GHG mitigation fees are appropriate.**

- **CONSTRUCTION EQUIPMENT EMISSION REDUCTIONS (NO<sub>x</sub> and PM)**

To mitigate air quality impacts from the emissions of construction equipment engines, the APCD has project proponents apply various emission reduction methods depending on the magnitude of the project. Below are the methods used:

**Standard Control Measures for Construction Equipment**

**The standard mitigation measures for reducing nitrogen oxide (NO<sub>x</sub>), reactive organic gases (ROG), and diesel particulate matter (Diesel PM) emissions from construction equipment are listed below:**

- (a) Maintain all construction equipment in proper tune according to manufacturer's specifications;
- (b) Fuel all off-road and portable diesel powered equipment with ARB certified motor vehicle diesel fuel (non-taxed version suitable for use off-road);

- (c) Use diesel construction equipment meeting ARB's Tier 2 certified engines or cleaner off-road heavy-duty diesel engines, and comply with the State off-Road Regulation;
- (d) Use on-road heavy-duty trucks that meet the ARB's 2007 or cleaner certification standard for on-road heavy-duty diesel engines, and comply with the State On-Road Regulation;
- (e) Construction or trucking companies with fleets that do not have engines in their fleet that meet the engine standards identified in the above two measures (e.g. captive or NO<sub>x</sub> exempt area fleets) may be eligible by proving alternative compliance;
- (f) All on and off-road diesel equipment shall not idle for more than 5 minutes. Signs shall be posted in the designated queuing areas and or job sites to remind drivers and operators of the 5 minute idling limit;
- (g) Diesel idling within 1,000 feet of sensitive receptors is not permitted;
- (h) Staging and queuing areas shall not be located within 1,000 feet of sensitive receptors;
- (i) Electrify equipment when feasible;
- (j) Substitute gasoline-powered in place of diesel-powered equipment, where feasible; and,
- (k) Use alternatively fueled construction equipment on-site where feasible, such as compressed natural gas (CNG), liquefied natural gas (LNG), propane or biodiesel.

Best Available Control Technology (BACT) for Construction Equipment

**If the estimated construction phase ozone precursor emissions from the actual fleet for a given Phase are expected to exceed the APCD's threshold of significances after the standard mitigation measures are factored into the estimation, then BACT needs to be implemented to further reduce these impacts.**

**The BACT measures can include:**

- Further reducing emissions by expanding use of Tier 3 and Tier 4 off-road and 2010 on-road compliant engines;
- Repowering equipment with the cleanest engines available; and
- Installing California Verified Diesel Emission Control Strategies. These strategies are listed at: <http://www.arb.ca.gov/diesel/verdev/vt/cvt.htm>
- Implementing a design measure to minimize emissions from on and off-road equipment associated with the construction phase. This measure should include but not be limited to the following elements:
  - Tabulation of on and off-road construction equipment (type, age, horse-power, engine model year and miles and/or hours of operation);
  - Calculate daily worst case emissions and the quarterly emissions that include the overlapping segments of construction phases
  - Equipment Scheduling (NO<sub>x</sub> and PM)
    - Schedule activities to minimize the amount of large construction equipment operating simultaneously during any given time period;
    - Locate staging areas at least 1000 feet away from sensitive receptors;
    - Where feasible:
      - Limit the amount of cut and fill to 2,000 cubic yards per day;
      - Limit the length of the construction work-day period; and,
      - Phase construction activities.

On-Road Truck Management (NO<sub>x</sub> and PM)

- Schedule construction truck trips during non-peak hours to reduce peak hour emissions;
- Locate staging areas at least 1000 feet away from sensitive receptors;
- Proposed truck routes should be evaluated to define routing patterns with the least impact to residential communities and sensitive receptors and identify these receptors in the truck route map;
- To the extent feasible, construction truck trips should be scheduled during non-peak hours to reduce peak hour emissions; and
- Trucks and vehicles should be kept with the engine off when not in use, to reduce vehicle emissions. Signs shall be placed in queuing areas to remind drivers to limit idling to no longer than 5 minutes.

Offsite Mitigation for Construction Equipment

**If the estimated construction phase ozone precursor emissions from the actual fleet for a given Phase are expected to exceed the APCD's 6 tons/quarter threshold of significance after the standard and BACT measures are factored into the estimation, then off-site mitigation is appropriate.** The current mitigation rate is \$16,000 per ton of ozone precursor emission (NO<sub>x</sub> + ROG) over the APCD threshold evaluated over the length of the expected exceedance. The applicant may use these funds to implement APCD approved emission reduction projects near the project site or may pay that funding level plus a 15% administration fee to the APCD for the APCD to implement emission reduction projects in close proximity to the project. The applicant shall provide this funding at least two (2) months prior to the start of the project to help facilitate emission offsets that are real-time as possible.

• CONSTRUCTION WORKER TRIPS (NO<sub>x</sub>)

Implement an APCD approved Trip Reduction Program to reduce construction worker commute trips, which includes carpool matching, vanpooling, transit use, etc. Monitor worker use of alternative transportation throughout the project to ensure compliance.

• COMPLAINT RESPONSE (NO<sub>x</sub> and PM)

The CAMP should include a section that addresses complaints and complaint handling. At a minimum this section shall include the following:

- The person(s) responsible for addressing and resolving all complaints regarding the construction activity and their contact information is:
  - Name(s)
  - Company and Title(s)
  - Phone numbers and physical address.
- A hotline telephone number shall be established and publicized to help facilitate rapid complaint identification and resolution. In addition, Prop 65 notification with regard to toxic diesel emissions shall to be made.
- An action plan section shall be outlined that includes additional measures or modifications to existing mitigation measures in the event of complaints.
- All complaints shall be reported immediately to the APCD.

• PERMITTING REQUIREMENTS

Portable equipment, 50 horsepower (hp) or greater, used during construction activities may require California statewide portable equipment registration (issued by the California Air Resources Board) or an APCD permit. Operational sources may also require APCD permits.

The following list is provided as a guide to equipment and operations that may have permitting requirements, but should not be viewed as exclusive. For a more detailed listing, refer to page A-5 in the APCD's CEQA Handbook.

- Power screens, conveyors, diesel engines, and/or crushers.
- Portable generators 50 hp or greater
- Chemical product processing and or manufacturing
- Electrical generation plants or the use of standby generator
- Food and beverage preparation (primarily coffee roasters)
- Furniture and fixture products
- Metal industries, fabrication
- Small scale manufacturing
- Auto and vehicle repair and painting facilities
- Fuel dealers
- Dry cleaning
- Pipelines
- Public utility facilities
- Boilers
- IC Engines
- Sterilization units(s) using ethylene oxide and incinerator(s)
- Cogeneration facilities

- Unconfined abrasive blasting operations
- Concrete batch plants
- Rock and pavement crushing
- Tub grinders trommel screens

To minimize potential delays, prior to the start of the project, please contact the APCD Engineering Division at (805) 781-5912 for specific information regarding permitting requirements.

• **SPECIAL CONDITIONS**

Naturally Occurring Asbestos

If the project site is located in a candidate area for Naturally Occurring Asbestos (NOA), which has been identified as a toxic air contaminant by the California Air Resources Board (ARB) the following requirements apply. Under the ARB Air Toxics Control Measure (ATCM) for Construction, Grading, Quarrying, and Surface Mining Operations, prior to any construction activities at the site, the project proponent shall ensure that a geologic evaluation is conducted to determine if NOA is present within the area that will be disturbed. If NOA is not present, an exemption request must be filed with the APCD. If NOA is found at the site the applicant must comply with all requirements outlined in the Asbestos ATCM. This may include development of an Asbestos Dust Mitigation Plan and an Asbestos Health and Safety Program for approval by the APCD. Please refer to the APCD web page at <http://www.slocleanair.org/business/asbestos.asp> for more information or contact the APCD Enforcement Division at (805) 781-5912.

Demolition of Asbestos Containing Materials

Demolition activities can have potential negative air quality impacts, including issues surrounding proper handling, demolition, and disposal of asbestos containing material (ACM). Asbestos containing materials could be encountered during demolition or remodeling of existing buildings. Asbestos can also be found in utility pipes/pipelines (transite pipes or insulation on pipes). If utility pipelines are scheduled for removal or relocation; or building(s) are removed or renovated this project may be subject to various regulatory jurisdictions, including the requirements stipulated in the National Emission Standard for Hazardous Air Pollutants (40CFR61, Subpart M - asbestos NESHAP). These requirements include but are not limited to: 1) notification requirements to the APCD, 2) asbestos survey conducted by a Certified Asbestos Inspector, and, 3) applicable removal and disposal requirements of identified ACM. Please contact the APCD Enforcement Division at (805) 781-5912 for further information.

Lead During Demolition

Demolition of structures coated with lead based paint is a concern for the APCD. Improper demolition can result in the release of lead containing particles from the site. Sandblasting or removal of paint by heating with a heat gun can result in significant emissions of lead. Therefore, proper abatement of lead before demolition of these structures must be performed in order to prevent the release of lead from the site. Depending on removal method, an APCD permit may be required. Contact the APCD Engineering Division at (805) 781-5912 for more information. Approval of a lead work plan by the APCD is required and must be submitted ten days prior to the start of the demolition. Contact the APCD Enforcement Division at (805) 781-5912 for more information. For additional information regarding lead removal, please contact Cal-OSHA at (805) 654-4581.

**4.6 Qualified GHG Plan Level Guidance**

This guidance is intended to assist local governments in developing community scale Climate Action Plans. In drafting this guidance, the San Luis Obispo County Air Pollution Control District (APCD) has drawn from established methodologies and practices, rather than creating new protocols or quantification methods. This guidance should be interpreted as recommended approaches rather than a formal protocol. This guidance will be continually updated as new tools, methodologies and protocols are developed and refined.

Any Climate Action Plan (CAP) that aims to support tiering of future development projects for purposes of CEQA review of GHG impacts must include these standard elements.

- a. A community-wide GHG emissions inventory and "business-as-usual" forecast of year 2020 community-wide GHG emissions;
- b. GHG reduction targets consistent with AB 32;
- c. An analysis of local and state policies and actions that may impact GHG emissions within the jurisdiction;
- d. Quantification of GHG reduction measures demonstrating that, if fully implemented, the GHG reduction targets will be met;
- e. An implementation and monitoring strategy and timeline;
- f. An adequate environmental review of the proposed CAP.

Early consultation with APCD staff is essential; the importance of communicating with District staff early in the climate planning process cannot be overemphasized. District staff is available to meet with local government planners, review methodologies, discuss approaches and any other issues throughout the process of preparing the CAP.

An environmental document that relies on a greenhouse gas reduction plan for a cumulative impacts analysis must identify those requirements specified in the plan that apply to the project; if those requirements are not otherwise binding and enforceable, they must be incorporated as mitigation measures applicable to the project. If there is substantial evidence that the effects of a particular project may be cumulatively considerable, notwithstanding its compliance with the specified requirements in the plan for the reduction of greenhouse gas emissions, an EIR must be prepared for the project.

**Qualitative Requirements for Qualified GHG Reduction Strategies**

***1) The GHG emissions inventory should be complete and comprehensive***

Any GHG emissions source addressed in this guidance should be included in the GHG inventory and forecast for the local CAP. If an emissions source is not included (for example, direct access electricity use or wastewater treatment), it should be clearly explained why that source was omitted. District staff will review this explanation as part of the evaluation of the CAP.

***2) Calculations and assumptions should be transparent***

It is important to emphasize that all methodologies and assumptions should be documented and explained within the CAP document.

***3) GHG reduction strategies should rely primarily on mandatory measures***

To date, most CAPs have emphasized voluntary GHG reduction measures over mandatory measures, indicated with language like "should promote," and "will encourage," etc. However, because implementation of voluntary measures cannot be guaranteed, their contribution to meeting the GHG reduction target is more speculative than that of mandatory measures. Problems that may result from over-reliance on voluntary measures include the following:

- It could be very difficult for local jurisdictions to demonstrate that GHG reduction targets are being met through voluntary measures.
- This, in turn, will make it difficult for a local government to determine if a project is complying with the adopted CAP in order to appropriately tier off of the CAP CEQA document.
- If the local government cannot document that its CAP is on track to achieve the GHG reduction

target, then the CAP may cease to comply with the "qualified" criteria. In this case subsequent projects would not be eligible to benefit from the tiering provisions of CEQA.

If voluntary measures are included in the CAP, distinctions should be drawn between those that are more or less likely to result in full implementation. For example, incentive-based programs (like AB 811 programs) are usually more likely to achieve results than outreach-based programs. Some CAPs have taken a cautious approach and have not quantified GHG reductions from the latter type of measure, due to their highly speculative nature. The APCD recommends only mandatory measures and strong voluntary measures (such as incentive-based programs) be quantified as contributing toward the GHG reduction target.

4) ***Build in a margin of safety***

Once the CAP enters the implementation phase it is possible that unforeseen issues or obstacles may arise that prevent full implementation of all CAP measures, or the emission reductions achieved for some measures may be less than anticipated. These risks may be heightened by unforeseen economic or political developments that adversely affect implementation of the measures. Therefore, APCD recommends the CAP build in a margin of safety to ensure it can continue to serve as a defensible "Qualified GHG Reduction Strategy." This can be accomplished by:

- Including more GHG mitigation measures than needed to meet the GHG reduction target, thus creating a "buffer" against lower than anticipated results;
- Emphasizing mandatory over voluntary measures;
- Including contingency measures (with quantified emission reduction estimates) that can be activated to fill any gap needed to maintain the expected rate of progress toward achieving the emissions reduction target.

5) ***Measures should address existing as well as new development***

The AB 32 target of reducing GHG emissions to 1990 levels by 2020 represents an initial step toward achieving the longer term goal of Executive Order S-3-05, which calls for reducing GHG emissions to 80% below 1990 levels by 2050; this equates to less than 2 metric tons of GHGs per capita. Reducing GHG emissions from new development alone cannot provide sufficient GHG reductions to achieve this long-term target. Therefore, climate action plans should address energy use and emissions from existing development as well. In its review of climate action plans, the APCD recommends aggressive and innovative strategies to achieve emission reductions from existing as well as new development.

6) ***Implementation and monitoring should be clearly defined***

The parameters for determining if the CAP is being fully implemented, and if development projects are consistent with the CAP, must be clearly laid out. If a local government plans to tier future projects off the environmental review performed on a CAP, the monitoring program should include the following elements:

- *Annual tracking/reporting on implementation of all CAP measures, including measures that address existing development.* The phasing-in of mitigation measures should be addressed (i.e. — have all the measures that were to have been adopted or expanded in the past year actually been adopted/expanded?).
- *Annual reporting of how new development projects have been implementing CAP measures.* Tracking individual project attributes and implementation of mitigation measures should be done on a project-by-project basis. This can be facilitated through the use of a compliance checklist for new development projects to demonstrate consistency with the plan (listing all mandatory and voluntary measures that apply to new development) and whether the project is implementing the measures; the District will request a copy of this checklist (or similar documentation) when reviewing projects for CEQA.
- *Annual review of the State's implementation of measures included in the CAP.* Are state-level policies achieving the reductions anticipated?
- *Periodic update of the GHG inventory.* The APCD recommends updating the community-wide GHG inventory at least once every 5 years. However, updating the inventory on a more

frequent basis may improve the ability to monitor progress toward achieving the GHG reduction target in the CAP.

- *Analysis of whether the CAP is still a "qualified" plan for CEQA purposes.* The analysis should be based on level of implementation and effectiveness of measures.

Air Toxics Hot Spots Program Guidance Manual

February 2015

## Preface

The draft of the *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments* (Guidance Manual) is a description of the algorithms, recommended exposure variates, cancer and noncancer health values, and the air modeling protocols needed to perform a health risk assessment (HRA) under the Air Toxics Hot Spots Information and Assessment Act of 1987(Health and Safety Code Section 44300 et seq., see Appendix B). The Children's Environmental Health Protection Act of 1999 (Health and Safety Code Section 39606, also contained in Appendix B), which requires explicit consideration of infants and children in assessing risks from air toxics, necessitated revisions of the methods for both noncancer and cancer risk assessment, and of the exposure variates. This draft version of the Guidance Manual updates the previous version (OEHHA, 2003), and reflects advances in the field of risk assessment along with explicit consideration of infants and children.

The information presented in the draft manual is compiled from three technical support documents (TSDs) released by the Office of Environmental Health Hazard Assessment (OEHHA) for the Hot Spots Program. The three TSDs (which are also revised versions, replacing the original four Hot Spots TSDs adopted between 1999 and 2003) underwent public comment and peer review and were adopted for use in the Air Toxics Hot Spots program by the Director of OEHHA. The Technical Support Document for the Derivation of Noncancer Reference Exposure Levels (June, 2008) addressed the methodology for deriving acute, chronic and eight hour Reference Exposure Levels. The Technical Support Document for Cancer Potency Factors (May 2009) addresses the methodology for deriving cancer potency factors and adjusting cancer potency to account for the increased sensitivity of early-in-life exposure to carcinogens. The Technical Support Document for Exposure Assessment and Stochastic Analysis (June 2012) presents the exposure model for the Hot Spots program and reviews the available literature on exposure and relevant fate and transport variates. All three TSDs are available on OEHHA's web site at: [http://www.oehha.ca.gov/air/hot\\_spots/index.html](http://www.oehha.ca.gov/air/hot_spots/index.html). Excerpts of these three TSDs are presented in this document. There is relatively little new information in the Guidance Manual since the adoption of the TSDs.

The draft Guidance Manual was released for public review. Public comments were received and changes were made in response to some comments. Responses were developed to all public comments. Both the Guidance Manual and OEHHA's response to comments were then reviewed by the State's Scientific Review Panel on Toxic Air Contaminants (SRP), who previously reviewed the three TSDs upon which this guidance is based. Following review by the SRP, OEHHA finalized this Guidance Manual. This Guidance Manual supersedes the risk assessment methods presented in the Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments (OEHHA, 2003), which in turn replaced earlier guidance provided by the California Air Pollution Control Officer's Association (CAPCOA, 1993). This manual updates health effects values, exposure pathway variates (e.g., breathing rates), and

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

continues to use a tiered approach for performing HRAs based on current science and policy assessment. The Technical Support Document for Cancer Potency Factors (OEHHA, 2009) recommends a tenfold early-in-life potency factor adjustment for the third trimester and ages zero to less than two, and a threefold adjustment factor for ages two to less than sixteen. In addition, we recommend evaluating residency periods of nine, thirty and seventy years. This means that exposure variates are needed for the third trimester, ages zero to less than two, ages two to less than nine, ages two to less than 16, ages 16 to less than 30, and ages 16 to 70.

The tiered approach presented in this draft manual provides a risk assessor with flexibility and allows consideration of site-specific differences. Furthermore, risk assessors can tailor the level of effort and refinement of an HRA by using the point-estimate exposure variates or the stochastic treatment of distributions of exposure variates. The four-tiered approach to risk assessment primarily applies to residential cancer risk assessment. Compared to the OEHHA 2003 document, the exposure pathways in the Guidance Manual remain the same. The exposure and risk algorithms are similar, but they have been revised to accept new data or variables that are used in the tiered risk assessment approach.

The draft manual also contains example calculations and an outline for a modeling protocol and an HRA report. A software program, the Hot Spots Analysis and Reporting Program (HARP), has been developed by the Air Resources Board in consultation with OEHHA and Air Pollution Control/Air Quality Management District representatives. The HARP software, which is being updated with the new exposure variates and health values, is the recommended model for calculating and presenting HRA results for the Hot Spots Program. Information on obtaining the HARP software can be found on the ARB's web site at [www.arb.ca.gov](http://www.arb.ca.gov) under the Hot Spots Program.

The intent of the Guidance Manual and the HARP software is to incorporate children's health concerns, update risk assessment practices, and to provide consistent risk assessment procedures. The use of consistent risk assessment methods and report presentation has many benefits, such as expediting the preparation and review of HRAs, minimizing revision and resubmission of HRAs, allowing a format for facility comparisons, and cost-effective implementation of HRAs and the Hot Spots Program. Risk assessments prepared with this Guidance Manual may be used for permitting new or modified stationary sources, or public notification, and risk reduction requirements of the Hot Spots Program. The use of uniform procedures allows comparison of risks from different facilities and enables identification of facilities that are problematic from a public health perspective. OEHHA reviews the HRAs to insure they are adequate for decision making, but does not play a role in permitting decisions that may result from the HRAs. OEHHA will provide advice to the Districts when requested on any of the risk assessment methods or health values they have used.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

## 1 - Introduction

### 1.1 Development of Guidelines

The Air Toxics Hot Spots Information and Assessment Act is designed to provide information to state and local agencies and to the general public on the extent of airborne emissions from stationary sources and the potential public health impacts of those emissions. The Hot Spots Act requires that the Office of Environmental Health Hazard Assessment (OEHHA) develop risk assessment guidelines for the Hot Spots program (Health and Safety Code (HSC) Section 44360(b)(2)) (see Appendix B for the text of the HSC). In addition, the Hot Spots Act specifically requires OEHHA to develop a "likelihood of risks" approach to health risk assessment. In response, OEHHA developed a tiered approach to risk assessment where a point estimate approach is first employed. If a more detailed analysis is needed, OEHHA has developed a stochastic, or probabilistic, approach using exposure factor distributions that can be applied in a stochastic estimate of the exposure. A detailed presentation of the tiered approach, risk assessment algorithms, selected exposure variates (e.g., breathing rate), and distributions with a literature review is presented in the *Air Toxics Hot Spots Program Risk Assessment Guidelines; Technical Support Document for Exposure Assessment and Stochastic Analysis* (OEHHA, 2012). A summary of this information can be found in Chapter 5 of this document.

The Technical Support Document for the Derivation of Noncancer Reference Exposure Levels (OEHHA, 2008) addresses dose response relationships for noncancer health effects and the methodology for deriving acute, chronic and 8-hour Reference Exposure Levels (RELs). Currently there are 53 acute RELs, 82 chronic RELs, and 10 eight-hour RELs. Review and revision of RELs to take into account new information and sensitive subpopulations including infants and children is an ongoing process. All draft RELs for individual chemicals revised under the current noncancer methodology will undergo public comment and peer review, as mandated by the Hot Spots Act. The Technical Support Document for Cancer Potency Factors (OEHHA, 2009) addresses the methodology for deriving cancer potency factors and adjusting cancer potency to account for the increased sensitivity to early-in-life exposure to carcinogens. This document contains inhalation cancer potency factors and oral cancer potency factors for 142 toxicants and toxicant compound classes developed by OEHHA or developed by other authoritative bodies and endorsed by OEHHA. The OEHHA website ([www.oehha.ca.gov](http://www.oehha.ca.gov)) should be consulted for the most current adopted chronic, acute and 8-hour RELs and cancer potency factors. In addition, for a small subset of these substances that are subject to airborne deposition and hence human oral and dermal exposure, oral chronic RELs and oral cancer potency factors have been developed by OEHHA. A summary of cancer and noncancer health effects values can be found in Appendix L and Chapters 6 and 7 of the Guidance Manual. All three Technical Support Documents have undergone public and peer review and have been approved by the state's Scientific Review Panel on Toxic Air Contaminants and adopted by OEHHA. The Guidance Manual is undergoing the same public and peer review process.

### Air Toxics Hot Spots Program Guidance Manual

February 2015

The Guidance Manual contains a description of the algorithms, recommended exposure variates, and cancer and noncancer health values, and modeling protocols needed to perform a Hot Spots risk assessment under the Hot Spots Act (see Appendix B). The information for the Guidance Manual is taken from the three TSDs. The Guidance Manual supersedes the risk assessment methods presented in the Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments (OEHHA, 2003).

The Guidance Manual is intended to address health risks from airborne contaminants released by stationary sources. Some of the methodology used is common to other regulatory risk assessment applications, particularly for California programs. However, if the reader needs to prepare a Health Risk Assessment (HRA) under another program, the HRA may need additional analyses. Therefore, appropriate California and federal agencies should be contacted. For example, if a facility must comply with HRA requirements under the Resource Conservation and Recovery Act (RCRA) or the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), the California Department of Toxic Substances Control (DTSC) must be contacted to determine if an HRA written to comply with AB 2588 will also satisfy RCRA/CERCLA requirements.

### 1.2 Use of the Guidance Manual

The intent in developing this Guidance Manual is to provide HRA procedures for use in the Air Toxics Hot Spots Program or for the permitting of existing, new, or modified stationary sources. The Air Resources Board (ARB) website ([www.arb.ca.gov](http://www.arb.ca.gov)) provides more information on the Hot Spots Program and risk management guidelines, including recommendations for permitting existing, new, or modified stationary sources. The use of consistent risk assessment procedures and report presentation allows comparison of one facility to another, expedites the review of HRAs by reviewing agencies, and minimizes revision and resubmission of HRAs.

OEHHA recognizes that no one risk assessment procedure or set of exposure variates could perfectly address the many types of stationary facilities in diverse locations in California. Therefore a tiered risk assessment approach was developed to provide flexibility and allow consideration of site-specific differences. The tiered approach to risk assessment is discussed in detail in Chapter 8 of this Guidance.

These guidelines should be used in conjunction with the emission data collected and reported pursuant to requirements of the ARB's *Emission Inventory Criteria and Guidelines Regulations* (Title 17, California Code of Regulations, Sections 93300-93300.5), and the *Emission Inventory Criteria and Guidelines Report for the Air Toxics "Hot Spots" Program* (EICG Report), which is incorporated by reference therein (see ARB's web site: <http://www.arb.ca.gov/ab2588/2588guid.htm> for the most current version, which was approved on August 27, 2007). This regulation outlines requirements for the collection of emission data, based on an inventory plan, which must be approved by the Air Pollution Control or Air Quality Management District (District). The emissions reported under this program are routine or predictable and include continuous

1-2

DO NOT CITE OR QUOTE

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

and intermittent releases and predictable process upsets or leaks. Emissions for unpredictable releases (e.g., accidental catastrophic releases) are not reported under this program.

For landfill sites, these guidelines should be applied to the results of the landfill testing required under Health and Safety Code Section 41805.5 as well as to any emissions reported under the emission inventory requirements of the Air Toxics Hot Spots Act (e.g., from flares or other on-site equipment). Districts should be consulted to determine the specific landfill testing data to be used.

#### 1.3 Who is Required to Conduct a Risk Assessment

The Hot Spots Act requires that each local Air Pollution Control District or Air Quality Management District (hereinafter referred to as District) determine which facilities will prepare an HRA. As defined under the Hot Spots Act, an HRA includes a comprehensive analysis of the dispersion of hazardous substances in the environment, their potential for human exposure, and a quantitative assessment of both individual and population-wide health risks associated with those levels of exposure.

Districts are to determine which facilities will prepare an HRA based on a prioritization process outlined in the law. The process by which Districts identify priority facilities for risk assessment involves consideration of potency, toxicity, quantity of emissions, and proximity to sensitive receptors such as hospitals, daycare centers, schools, work-sites, and residences. The District may also consider other factors that may contribute to an increased potential for significant risk to human receptors. As part of this process Districts categorize facilities as high, intermediate, or low priority. The District prioritization process is described in the *CAPCOA Air Toxics Hot Spots Program Facility Prioritization Guidelines, July 1990* (CAPCOA, 1990), although some Districts may have adopted their own method for prioritizing facilities for the purposes of AB2588, permitting, etc. Consult the District for updates to the Prioritization Guidelines. See the Hot Spots Program on ARB's web site at [www.arb.ca.gov](http://www.arb.ca.gov) for more information on facility prioritization procedures.

Facilities designated by a District as "high priority" are required to submit an HRA to the District within 150 days of designation. Districts may grant a 30-day extension. However, a District may require any facility to prepare and submit an HRA according to the District priorities established for purposes of the Hot Spots Act.

February 2015

#### 1.4 The Hot Spots Analysis and Reporting Program (HARP) Software

The ARB and the Districts have identified a critical need for software to assist with the programmatic aspects of the Hot Spots Program. HARP is computer software used by the ARB, OEHHA, Districts, and facility operators to promote statewide consistency, efficiency, and cost-effective implementation of HRAs and the Hot Spots Program. The HARP software package includes: 1) an Emissions Inventory Database Module, 2) an Air Dispersion Modeling Module, and 3) a Risk Analysis Module. The user-friendly Windows-based package provides for:

1. Electronic implementation of the risk assessment methods presented in the OEHHA guidelines (Guidance Manual);
2. Electronic data transfer from facilities and Districts;
3. The production of reports;
4. Facility prioritization;
5. Air dispersion modeling (AERMOD) of multiple emission releases or facilities for cumulative impact evaluations;
6. A summary report of acute, 8-hour, and chronic health hazard quotients or indices, and cancer risk at the point of maximum impact (PMI), maximally exposed individual resident (MEIR), maximally exposed individual worker (MEIW) and other receptors to be evaluated as needed;
7. Mapping displays of facility property boundaries, risk isopleths, and elevation contours;
8. The ability to display combined risk contours from multiple emission sources;
9. Output of data for use in other "off-the-shelf" Geographic Information Systems (GIS) programs for additional types of analysis; and
10. Census data for determining population-related health impacts showing the number of people exposed at various cancer risk levels and cancer burden.

#### 1.5 Risk Assessment Review Process

The Hot Spots Act risk assessments are reviewed by the local District and by OEHHA. The Districts focus their review on the emissions data and the air dispersion modeling. OEHHA provides comments on the HRA's general concordance with the Guidelines Manual and the completeness of the reported health risks. The District, taking into account the comments of OEHHA, approves the HRA or returns it to the facility for revision and resubmission. If the HRA is not revised and resubmitted by the facility within 60 days, the District may modify the HRA and approve it as modified. Based on the approved HRA, the District determines if there is a significant health risk associated with emissions from the facility. If the District determines that facility emissions pose a significant health risk, the facility operator provides notice to all exposed individuals regarding the results of the HRA and may be required to take steps to reduce emissions by implementing a risk reduction audit and plan. Notification is to be made according to

1-4

DO NOT CITE OR QUOTE

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

procedures specified by the District. Each District determines its own levels of significance for cancer and noncancer health effects for notification and risk reduction. See the Hot Spots Program on ARB's web site at [www.arb.ca.gov](http://www.arb.ca.gov) for more information on significance levels selected by each District.

#### 1.6 Uncertainty in Risk Assessment

OEHHA has striven to use the best science available in developing these risk assessment guidelines. However, there is a great deal of uncertainty associated with the process of risk assessment. The uncertainty arises from lack of data in many areas necessitating the use of assumptions. The assumptions used in these guidelines are designed to err on the side of health protection in order to avoid underestimation of risk to the public. Sources of uncertainty, which may overestimate or underestimate risk, include: 1) extrapolation of toxicity data in animals to humans, 2) uncertainty in the estimation of emissions, 3) uncertainty in the air dispersion models, and 4) uncertainty in the exposure estimates. In addition to uncertainty, there is a natural range or variability in measured parameters defining the exposure scenario. Scientific studies with representative sampling and large enough sample sizes can characterize this variability. In the specific context of a Hot Spots risk assessment, the source of variability with the greatest quantitative impact is variation among the human population in such properties as height, weight, food consumption, breathing rates, and susceptibility to chemical toxicants. OEHHA captures at least some of the variability in exposure by developing data driven distributions of intake rates, where feasible, in the TSD for Exposure Assessment (OEHHA, 2012).

Interactive effects of exposure to more than one carcinogen or toxicant are addressed in the risk assessment with default assumptions of additivity. Cancer risks from all carcinogens addressed in the HRA are added. Similarly, non-cancer hazard quotients for substances impacting the same target organ/system are added to determine the hazard index (HI). Although such effects of multiple chemicals are assumed to be additive by default, several examples of synergism (interactive effects greater than additive) are known. For substances that act synergistically, the HRA could underestimate the risks. Some substances may have antagonistic effects (lessen the toxic effects produced by another substance). For substances that act antagonistically, the HRA could overestimate the risks.

Other sources of uncertainty, which may underestimate or overestimate risk, can be found in exposure estimates where little or no data are available (e.g., soil half-life and dermal penetration of some substances from a soil matrix).

The differences among species and within human populations usually cannot be easily quantified and incorporated into risk assessments. Factors including metabolism, target site sensitivity, diet, immunological responses, and genetics may influence the response to toxicants. The human population is much more diverse both genetically and culturally (e.g., lifestyle, diet) than inbred experimental animals. The intraspecies variability among humans is expected to be much greater than in laboratory animals.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

In most cases, cancer potency values have been estimated only for the single most affected tumor site. This represents a source of uncertainty in the cancer risk assessment. Adjustment for tumors at multiple sites induced by some carcinogens may result in a higher potency. Some recent assessments of carcinogens include such adjustments. Other uncertainties arise 1) in the assumptions underlying the dose-response model used, and 2) in extrapolating from large experimental doses, where other toxic effects may compromise the assessment of carcinogenic potential, to usually much smaller environmental doses.

When occupational epidemiological data are used to generate a carcinogenic potency or a health protective level for a non-carcinogen, less uncertainty is involved in the extrapolation from workplace exposures to environmental exposures. When using human data, no interspecies extrapolation is necessary eliminating a significant source of uncertainty. However, children are a subpopulation with hematological, nervous, endocrine, and immune systems that are still developing and may be more sensitive to the effects of toxicants. The worker population and risk estimates based on occupational epidemiological data are more uncertain for children than adults. Current risk assessment guidelines include procedures designed to address the possibly greater sensitivity of infants and children, but there are only a few compounds for which these effects have actually been measured experimentally. In most cases, the adjustment relies on default assumptions which may either underestimate or overestimate the true risks faced by infants and children exposed to toxic substances or carcinogens.

Risk estimates generated by an HRA should not be interpreted as the expected rates of disease in the exposed population but rather as estimates of potential for disease, based on current knowledge and a number of assumptions.

In the Hot Spots program, cancer risk is often expressed as the maximum number of new cases of cancer projected to occur in a population of one million people due to exposure to the cancer-causing substance over a 30-year residential period. However, there is uncertainty associated with the cancer risk estimate. An individual's risk of contracting cancer from exposure to facility emissions may be less or more than the risk calculated in the risk assessment. An individual's risk not only depends on the individual's exposure to a specific chemical but also on his or her genetic background, health, diet, lifestyle choices and other environmental and workplace exposures. OEHHA uses health-protective exposure assumptions to avoid underestimating risk. For example, the risk estimate for airborne exposure to chemical emissions uses the health-protective assumption that the individual has a high breathing rate and exposure began early in life when cancer risk is highest.

A Reference Exposure Level (REL) is the concentration level at or below which no adverse non-cancer health effects are anticipated for the specified exposure duration. RELs are based on the most sensitive, relevant, adverse health effect reported in the medical and toxicological literature. RELs are designed to protect the most sensitive individuals in the population by the inclusion of factors that account for uncertainties as well as individual differences in human susceptibility to chemical exposures. The factors used in the calculation of RELs are meant to err on the side of public health.

1-6

**Air Toxics Hot Spots Program Guidance Manual**

**February 2015**

protection in order to avoid underestimation of non-cancer hazards. Exceeding the REL does not automatically indicate an adverse health impact. However, increasing concentrations above the REL value increases the likelihood that the health effect will occur.

Risk assessments under the Hot Spots program are often used to compare one source with another and to prioritize concerns. Consistent approaches to risk assessment are necessary to fulfill this function.

**1.7 Tiered Approach to Risk Assessment**

OEHHA developed a tiered approach to accommodate consideration of site-specific data that may be more appropriate for a given facility than the default variate. The first tier is the simplest point estimate approach to estimating exposure to facility emissions. Tier 1 is the first step in conducting a comprehensive risk assessment using algorithms and point estimates of input values described in the *Technical Support Document for Exposure Assessment and Stochastic Analysis*. (OEHHA, 2012) Each facility conducts a Tier 1 risk assessment to promote consistency across the state in facility risk assessments and facilitate comparisons across facilities. To be health-protective, high-end estimates for the key intake exposure variates are used for the dominant exposure pathways.

Tier 2 allows use of site-specific point estimates of exposure variates as long as these estimates can be justified. For example, if there are data indicating that consumption of fish from an impacted body of water is lower than the OEHHA-recommended fish consumption rate, then the facility can use that data to generate a point estimate for sport-fish consumption from that body of water. The risk assessor must supply the data and methods used for the site-specific estimates, and the site-specific estimates must be reproducible and approved by both the District and OEHHA.

Tier 3 risk assessment involves stochastic analysis of exposure using data-based distributions for the key exposure variates compiled in the OEHHA (2012) *Technical Support Document*. Since a stochastic approach to risk assessment provides more information about the range of risk estimates based on the range of exposures, Tier 3 can serve as a useful supplement to the Tier 1 and 2 approaches. Variance propagation methods (e.g., Monte Carlo analysis) are used to derive a range of cancer risk estimates reflecting the known variability in the inputs. Finally, a Tier 4 approach would use distributions of exposure variates that may be more appropriate for a site, such as the distribution of fish consumption rates for a specific body of water impacted by a facility. As in a Tier 2 approach, the risk assessment must supply the data and methods used for the site-specific distributions for exposure variates, and the site-specific estimates must be justified to and reproducible by the Districts and OEHHA.

February 2015

## 2 - Overview of Health Risk Assessment

### 2.1 The Model for Risk Assessment

The standard approach currently used for health risk assessment (HRA) was originally proposed by the National Academy of Sciences in the 1983 book: *Risk Assessment in the Federal Government: Managing the Process* (NAS, 1983) and was updated in the Academy's 1994 book: *Science and Judgment in Risk Assessment* (NAS, 1994). In 2009 the National Academy published *Science and Decisions: Advancing Risk Assessment* (NAS, 2009), in which a number of recommendations are made on improving the risk assessment process and expanding it to include community concerns and cumulative risks. The four steps involved in the risk assessment process are 1) hazard identification, 2) exposure assessment, 3) dose-response assessment, and 4) risk characterization. These four steps are briefly discussed below.

### 2.2 Hazard Identification

For air toxics sources, hazard identification involves the pollutant(s) of concern emitted by a facility, and the types of adverse health effects associated with exposure to the chemical(s), including whether a pollutant is a potential human carcinogen or is associated with other types of adverse health effects. For the Air Toxics Hot Spots Program (Hot Spots), the emitted substances that are addressed in a risk assessment are found in the list of substances designated in the ARB's *Emission Inventory Criteria and Guidelines Regulations (Title 17, California Code of Regulations, Sections 93300-93300.5)*, and the *Emission Inventory Criteria and Guidelines Report* (EICG Report), which is incorporated by reference therein (ARB, 2007). This list of substances is contained in Appendix A of this document and the EICG Report. The list of substances also identifies those substances that are considered human carcinogens or potential human carcinogens.

### 2.3 Exposure Assessment

The purpose of the exposure assessment is to estimate the extent of public exposure to emitted substances. For the Hot spots program, in practice this means estimating exposures for those emitted substances for which potential cancer risk or noncancer health hazards for acute, repeated 8-hour, and chronic exposures will be evaluated. This involves emission quantification, modeling of environmental transport, evaluation of environmental fate, identification of exposure routes, identification of exposed populations, and estimation of short-term (e.g., 1-hour maximum), 8-hour average, and long-term (annual) exposure levels. These activities are described in Chapters 4 and 5. Chapter 5 also discusses the tiered approach to risk assessment.

The ARB's Emission Inventory Criteria and Guidelines (EICG) Report provides assistance in determining those substances that must be evaluated in an HRA and the reporting requirements of facilities, while the Hot Spots Analysis and Reporting Program (HARP) software can be used to model ground level concentrations at specific off-site

2-1

## O-MBA20L7

Air Toxics Hot Spots Program Guidance Manual

February 2015

locations resulting from facility emissions. The United States Environmental Protection Agency (U.S. EPA) has adopted the AERMOD air dispersion model into its list of regulatory approved models, in place of the previously used ISCST3 model. AERMOD is a steady-state plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of both surface and elevated sources, and both simple and complex terrain (U.S. EPA, 2009). The Air Resources Board recommends AERMOD for Hot Spots risk assessments. The AERMOD air modeling software will be incorporated into the HARP software, which allows the user to input all dispersion parameters directly into the program to generate air dispersion data. Alternatively, the air dispersion data may be generated separately from HARP using other air dispersion models, and then imported into HARP to generate risk estimates. Data imported into HARP must already be in the format required by HARP. HARP has the flexibility to generate a summary of the risk data necessary for an HRA by either of the above approaches.

Most of the toxicants assessed under the Hot Spots program are volatile organic compounds that remain as gases when emitted into the air. These chemicals are not subject to appreciable deposition to soil, surface waters, or plants. Therefore, human exposure via ingestion or dermal exposure, at least at concentrations typically encountered in the ambient air, is not considered for volatile organic compounds in the Hot Spots risk assessments. While some models indicate potential for dermal exposure to certain volatile organic compounds, at this time, the Hot spots program does not consider this pathway. Significant exposure to volatile organic toxicants emitted into the air occurs through the inhalation pathway, and this pathway is the primary consideration in the Hot Spots risk assessments. A small subset of Hot Spots substances consists of semi-volatile organic and metal toxicants emitted partially or totally as particles subject to deposition. Ingestion and dermal pathways as well as the inhalation pathway must be evaluated for these chemicals. A few of these semi-volatile organic and metal toxicants must also include the breast milk ingestion pathway. Additional ingestion pathways may also need to be evaluated depending on the pathways of exposure for the specific receptor of interest. Table 5.1 in Chapter 5, Table 6.4 in Chapter 6, and Table 7.1 in Chapter 7 list the substances that must be evaluated for multipathway impacts. HARP is designed to assess potential health impacts posed by substances that must be analyzed by a multipathway approach.

### 2.4 Dose-Response Assessment

Dose-response assessment is the process of characterizing the relationship between exposure to an agent and incidence of an adverse health effect in exposed populations. In quantitative carcinogenic risk assessment, the dose-response relationship is expressed in terms of a potency slope that is used to calculate the probability or risk of cancer associated with an estimated exposure. Cancer potency factors are expressed as the 95<sup>th</sup> percent upper confidence limit of the slope of the dose response curve estimated assuming continuous lifetime exposure to a substance. Typically, potency factors are expressed as units of inverse dose (e.g., (mg/kg BW/day)<sup>-1</sup>) or inverse concentration (e.g., (µg/m<sup>3</sup>)<sup>-1</sup>). It is assumed in cancer risk assessments that risk is directly proportional to dose and that there is no threshold for carcinogenesis.

2-2

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

The Office of Environmental Health Hazard Assessment (OEHHA) has compiled cancer potency factors, which should be used in risk assessments for the Hot Spots program, in Table 7.1. Cancer potency factors listed in Table 7.1 were derived either by the U.S. EPA or by OEHHA, underwent public and peer-review, and were adopted for use in the program. Chapter 8 describes procedures for use of potency values in estimating excess cancer risk. For a detailed description of cancer potency factors, refer to the *Technical Support Document for Cancer Potency Factors* (OEHHA, 2009).

For noncarcinogenic effects, dose-response data developed from animal or human studies are used to develop acute, 8-hour, and chronic noncancer Reference Exposure Levels (RELs). The acute, 8-hour and chronic RELs are defined as the concentration at which no adverse noncancer health effects are anticipated even in sensitive members of the general population, with infrequent one hour exposures, repeated 8-hour exposures over a significant fraction of a lifetime, or continuous exposure over a significant fraction of a lifetime, respectively. The most sensitive health effect is chosen to develop the REL if the chemical affects multiple organ systems. Unlike cancer health effects, noncancer health effects are generally assumed to have thresholds for adverse effects. In other words, injury from a pollutant will not occur until exposure to that pollutant has reached or exceeded a certain concentration (i.e., threshold) and/or dose. The acute, 8-hour, and chronic RELs are air concentrations intended to be below the threshold for health effects for the general population.

The actual threshold for health effects in the general population is generally not known with any precision. Uncertainty factors are applied to the Lowest Observed Adverse Effects Level (LOAEL) or No Observed Adverse Effects Level (NOAEL) or Benchmark Concentration values from animal or human studies to help ensure that the chronic, 8-hour and acute REL values are below the threshold for human health for nearly all individuals. This guidance manual provides the acute, 8-hour, and chronic Reference Exposure Levels in Tables 6.1 through 6.3. Some substances that pose a chronic or repeated 8-hour inhalation hazard may also present a chronic hazard via non-inhalation routes of exposure (e.g., ingestion of contaminated water, foods, or soils, and dermal absorption). The oral RELs for these substances are presented in Table 6.4. The methodology and derivations for acute, 8-hour, and chronic, RELs are described in the *Technical Support Document for the Derivation of Noncancer Reference Exposure Levels* (OEHHA, 2008).

### 2.5 Risk Characterization

This is the final step of risk assessment. In this step, modeled concentrations and exposure information, which are determined through exposure assessment, are combined with potency factors and RELs that are developed through dose-response assessment. The use of cancer potency factors to assess total cancer risk and the use of the hazard index approach for evaluating the potential for noncarcinogenic health effects are described in Chapter 8. Example calculations for determining (inhalation) cancer risk and noncancer acute, 8-hour, and chronic hazard quotients and hazard indices are presented in Appendix I. Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

2-3

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

Under the Hot Spots Act, health risk assessments are to quantify both individual and population-wide health impacts (Health and Safety Code, Section 44306) (Appendix B). The health risk assessments are facility specific and the calculated risk should be combined for all pollutants emitted by a single facility. For example, cancer risk from multiple carcinogens is considered additive. For exposures to multiple non-carcinogen pollutants, a hazard index approach is applied for air contaminants affecting the same organ system. All substances emitted by the facility that are on the Hot Spots Act list of substances must be identified in the HRA, including those on the list that do not have a potency value or REL.

For assessing risk, OEHHA has developed two methods for determining dose via inhalation, dermal absorption, and ingestion pathways. These two methods, the point estimate approach and the stochastic exposure assessment approach, are described below and in Chapters 5 and 8. Detailed presentations of these methods can be found in: *Technical Support Document for Exposure Assessment and Stochastic Analysis* (OEHHA, 2012).

#### 2.5.1 Point Estimate Approach

OEHHA provides information in this document on average and high-end values for key exposure pathways (e.g., breathing rate for the inhalation exposure pathway). The average and high-end of point estimates in this document are defined in terms of the probability distribution of values for that variate. The mean represents the average values for point estimates and the 95<sup>th</sup> percentiles represent the high-end point estimates from the distributions identified in OEHHA (2012). Thus, within the limitations of the data, average and high-end point estimates are supported by the distribution.

Tier 1 of the tiered approach to risk assessment, which is briefly discussed in Section 2.5.3 and presented in more detail in Chapter 8, utilizes a combination of the average and high-end point estimates to more realistically estimate exposure in multipathway risk assessments. This method uses high-end exposure estimates for the pathways that are the main drivers of exposure and the average point estimate for the other non-driving exposure pathways. This approach will lessen the issue of compounding high-end exposure estimates, while retaining a health-protective approach for the more important exposure pathways. It is unlikely that an individual receptor would be on the high-end of exposure for all exposure pathways. See Chapter 8 for detailed discussions of how this multipathway methodology is applied to cancer and noncancer calculations. The HARP software can perform this analysis (referred to as the derived approach in the HARP software).

In addition to using an estimate of average and high-end consumption rates, cancer risk evaluations at individual receptors are presented for 9, 30, and 70-year exposure durations. The 9 and 30-year durations correspond to the average and high-end of residency time recommended by U.S. EPA (1997). The California data presented in Appendix L of the Exposure TSD (OEHHA, 2012) are generally supportive of the nationwide data. The 9 and 70-year exposure durations present potential impacts over the range of residency periods, while the 30-year exposure duration is recommended

2-4

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

for use as the basis for estimating cancer risk at the MEIR in all HRAs. Population-wide impacts should use the 70-year exposure duration.

The parameters used for all exposure durations assume exposure begins in the last trimester of pregnancy and progresses through the exposure duration of interest (e.g., 9, 30, or 70 years). These assumptions are thus protective of children. Children have higher intake rates on a per kilogram body weight basis (e.g., they breathe, drink and eat more per kg body weight than adults) and thus receive a higher dose from contaminated media. See Chapter 5 for the point estimates that can be used to estimate impacts for children. Chapters 5 and 8 discuss how to calculate cancer risk based on various exposure durations and point estimates. Appendix I contains an example calculation and Chapter 9 clarifies how to present the findings in an HRA.

#### 2.5.2 Stochastic Exposure Assessment

OEHHA was directed under the Air Toxics "Hot Spots" program (SB 1731, Calderon, stat. 1992; Health and Safety Code Section 44360(b)(2)) to develop a "likelihood of risk" approach to risk assessment. To satisfy this requirement, OEHHA developed a stochastic approach to risk assessment that utilizes distributions for exposure variates such as breathing rate and water consumption rate rather than a single point estimate. The variability in exposure can be propagated through the risk assessment model using the distributions as input and a Monte Carlo or similar method. The result of such an analysis is a range of risks that at least partially characterizes variability in exposure.

Distributions of key exposure variates that are presented in the *Technical Support Document for Exposure Assessment and Stochastic Analysis* (OEHHA, 2012) were taken from the literature, if adequate, or developed from raw data of original studies. Intake variates such as vegetable consumption are relatively data rich; for these variates reasonable probability distributions can be constructed. However, the data necessary to characterize the variability in risk assessment variates are not always available. For example, for the fate and transport variates (e.g., fish bioaccumulation factors), there are only a few measurements for a given chemical available which precludes the adequate characterization of a probability distribution. We only developed distributions for those key exposure variates that were adequately characterized by data. Development of distributions is described in detail in the *Technical Support Document for Exposure Assessment and Stochastic Analysis* (OEHHA, 2012).

2-5

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### 2.5.3 Tiered Approach to Risk Assessment

OEHHA recommends using a tiered approach to risk assessment. Tier 1 is a standard point estimate approach using the recommended point estimates presented in this document. If site-specific information is available to modify some point estimates developed in the *Technical Support Document for Exposure Assessment and Stochastic Analysis* (OEHHA, 2012) and is more appropriate to use than the recommended point estimates in this document, then Tier 2 allows use of that site-specific information. Site-specific information should be presented to the District before being used. The District may contact OEHHA for additional advice. Note that all non-default variates need to be adequately justified to OEHHA and the Districts to be used. In Tier 3, a stochastic approach to exposure assessment is used with the data distributions developed in the TSD (OEHHA, 2012) and presented in this document. Tier 4 is also a stochastic approach but allows for utilization of site-specific distributions, if they are justifiable (to OEHHA and the Districts) and more appropriate for the site under evaluation than those recommended in this document. Persons preparing an HRA that has a Tier 2 through Tier 4 evaluation must also include the results of a Tier 1 evaluation. Tier 1 evaluations are required for all HRAs prepared for the Hot Spots Program to promote consistency across the state for all facility risk assessments and allow comparisons across facilities. Chapter 8 provides a summary of the tiered approach and the TSD (OEHHA, 2012) discusses it in detail. Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

**3 - Hazard Identification - Air Toxics Hot Spots Emissions**

**3.1 The Air Toxics Hot Spots List of Substances and Emissions Inventory**

For air toxics sources, hazard identification involves identifying pollutants of concern and whether these pollutants are potential human carcinogens or associated with other types of adverse health effects. For the Air Toxics Hot Spots (Hot Spots) Program, the emitted substances that are addressed in a health risk assessment (HRA) are found in the list of hazardous substances designated in the Air Resources Board's (ARB's) *Emission Inventory Criteria and Guidelines Regulations (Title 17, California Code of Regulations, Sections 93300-93300.5)*, and the *Emission Inventory Criteria and Guidelines Report* (EICG Report), which is incorporated by reference therein (ARB, 2007). This list of substances is contained in both Appendix A of this document and the EICG Report. The list of substances also identifies those substances that are considered human carcinogens or potential human carcinogens.

The substances included on the Hot Spots Program list of substances are defined in the statute as those substances found on lists developed by the following sources:

- International Agency for Research on Cancer (IARC);
- U.S. Environmental Protection Agency (U.S. EPA);
- U.S. National Toxicology Program (NTP);
- ARB Toxic Air Contaminant Identification Program List;
- Hazard Evaluation System and Information Service (HESIS) (State of California);
- Proposition 65 (Safe Drinking Water and Toxic Enforcement Act of 1986) list of carcinogens and reproductive toxicants (State of California);
- Any additional substance recognized by the State Board as presenting a chronic or acute threat to public health when present in the ambient air.

All substances emitted by the facility that are on the Hot Spots Act list of substances must be identified in the HRA.

The ARB EICG Report (ARB, 2007) specifies that each facility subject to the Hot Spots Act must submit an Emission Inventory Report to the local air pollution control or air quality management district. This Emission Inventory Report must identify and account for all listed substances used, manufactured, formulated, or released by the facility. All routine, predictable releases must be reported. These inventory reports include the emission data necessary to estimate off-site levels of facility-released Hot Spots substances. These inventory reports will be discussed in further detail in Chapter 4. See Chapter 9 for an outline that specifies the content and recommended format for presenting the air dispersion modeling and HRA results. As presented in Appendix A, the EICG Report divides the list into three groups for reporting purposes. Potency or severity of toxic effects and potential for facility emission were considered in placing compounds into the three groups.

3-1

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

For the first group (listed in these guidelines in Appendix A-I), all emissions of these substances must be quantified in the HRA. For substances in the second group (listed in these guidelines in Appendix A-II), emissions are not quantified; however, facilities must report whether the substance is used, produced, or otherwise present on-site (i.e., these substances are simply listed in a table in the HRA). Lastly, substances in the third group (Appendix A-III) also only need to be reported in a table in the HRA if they are manufactured by the reporting facility.

Facilities that must comply with the Resource Conservation and Recovery Act and Comprehensive Environmental Response, Compensation and Liability Act (RCRA/CERCLA) requirements for risk assessment need to consult the California Department of Toxic Substances Control (DTSC) Remedial Project Manager to determine which substances must be evaluated in their risk assessment. Some RCRA/CERCLA facilities may emit substances which are not currently listed under the Hot Spots Program but which may require evaluation in a RCRA/CERCLA risk assessment.

February 2015

## 4 - Air Dispersion Modeling

The information contained in this section is primarily an abbreviated version of the material found in Chapter 2 of the Air Toxics Hot Spots Risk Assessment Guidelines; Exposure Assessment and Stochastic Analysis Technical Support Document (OEHHA, 2012). Several references have been included in this section to indicate those areas that are covered in more detail in Chapter 2 of the Technical Support Document. However, some air dispersion concepts and procedures have been added to assist the reader in the health risk assessment (HRA) process. In particular, a brief summary of the Hot Spots Analysis and Reporting Program (HARP) software applicability to air dispersion analysis has been included. The HARP software has been developed by the Air Resources Board (ARB), in consultation with OEHHA and Air Pollution Control or Air Quality Management District (District) representatives. The HARP software is the recommended model for calculating and presenting HRA results for the Air Toxics Hot Spots Program (Hot Spots). Information on obtaining the HARP software can be found under the Hot Spots Program on the ARB's web site at [www.arb.ca.gov](http://www.arb.ca.gov). See Chapter 9 for an outline that specifies the content and recommended format for presenting the air dispersion modeling and HRA results.

The U.S. EPA has adopted the AERMOD air dispersion model into their list of regulatory approved models, in place of the previously used ISCST3 model. AERMOD is a steady-state plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of both surface and elevated sources, and both simple and complex terrain (U.S. EPA, 2009). The Air Resources Board recommends AERMOD for Hot Spots risk assessments.

#### 4.1 Air Dispersion Modeling in Exposure Assessment: Overview

Estimates of air concentrations of emitted toxicants in the surrounding community from a facility's air emissions are needed in order to determine cancer and noncancer risks. One approach to determining the concentration of air pollutants emitted from the facility is to do air monitoring in the surrounding community. However, there are a number of disadvantages to this approach. Ambient air monitoring is costly because good estimates of an annual average concentration typically require monitoring at least one day in six over a year. Because it is costly, monitoring is usually limited to a select number of pollutants, and a limited number of sites. There can be significant risks from some chemicals at or even below the monitoring detection limit, which can add considerable uncertainty to risk estimates if many of the measurements are below or near the detection limit. Monitoring measures not only facility emissions but also general ambient background as well. It can be difficult and expensive to distinguish between the two using monitoring, particularly if general ambient background levels are high relative to the contribution of facility emissions. These limitations often make it impractical to use monitoring in a program such as the Air Toxics Hot Spots program with hundreds of facilities.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

Air dispersion models have several advantages over monitoring. Modeling can provide greater spatial detail and the costs are relatively cheap by comparison. For example, dispersion models can estimate the pollutant concentration in air at many receptor locations (hundreds to thousands) and for a multitude of averaging periods. Air dispersion models have been validated using air monitoring.

There are, however, uncertainties associated with the typical usage of air dispersion modeling. The use of meteorological data from the nearest airport may not ideally be the best representation of localized conditions. Gaussian plume air dispersion models ignore calm hours. This can bias model predictions towards underestimation. Some dispersion models offer limited chemical reactions within the algorithms; however, we generally assume the pollutant is inert for the near-field atmospheric travel time. This may bias estimated concentrations towards over-prediction for those pollutants that are highly reactive in the atmosphere. Air dispersion model results are only as good as the emissions estimates and emissions estimates can be uncertain. However, on the whole, the advantages of air dispersion modeling for a program like the Air Toxics Hot Spots far outweigh the disadvantages.

Professional judgment is required throughout the dispersion modeling process. The local air quality district has final authority on modeling protocols. The following guidance is intended to assist in the understanding of dispersion modeling for risk assessments.

Air dispersion modeling includes the following steps (see Figure 1):

1. Create an emission inventory of the toxic releases (Section 4.2)
2. Identify the source types (Section 4.3)
3. Identify the terrain type and land use (Section 4.4)
4. Determine the detail needed for the analysis: screening or refined (Section 4.5)
5. Identify the population exposure (Section 4.6)
6. Identify the receptor network (Section 4.7)
7. Obtain meteorological data (for refined air dispersion modeling only) (Section 4.8)
8. Select an air dispersion model (Section 4.9)
9. Prepare a modeling protocol and submit to the local Air District (hereafter referred to as "the District") (Section 4.14)
10. Complete the air dispersion analysis
11. If necessary, redefine the receptor network and return to Step 10

4-2

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

12. Complete the risk assessment

13. If necessary, refine the inputs and/or the model selection and return to Step 8

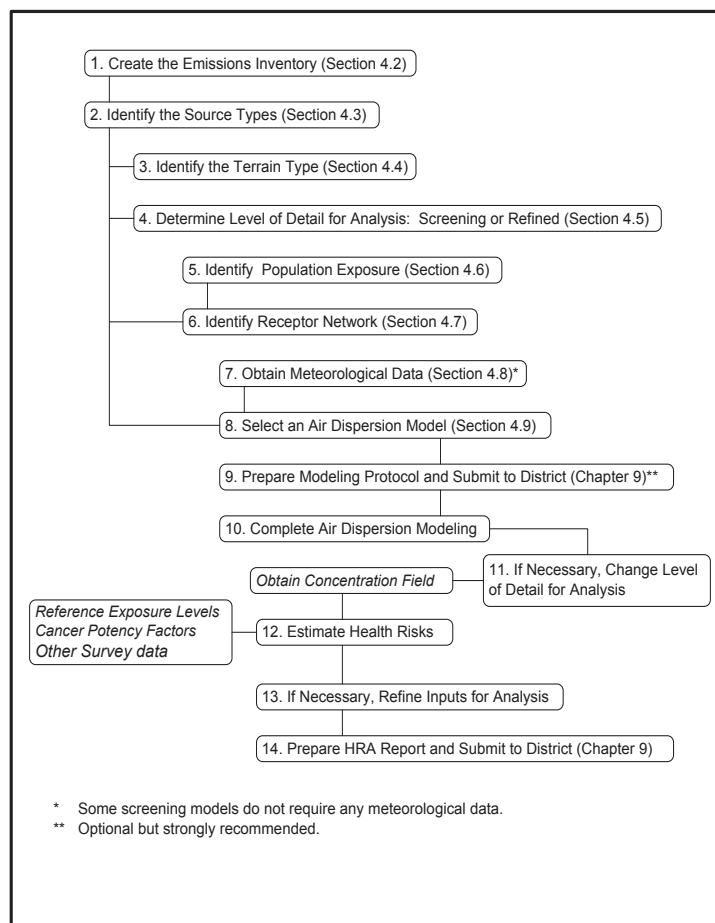

14. Present the HRA results (Chapter 9 provides an outline that specifies the content and recommended format of HRA results).

The output of the air dispersion modeling analysis includes a receptor field of ground level concentrations of the pollutant in ambient air. These concentrations can be used to estimate an inhaled or ingested dose for the estimation of multipathway cancer risk, or used to determine a hazard index for acute (inhalation), and chronic noncancer multipathway risks. It should be noted that in the Air Toxics "Hot Spots" program, facilities simulate the dispersion of the chemical emitted as an inert compound, and do not model any atmospheric transformations or dispersion of products from such reactions. The U.S. EPA Guideline on Air Quality Models (U.S. EPA, 2005) should be consulted when evaluating reactive pollutants for other regulatory purposes.

4-3

**Figure 1 Overview of the Air Dispersion Modeling Process.**

## 4.2 Emission Inventories

The Emission Inventory Reports (Inventory Reports) developed under the Hot Spots Program provide data to be used in the HRA and in the air dispersion modeling process. The Inventory Reports contain information regarding emission sources, emitted substances, emission rates, emission factors, process rates, and release parameters (area and volume sources may require additional release data beyond that generally available in Emissions Inventory reports). This information is developed according to the ARB's *Emission Inventory Criteria and Guidelines Regulations (Title 17, California Code of Regulations, Sections 93300-93300.5)*, and the *Emission Inventory Criteria and Guidelines Report* (EICG Report), which is incorporated by reference therein (ARB, 2007).

Updated emission data for process changes, emission factor changes, material/fuel changes, or shutdown must be approved by the District prior to the submittal of the health risk assessment (HRA). Ideally, the District review of updated emissions could be completed within the modeling protocol. In addition, it must be stated clearly in the risk assessment if the emission estimates are based on updated or revised emissions (e.g., emission reductions). This section summarizes the requirements that apply to the emission data which are used for Air Toxics "Hot Spots" Act risk assessments.

### 4.2.1 Air Toxics Hot Spots Emissions

As noted in Chapter 3, Hazard Identification, the HRA should identify all substances emitted by the facility, which are on the Hot Spots Act list of substances (see Appendix A of the Guidance Manual or the EICG Report). The EICG Report specifies that Inventory Reports must identify and account for all listed substances used, manufactured, formulated, or released by the facility. All routine, predictable releases must be reported. Under the regulations, the list is divided into three groups for reporting purposes. The first group (listed in Appendix A-I of the Inventory Guidelines Report) has all pollutants whose emissions must be quantified. The second group (listed in Appendix A-II of the Inventory Guidelines Report) includes substances where emissions do not need to be quantified; however, facilities must report whether the substance is used, produced, or otherwise present on-site. The third group (listed in Appendix A-III of the Emissions Inventory Guidelines Report) includes substances whose emissions need not be reported unless the substance is manufactured by the facility. Chemicals or substances in the second and third groups should be listed in a table in the risk assessment.

Facilities that must comply with the Resource Conservation and Recovery Act and Comprehensive Environmental Response, Compensation and Liability Act (RCRA/CERCLA) requirements for risk assessment need to consult the Department of Toxic Substances Control (DTSC) Remedial Project Manager to determine which substances must be evaluated in their risk assessment in addition to the list of "Hot Spots" chemicals. Some RCRA/CERCLA facilities may emit chemicals that are not currently listed under the "Hot Spots" Program. Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### 4.2.1.1 Emission Estimates Used in the Risk Assessment

The HRA must include emission estimates for all substances that are required to be quantified in the facility's emission inventory report. Specifically, HRAs should include both annual average emissions and maximum 1-hour emissions for each pollutant. Maximum 1-hour emissions are used for acute noncancer health impacts while annual emissions are used for chronic exposures (i.e., chronic and 8-hour noncancer health impacts or cancer risk assessment).

Emissions for each substance must be reported for individual emitting processes associated with unique devices within a facility. Total facility emissions for an individual air contaminant will be the sum of emissions, reported by process, for that facility. Information on daily and annual hours of operation, and relative monthly activity, must be reported for each emitting process. Devices and emitting processes must be clearly identified and described and must be consistent with those reported in the emissions inventory report.

The HRA should include tables that present the emission information (i.e., emission rates for each substance released from each process) in a clear and concise manner. The District may allow the facility operator to base the HRA on more current emission estimates than those presented in the previously submitted emission inventory report (i.e., actual enforceable emission reductions realized by the time the HRA is submitted to the District). If the District allows the use of more current emission estimates, the District must review and approve the new emissions estimates prior to use in the HRA. The HRA report must clearly state what emissions are being used and when any reductions became effective. Specifically, a table presenting emission estimates included in the previously submitted emission inventory report as well as those used for the HRA should be presented. The District should be consulted concerning the specific format for presenting the emission information. Chapter 9 provides an outline that specifies the content and recommended format of HRA results. A revised emission inventory report must be submitted to the District prior to submitting the HRA and forwarded by the District to the ARB, if revised emission data are used.

##### 4.2.1.1.1 Molecular Weight Adjustments for the Emissions of Metal Compounds

For most of the Hot Spots toxic metals, the OEHHA cancer potency factors, acute and chronic RELs apply to the weight of the toxic metal atom contained in the overall compound. Some of the Hot Spots compounds contain various elements along with the toxic metal atom (e.g., "Nickel hydroxide", CAS number 12054-48-7, has a formula of  $H_2NiO_2$ ). Therefore, an adjustment to the reported pounds of the overall compound is needed before applying the OEHHA cancer potency factor for "Nickel and compounds" to such a compound. This ensures that the cancer potency factor, acute or chronic REL is applied only to the fraction of the overall weight of the emissions that are associated with health effects of the metal. In other cases, the Hot Spots metals are already reported as the metal atom equivalent (e.g., CAS 7440-02-0, "Nickel"), and these cases do not use any further molecular weight adjustment. (Refer to Note [7] in Appendix A,

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

List of Substances in the EICG Report for further information on how the emissions of various Hot Spots metal compounds are reported.)

The appropriate molecular weight adjustment factors (MWF) to be used along with the OEHHA cancer potency factors, acute and chronic RELs for Hot Spots metals can be found in the MWF column<sup>1</sup> of the table containing OEHHA/ARB Approved Health Values for use in Hot Spots Facility Risk Assessments that is in Appendix L of this document.

As an example, the compound "Nickel hydroxide" has a molecular formula of  $H_2NiO_2$ . The atomic weight of each of the elements in this compound, and the fraction they represent of the total weight, are therefore as follows:

Element	Number of atoms	Atomic Weight	Fraction of Total Weight = MWF
1 x Nickel (Ni)	1 x	58.70	$58.70 / 92.714 = 0.6332$ (MWF for Nickel)
2 x Oxygen (O)	2 x	15.999	
2 x Hydrogen (H)	2 x	1.008	
Total Molecular Weight of $H_2NiO_2$ :		92.714	

So, for example, assume that 100 pounds of "Nickel hydroxide" emissions are reported under CAS number 12054-48-7. To get the Nickel atom equivalent of these emissions, multiply by the listed MWF (0.6332) for Nickel hydroxide:

- 100 pounds x 0.6332 = 63.32 pounds of Nickel atom equivalent.

This step should be completed prior to applying the OEHHA cancer potency factor for "Nickel and compounds" in a calculation for a prioritization score or risk assessment calculation. (Note - The HARP software automatically applies the appropriate MWF for each Hot Spots chemical (by CAS number), so the emissions should not be manually adjusted when using HARP. Therefore, if using HARP, you would use 100 pounds for Nickel hydroxide and HARP will make the MWF adjustment for you. If not using HARP, you would use 63.32 pounds.)

<sup>1</sup> The value listed in the MWF column for Asbestos is not a molecular weight adjustment. This is a conversion factor for adjusting mass and fibers or structures. See Appendix C for more information on Asbestos reporting and risk assessment information or see the EICG report for reporting guidance.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### 4.2.1.2 Release Parameters

Emission release parameters (e.g., stack height and inside diameter, stack gas exit velocity, release temperature and emission source location in UTM coordinates) are needed as inputs to the air dispersion model. The Inventory Guidelines specify the release parameters that must be reported for each stack, vent, ducted building, exhaust site, or other site of exhaust release. Additional information may be required to characterize releases from non-stack (volume and area) sources; see U.S. EPA dispersion modeling guidelines or specific user's manuals. This information should also be included in the air dispersion section of the risk assessment. This information must be presented in tables included in the risk assessment. Note that some dimensional units needed for the dispersion model may require conversion from the units reported in the Inventory Report (e.g., Kelvin (K) vs. degrees Fahrenheit (°F)). Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

#### 4.2.1.3 Operation Schedule

The HRA should include a discussion of the facility operation schedule and daily emission patterns. For AB2588 purposes, emissions should be reported based on routine and predictable operations. Weekly or seasonal emission patterns may vary and should be discussed. This is especially important in a refined HRA. Diurnal emission patterns should be simulated in the air dispersion model because of diurnal nature of meteorological observations. Diurnal evaluations are important to include since diurnal weather patterns and emission releases may cause significant differences in the concentration at a receptor of interest.

A table should be included listing the emission schedule on an hourly and yearly basis. In addition, the emission schedule and exposure schedule should corroborate any exposure adjustment factors used for approximating an inhaled dose. For more information about exposure adjustment factors, see Section 4.8.1. Alternatively, exposure adjustments can be made through refining the air dispersion analysis. See Section 4.11.1.2(h) for special case modeling or Appendix M. An alternative to including modeling that addresses diurnal influences would be to include a sensitivity study showing, and/or text explaining, the reason(s) why there are no significant differences due to diurnal influences on the emissions from the facility or at the receptor(s) of interest. For more guidance, you can contact the district or reviewing authority. Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

#### 4.2.1.4 Emission Controls

The HRA should include a description of control equipment, the emitting processes it serves, and its efficiency in reducing emissions of substances on the Air Toxics "Hot Spots" list. The EICG Report requires that this information be included in the Inventory Reports, along with the emission data for each emitting process. If the control equipment did not operate full-time throughout the year, then the reported overall control efficiency must be adjusted to account for any predictable downtime of the

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

control equipment. Any entrainment of toxic substances to the atmosphere from control equipment should be accounted for; this includes fugitive releases during maintenance and cleaning of control devices (e.g., baghouses and cyclones). Contact the District for guidance with control equipment adjustments. Recommended default deposition rates that are used when calculating potential noninhalation health impacts are listed in Section 5.3.2. Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

#### 4.2.2 Landfill Emissions

Emission estimates for landfill sites should be based on testing required under Health and Safety Code, Section (HSC) 41805.5 (AB 3374, Calderon) and any supplemental AB 2588 source tests or emission estimates used to characterize air toxics emissions from landfill surfaces or through off-site migration. The District should be consulted to determine the specific Calderon data to be used in the HRA. The "Hot Spots" Program HRA for landfills should also include emissions of listed substances for all applicable power generation and maintenance equipment at the landfill site. Processes that need to be addressed include stationary internal combustion engines, flares, evaporation ponds, composting operations, boilers, and gasoline dispensing systems.

#### 4.3 Source Characterization

Pollutants are released into the atmosphere in many different ways. The release conditions need to be properly identified and characterized to appropriately use the air dispersion models.

##### 4.3.1 Source Type

Source types can be identified as point, line, area, or volume sources for input to the air dispersion model. Several air dispersion models have the capability to simulate more than one source type.

##### 4.3.1.1 Point Sources

Point sources are probably the most common type of source and most air dispersion models have the capability to simulate them. Typical examples of point sources include exhaust stacks. Isolated vents from buildings are special examples of point sources.

##### 4.3.1.2 Line Sources

The version 12345 or newer of the AERMOD can accommodate line sources. Line sources can be also treated as a special case of either an area or a volume source. Examples of line sources include: conveyor belts and rail lines, freeways, and busy roadways. Not all mobile sources may be subject to the Hot Spots program; however, non-motor vehicles that operate within a facility (e.g., ships, trains, and cranes, etc.) are subject to the Hot Spots program. For more information, see the ARB's Emission Inventory and Criteria Guidelines document or ARB's interpretation and guidance

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

memorandum to CAPCOA regarding mobile sources which are subject to the "Hot Spots" program. This memo can be found at <http://www.arb.ca.gov/ab2588/motorv.pdf>.

Mobile sources and rail lines are required to be evaluated under SB 352. SB 352 requires a risk assessment performed under the Hot Spots risk assessment guidance for proposed school sites within 500 feet of a busy roadway. Dedicated air dispersion models are available for motor vehicle emissions from roadways which are a special type of line source. These models (i.e., CALINE3, CAL3QHCRCR, and CALINE4) are designed to simulate the mechanical turbulence and thermal plume rise due to the motor vehicle activity on the roadway. However, these dedicated models use the Pasquill-Gifford dispersion stability classes for dispersion; the AERMOD dispersion model uses a more advanced continuous stability estimation method based on observations. The limitation with AERMOD is that the user needs to estimate initial mixing (Szo and Syo) for mechanical turbulence and thermal plume rise. Consult with the District prior to conducting roadway modeling to determine model use.

For practical information on how to simulate roadway emission dispersion using these models, see the California Air Pollution Control Officer's Association (CAPCOA) website at <http://www.capcoa.org> or the Sacramento Metropolitan AQMD (SMAQMD) website at <http://www.airquality.org/ceqa/RoadwayProtocol.shtml>. The SMAQMD has a document titled, "Recommended Protocol for Evaluating the Location of Sensitive Land Uses Adjacent to Major Roadways" (January, 2010). The ARB recommends this document for SB-352 risk assessments.

#### 4.3.1.3 Area Sources

Emissions that are to be modeled as area sources are typical of fugitive sources characterized by non-buoyant emissions containing negligible vertical extent (e.g., no plume rise or emissions distributed over a large horizontal area).

Fugitive particulate (PM2.5, PM10, TSP) emission sources include areas of disturbed ground (e.g., open pits, parking lots) which may be present during operational phases of a facility's life. Also included are areas of exposed material (e.g., storage piles and slag dumps) and segments of material transport where potential fugitive emissions may occur (uncovered haul trucks or rail cars, emissions from unpaved roads). Fugitive emissions may also occur during stages of material handling where particulate material is exposed to the atmosphere (uncovered conveyors, hoppers, and crushers).

Other fugitive emissions emanating from many points of release may be modeled as area sources. Examples include fugitive emissions from valves, flanges, venting, and other connections that occur at ground level or at an elevated level or deck if on a building or structure. Modern dispersion models include an option for an initial vertical extent (Szo) where needed.

Modeling portable equipment as an area source is a case-by-case situation that should be discussed with the District or reviewing authority. Situations may exist where this type of operation is best represented as another type of release.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### 4.3.1.4 Volume Sources

Non-point sources with emissions containing an initial vertical extent should be modeled as volume sources. The initial vertical extent may be due to plume rise or a vertical distribution of numerous smaller sources over a given area. Examples of volume sources include buildings with natural fugitive or passive ventilation, and line sources such as conveyor belts and rail lines.

#### 4.3.2 Quantity of Sources

The number of sources at a facility may influence the selection of the air dispersion model. Some dispersion models are capable of simulating only one source at a time, and are therefore referred to as single-source models (e.g., AERSCREEN).

In some cases, for screening purposes, single-source models may be used in situations involving more than one source using one of the following approaches:

- Combining all sources into one single "representative" source

In order to be able to combine all sources into one single source, the individual sources must have similar release parameters. For example, when modeling more than one stack as a single "representative" stack, the stack gas exit velocities and temperatures must be similar. In order to obtain a conservative estimate, the values leading to the higher concentration estimates should typically be used (e.g., the lowest stack gas exit velocity and temperature, the height of the shortest stack, and a receptor distance and spacing that will provide maximum concentrations, etc.).

- Running the model for each individual source and superimposing results

Superimposition of results of single sources of emissions is the actual approach followed by all the Gaussian models capable of simulating more than one source. Simulating sources in this manner may lead to conservative estimates if worst-case meteorological data are used or if the approach is used with a model that automatically selects worst-case meteorological conditions, especially wind direction. The approach will typically be more conservative the farther apart the sources are because each run would use a different worst-case wind direction.

Additional guidance regarding source merging is provided by the U.S. EPA (1995a). It should be noted that depending upon the population distribution, the total burden can actually increase when pollutants are more widely dispersed. If the total burden from the facility or zone of impact (see Section 4.6.1) could increase for the simplifying modeling assumptions described above, the District should be consulted.

#### 4.4 Terrain Type

Two types of terrain characterizations are required to select the appropriate model. One classification is made according to land type and another one according to terrain topography.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### 4.4.1 Terrain Type – Land Use

Some air dispersion models (e.g., CALINE) use different dispersion coefficients (sigmas) depending on the land use over which the pollutants are being transported. The land use type is also used by some models to select appropriate wind profile exponents. Traditionally, the land type has been categorized into two broad divisions for the purposes of dispersion modeling: urban and rural. Accepted procedures for determining the appropriate category are those suggested by Irwin (1978): one based on land use classification and the other based on population.

The land use procedure is generally considered more definitive. Population density should be used with caution and should not be applied to highly industrialized areas where the population density may be low. For example, in low population density areas a rural classification would be indicated, but if the area is sufficiently industrialized the classification should already be “urban” and urban dispersion parameters should be used.

If the facility is located in an area where land use or terrain changes abruptly, for example, on the coast, the District should be consulted concerning the classification. If need be, the model should be run in both urban and rural modes and the District may require a classification that biases estimated concentrations towards over prediction. As an alternative, the District may require that receptors be grouped according to the terrain between source and receptor.

AERMOD is the U.S. EPA’s preferred dispersion model for a wide range of applications in rural or urban conditions. The users should refer to section 5.0 of the AERMOD Implementation Guide to determine urban or rural conditions.

The Land Use and the Population Density Procedures discussed above are described as follows.

##### 4.4.1.1 Land Use Procedure

- (1) Classify the land use within the total area A, circumscribed by a 3 km radius circle centered at the source using the meteorological land use typing scheme proposed by Auer (1978) and shown in Table 4.1.
- (2) If land use types I1, I2, C1, R2 and R3 account for 50 percent or more of the total area A described in (1), use urban dispersion coefficients. Otherwise, use appropriate rural dispersion coefficients.

##### 4.4.1.2 Population Density Procedure

- (1) Compute the average population density ( $p$ ) per square kilometer with A as defined in the Land Use procedure described above. (Population estimates are also required to determine the exposed population; for more information see Section 4.6.3.)

4-12

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

- (2) If  $p$  is greater than 750 people/km<sup>2</sup> use urban dispersion coefficients, otherwise, use appropriate rural dispersion coefficients.

**Table 4.1 Identification and classification of land use types (Auer, 1978)**

Used to define rural and urban dispersion coefficients in certain models.

Type	Use and Structures	Vegetation
I1	<i>Heavy Industrial</i> Major chemical, steel and fabrication industries; generally 3-5 story buildings, flat roofs	Grass and tree growth extremely rare; <5% vegetation
I2	<i>Light-moderate industrial</i> Rail yards, truck depots, warehouses, industrial parks, minor fabrications; generally 1-3 story buildings, flat roofs	Very limited grass, trees almost totally absent; <5% vegetation
C1	<i>Commercial</i> Office and apartment buildings, hotels; >10 story heights, flat roofs	Limited grass and trees; <15% vegetation
R1	<i>Common residential</i> Single family dwelling with normal easements; generally one story, pitched roof structures; frequent driveways	Abundant grass lawns and light-moderately wooded; >70% vegetation
R2	<i>Compact residential</i> Single, some multiple, family dwelling with close spacing; generally <2 story, pitched roof structures; garages (via alley), no driveways	Limited lawn sizes and shade trees; <30% vegetation
R3	<i>Compact residential</i> Old multi-family dwellings with close (<2 m) lateral separation; generally 2 story, flat roof structures; garages (via alley) and ash pits, no driveways	Limited lawn sizes, old established shade trees; <35% vegetation
R4	<i>Estate residential</i> Expansive family dwelling on multi-acre tracts	Abundant grass lawns and lightly wooded; >80% vegetation
A1	<i>Metropolitan natural</i> Major municipal, state, or federal parks, golf courses, cemeteries, campuses; occasional single story structures	Nearly total grass and lightly wooded; >95% vegetation
A2	Agricultural rural	Local crops (e.g., corn, soybean); >95% vegetation
A3	<i>Undeveloped</i> Uncultivated; wasteland	Mostly wild grasses and weeds, lightly wooded; >90% vegetation
A4	Undeveloped rural	Heavily wooded; >95% vegetation
A5	<i>Water surfaces</i> Rivers, lakes	

4-13

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### 4.4.2 Terrain Type - Topography

Surface conditions and topographic features generate turbulence, modify vertical and horizontal winds, and change the temperature and humidity distributions in the boundary layer of the atmosphere. These in turn affect pollutant dispersion and models differ in their need to take these factors into account.

The classification according to terrain topography should ultimately be based on the topography at the receptor location with careful consideration of the topographical features between the receptor and the source. Differentiation of simple versus complex terrain is unnecessary with AERMOD. In complex terrain, AERMOD employs the well-known dividing-streamline concept in a simplified simulation of the effects of plume-terrain interactions. For other plume models, topography can be classified as follows:

##### 4.4.2.1 Simple Terrain (also referred to as "Rolling Terrain")

Simple terrain is all terrain located below stack height including gradually rising terrain (i.e., rolling terrain). Note that *Flat Terrain* also falls in the category of simple terrain.

##### 4.4.2.2 Intermediate Terrain

Intermediate terrain is terrain located above stack height and below plume height. The recommended procedure to estimate concentrations for receptors in intermediate terrain is to perform an hour-by-hour comparison of concentrations predicted by simple and complex terrain models. The higher of the two concentrations should be reported and used in the risk assessment.

##### 4.4.2.3 Complex Terrain

Complex terrain is terrain located above plume height. Complex terrain models are necessarily more complicated than simple terrain models. There may be situations in which a facility is "overall" located in complex terrain but in which the nearby surroundings of the facility can be considered simple terrain. In such cases, receptors close to the facility in this area of simple terrain will "dominate" the risk analysis and there may be no need to use a complex terrain model. It is unnecessary to determine which terrain dominates the risk analysis for users of AERMOD.

#### 4.5 Level of Detail: Screening vs. Refined Analysis

Air dispersion models can be classified according to the level of detail which is used in the assessment of the concentration estimates as "screening" or "refined". Refined air dispersion models use more robust algorithms capable of using representative meteorological data to predict more representative and usually less conservative estimates. Refined air dispersion models are, however, more resource intensive than their screening counterparts. It is advisable to first use a screening model to obtain conservative concentration estimates and calculate health risks. If the health risks are estimated to be above the threshold of concern, then use of a refined model to calculate

4-14

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

more representative concentration and health risk estimates would be warranted. There are situations when screening models represent the only viable alternative (e.g., when representative meteorological data are not available). The district or reviewing authority should be consulted to determine the appropriate method for determining the level of detail in the modeling analysis. The HARP software will incorporate the capability of using either representative meteorological data from AERMOD or the default meteorological conditions from the AERSCREEN model.

It is acceptable to use a refined air dispersion model in a "screening" mode for this program's health risk assessments. In this case, a refined air dispersion model is used:

- with worst-case meteorology instead of representative meteorology;
- with a conservative averaging period conversion factor to calculate longer term concentration estimates (see Section 4.10 for more discussion on screening air dispersion models and adjustments factors).

Note that use of worst case meteorology in a refined model is not the normal practice in New Source Review or Ambient Air Quality Standard evaluation modeling.

#### 4.6 Population Exposure

The level of detail required for the analysis (e.g., screening or refined), and the procedures to be used in determining geographic resolution and exposed population require case-by-case analysis and professional judgment. The District should be consulted before beginning the population exposure estimates, and as results are generated, further consultation may be necessary. Some suggested approaches and methods for handling the breakdown of population and performance of a screening or detailed risk analysis are provided in this section.

In addition to estimating individual cancer risk at specific points such as the MEI (maximally exposed individual), OEHHA recommends determining the number of people who reside within the  $1 \times 10^{-6}$ ,  $1 \times 10^{-5}$ ,  $1 \times 10^{-4}$ , and higher cancer risk isopleths. For noncancer population evaluations, the number of people who reside within the 0.5, one, five, or higher hazard index isopleths should be reported. The HARP software can provide population exposure estimates as cancer burden or as the number of persons exposed to a selected (user identified) health risk/impact level. Information on obtaining the HARP software can be found under the Hot Spots Program on the ARB's web site at [www.arb.ca.gov](http://www.arb.ca.gov). Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

##### 4.6.1 Zone(s) of Impact

As part of the estimation of the population exposure for the cancer risk analysis, it is necessary to determine the geographic area affected by the facility's emissions. An initial approach to define a "zone of impact" surrounding the source is to generate an isopleth where the total excess lifetime cancer risk from inhalation exposure to all emitted carcinogens is greater than  $10^{-6}$  (one in 1,000,000).

4-15

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

For noncarcinogens, a second, third, and fourth isopleth (to represent the chronic, 8-hour, and acute impacts) should be created to define the zone of impact for the hazard index from both inhalation and noninhalation pathways greater than or equal to 1.0. For clarity these isopleths may need to be presented on separate maps in the HRA.

Contact the District or reviewing authority to discuss inclusion of isopleth maps if all potential health risks fall within the facility boundary and no receptors have, or will ever, be present within the boundary (also see Section 4.7.1 for a discussion of on-site receptors).

The initial "zone of impact" can be determined as follows:

- Use a screening dispersion model (e.g., AERSCREEN) to obtain concentration estimates for each emitted pollutant at varying receptor distances from the source. Several screening models feature the generation of an automatic array of receptors which is particularly useful for determining the zone of impact. In order for the model to generate the array of receptors the user needs to provide some information normally consisting of starting distance, increment and number of intervals.
- Calculate total cancer risk and hazard index (HI) for each receptor location by using the methods provided in the risk characterization sections in Chapter 8 of the Air Toxics Hot Spots Risk Assessment Guidance Manual.
- Find the distance where the total inhalation cancer risk is equal to  $10^{-6}$ ; this may require redefining the receptor array in order to have two receptor locations that bound a total cancer risk of  $10^{-6}$ . Next, find the distance where the chronic, 8-hour, and acute health hazard indices are declared significant by the District (e.g., acute, 8-hour, or chronic HI = 1.0).

Some Districts may prefer to use a cancer risk of  $10^{-7}$  or an HI of 0.5 as the zone of impact. Therefore, the District should be consulted before modeling efforts are initiated. If the zone of impact is greater than 25 km from the facility at any point, then the District should be consulted. The District may specify limits on the area of the zone of impact. Ideally, these preferences would be presented in the modeling protocol (see Section 4.14).

Note that when depicting the risk assessment results, risk isopleths must present the total cancer and noncancer risk from both inhalation and noninhalation pathways. The zone of impact should be clearly shown on a map with geographic markers of adequate resolution (see Section 4.6.3.1). The text below discusses methodology for defining the zone of impact and has format recommendations. Chapter 9 provides an outline that specifies the content and recommended format of all HRA results.

The zone of impact can be defined once the exposure assessment (air dispersion modeling) process has determined the pollutant concentrations at each designated off-site receptor and a risk analysis (see Chapter 8) has been performed. For clarity, the cancer and noncancer zone(s) of impact should be presented on separate maps. A

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

map illustrating the carcinogenic zone of impact is required. The District may at its discretion ask for the map illustrating the potential carcinogenic zone of impact to identify the zone of impact for the minimum exposure pathways (inhalation, soil, dermal, and mother's milk) and the zone of impact for all applicable pathways of exposure (minimum pathways plus site/route dependent pathways). Two maps may be needed to accomplish this. The legend of these maps should state the level(s) used for the zone of impact and identify the exposure pathways that were included in the assessment.

The noncancer maps should also clearly identify the noncancer zones of impact. These include the acute (inhalation) zone of impact, 8-hour (inhalation) zone of impact and the chronic (including both inhalation, multipathway) zone of impact. The District may at its discretion require separate chronic inhalation and chronic multipathway zones of impact maps. For clarity, presentation of the two chronic zones of impact may also require two or more maps. The legend of these maps should state the level(s) used for the zone of impact and identify the exposure pathways (and target organs) that were included in the assessment. Further information regarding the methods for determination of hazard indices and cancer risk are discussed in Chapter 8 and Appendix I.

#### 4.6.2 Screening Population Estimates for Risk Assessments

A screening risk assessment should include an estimate of the maximum exposed population. For screening risk assessments, a detailed description of the exposed population is not required. The impact area to be considered should be selected to be health protective (i.e., will not underestimate the number of exposed individuals). A health-protective assumption is to assume that all individuals within a large radius of the facility are exposed to the maximum concentration. If a facility must also comply with the RCRA/CERCLA risk assessment requirements, health effects to on-site workers may also need to be addressed. The DTSC's Remedial Project Manager should be consulted on this issue. The District should be consulted to determine the population estimate that should be used for screening purposes. Guidance for one screening method is presented here.

1. Use a screening dispersion model (e.g., AERSCREEN) to obtain concentration estimates for each emitted pollutant at varying receptor distances from the source. Several screening models feature the generation of an automatic array of receptors that is particularly useful for determining the zone of impact. In order for the model to generate the array of receptors, the user needs to provide some information normally consisting of starting distance, increment, and number of intervals.
2. Calculate the potential cancer risk and hazard index for each receptor location by using the methods provided in the risk characterization sections of this document (Chapter 8).
3. Find the distance where the potential cancer risk is equal to District specified levels (e.g.,  $10^{-6}$ ); this may require redefining the receptor array in order to have

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

two receptor locations that bound a total cancer risk of  $10^{-6}$ . This exercise should be repeated for the noncancer health impacts.

4. Calculate cancer burden by estimating the number of people in the grid and stipulate that all are exposed at the highest level.

#### 4.6.3 Refined Population Estimates for Risk Assessments

The refined HRA requires a detailed analysis of the population exposed to emissions from the facility. Where possible, a detailed population exposure analysis provides estimates of the number of individuals in residences and offsite workplaces, as well as at sensitive receptor sites such as schools, daycare centers and hospitals. The District may require that locations with high densities of sensitive individuals be identified (e.g., schools, daycare centers, hospitals). These population analyses can include exposure estimates for workers and residents through the use of land use maps or other tools. The overall exposed residential and worker populations should be apportioned into smaller geographic subareas. The information needed for each subarea is:

1. The number of exposed persons, and
2. The receptor location at which the calculated ambient air concentration is assumed to be representative of the exposure to the entire population in the subarea.

A multi-tiered approach is suggested for the population analysis. Census tracts, which the facility could significantly impact, should be identified (see Section 4.6.3.1). A census tract should be divided into smaller subareas if it is close to the facility where ambient concentrations vary widely. The District may determine that census tracts provide sufficient resolution near the facility to adequately characterize population exposure or they may prefer the census information to be evaluated using smaller blocks. Further downwind where ambient concentrations are less variable, the census tract level may be acceptable to the District. The District may determine that the aggregation of census tracts (e.g., when the census tracts making up a city are combined) is appropriate for receptors that are considerable distances from the facility.

If a facility must also comply with the RCRA/CERCLA HRA requirements, health effects to on-site workers may also need to be addressed. The DTSC's Remedial Project Manager should be consulted on this issue. In some cases it may be appropriate to evaluate risks to on-site receptors. The district should be consulted about special cases for which evaluation of on-site receptors is appropriate, such as facilities frequented by the public or where people may reside (e.g., military facilities).

##### 4.6.3.1 Census Tracts

For a refined risk assessment, the boundaries of census tracts can be used to define the geographic area to be included in the population exposure analysis. Digital maps showing the census tract boundaries in California can be obtained from "The Thomas

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

Guide"® on the World Wide Web. Statistics for each census tract can be obtained from the U.S. Census Bureau. The website address for the U.S. Census Bureau is <http://www.census.gov>. Numerous additional publicly accessible or commercially available sources of census data can be found on the World Wide Web. A specific example of a census tract is given in Appendix K. The HARP software includes U.S. census data and is a recommended tool for performing population exposure estimates.

The two basic steps in defining the area under analysis are:

(1) Identify the "zone of impact" (as defined previously in Section 4.6.1) on a map detailed enough to provide for resolution of the population to the subcensus tract level. (The U.S. Geological Survey (USGS) 7.5-minute series maps and the maps within the HARP software provide sufficient detail.) This is necessary to clearly identify the zone of impact, location of the facility, and sensitive receptors within the zone of impact. If significant development has occurred since the USGS survey, this should be indicated. A specific example of a 7.5-minute series map is given in Appendix K.

(2) Identify all census tracts within the zone of impact using a U.S. Bureau of Census or equivalent map (e.g., Thomas Brothers, HARP Software). If only a portion of the census tract lies within the zone of impact, then only the population that falls within the isopleth should be used in the population estimate or burden calculation. To determine this level of detail, local planning and zoning information may need to be collected. When this more detailed information is not available, then a less refined approach is to include the census data if the centroid of the census block falls within the isopleths of interest. The census tract boundaries should be transferred to a map, such as a USGS map (referred to hereafter as the "base map").

An alternative approach for estimating population exposure in heavily populated urban areas is to apportion census tracts to a Cartesian grid cell coordinate system. This method allows a Cartesian coordinate receptor concentration field to be merged with the population grid cells. This process can be computerized and minimizes manual mapping of centroids and census tracts. The HARP software includes this function and will provide population estimates that are consistent with the methodology discussed here.

The District may determine that aggregation of census tracts (e.g., which census tracts making up a city can be combined) is appropriate for receptors that are located at considerable distances from the facility. If the District permits such an approach, it is suggested that the census tract used to represent the aggregate be selected in a manner to ensure that the approach is health protective. For example, the census tract included in the aggregate that is nearest (downwind) to the facility should be used to represent the aggregate.

##### 4.6.3.1.1 Subcensus Tract

Within each census tract are smaller population units. These units [urban block groups (BG) and rural enumeration districts (ED)] contain about 1,100 persons. BGs are

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

further broken down into statistical units called blocks. Blocks are generally bounded by four streets and contain an average of 70 to 100 persons. However, this range in population is an average and population units may vary significantly. In some cases, the EDs are very large and identical to a census tract.

The area requiring detailed (subcensus tract) resolution of the exposed residential and worker population will need to be determined on a case-by-case basis through consultation with the District. The District may determine that census tracts provide sufficient resolution near the facility to adequately characterize population exposure.

Employment population data can be obtained at the census tract level from the U.S. Census Bureau or from local planning agencies. This degree of resolution will generally not be sufficient for most risk assessments. For the area requiring detailed analysis, zoning maps, general plans, and other planning documents should be consulted to identify subareas with worker populations.

The boundaries of each residential and employment population area should be transferred to the base map.

#### 4.6.4 Sensitive Receptor Locations

Individuals who may be more sensitive to toxic exposures than the general population are distributed throughout the total population. Sensitive populations may include young children and chronically ill individuals. The District may require that locations with high densities of sensitive individuals be identified (e.g., schools, nursing homes, residential care facilities, daycare centers, and hospitals). The HRA should state what the District requirements are regarding identification of sensitive receptor locations.

Although protection of sensitive individuals is incorporated into OEHHA's risk assessment methodology in both cancer risk and noncancer risk assessment, the assessment of risk at the specific location of such sensitive individuals (e.g., schools, hospitals, or nursing homes) may be useful to assure the public that such individuals are being considered in the analysis. For some chemicals (e.g., mercury and manganese) children have been specifically identified as the sensitive subpopulation for noncancer health impacts, so it can be particularly appropriate to assess school sites.

### 4.7 Receptor Siting

#### 4.7.1 Receptor Points

The modeling analysis should contain a network of receptor points with sufficient detail (in number and density) to permit the estimation of the maximum concentrations. Locations that must be identified include:

- The maximum estimated off-site impact or point of maximum impact (PMI),
- The maximum exposed individual at an existing residential receptor (MEIR),
- The maximum exposed individual at an existing occupational worker receptor (MEIW).

4-20

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

Note that some situations may also require that on-site receptor (worker or residential) locations be evaluated. The risk assessor can contact the District or reviewing authority for guidance if on-site exposure situations are present at the emitting facility. However, these on-site locations should be included in the HRA. Some examples where the health impacts of on-site receptors may be appropriate could be military base housing, prisons, universities, day care facilities, or locations where the public may have regular access for the appropriate exposure period (e.g., a lunch time café or museum for acute exposures). When a receptor lives and works on the facility, site, or property, then these receptors should be evaluated and reported under both residential and worker scenarios and the one that is most health protective should be used for risk management decisions. The cancer risk estimates for the onsite residents may use a 30-year exposure duration while the 25-year exposure duration is used for a worker. Under a Tier 2 analysis, alternate exposure durations may be evaluated and presented with all assumptions supported.

All of these locations (i.e., PMI, MEIR, and MEIW) must be identified for potential multipathway carcinogenic and noncarcinogenic effects. It is possible that the estimated PMI, MEIR, and MEIW risk for cancer, chronic noncancer, 8-hour, and acute noncarcinogenic risks occur at different locations or that some of these evaluations may not be necessary (e.g., the receptor does not exist). For example, some facilities will not have off-site workers in the vicinity of the facility and will not need to evaluate worker exposure, or the exposure situation may only require the evaluation of short-term carcinogenic or acute noncancer impacts (see Section 8.2.10 for a discussion of short-term projects). The approval to revise the exposure assessment for a receptor, or to omit the MEIW receptor, should be verified in writing with the District or reviewing authority and included in the HRA.

Other sensitive receptor locations may also be of interest and required to be included in the HRA. The District or reviewing authority should be consulted to determine which sensitive receptor locations must be included.

The results from a screening model (if available) can be used to identify the area(s) where the maximum concentrations are likely to occur. Receptor points should also be located at the population centroids (see Section 4.7.2) and sensitive receptor locations (see Section 4.6.4). The exact configuration of the receptor array used in an analysis will depend on the topography, population distribution patterns, and other site-specific factors. All receptor locations should be identified in the HRA using UTM (Universal Transverse Mercator) coordinates and receptor number. The receptor numbers in the summary tables should match receptor numbers in the computer output (e.g., HARP output files). In addition to actual UTM coordinates, the block/street locations (i.e., north side of 3,000 block of Smith Street) should be provided in the HRA for the PMI, MEIR, and MEIW for carcinogenic and noncarcinogenic health effects. Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

4-21

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### 4.7.1.1 Receptor Height

To evaluate localized impacts, receptor height should be taken into account at the point of maximum impact on a case-by-case basis. For example, receptor heights may have to be included to account for receptors significantly above ground level. Flagpole receptors at the height of the breathing zone of a person may need to be considered when the source receptor distance is less than a few hundred meters. Consideration must also be given to the noninhalation pathway analysis which requires modeling of chemical deposition onto soil or water at ground level. For the inhalation pathway, a health protective approach is to select a receptor height from 0 meters to 1.8 meters that will result in the highest predicted downwind concentration. Final approval of this part of the modeling protocol should be with the District or reviewing authority.

#### 4.7.2 Centroid Locations

For each subarea analyzed, a centroid location (the location at which a calculated ambient concentration is assumed to represent the entire subarea) should be determined. When population is uniformly distributed within a population unit, a geographic centroid based on the shape of the population unit can be used. If only a portion of the census tract lies within the isopleth or area of interest, then only the population that falls within the isopleth should be used in the calculation for population exposure. To determine this level of detail, local planning and zoning information may need to be collected. Where populations are not uniformly distributed, a population-weighted centroid may be used. Another alternative uses the concentration at the point of maximum impact within that census tract as the concentration to which the entire population of that census tract is exposed. While this less refined approach is commonly accepted, Districts should be contacted to approve this method prior to its use in a risk assessment.

The centroids represent locations that should be included as receptor points in the dispersion modeling analysis. Annual average concentrations should be calculated at each centroid using the modeling procedures presented in this chapter.

For census tracts and BG/EDs, judgments can be made using census tracts maps and street maps to determine the centroid location. At the block level, a geographic centroid is sufficient.

#### 4.7.3 Spatial Averaging

Since the inception of the "Hot Spots" and California's Air Toxics Programs, HRA results for an individual receptor have typically been based on air dispersion modeling results at a single point or location. With a few exceptions, this method has been traditionally used for all types of receptors (e.g., PMI, MEIR, MEIW, pathway receptors, etc.). The assumptions used in risk assessment are designed to prevent underestimation of health impacts to the public resulting in a health protective approach. However, basing risk estimates on a single highest point (PMI, MEIR, or MEIW) does not take into account that a person does not remain at one location on their property, or in one location at the

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

workplace over an extended period of time. Therefore, the average air concentration over a small area is likely to be more representative than using the air concentration at a single point, particularly in those situations where concentrations fall off rapidly around that single point. The concept of averaging air concentrations over a small area is known as spatial averaging.

In order to understand how spatial averaging can impact air dispersion modeling results with various types of facilities, the ARB, in conjunction with the OEHHA, performed sensitivity analyses to evaluate the impacts of spatially averaging air dispersion modeling results (see Appendix C of the Air Toxics Hot Spots Program Risk Assessment Guidelines: Technical Support Document for Exposure Assessment and Stochastic Analysis (EASA)). Based on these sensitivity analyses, it is reasonable and appropriate to include spatial averaging techniques in air toxic risk assessments as supplemental information to Tier 1 information (i.e., modeling results that are based on the air concentration from a single point or location). While all risk assessments must include results based on Tier 1 methodology, the spatially averaged concentrations around the point of interest (e.g., PMI, MEIR, MEIW, multipathway exposure evaluations, etc.) could also be included as an option in risk assessments and acceptable for risk management decisions subject to approval by the District or reviewing agency. Spatial averaging is an option for the purpose of additional refinement to the risk assessment.

A few reasons that support the inclusion of spatially averaged modeled concentrations in risk assessment include the following:

- Averaging results over a small domain will give a more representative picture of individual exposure and risk than an estimate based on one single location within their property.
- Spatial averaging will allow air dispersion modeling and risk assessment results to be characterized as the estimated concentration and risk in a discrete area of interest, rather than an exact value for a single location.
- From a risk communication standpoint, the ARB and OEHHA feel it is more appropriate to present the modeling output and the calculated health impacts as the potential impacts within a small or discrete area, rather than an exact value at a specific point on a grid or map.
- Spatial averaging is the recommended procedure in ARB's Lead Risk Management Guidelines (2001) and has been used in several complex source HRAs [e.g., Roseville Railyard (2004), Ports of LA/LB (2006), Port of Oakland (2008)].
- Spatially averaging the deposition concentrations over pasture land, a garden, or a water body for multipathway exposure scenarios is a planned upgrade for the HARP Software. This will provide an option that will refine multipathway exposure assessments. Average deposition on these types of areas (e.g., a water body) is not necessarily well represented by the single highest point of deposition, or deposition at the geographic center of the water body. Likewise, since produce is grown over the entire surface of the garden and cows graze the

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

entire pasture, deposition is better estimated by evaluating the entire area rather than using a single point.

#### 4.7.3.1 Spatial Averaging Methodology

The spatial averaging sensitivity study in Appendix C of the EASA is based on simulating emissions from point, volume, area, and line sources. Most source types (e.g., point) are simulated as a small, medium or large source. Line sources are only simulated as small and large. In addition, meteorological data collected at five different locations in California were used. Nested spatial average grids of various domains were used to study the differences on the spatial average concentration. In the case of the 20 meter by 20 meter spatial average nested grid, the spatial average concentration showed little change over the PMI for medium and large sources. In the case for small sources, the spatial average concentration is approximately 45% to 80% of the PMI concentration. Individual source type and meteorological conditions will cause variations in these results.

The results of the spatial averaging sensitivity study in Appendix C of the EASA shows that sources with low plume rise that result in a PMI, MEIW, or MEIR located at or near the property fence line are most sensitive to spatial averaging. Source types with high plume rise (e.g., tall stacks) show a PMI far downwind where the concentration gradient is more gradual and therefore spatial averaging has a lesser effect. While spatial averaging can be used regardless of source size or the location of the PMI, the following conditions generally apply when a source is a good candidate for spatial averaging:

- The MEIR, MEIW, or PMI is located at the fence line or close to the emission source.
- The concentration gradient is high near the PMI. This is more associated with low level plumes such as fugitive, volume, area, or short stacks.
- A long term average is being calculated to represent a multi-year risk analysis based on one to five years of meteorological data. Note that spatial averaging should **not** be used for short term (acute) calculations.

In general, the method for calculating the spatial average in air toxic risk assessments includes the following steps:

1. Locate the point(s) of interest and receptor(s) (i.e., PMI, MEIW, MEIR, and any additional receptor locations of interest or concern) with a grid resolution spacing of no greater than five meters. To achieve this, two or more modeling runs with successively finer nested grid resolutions may be needed to find the final location where the nested grid that will be used for spatial averaging will be placed.

4-24

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

2. Center the spatial average nested grid on the each receptor's location of interest determined in step 1. Limit the nested grid to no larger than 20 meters by 20 meters or 400 square meters. Note that if a portion of the centered and nested grid falls within the facility boundary and the receptor location of interest is outside of the boundary, then adjustments to the nested grid to obtain the spatially-averaged concentration for the offsite receptor are reasonable. This may be done by either repositioning the nested grid to cover 400 square meters of off-boundary area surrounding the receptor or center the nested grid and delete any on-site grid points so that only the offsite grid points surrounding the receptor are used in the spatially averaged concentration. The grid resolution spacing should be no greater than five meters. With a five meter grid resolution, the 20 meter by 20 meter domain will result in 25 receptors. The size, shape, and placement of the domain and the resolution of points are subject to approval by the District, ARB, or other reviewing authority. See the Sections 4.7.3.1.2 and 4.7.3.1.3 below for additional discussion on domain sizing and grid spacing at worksites, pastures, gardens, and water bodies.
3. Some configurations of source activity and meteorological conditions result in a predominant downwind plume center line that is significantly askew from one of the four ordinate directions. In this case, a tilted nested grid is necessary to coincide with the dominant plume centerline. Polar receptors are easier to implement than a tilted rectangular grid. The domain of the polar receptor field should be limited to a 15 meter radius. See Appendix C of the EASA for detailed instructions on tilted polar receptors.
4. Calculate the arithmetic mean of the long term period average concentration (e.g., annual average) of the nested grid of receptors to represent the spatial average. This average is used in the risk calculations.
5. Document and include all methods, assumptions, data, maps, and files used in the spatial averaging analysis and clearly present this information in the risk assessment following the requirements of the District or reviewing authority. Note that in the update to the HARP software, functionality will be included that will assist with spatial averaging and the methodology discussed.

The following sections discuss the use of spatial averaging for various receptor types and exposure pathways.

#### 4.7.3.1.1 *Residential Receptors*

Follow the steps in Section 4.7.3 outlining the spatial averaging methodology. To remain health protective when evaluating a residential receptor, spatial averaging should not take place using large nested domains. The domain used for spatial averaging should be no larger than 20 meters by 20 meters with a maximum grid spacing resolution of equal to or less than five meters. This domain represents an area

4-25

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

that is approximately the size of a small urban lot. The size of the domain and resolution of points shall be subject to approval by the District, ARB, or other reviewing authority.

#### 4.7.3.1.2 Worker Receptors

Offsite worker locations (e.g. MEIW) may also be a candidate for spatial averaging. However, workers can be at the same location during almost their entire daily work shift (e.g., desk/office workers). When this is the situation, then the traditional method of using a single location and corresponding modeled concentration is appropriate. If spatial averaging is used, care should be taken to determine the proper domain size and grid resolution. Follow the steps in Section 4.7.3 outlining the spatial averaging methodology. To be consistent with the residential receptor assumptions and remain health protective, a modeling domain size no larger than 20 meters by 20 meters is recommended with a grid spacing resolution of equal to or less than five meters. However, if workers routinely and continuously move throughout the worksite over a space greater than 20 meters by 20 meters, then a larger domain may be considered.

The HRA or modeling protocol shall support all assumptions used, including, but not limited to, documentation for all workers showing the area where each worker routinely performs their duties and the percentage of time spent in those areas. The final domain size should not be greater than the smallest area of worker movement. Other considerations for determining domain size and grid spacing resolution may include an evaluation of the concentration gradients across the worker area. The grid spacing used within the domain to find the concentration that will be used to calculate health impacts should be sufficient in number and detail to obtain a representative concentration across the area of interest. The size of the domain and resolution of points shall be subject to approval by the District, ARB, or other reviewing authority.

#### 4.7.3.1.3 Pastures, Gardens, or Water Bodies

The simplified approach of using the concentration (deposition rate) at the centroid, a specific point of interest, or the PMI location for an area being evaluated for noninhalation exposures (e.g., a body of water used for fishing, a pasture used for grazing, area of a garden, etc.) is acceptable for use in HRA. However, evaluating deposition concentrations over pasture land, a garden, or a water body for multipathway exposure scenarios using spatial averaging could give more representative estimates of the overall deposition rate. Use of spatial averaging in this application is subject to approval by the District, ARB, or other reviewing authority.

If spatial averaging will be done, follow the steps in Section 4.7.3.1 outlining the spatial averaging methodology. When using spatial averaging over the deposition area, care should be taken to determine the proper domain size to make sure it includes all reasonable areas of potential deposition. The size and shape of the area of interest (e.g., pasture or water body) should be identified and used for the modeling domain. The grid spacing or resolution used within the domain should be sufficient in detail to obtain a representative deposition concentration across the area of interest. One way

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

to determine the grid resolution is to include an evaluation of the concentration gradients across the deposition area. The HRA or modeling protocol shall support all assumptions used, including, but not limited to, documentation of the deposition area (e.g., size and shape of the pasture, garden, or water body, maps, representative coordinates, grid resolution, concentration gradients, etc.). The size of the domain and grid resolution is subject to approval by the reviewing authority.

In lieu of following the details in the paragraph above, the approach used for the other receptors (e.g., MEIR, MEIW) that uses a domain size not greater than 20 meters by 20 meters, located on the PMI within the area of interest, with a maximum grid spacing resolution of five meters, can be used. This default refined approach would apply to deposition areas greater than 20 meters by 20 meters. For smaller deposition areas, the simplified approach of using the PMI for the area, the concentration at the centroid or a specific point of interest, or averaging over the actual smaller domain can be used. This again is subject to approval by the reviewing authority.

The HRA or modeling protocol shall support all assumptions used, including, but not limited to, documentation of the deposition area (e.g., size and shape of the water body, pasture, or garden; all data; maps; representative coordinates, and etc.), and the details clarifying how and where the averaging was done (e.g., location and magnitude of concentration gradients, the grid spacing used).

#### 4.8 Meteorological Data

Refined air dispersion models require hourly meteorological data. The first step in obtaining meteorological data should be to check with the District and the ARB for data availability. Other sources of data include the National Weather Service (NWS), National Climatic Data Center (NCDC), Asheville, North Carolina, ARB meteorological database (METDB), military stations and private networks. Meteorological data for a subset of NWS stations are available from the U.S. EPA Support Center for Regulatory Air Models (SCRAM). The SCRAM can be accessed at [www.epa.gov/scram001/main.htm](http://www.epa.gov/scram001/main.htm). All meteorological data sources should be approved by the District. Data not obtained directly from the District or the ARB should be checked for quality, representativeness, and completeness. It should be approved by the District before use. U.S. EPA provides guidance (U.S. EPA, 1995e) for these data. Meteorological data may need further processing. Data users can consult with the District or the ARB on how to process the raw meteorological data. The risk assessment should indicate if the District required the use of a specified meteorological data set. All memos indicating District approval of meteorological data should be attached in an appendix. If no representative meteorological data are available, screening procedures should be used as indicated in Section 4.10.

The analyst should acquire enough meteorological data to ensure that the worst-case meteorological conditions are represented in the model results. The US-EPA Guideline on Air Quality Models (U.S. EPA 2005) prefers that the latest five years of consecutive meteorological data be used to represent long term averages (i.e., cancer and chronic impacts). Previous OEHHa guidance allowed the use of the worst-case year to save

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

computer time. The processing speed of modern computers has increased to the point where processing five years of data over one year is no longer burdensome. However, the District may determine that one year of representative meteorological data is sufficient to adequately characterize the facility's impact. This may especially be the case when five years of quality consecutive data are not available.

To determine long term average concentrations the data can be averaged. For calculation of the one-hour maximum concentrations needed to evaluate acute effects, the worst-case year should be used in conjunction with the maximum hourly emission rate. For example, the long term average concentration and one-hour maximum concentration at a single receptor for five years of meteorological data are calculated below:

Year	Annual Average ( $\mu\text{g}/\text{m}^3$ )	Maximum One-Hour ( $\mu\text{g}/\text{m}^3$ )
1	7	100
2	5	80
3	9	90
4	8	110
5	6	90
5-year average	7	

In the above example, the long-term average concentration over five years is  $7 \mu\text{g}/\text{m}^3$ . Therefore,  $7 \mu\text{g}/\text{m}^3$  should be used to evaluate carcinogenic and chronic effects (i.e., annual average concentration). The one-hour maximum concentration is the highest one-hour concentration in the five-year period. Therefore,  $110 \mu\text{g}/\text{m}^3$  is the peak one-hour concentration that should be used to evaluate acute effects.

The higher hourly concentration usually occurs when meteorological dispersion conditions become worse, such as, calm or light wind, inversion, etc. Inversion usually happens in late afternoon through early morning. As the sun goes down, the atmospheric temperature near surface starts to fall, usually faster than the temperature in the upper atmosphere causing a temperature inversion layer to form and extend downward. This inversion layer usually sustains throughout the night, and remains until early morning. Because of the inversion (cold air sitting on warm air at the top of the inversion layer), pollutant vertical mixing is very low in the morning.

When predicted concentrations are high and the mixing height is very low for the corresponding averaging period, the modeling results deserve additional consideration. For receptors in the near field, it is within the model formulation to accept a very low mixing height for short durations. However, it would be unlikely that the very low mixing height would persist long enough for the pollutants to travel into the far field. In the

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

event that the analyst identifies any of these time periods, they should be discussed with the District on a case-by-case basis.

#### 4.8.1 Meteorological Data Formats

Most short-term dispersion models require input of hourly meteorological data in a format which depends on the model. U.S. EPA provides software for processing meteorological data for use in U.S. EPA recommended dispersion models. U.S. EPA recommended meteorological processors include the Meteorological Processor for Regulatory Models (MPRM), PCRAMMET, and AERMET. Use of these processors will ensure that the meteorological data used in an U.S. EPA recommended dispersion model will be processed in a manner consistent with the requirements of the model.

Meteorological data for a subset of NWS stations are available on the World Wide Web at the U.S. EPA SCRAM address, <http://www.epa.gov/scram001>.

#### 4.8.2 Treatment of Calms

Calms are hours when the wind speed is below the starting threshold of the anemometer. Gaussian plume models require a wind speed and direction to estimate plume dispersion in the downwind direction.

U.S. EPA's policy is to disregard calms until such time as an appropriate analytical approach is available. The recommended U.S. EPA models contain a routine that eliminates the effect of the calms by nullifying concentrations during calm hours and recalculating short-term and annual average concentrations. Certain models lacking this built-in feature can have their output processed by U.S. EPA's CALMPRO program (U.S. EPA, 1984a) to achieve the same effect. Because the adjustments to the concentrations for calms are made by either the models or the postprocessor, actual measured on-site wind speeds should always be input to the preprocessor. These actual wind speeds should then be adjusted as appropriate under the current U.S. EPA guidance by the preprocessor.

Following the U.S. EPA methodology, measured on-site wind speeds of less than 1.0 m/s, but above the instrument threshold, should be set equal to 1.0 m/s by the preprocessor when used as input to Gaussian models. Calms are identified in the preprocessed data file by a wind speed of 1.0 m/s and a wind direction equal to the previous hour. For input to AERMOD, no adjustment should be made to the site specific wind data. AERMOD can produce model estimates for conditions when the wind speed may be less than 1 m/s but still greater than the instrument threshold. Some air districts provide pre-processed meteorological data for use in their district that treats calms differently. Local air districts should be consulted for available meteorological data. In addition, to reduce the number of calms and missing winds in the surface data, EPA has developed a pre-processor – AERMINUTE – to process 1-minute ASOS wind data for generating hourly average wind speed and directions for input to AERMET in Stage 2. The details can be found in the EPA's AERMINUTE User's Instructions at:

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

[http://www.epa.gov/ttn/scram/models/aermod/aerminute\\_userguide\\_v11059\\_draft.pdf](http://www.epa.gov/ttn/scram/models/aermod/aerminute_userguide_v11059_draft.pdf)

If the fraction of calm hours is excessive, then an alternative approach may need to be considered to characterize dispersion. The Calpuff model modeling system can simulate calm winds as well as complex wind flow and therefore is a viable alternative. The local air district should be consulted for alternative approaches.

#### 4.8.3 Treatment of Missing Data

Missing data refer to those hours for which no meteorological data are available from the primary on-site source for the variable in question. When missing values arise, they should be handled in one of the following ways listed below, in the following order of preference:

- (1) If there are other on-site data, such as measurements at another height, they may be used when the primary data are missing. If the height differences are significant, corrections based on established vertical profiles should be made. Site-specific vertical profiles based on historical on-site data may also be appropriate to use if their determination is approved by the reviewing authority. If there is question as to the representativeness of the other on-site data, they should not be used.
- (2) If there are only one or two missing hours, then linear interpolation of missing data may be acceptable, however, caution should be used when the missing hour(s) occur(s) during day/night transition periods.
- (3) If representative off-site data exist, they may be used. In many cases this approach may be acceptable for cloud cover, ceiling height, mixing height, and temperature. This approach will rarely be acceptable for wind speed and direction. The representativeness of off-site data should be discussed and agreed upon in advance with the reviewing authority.
- (4) An imputation methodology may be acceptable, provided it is well-documented, sufficiently justified, and properly applied.
- (5) Failing any of the above, the data field should be coded as missing using missing data codes appropriate to the applicable meteorological pre-processor.

Appropriate model options for treating missing data, if available in the model, should be employed. Substitutions for missing data should only be made in order to complete the data set for modeling applications, and should not be used to attain the "regulatory completeness" requirement of 90%. That is, the meteorological data base must be 90% complete on a monthly basis (before substitution) in order to be acceptable for use in air dispersion modeling. The use of any data substitution technique should be thoroughly documented to provide the District or reviewing authority with all the information necessary to determine its approvability.

4-30

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

If the recommended methods for addressing missing meteorological data cannot be achieved as described, then alternative approaches should be discussed and developed in conjunction with the District or reviewing authority.

#### 4.8.4 Representativeness of Meteorological Data

The atmospheric dispersion characteristics at an emission source need to be evaluated to determine if the collected meteorological data can be used to adequately represent atmospheric dispersion for the project.

Such determinations are required when the available meteorological data are acquired at a location other than that of the proposed source. In some instances, even though meteorological data are acquired at the location of the pollutant source, they still may not correctly characterize the important atmospheric dispersion conditions.

Considerations of representativeness are always made in atmospheric dispersion modeling whether the data base is "on-site" or "off-site." These considerations call for the judgment of a meteorologist or an equivalent professional with expertise in atmospheric dispersion modeling. If in doubt, the District should be consulted.

##### 4.8.4.1 Spatial Dependence

The location where the meteorological data are acquired should be compared to the source location for similarity of terrain features. For example, in complex terrain, the following considerations should be addressed in consultation with the District:

- Aspect ratio of terrain, i.e., ratio of:
  - Height of valley walls to width of valley;
  - Height of ridge to length of ridge; and
  - Height of isolated hill to width of hill at its base
- Slope of terrain
- Ratio of terrain height to stack/plume height
- Distance of source from terrain (i.e., how close to valley wall, ridge, isolated hill)
- Correlation of terrain feature to prevailing meteorological conditions

Likewise, if the source is located on a plateau or plain, the source of meteorological data used should be from a similar plateau or plain.

Judgments of representativeness should be made only when sites are climatologically similar. Sites in nearby, but different air sheds, often exhibit different weather patterns. For instance, meteorological data acquired along a shoreline are not normally representative of inland sites and vice versa.

4-31

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

Meteorological data collected need to be examined to determine if drainage, transition, and synoptic flow patterns are characteristics of the source, especially those critical to the regulatory application. Consideration of orientation, temperature, and ground cover should be included in the review.

An important aspect of space dependence is height above the ground. Where practical, meteorological data should be acquired at the release height, as well as above or below, depending on the buoyancy of the source's emissions. AERMOD at a minimum requires wind observations at a height above ground between seven times the local surface roughness height and 100 meters.

#### 4.8.4.2 Temporal Dependence

To be representative, meteorological data must be of sufficient duration to define the range of sequential atmospheric conditions anticipated at a site. As a minimum, one full year of on-site meteorological data is necessary to prescribe this time series. Multiple years of data are used to describe variations in annual and short-term impacts. Consecutive years from the most recent, readily available 5-year period are preferred to represent these yearly variations.

#### 4.8.4.3 Further Considerations

It may be necessary to recognize the non-homogeneity of meteorological variables in the air mass in which pollutants disperse. This non-homogeneity may be essential in correctly describing the dispersion phenomena. Therefore, measurements of meteorological variables at multiple locations and heights may be required to correctly represent these meteorological fields. Such measurements are generally required in complex terrain or near large land-water body interfaces.

It is important to recognize that, although certain meteorological variables may be considered unrepresentative of another site (for instance, wind direction or wind speed), other variables may be representative (such as temperature, dew point, cloud cover). Exclusion of one variable does not necessarily exclude all. For instance, one can argue that weather observations made at different locations are likely to be similar if the observers at each location are within sight of one another - a stronger argument can be made for some types of observations (e.g., cloud cover) than others. Although by no means a sufficient condition, the fact that two observers can "see" one another supports a conclusion that they would observe similar weather conditions.

Other factors affecting representativeness include change in surface roughness, topography and atmospheric stability. Currently there are no established analytical or statistical techniques to determine representativeness of meteorological data. The establishment and maintenance of an on-site data collection program generally fulfills the requirement for "representative" data. If in doubt, the District should be consulted.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### 4.8.5 Alternative Meteorological Data Sources

It is necessary, in the consideration of most air pollution problems, to obtain data on site-specific atmospheric dispersion. Frequently, an on-site measurement program must be initiated. As discussed in Section 4.8.3, representative off-site data may be used to substitute for missing periods of on-site data. There are also situations where current or past meteorological records from a National Weather Service station may suffice. These considerations call for the judgment of a meteorologist or an equivalent professional with expertise in atmospheric dispersion modeling. More information on Weather Stations including: National Weather Service (NWS), military observations, supplementary airways reporting stations, upper air and private networks, is provided in "On-Site Meteorological Program Guidance for Regulatory Modeling Applications" (U.S. EPA, 1995e).

#### 4.8.5.1 Recommendations

On-site meteorological data should be processed to provide input data in a format consistent with the particular models being used. The input format for U.S. EPA short-term regulatory models is defined in U.S. EPA's MPRM. The input format for AERMOD is defined in the AERMET meteorological pre-processor. Processors are available on the SCRAM web site. The actual wind speeds should be coded on the original input data set. Wind speeds less than 1.0 m/s but above the instrument threshold should be set equal to 1.0 m/s by the preprocessor when used as input to Gaussian models. Wind speeds below the instrument threshold of the cup or vane, whichever is greater, should be considered calm, and are identified in the preprocessed data file by a wind speed of 1.0 m/s and a wind direction equal to the previous hour. For input to AERMOD, no adjustment should be made to the site specific wind data. AERMOD can produce model estimates for conditions when the wind speed may be less than 1 m/s but still greater than the instrument threshold.

If data are missing from the primary source, they should be handled as follows, in order of preference: (1) substitution of other representative on-site data; (2) linear interpolation of one or two missing hours; (3) substitution of representative off-site data; (4) use of a well-documented and justified imputation methodology; or (5) coding as a missing data field, according to the discussions in Section 4.8.3. The use of any data substitution technique should be thoroughly documented to provide the District or reviewing authority with all the information necessary to determine its approvability.

If the data processing recommendations in this section cannot be achieved, then alternative approaches should be discussed and developed in conjunction with the District or reviewing authority.

#### 4.8.6 Quality Assurance and Control

The purpose of quality assurance and maintenance is the generation of a representative amount (90% of hourly values for a year on a monthly basis) of valid data. For more information on data validation consult reference U.S. EPA (1995e). Maintenance may

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

be considered the physical activity necessary to keep the measurement system operating as it should. Quality assurance is the management effort to achieve the goal of valid data through plans of action and documentation of compliance with the plans.

Quality assurance (QA) will be most effective when following a QA Plan which has been signed-off by appropriate project or organizational authority. The QA Plan should contain the following information (paraphrased and particularized to meteorology from Lockhart):

1. Project description - how meteorology data are to be used
2. Project organization - how data validity is supported
3. QA objective - how QA will document validity claims
4. Calibration method and frequency - for data
5. Data flow - from samples to archived valid values
6. Validation and reporting methods - for data
7. Audits - performance and system
8. Preventive maintenance
9. Procedures to implement QA objectives - details
10. Management support - corrective action and reports

It is important for the person providing the quality assurance (QA) function to be independent of the organization responsible for the collection of the data and the maintenance of the measurement systems. Ideally, the QA auditor works for a separate company.

#### 4.9 Model Selection

There are several air dispersion models that can be used to estimate pollutant concentrations and new ones are likely to be developed. U.S. EPA added AERMOD, which incorporates the PRIME downwash algorithm, to the list of preferred models in 2005 as a replacement to ISCST3. CalPuff was added in 2003. The latest version of the U.S. EPA recommended models can be found at the SCRAM Bulletin board located at <http://www.epa.gov/scram001>. However, any model, whether a U.S. EPA guideline model or otherwise, must be approved for use by the local air district. Recommended models and guidelines for using alternative models are presented in this section. All air dispersion models used to estimate pollutant concentrations for risk assessment analyses must be in the public domain. Classification according to terrain, source type and level of analysis is necessary before selecting a model (see Section 4.4). The selection of averaging times in the modeling analysis is based on the health effects of concern. Annual average concentrations are required for an analysis of carcinogenic or other chronic effects. One-hour maximum concentrations are required for analysis of acute effects.

##### 4.9.1 Recommended Models

Recommended air dispersion models to estimate concentrations for risk assessment analyses are generally referenced in US EPA's Guideline on Air Quality Models

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

available at <http://www.epa.gov/scram001>. Currently AERMOD is recommended for most refined risk assessments in flat or complex terrain and in rural or urban environments<sup>1</sup>. In addition, CalPuff is available where spatial wind fields are highly variable or transport distances are large (e.g., 50 km). AERSCREEN is a screening model based on AERMOD. AERSCREEN can be used when representative meteorological data are unavailable. CTSCREEN is available for screening risk assessments in complex terrain. The most current version of the models should be used for risk assessment analysis. Some facilities may also require models capable of special circumstances such as dispersion near coastal areas. For more information on modeling special cases see Sections 4.12 and 4.13.

Most air dispersion models contain provisions that allow the user to select among alternative algorithms to calculate pollutant concentrations. Only some of these algorithms are approved for regulatory application such as the preparation of health risk assessments. The sections in this guideline that provide a description of each recommended model contain information on the specific switches and/or algorithms that must be selected for regulatory application.

To further facilitate the model selection, the District should be consulted for additional recommendations on the appropriate model(s) or a protocol submitted for District review and approval (see Section 4.14.1).

#### 4.9.2 Alternative Models

Alternative models are acceptable if applicability is demonstrated or if they produce results identical or superior to those obtained using one of the preferred models referenced in Section 4.9.1. For more information on the applicability of alternative models refer to the following documents:

- U.S. EPA (2005). "Guideline on Air Quality Models" Section 3.2.2
- U.S. EPA (1992). "Protocol for Determining the Best Performing Model"
- U.S. EPA (1985a). "Interim Procedures for Evaluating Air Quality Models – Experience with Implementation"
- U.S. EPA (1984b). "Interim Procedures for Evaluating Air Quality Models (Revised)"

#### 4.10 Screening Air Dispersion Models

A screening model may be used to provide a maximum concentration that is biased toward overestimation of public exposure. Use of screening models in place of refined modeling procedures is optional unless the District specifically requires the use of a refined model. Screening models are normally used when no representative meteorological data are available and may be used as a preliminary estimate to determine if a more detailed assessment is warranted.

<sup>1</sup> AERMOD was promulgated by U.S. EPA as a replacement to ISCST3 on November 9, 2006.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

Some screening models provide only 1-hour average concentration estimates. Other averaging periods can be estimated based on the maximum 1-hour average concentration in consultation and approval of the responsible air district. Because of variations in local meteorology, the exact factor selected may vary from one district to another. Table 4.2 provides guidance on the range and typical values applied. The conversion factors are designed to bias predicted longer term averaging periods towards overestimation.

**Table 4.2 Recommended Factors to Convert Maximum 1-hour Avg. Concentrations to Other Averaging Periods (U.S. EPA, 2011, 1995a; ARB, 1994).**

Averaging Time	Range	Typical SCREEN3 Recommended	AERSCREEN Recommended
3 hours	0.8 - 1.0	0.9	1.0
8 hours	0.5 - 0.9	0.7	0.9
24 hours	0.2 - 0.6	0.4	0.6
30 days	0.2 - 0.3	0.3	
Annual	0.06 - 0.1	0.08	0.1

AERSCREEN automatically provides the converted concentration for longer than 1-hour averaging periods. For area sources, the AERSCREEN 3, 8, and 24-hour average concentration are equal to the 1-hour concentration. No annual average concentration is calculated. SCREEN3 values are shown for comparison purposes.

#### 4.10.1 AERSCREEN

The AERSCREEN (U.S. EPA, 2011) model is now available and should be used in lieu of SCREEN3 with approval of the local District. AERSCREEN is a screening level air quality model based on AERMOD. AERSCREEN does not require the gathering of hourly meteorological data. Rather, AERSCREEN requires the use of the MAKEMET program which generates a site specific matrix of meteorological conditions for input to the AERMOD model. MAKEMET generates a matrix of meteorological conditions based on local surface characteristics, ambient temperatures, minimum wind speed, and anemometer height.

AERSCREEN is currently limited to modeling a single point, capped stack, horizontal stack, rectangular area, circular area, flare, or volume source. More than one source may be modeled by consolidating the emissions into one emission source.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### 4.10.2 Valley Screening

The Valley model is designed to simulate a specific worst-case condition in complex terrain, namely that of a plume impaction on terrain under stable atmospheric conditions. The algorithms of the VALLEY model are included in other models such as SCREEN3 and their use is recommended in place of the VALLEY model. The usefulness of the VALLEY model and its algorithms is limited to pollutants for which only long-term average concentrations are required. For more information on the Valley model consult the user's guide (Burt, 1977).

##### 4.10.2.1 Regulatory Options

Regulatory application of the Valley model requires the setting of the following values during a model run:

- Class F Stability (rural) and Class E Stability (urban)
- Wind Speed = 2.5 m/s
- 6 hours of occurrence of a single wind direction (not exceeding a 22.5 deg sector)
- 2.6 stable plume rise factor

#### 4.10.3 CTSCREEN

The CTSCREEN model (Perry et al., 1990) is the screening mode of the Complex Terrain Dispersion Model (CTDMPLUS). CTSCREEN can be used to model single point sources only. It may be used in a screening mode for multiple sources on a case by case basis in consultation with the District. CTSCREEN is designed to provide conservative, yet theoretically sounder, worst-case 1-hour concentration estimates for receptors located on terrain above stack height. Internally-coded time-scaling factors are applied to obtain other averages (see Table 4.3). These factors were developed by comparing the results of simulations between CTSCREEN and CTDMPLUS for a variety of scenarios and provide conservative estimates (Perry et al., 1990). CTSCREEN produces identical results as CTDMPLUS if the same meteorology is used in both models. CTSCREEN accounts for the three-dimensional nature of the plume and terrain interaction and requires detailed terrain data representative of the modeling domain. A summary of the input parameters required to run CTSCREEN is given in Table 4.4. The input parameters are provided in three separate text files. The terrain topography file (TERRAIN) and the receptor information file (RECEPTOR) may be generated with a preprocessor that is included in the CTSCREEN package. In order to generate the terrain topography file the analyst must have digitized contour information.

**Table 4.3 Time-scaling factors internally coded in CTSCREEN**

Averaging Period	Scaling Factor
3 hours	0.7
24 hour	0.15
Annual	0.03

**Table 4.4 Input Parameters Required to Run CTSCREEN**

Parameter	File
Miscellaneous program switches	CTDM.IN
Site Latitude and Longitude (degrees)	CTDM.IN
Site TIME_ZONE	CTDM.IN
Meteorology Tower Coordinates (user units)	CTDM.IN
Source Coordinates: x and y (user units)	CTDM.IN
Source Base Elevation (user units)	CTDM.IN
Stack Height (m)	CTDM.IN
Stack Diameter (m)	CTDM.IN
Stack Gas Temperature (K)	CTDM.IN
Stack Gas Exit Velocity (m/s)	CTDM.IN
Emission Rate (g/s)	CTDM.IN
Surface Roughness for each Hill (m)	CTDM.IN
Meteorology: Wind Direction (optional)	CTDM.IN
Terrain Topography	TERRAIN
Receptor Information (coordinates and associated hill number)	RECEPTOR

#### 4.11 Refined Air Dispersion Models

Refined air dispersion models are designed to provide more representative concentration estimates than screening models. In general, the algorithms of refined models are more robust and have the capability to account for site-specific meteorological conditions. For more information regarding general aspects of model selection see Section 4.9.

##### 4.11.1 AERMOD

For a wide variety of applications in all types of terrain, the recommended model is AERMOD. AERMOD is a steady-state plume dispersion model for assessment of pollutant concentrations from a variety of sources. AERMOD simulates transport and dispersion from multiple point, area, or volume sources based on an up-to-date characterization of the atmospheric boundary layer. Sources may be located in rural or urban areas and receptors may be located in simple or complex terrain. AERMOD accounts for building wake effects (i.e., plume downwash) based on the PRIME building downwash algorithms. The model employs hourly sequential preprocessed meteorological data to estimate concentrations for averaging times from one hour to one year (also multiple years). AERMOD is designed to operate in concert with two pre-processor codes: AERMET processes meteorological data for input to AERMOD, and AERMAP processes terrain elevation data and generates receptor information for input to AERMOD. Guidance on input requirements may be found in the AERMOD Users Guide.

##### 4.11.1.1 Regulatory Options

U.S. EPA regulatory application of AERMOD requires the selection of specific switches (i.e., algorithms) during a model run. All the regulatory options can be set by selecting the DFAULT keyword. The U.S. EPA regulatory options, automatically selected when the DFAULT keyword is used, are:

- Stack-tip downwash
- Incorporates the effects of elevated terrain
- Includes calms and missing data processing routines
- Does not allow for exponential decay for applications other than a 4-hour half life for SO<sub>2</sub>

Additional information on these options is available in the AERMOD User's Guide.

##### 4.11.1.2 Special Cases

- Building Downwash:**  
AERMOD automatically determines if the plume is affected by the wake region of buildings when their dimensions are given. The specification of building dimensions does not necessarily mean that there will be downwash. See

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

Section 4.13.1 for guidance on how to determine when downwash is likely to occur.

b. Area Sources:

The area source algorithm in AERMOD estimates source emission strength by integrating an area upwind of the receptor location. Receptors may be placed within the area itself, downwind of the area or adjacent to the area. However, since the vertical distribution parameter ( $\sigma_z$ ) goes to zero as the downwind distance goes to zero, the plume function solution is infinite for a downwind receptor distance of zero. In order to avoid such singularity in the plume function solution, the AERMOD model arbitrarily sets the plume function to zero when the receptor distance is less than one meter. As a result, the area source algorithm will not provide reliable solutions for receptors located within or adjacent to very small areas, with dimensions on the order of a few meters across. In these cases, the receptor should be placed at least one meter outside of the area.

c. Volume Sources:

The volume source algorithms in AERMOD require an estimate of the initial distribution of the emission source. The initial distribution of emissions for a volume source is in the horizontal and vertical directions. When modeling volume source emissions, one needs to provide initial horizontal ( $\sigma_{y0}$ ) and vertical ( $\sigma_{z0}$ ) dimensions as accurate as possible so that pollutant buoyancy and dispersion are also calculated accurately. US EPA's AERMOD User Guide provides suggested procedures to estimate these initial dimensions based on source type (Table 3-1) (U.S. EPA, 2004a).

d. Line Sources:

Examples of line sources include conveyor belts or roads. Depending on the source, these can be modeled three ways; as a line source, as a series of volume sources, or as an elongated area source. Where the emission source is neutrally buoyant, such as a conveyor belt, AERMOD can be used according to the user guide. In the event that the line source is a roadway, then additional considerations are required.

At the present time, CALINE (CALINE3, CAL3QHCR, and CALINE4) is the only model dedicated to modeling the enhanced mechanical and thermal turbulence created by motor vehicles traveling on a roadway. Of these, CAL3QHCR is the only model that accepts hourly meteorological data and can estimate annual average concentrations. However, CALINE uses the Pasquill-Gifford stability categories which are used in the ISCST model. AERMOD is now the preferred plume model over ISCST3 with continuous plume dispersion calculations based on observations but AERMOD does not include the enhanced roadway turbulence. Therefore, in the case where roadway emissions dominate the risk assessment, it may be most important to simulate the enhanced thermal and mechanical turbulence from motor vehicles with the CAL3QHCR model.

4-40

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

In the case where roadway emissions are a subset of all emissions for the risk assessment, including roadway emissions along with facility emissions, it may be best to use AERMOD for all emissions, roadway and facility, in order to maintain continuity with one dispersion model for the risk assessment. If AERMOD is used, it is important to consider that a major freeway may act similar to a large building which can cause some mixing and therefore initial vertical dispersion. This dispersion could be estimated with sensitivity studies based on wind speed, wind angle, roadway orientation, roadway width, and etc. This could be a complex estimation and needs very adept modeling skills. Roadway modeling should be evaluated on a case-by-case basis in consultation with the District or the reviewing authority.

Line sources inputs include a composite fleetwide emission factor, roadway geometry, hourly vehicle activity (i.e., diurnal vehicle per hour pattern), hourly meteorological data, and receptor placement. For practical information on how to simulate roadway emissions using these models, see CAPCOA's website at <http://www.capcoa.org> or the Sacramento Metropolitan AQMD (SMAQMD) website at <http://www.airquality.org/ceqa/RoadwayProtocol.shtml>. The SMAQMD has a document titled, "Recommended Protocol for Evaluating the Location of Sensitive Land Uses Adjacent to Major Roadways" (January, 2010).

e. Complex Terrain:

AERMOD uses the Dividing Streamline (Hc) concept for complex terrain. Above Hc, the plume is assumed to be "terrain following" in the convective boundary layer. Below Hc, the plume is assumed to be "terrain impacting" in the stable boundary layer. AERMOD computes the concentration at any receptor as a weighted function between the two plume states (U.S. EPA, 2004b).

f. Deposition:

AERMOD contains algorithms to model settling and deposition and requires additional information to do so including particle size distribution. For more information consult the AERMOD User's Guide (U.S. EPA, 2004a).

g. Diurnal Considerations:

Systematic diurnal changes in atmospheric conditions are expected along the coast (or any large body of water) or in substantially hilly terrain. The wind speed and direction are highly dependent on time of day as the sun rises and begins to heat the Earth. The sun heats the surface of the land faster than the water surface. Therefore the air above the land warms up sooner than over water. This creates a buoyant effect of warm air rising over land and the cool air from over water moves in to fill the void. Near large bodies of water (e.g., the ocean) this is known as a sea breeze. In complex terrain this is known as upslope flow as the hot air follows the terrain upwards. When the sun sets and the surface of the land begins to cool, the air above also cools and creates a draining effect. Near the water this is the land breeze; in complex terrain this is known as downslope or drainage flow. In addition, for the sea breeze, the atmospheric

4-41

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

conditions change rapidly from neutral or stable conditions over water to unstable conditions over land.

Near the large bodies of water the sea breeze is typical in the afternoon and the land breeze is typical for the early morning before sunrise. In complex terrain upslope flow is typical in the afternoon, while drainage flow is typical at night. Diurnal profiles need to be evaluated in conjunction with the facility emissions since sources can have varied emission profiles (e.g., some sources are continuously emitting while others are intermittent). These intermittent emission profiles may be influenced by diurnal patterns; therefore, they need to be evaluated to properly estimate potential exposures. For these reasons, it is especially important to simulate facility emissions with a hourly diurnal pattern reflective of source activity so that the risk assessment is representative of daily conditions.

- h. 8-hour Modeling for the Offsite Worker's Exposure and Residential Exposure:  
If the ground level air concentrations from a facility operating 5 days a week, 8 hours per day have been estimated by a 24 hour per day annual average, an adjustment factor can be applied to estimate the air concentration that an offsite worker with the same schedule would be exposed to. The 24-hour annual average concentration is multiplied times 4.2.

If the meteorology during the time that the facility is emitting is used, hourly model simulations need to be post-processed to cull out the data needed for the offsite worker exposure. See Appendix M for information on how to calculate the refined offsite worker concentrations using the hourly raw results from the AERMOD air dispersion model. For more discussion on worker exposure, see Section 4.8.1.

Eight-hour exposure modeling can be used to evaluate the potential for health impacts (including effects of repeated exposures) in children and teachers exposed during school hours. Although not required in the HRA, 8-hour exposure modeling could also be performed at the discretion of the District to a residential scenario (i.e., the MEIR) where a facility operates only a portion of the day and exposure to residences are not adequately reflected by averaging concentrations over a 24 hour day.

#### 4.11.1.3 HARP Dispersion Analysis

It is highly recommended that air dispersion analysis be performed using the HARP software. HARP can perform refined dispersion analysis by utilizing the U.S. EPA standard program AERMOD. In the future, the updated version of HARP will link the AERMOD outputs with risk assessment modules.

#### 4.11.2 CTDMPLUS

CTDMPLUS is a Gaussian air quality model for use in all stability conditions in complex terrain. In comparison with other models, CTDMPLUS requires considerably more

4-42

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

detailed meteorological data and terrain information that must be supplied using specifically designed preprocessors. CTDMPLUS was designed to handle up to 40 point sources.

#### 4.12 Modeling to Obtain Concentrations used for Various Health Impacts

The following section outlines how emissions and air dispersion modeling results are used or adjusted for a receptor that is exposed to either a non-continuous or continuously emitting source.

##### 4.12.1 Emission Rates for Cancer, Chronic, and Acute Health Impacts

As discussed in Section 4.2.1.1, the HRA should include both annual average emissions and maximum 1-hour emissions for each pollutant emitted by the facility. Maximum 1-hour emissions are used for acute noncancer health impacts while annual emissions are used for chronic exposures (i.e., chronic and 8-hour noncancer health impacts or cancer risk assessment). When applying the emission rates in the air dispersion analysis, it is important not to artificially inflate or deplete the reported emission inventory.

For annual average emissions, the emissions are spread evenly over the entire year for continuous emitting sources. However, for sources where the emission patterns vary (i.e., non-continuous emitting sources), the emission rate should also account for the facility's emission schedule. If appropriate, the variable emissions rate option (e.g., hour-of-day) should be used in the air dispersion analysis. For more information consult the AERMOD User's Guide (U.S. EPA, 2004a). Also, when calculating emission rates for acute health impacts, it is important the emission rates never exceed the reported maximum 1-hour emissions.

##### 4.12.2 Modeling and Adjustments for Inhalation Cancer Risk at a Worksite

Modeled long-term averages are typically used for cancer risk assessments for residents and workers. In an inhalation cancer risk assessment for an offsite worker, the long-term average should represent what the worker breathes during their work shift. However, the long-term averages calculated from AERMOD typically represent exposures for receptors that were present 24 hours a day and seven days per week (i.e., the schedule of a residential receptor). To estimate the offsite worker's concentration, there are two approaches. The more refined, complex, and time consuming approach is to post-process the hourly raw dispersion model output and examine the hourly concentrations that fall within the offsite worker's shift. See Appendix M for information on how to simulate the long-term concentration for the offsite worker that can be used to estimate inhalation cancer risk.

In lieu of post-processing the hourly dispersion model output, the more typical approach is to obtain the long-term average concentration as you would for modeling a residential receptor and approximate the worker's inhalation exposure using an adjustment factor. The actual adjustment factor that is used to adjust the concentration may differ from the example below based on the specifics of the source and worker receptor

4-43

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

(e.g., work-shift overlap). Once the worker's inhalation concentration is determined, the inhalation dose is calculated using additional exposure frequency and duration adjustments. See Chapter 5 for more information on the inhalation dose equation.

#### 4.12.2.1 Non-Continuous Sources

When modeling a non-continuously emitting source (e.g., operating for eight hours per day and five days per week), the modeled long-term average concentrations are based on 24 hours a day and seven days per week for the period of the meteorological data set. Even though the emitting source is modeled using a non-continuous emissions schedule, the long-term concentration is still based on 24 hours a day and seven days per week. Thus, this concentration includes the zero hours when the source was not operating. For the offsite worker inhalation risk, we want to determine the long-term concentration the worker is breathing during their work shift. Therefore, the long-term concentration needs to be adjusted so it is based only on the hours when the worker is present. For example, assuming the emitting source and worker's schedules are the same, the adjustment factor is  $4.2 = (24 \text{ hours per day} / 8 \text{ hours per shift}) \times (7 \text{ days in a week} / 5 \text{ days in a work week})$ . In this example, the long term residential exposure is adjusted upward to represent the exposure to a worker. Additional concentration adjustments may be appropriate depending on the work shift overlap. These adjustments are discussed below.

The calculation of the adjustment factor from a non-continuous emitting source is summarized in the following steps.

- Obtain the long-term concentrations from air dispersion modeling as is typical for residential receptors (all hours of a year for the entire period of the meteorological data set).
- Determine the coincident hours per day and days per week between the source's emission schedule and the offsite worker's schedule.
- Calculate the worker adjustment factor (WAF) using Equation 4.1. When assessing inhalation cancer health impacts, a discount factor (DF) may also be applied if the offsite worker's schedule partially overlaps with the source's emission schedule. The discount factor is based on the number of coincident hours per day and days per week between the source's emission schedule and the offsite worker's schedule (see Equation 4.2). The DF is always less than or equal to one.

Please note that worker adjustment factor does not apply if the source's emission schedule and the offsite worker's schedule do not overlap. Since the worker is not present during the time that the source is emitting, the worker is not exposed to the source's emission (i.e., the DF in Equation 4.2 becomes 0).

$$WAF = \frac{H_{\text{residential}}}{H_{\text{source}}} \times \frac{D_{\text{residential}}}{D_{\text{source}}} \times DF \quad \text{Eq. 4.1}$$

4-44

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

Where:

WAF = the worker adjustment factor

$H_{\text{residential}}$  = the number of hours per day the long-term residential concentration is based on (always 24 hours)

$H_{\text{source}}$  = the number of hours the source operates per day

$D_{\text{residential}}$  = the number of days per week the long-term residential concentration is based on (always 7 days)

$D_{\text{source}}$  = the number of days the source operates per week

DF = a discount factor for when the offsite worker's schedule partially overlaps the source's emission schedule. Use 1 if the offsite worker's schedule occurs within the source's emission schedule. If the offsite worker's schedule partially overlaps with the source's emission schedule, then calculate the discount factor using Equation 4.2 below.

$$DF = \frac{H_{\text{coincident}}}{H_{\text{worker}}} \times \frac{D_{\text{coincident}}}{D_{\text{worker}}} \quad \text{Eq. 4.2}$$

Where:

DF = the discount factor for assessing cancer impacts

$H_{\text{coincident}}$  = the number of hours per day the offsite worker's schedule and the source's emission schedule overlap

$D_{\text{coincident}}$  = the number of days per week the offsite worker's schedule and the source's emission schedule overlap

$H_{\text{worker}}$  = the number of hours the offsite worker works per day

$D_{\text{worker}}$  = the number of days the offsite worker works per week

- The final step is to estimate the offsite worker's inhalation concentration by multiplying the worker adjustment factor with the long-term residential concentration. The worker's concentration is then plugged into the dose equation and risk calculation.

The HARP software has the ability to calculate worker impacts using an approximation factor and, in the future, it will have the ability to post-process refined worker concentrations using the hourly raw results from an air dispersion analysis.

#### 4.12.2.2 Continuous Sources

If the source is continuously emitting, then the worker is assumed to breathe the long-term annual average concentration during their work shift. Equation 4.1 becomes one and no concentration adjustments are necessary in this situation when estimating the inhalation cancer risk. Note however, if an assessor does not wish to apply the assumption the worker breathes the long-term annual average concentration during the work shift, then a refined concentration can be post-processed as described in Appendix M. All alternative assumptions should be approved by the reviewing authority and supported in the presentation of results.

#### 4.12.3 Modeling and Adjustments for Noncancer 8-Hour RELs

For 8-hour noncancer health impacts, we evaluate if the receptor (e.g., worker or resident) is exposed to an 8 hour average concentration, occurring daily, that exceeds the 8-hour REL. The 8 hour RELs were derived primarily for the offsite worker scenario. Although not required in an HRA, residential receptors can be evaluated with an 8-hour

4-45

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

REL at the discretion of the District or Reviewing authority. For ease, we use a worker receptor in this discussion and in the discussion below for a non-continuously emitting source. The daily average concentration is intended to represent the long-term average concentration the worker is breathing during the work shift. In general, there are two approaches for estimating the concentration used for the 8-hour hazard index. The more refined, complex, and time consuming approach is to post-process the hourly dispersion model output and use only the hourly concentrations that are coincident with the offsite worker hours to obtain the long-term concentration. See Appendix M for information on how to simulate the daily average concentration through air dispersion modeling.

Before proceeding through a refined analysis described in Appendix M, the assessor may wish to approximate the long-term concentration, as described below, and calculate the 8-hour hazard index. In lieu of post-processing the hourly dispersion model output described in Appendix M, the more typical approach is to obtain the long-term average concentration as you would for modeling a residential receptor and approximate the worker's inhalation concentration using an adjustment factor. The method for applying the adjustment factor is described in the section below.

The results from the 8-hour hazard index calculations should not be combined with the chronic or acute hazard indices. Each of the potential noncancer health impacts should be reported independently. See Chapter 8 for more discussion on calculating health impacts.

#### 4.12.3.1 Non-Continuous Sources

When modeling a non-continuously emitting source (e.g., operating for eight hours per day and five days per week), the modeled long-term average concentrations are based on 24 hours a day and seven days per week for the period of the meteorological data set. Even though the emitting source is modeled using a non-continuous emissions schedule, the long-term concentration is still based on 24 hours a day and seven days per week. Thus, this concentration includes the zero hours when the source was not operating. For the offsite worker 8-hour hazard index, we want to determine the long-term average daily concentration the worker may be breathing during their work shift. This is similar to the cancer approximation adjustment method with one difference; there is no adjustment for partial overlap between the worker's schedule and the source's emission schedule. The reason for this difference in methodology is because the 8-hour REL health factors are designed for repeated 8-hour exposures and cannot readily be adjusted to other durations of exposure. The 8-hour RELs should be used for typical daily work shifts of 8-9 hours. For further questions, assessors should contact OEHHA, the District, or reviewing authority to determine if the 8-hour RELs should be used in your HRA. Any discussions or directions to exclude the 8-hour REL evaluation should be documented in the HRA.

When calculating the long-term average daily concentration for the 8-hour REL comparison, the long-term residential concentration needs to be adjusted so it is based only on the operating hours of the emitting source with the assumption the offsite

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

worker's shift falls within the emitting source's schedule. For example, assuming the emitting source operates 8 hours per day, 5 days per week and the offsite worker's schedules falls anywhere within this period of emissions, then the adjustment factor is  $4.2 = (24 \text{ hours per day} / 8 \text{ hours of emissions per day}) \times (7 \text{ days in a week} / 5 \text{ days of emissions per week})$ . In this example, the long term residential exposure is adjusted upward to represent the 8-hour exposure to a worker. No adjustments are applied for partial work shift overlap with the emitting source. If the source emits at night, then see Appendix N for additional recommendations.

Using the approximation factor is a screening method. If the 8-hour hazard index is above a threshold of concern with this method, the district or assessor should contact OEHHA for further guidance regarding the substance of concern. If necessary, further evaluation can be performed using the refined daily average modeling methodology discussed in Appendix M.

The calculation of the adjustment factor from a non-continuous emitting source is summarized in the following steps.

- b. Obtain the long-term concentrations from air dispersion modeling as is typical for residential receptors (all hours of a year for the entire period of the meteorological data set).
- c. Calculate the worker adjustment factor (WAF) using Equation 4.3. The source's emission schedule is assumed to overlap offsite worker's schedule. Note that the worker adjustment factor and the 8-hour inhalation REL do not apply if the source's emission schedule and the offsite worker's schedule do not overlap at some point.

$$WAF = \frac{H_{\text{residential}}}{H_{\text{source}}} \times \frac{D_{\text{residential}}}{D_{\text{source}}} \quad \text{Eq. 4.3}$$

Where:

WAF = the worker adjustment factor  
 $H_{\text{residential}}$  = the number of hours per day the long-term residential concentration is based on (always 24 hours)  
 $H_{\text{source}}$  = the number of hours the source operates per day  
 $D_{\text{residential}}$  = the number of days per week the long-term residential concentration is based on (always 7 days).  
 $D_{\text{source}}$  = the number of days the source operates per week.

- d. The final step is to estimate the offsite worker's daily average inhalation concentration by multiplying the WAF with the long-term residential concentration. The worker's concentration is then used to calculate the 8-hour hazard index. This method using the approximation factor is a screening method. If the 8-hour hazard index is above a threshold of concern, the district or assessor should contact OEHHA for further guidance regarding the substance of concern.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

In the future, the HARP software will have the ability to use 8-hour RELs, calculate worker impacts using an approximation factor, and to post-process worker concentrations using the hourly raw results from an air dispersion analysis.

#### 4.12.3.2 Continuous Sources

If the source is continuously emitting, then the worker is assumed to breathe the long-term annual average concentration during their work shift and no concentration adjustments are made when estimating 8-hour health impacts. Note however, if an assessor does not wish to assume the worker breathes the long-term annual average concentration during the work shift, then a refined concentration can be post-processed as described in Appendix M. All alternative assumptions should be approved by the reviewing authority and supported in the presentation of results.

Note that 8-hour RELs are not typically used for continuously emitting sources for residential receptors. In this situation it is only necessary to estimate a chronic Hazard Index using the annual average concentrations and chronic RELs. However, there may be situations where the District may wish to assess an 8-hour Hazard Index, for example, where there are significant differences in modeled concentration of emissions during the day due to diurnal wind patterns.

#### 4.12.4 Modeling and Adjustment Factors for Noncancer Chronic RELs

Potential chronic noncancer health impacts use the long-term annual average concentration regardless of the emitting facility's schedule. No adjustment factors should be used to adjust this concentration. Chronic RELs are used to assess not only residential health impacts, but in many cases worker health impacts as well. There are currently only a limited number of substances with an 8-hour inhalation REL, and a facility may emit only, or mostly, substances that currently have just a chronic REL. Until there are 8-hour RELs for all the Hot Spots substances emitted from a specified facility, we recommend determining the chronic HI for the MEIOW to adequately protect the offsite worker.

The results from the chronic hazard index calculations are not combined with the 8-hour or acute hazard indices. All potential noncancer results should be reported independently. See Chapter 8 for more discussion on calculating health impacts.

#### 4.12.5 Modeling and Adjustments for Oral Cancer Potencies and Oral RELs

When estimating the cancer risk or noncancer health impacts from noninhalation pathways, no adjustment is made to the long-term annual average concentration regardless of the emitting facility's schedule. Since the media (e.g., soil) at the receptor location where deposition takes place for noninhalation pathways is continuously present, the concentrations used for all noninhalation pathways are not adjusted (up or down) by an adjustment factor. However, some adjustments are made to the concentration once the pollutants reach the media, for example, pollutants undergo decay in soils. In addition, when the dose for each pathway is calculated, exposure adjustments may also be made. See Chapter 5 of this document and the Technical

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

Support Document for Exposure Assessment and Stochastic Analysis (OEHHA, 2012) to get more information on these types of adjustments. Oral cancer potencies and oral RELs are used to assess both residential or worker health impacts.

#### 4.12.6 Modeling One-Hour Concentrations using Simple and Refined Acute Calculations

Modeled one-hour concentrations are needed for the acute health hazard index calculations. HARP has two methods to calculate this concentration: Simple and Refined. As an aid to understanding the differences between Simple and Refined, Figure 2 shows three possible conditions showing how wind direction may vary and impact a downwind receptor (i,j) differently from just two sources (A and B).

For the Simple calculation, HARP stores only the maximum one-hour concentration at each receptor (i,j) from each source (A and B) as the dispersion model marches down each hour of the simulation (e.g., one to five years of hourly data). At the end of the simulation period, HARP reports back only the maximum impacts at each receptor from each source regardless of which hour of the simulation period this occurred. For example, the Simple Maximum Acute Impacts would be the summation of Source A impacts from Wind Direction 1 and Source B impacts from Wind Direction 2 as shown in Figure 2.

For the Refined simulation, HARP stores each hourly concentration at each receptor (i,j) from each source. At the end of the simulation period, HARP evaluates the coincident impact at each receptor from all sources for each hour of the simulation period. In this case the maximum impacts will be identified by a particular hour of the period with associated wind speed, direction, and atmospheric conditions. For example, the Refined Maximum Acute impact from Sources A and B on receptor (i,j) could be from any wind direction (1,2, or 3) as shown in Figure 2. Since HARP stores all simulations for all sources – at all receptors – for all hours to calculate the refined impacts, there is great potential to fill large amounts of disk storage space. The Refined simulation provides a more representative picture of the maximum acute hazard index from a facility. The Simple calculation will provide an upper bound to the acute hazard index.

Figure 2 Acute Scenarios

#### 4.13 Modeling Special Cases; Specialized Models

Special situations arise in modeling some sources that require considerable professional judgment; a few are outlined below. It is recommended that the reader consider retaining professional consultation services if the procedures are unfamiliar. The following sections, taken mostly from the document "On-Site Meteorological Program Guidance for Regulatory Modeling Applications" (U.S. EPA, 1995e), provide general information on data formats and representativeness. Some Districts may have slightly different recommendations from those given here.

##### 4.13.1 Building Downwash

The entrainment of a plume in the wake of a building can result in the "downwash" of the plume to the ground. This effect can increase the maximum ground-level concentration downwind of the source. Therefore, stack sources must be evaluated to determine whether building downwash is a factor in the calculation of maximum ground-level concentrations.

The PRIME algorithm, included with AERMOD, has several advances in modeling building downwash effects including enhanced dispersion in the wake, reduced plume rise due to streamline deflection and increased turbulence, and continuous treatment of the near and far wakes (Schulman, 2000).

Complicated situations involving more than one building may necessitate the use of the Building Profile Input Program (BPIP) which can be used to generate the building dimension section of the input file of the ISC models (U.S. EPA, 1993). The BPIP program calculates each building's direction-specific projected width. The Building Profile Input Program for PRIME (BPIPPRM) is the same as BPIP but includes an algorithm for calculating downwash values for input into the PRIME algorithm which is contained in such models as AERMOD. The input structure of BPIPPRM is the same as that of BPIP.

4-50

O-MBA20L7

Air Toxics Hot Spots Program Guidance Manual

February 2015

#### 4.13.2 Deposition

There are two types of deposition: wet deposition and dry deposition. Wet deposition is the incorporation of gases and particles into rain-, fog- or cloud water followed by a precipitation event and also rain scavenging of particles during a precipitation event. Wet deposition of gases is therefore more important for water soluble chemicals; particles (and hence particle-phase chemicals) are efficiently removed by precipitation events (Bidleman, 1988). Dry deposition refers to the removal of gases and particles from the atmosphere.

In the Air Toxics "Hot Spots" program, deposition is quantified for particle-bound pollutants and not gases. Wet deposition of water-soluble gas phase chemicals is thus not considered. When calculating pollutant mass deposited to surfaces without including depletion of pollutant mass from the plume, airborne concentrations remaining in the plume and deposition to surfaces can be overestimated, thereby resulting in overestimates of both the inhalation and multi-pathway risk estimates. However, neglecting deposition in the air dispersion model, while accounting for it in the multipathway health risk assessment, is a conservative, health protective approach (CAPCOA, 1987; Croes, 1988). Misapplication of plume depletion can also lead to possible underestimates of multi-pathway risk and for that reason no depletion is the default assumption. If plume depletion is incorporated, then some consideration for possible resuspension is warranted. An alternative modeling methodology accounting for plume depletion can be discussed with the Air District and used in an approved modeling protocol.

Although not generally used, several air dispersion models can provide downwind concentration estimates that take into account the upwind deposition of pollutants to surfaces and the consequential reduction of mass remaining in the plume. Air dispersion models having deposition and plume depletion algorithms require particle distribution data that are not always readily available. These variables include particle size, mass fraction, and density for input to AERMOD. In addition, the meteorological fields need to include additional parameters including relative humidity, precipitation, cloud cover, and surface pressure. Consequently, depletion of pollutant mass from the plume often is not taken into account.

In conclusion, multipathway risk assessment analyses normally incorporate deposition to surfaces in a screening mode, specifically by assigning a default deposition velocity of 2 cm/s for controlled sources and 5 cm/s for uncontrolled sources in lieu of actual measured size distributions (ARB, 1989). For particles (and particle-phase chemicals), the deposition velocity depends on particle size and is minimal for particles of diameter approximately 0.1-1 micrometer; smaller and larger particles are removed more rapidly.

##### 4.13.3 Short Duration Emissions

Short-duration emissions (i.e., much less than an hour) require special consideration. In general, "puff models" provide a better characterization of the dispersion of pollutants having short-duration emissions. Continuous Gaussian plume models have traditionally

4-51

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

been used for averaging periods as short as about 10 minutes and are not recommended for modeling sources having shorter continuous emission duration.

#### 4.13.4 Fumigation

Fumigation occurs when a plume that was originally emitted into a stable layer in the atmosphere is mixed rapidly to ground-level when unstable air below the plume reaches plume level. Fumigation can cause very high ground-level concentrations. Typical situations in which fumigation occurs are:

- Breaking up of a nocturnal radiation inversion by solar warming of the ground surface (rising warm unstable air); note that the break-up of a nocturnal radiation inversion is a short-lived event and should be modeled accordingly.
- Shoreline fumigation caused by advection of pollutants from a stable marine environment to an unstable inland environment
- Advection of pollutants from a stable rural environment to a turbulent urban environment

SCREEN3 incorporates concentrations due to inversion break-up and shoreline fumigation and is limited to maximum hourly evaluations. The Offshore and Coastal Dispersion Model incorporates overwater plume transport and dispersion as well as changes that occur as the plume crosses the shoreline – hourly meteorological data are needed from both offshore and onshore locations.

#### 4.13.5 Raincap on Stack

The presence of a raincap or any obstacle at the top of the stack hinders the momentum of the exiting gas. The extent of the effect is a function of the distance from the stack exit to the obstruction and of the dimensions and shape of the obstruction.

On the conservative side, the stack could be modeled as having a non-zero, but negligible exiting velocity, effectively eliminating any momentum rise. Such an approach would result in final plume heights closer to the ground and therefore higher concentrations nearby. There are situations where such a procedure might lower the actual population-dose and a comparison with and without reduced exit velocity should be examined.

Plume buoyancy is not strongly reduced by the occurrence of a raincap. Therefore, if the plume rise is dominated by buoyancy, it is not necessary to adjust the stack conditions. (The air dispersion models determine plume rise by either buoyancy or momentum, whichever is greater.)

The stack conditions should be modified when the plume rise is dominated by momentum and in the presence of a raincap or a horizontal stack. Sensitivity studies with the SCREEN3 model, on a case-by-case basis, can be used to determine whether

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

plume rise is dominated by buoyancy or momentum. The District should be consulted before applying these procedures.

- Set exit velocity to 0.001 m/sec
- Turn stack tip downwash off
- Reduce stack height by 3 times the stack diameter

Stack tip downwash is a function of stack diameter, exit velocity, and wind speed. The maximum stack tip downwash is limited to three times the stack diameter in the AERMOD air dispersion model. In the event of a horizontal stack, stack tip downwash should be turned off and no stack height adjustments should be made. Note: This approach may not be valid for large (several meter) diameter stacks.

An alternative, more refined, approach could be considered for stack gas temperatures which are slightly above ambient (e.g., ten to twenty degrees Fahrenheit above ambient). In this approach, the buoyancy and the volume of the plume remain constant and the momentum is minimized.

- Turn stack tip downwash off
- Reduce stack height by 3 times the stack diameter ( $3D_o$ )
- Set the stack diameter ( $D_b$ ) to a large value (e.g., 10 meters)
- Set the stack velocity to  $V_b = V_o (D_o/D_b)^2$

Where  $V_o$  and  $D_o$  are the original stack velocity and diameter and  $V_b$  and  $D_b$  are the alternative stack velocity and diameter for constant buoyancy. This approach is advantageous when  $D_b \gg D_o$  and  $V_b \ll V_o$  and should only be used with District approval.

In the presence of building downwash and in the event that PRIME downwash is being utilized in AERMOD, an alternative approach is recommended. PRIME algorithms use the stack diameter to define initial plume radius and to solve conservation laws. The user should input the actual stack diameter and exit temperature but set the exit velocity to a nominally low value (e.g., 0.001 m/s). Also since PRIME does not explicitly consider stack-tip downwash, no adjustments to stack height should be made.

Currently U.S. EPA is BETA testing options for capped and horizontal releases in AERMOD. It is expected that these options will replace the above guidance when BETA testing is complete.

#### 4.13.6 Landfill Sites

Landfills should be modeled as area sources. The possibility of non-uniform emission rates throughout the landfill area should be investigated. A potential cause of non-uniform emission rates would be the existence of cracks or fissures in the landfill cap (where emissions may be much larger). If non-uniform emissions exist, the landfill should be modeled with several smaller areas assigning an appropriate emission factor to each one of them, especially if there are nearby receptors (distances on the same order as the dimensions of the landfill).

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### 4.14 Specialized Models

Some models have been developed for application to very specific conditions. Examples include models capable of simulating sources where both land and water surfaces affect the dispersion of pollutants and models designed to simulate emissions from specific industries.

##### 4.14.1 Buoyant Line and Point Source Dispersion Model (BLP)

BLP is a Gaussian plume dispersion model designed for the unique modeling problems associated with aluminum reduction plants, and other industrial sources where plume rise and downwash effects from stationary line sources are important.

##### 4.14.1.1 Regulatory Application

Regulatory application of BLP model requires the selection of the following options:

- rural (IRU=I) mixing height option;
- default (no selection) for all of the following: plume rise wind shear (LSHEAR), transitional point source plume rise (LTRANS), vertical potential temperature gradient (DTHTA), vertical wind speed power law profile exponents (PEXP), maximum variation in number of stability classes per hour (IDELS), pollutant decay (DECFA), the constant in Briggs' stable plume rise equation (CONST2), constant in Briggs' neutral plume rise equation (CONST3), convergence criterion for the line source calculations (CRIT), and maximum iterations allowed for line source calculations (MAXIT); and
- terrain option (TERAN) set equal to 0.0, 0.0, 0.0, 0.0, 0.0, 0.0.

For more information on the BLP model consult the user's guide (Schulman and Scire, 1980).

##### 4.14.2 Offshore and Coastal Dispersion Model (OCD)

OCD (DiCristofaro and Hanna, 1989) is a straight-line Gaussian model developed to determine the impact of offshore emissions from point, area or line sources on the air quality of coastal regions. OCD incorporates "over-water" plume transport and dispersion as well as changes that occur as the plume crosses the shoreline. Hourly meteorological data are needed from both offshore and onshore locations. Additional data needed for OCD are water surface temperature, over-water air temperature, mixing height, and relative humidity.

Some of the key features include platform building downwash, partial plume penetration into elevated inversions, direct use of turbulence intensities for plume dispersion, interaction with the overland internal boundary layer, and continuous shoreline fumigation.

4-54

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### 4.14.2.1 Regulatory Application

OCD has been recommended for use by the Minerals Management Service for emissions located on the Outer Continental Shelf (50 FR 12248; 28 March 1985). OCD is applicable for over-water sources where onshore receptors are below the lowest source height. Where onshore receptors are above the lowest source height, offshore plume transport and dispersion may be modeled on a case-by-case basis in consultation with the District.

##### 4.14.3 Shoreline Dispersion Model (SDM)

SDM (PEI, 1988) is a hybrid multipoint Gaussian dispersion model that calculates source impact for those hours during the year when fumigation events are expected using a special fumigation algorithm and the MPTER regulatory model for the remaining hours.

SDM may be used on a case-by-case basis for the following applications:

- tall stationary point sources located at a shoreline of any large body of water;
- rural or urban areas;
- flat terrain;
- transport distances less than 50 km;
- 1-hour to 1-year averaging times.

#### 4.15 Interaction with the District

The risk assessor must contact the District to determine if there are any specific requirements. Examples of such requirements may include, but are not limited to: specific receptor location guidance, specific usage of meteorological data, and specific report format (input and output). See Chapter 9 for more information on the format and content of modeling protocols and HRAs.

##### 4.15.1 Submittal of Modeling Protocol

It is strongly recommended that a modeling protocol be submitted to the District for review and approval prior to extensive analysis with an air dispersion model. The modeling protocol is a plan of the steps to be taken during the air dispersion modeling process. Following is an example of the format that may be followed in the preparation of the modeling protocol. **Consult with the District to confirm format and content requirements or to determine the availability of District modeling guidelines before submitting the protocol.**

4-55

**Outline for a Modeling Protocol**

**I. Introduction**

***Include the facility name, address, and a brief overview describing the facility's operations.***

- Provide a description of the terrain and topography surrounding the facility and potential receptors.
- Indicate the format in which data will be provided. Ideally, the report and summary of data will be on paper and all data and model input and output files will be provided electronically (e.g., compact disk or CD).
- Identify the guidelines used to prepare the protocol (e.g., District Guidelines).

**II. Emissions**

***For each pollutant and process whose emissions are required to be quantified in the HRA, list the annual average emissions (pounds/year and grams/second) and the maximum one-hour emissions (pounds/hour and grams/second)<sup>2</sup>. Maximum 1-hour emissions are used for acute noncancer health impacts while annual emissions are used for chronic exposures (i.e., chronic and 8-hour noncancer health impacts or cancer risk assessment).***

- Identify the reference and method(s) used to determine emissions (e.g., source tests, emission factors, etc.). Clearly indicate any emission data that are not reflected in the previously submitted emission inventory report. In this event, a revised emission inventory report will need to be submitted to the District.
- Identify if this will be a multipathway assessment based on emitted substances.

**III. Models / Modeling Assumptions**

***Specify the model and modeling assumptions***

- Identify the model(s) to be used, including the version number.
- Identify the model options that will be used in the analysis.

<sup>2</sup> Except radionuclides, for which annual and hourly emissions are reported in Curies/year and millicuries/hour, respectively.

- Identify the modeling domain(s) and the spacing of receptor grid(s). Grid spacing should be sufficient in number and detail to capture the concentration at all of the receptors of interest.
- Indicate complex terrain options that may be used, if applicable.
- Identify the source type(s) that will be used to represent the facility's operations (e.g., point, area, or volume sources, flare options or other).
- Indicate the preliminary source characteristics (e.g., stack height, gas temperature, exit velocity, dimensions of volume source, etc.).
- Identify and support the use of urban or rural dispersion coefficients for those models that require dispersion coefficients. For other models, identify and support the parameters required to characterize the atmospheric dispersion due to land characteristics (e.g., surface roughness, Monin-Obukhov length).

**IV. Meteorological Data**

***Specify the type, source, and year(s) of hourly meteorological data (e.g., hourly surface data, upper air mixing height information).***

- State how the data are representative for the facility site.
- Describe QA/QC procedures.
- Identify any gaps in the data; if gaps exist, describe how the data gaps are filled.

**V. Deposition**

- Specify the method to calculate deposition (if applicable).

**VI. Receptors**

***Specify the type and location of receptors. Include all relevant information describing how the individual and population-related receptors will be evaluated.***

- Identify and describe the location(s) of known or anticipated potential sensitive receptors, the point of maximum impact (PMI), and the maximum exposed individual residential (MEIR) and worker (MEIW) receptors. Identify any special considerations or grids that will be used to model these receptors. This information should correspond with information provided in Section III (e.g., fine receptor spacing of 20 meters at the fence line and centered on the maximum impacts; coarse receptor spacing of 100 meters out to 2,000 meters; extra coarse spacing of 1,000 meters out to 20,000 meters).

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

- Identify if spatial averaging will be used. Include necessary background information on each receptor including how the domain and spacing will be determined for each receptor or exposure pathway.
- Describe how the cancer burden or population impact estimates are calculated. Clarify the same information for the presentation of noncancer population impacts (e.g., centroids of the census tracts in the area within the zone of impact).
- Specify that actual UTM coordinates and the block/street locations (i.e., north side of 3,000 block of Smith Street), where possible, will be provided for specified receptor locations.
- Identify and support the use of any exposure adjustments (e.g., time a location, diurnal).
- Include the list of anticipated exposure pathways that will be included and indicate which substance will be evaluated in the multipathway assessment. Identify if sensitive receptors are present and which receptors will be evaluated in the HRA.

#### VII. Maps

##### *Identify how the information will be graphically presented.*

- Indicate which cancer risk isopleths will be plotted for the cancer zone of impact (e.g.,  $10^{-7}$ ,  $10^{-6}$  see Section 4.6.1).
- Indicate the hazard quotients or hazard indices to be plotted for the noncancer acute, 8 hour, and chronic zones of impact (e.g., 0.5, 1.0, etc.).

#### 4.16 Health Risk Assessment Report

This section describes the information related to the air dispersion modeling process that needs to be reported in the risk assessment. This section is also presented in Chapter 9, Summary of the Requirements for a Modeling Protocol and a Health Risk Assessment Report, in Section 9.2. The District may have specific requirements regarding format and content (see Section 4.15). Sample calculations should be provided at each step to indicate how reported emissions data were used. Reviewing agencies must receive input, output, and supporting files of various model analyses on computer-readable media (e.g., CD).

##### 4.16.1 Information on the Facility and its Surroundings

Report the following information regarding the facility and its surroundings:

- Facility Name

4-58

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

- Location (UTM coordinates and street address)
- Land use type (see Section 2.4)
- Local topography
- Facility plot plan identifying:
  - source locations
  - property line
  - horizontal scale
  - building heights
  - emission sources

#### 4.16.2 Source and Emission Inventory Information<sup>3</sup>

##### 4.16.2.1 Release Parameters

Report the following information for each release location in table format:

- Release location identification number
- Release name
- Release type (e.g., point, volume, area, line, pit, etc.)
- Source identification number(s) used by the facility that emit out of this release location
- Release location using UTM coordinates
- Release parameters by release type (e.g., shown for point source):
  - Stack height (m), stack diameter (building dimensions for downwash), exhaust gas exit velocity (m/s), exhaust gas volumetric flow rate (ACFM), exhaust gas exit temperature (K), etc.

##### 4.16.2.2 Source Description and Operating Schedule

The description and operating schedule for each source should be reported in table form including the following information:

- Source identification number used by the facility
- Source name
- Number of operating hours per day and per year (e.g., 0800-1700, 2700 hr/yr)
- Number of operating days per week (e.g., Mon-Sat)
- Number of operating days or weeks per year (e.g., 52 wk/yr excluding major holidays)
- Release point identification number(s) for where source emissions are released

<sup>3</sup> Health and Safety Code section 44346 authorizes facility operators to designate certain "Hot Spots" information as trade secret. Section 44361(a) requires districts to make health risk assessments available for public review upon request. Section 44346 specifies procedures to be followed upon receipt of a request for the release of trade secret information. See also the Inventory Guidelines Report regarding the designation of trade secret information in the Inventory Reports.

4-59

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

- Fraction of source emissions emitted at each release point by release point ID number

#### 4.16.2.3 Emission Control Equipment and Efficiency

Report emission control equipment and efficiency by source and by substance

#### 4.16.2.4 Emissions Data Grouped By Source

Report emission rates for each toxic substance, grouped by source (i.e., emitting device or process identified in Inventory Report), in table form including the following information:

- Source name
- Source identification number
- Substance name and CAS number (from Inventory Guidelines)
- Annual average emissions for each substance (lb/yr)
- Hourly maximum emissions for each substance (lb/hr)

#### 4.16.2.5 Emissions Data Grouped by Substance

Report facility total emission rate by substance for all emitted substances listed in the Air Toxics "Hot Spots" Program including the following information:

- Substance name and CAS number (from Inventory Guidelines)
- Annual average emissions for each substance (lb/yr)
- Hourly maximum emissions for each substance (lb/hr)

#### 4.16.2.6 Emission Estimation Methods

Report the methods used in obtaining the emissions data indicating whether emissions were measured or estimated. Clearly indicate any emission data that are not reflected in the previously submitted emission inventory report and submit a revised emission inventory report to the district. A reader should be able to reproduce the risk assessment without the need for clarification.

#### 4.16.2.7 List of Substances

Include tables listing all "Hot Spots" Program substances which are emitted, plus any other substances required by the District. Indicate substances to be evaluated for cancer risks and noncancer health impacts.

### 4.16.3 **Exposed Population and Receptor Location**

Report the following information regarding exposed population and receptor locations. See Chapter 9 and specific sections within this chapter for more detailed information.

4-60

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

- Description of zone of impact including map showing the location of the facility, boundaries of zone of impact, census tracts, emission sources, sites of maximum exposure, and the location of all appropriate receptors. This should be a true map (one that shows roads, structures, etc.), drawn to scale, and not just a schematic drawing. USGS 7.5 minute maps or GIS based maps are usually the most appropriate choices. (If significant development has occurred since the user's survey, this should be indicated.)
- Separate maps for the cancer risk zone of impact and the hazard index (noncancer) zone of impact(s). The cancer zone of impact should include isopleths down to at least the 1/1,000,000 risk level. Because some districts use a level below 1/1,000,000 to define the zone of impact, the District should be consulted. Three separate maps (to represent both chronic, 8-hour, and acute HI) should be created to define the zone of impact for the hazard index from both inhalation and noninhalation pathways greater than or equal to 0.5. The point of maximum impact (PMI), maximum exposed individual at a residential receptor (MEIR), the maximum exposed individual worker (MEIW), and any other locations of interest for both cancer and noncancer risks should be located on the maps.
- Tables identifying population units and sensitive receptors (UTM coordinates, receptor IDs, and street addresses of specified receptors).
- Heights or elevations of the receptor points.
- For each receptor type (e.g., PMI, MEIR, MEIW, and any other location(s) of interest) that will utilize spatial averaging, the domain size and grid resolution must be clearly identified. If another domain or grid resolution other than 20 meters by 20 meters with 5-meter grid spacing will be used for a receptor, then care should be taken to determine the proper domain size and grid resolution that should be used. For a worker, the HRA shall support all assumptions used, including, but not limited to, documentation for all workers showing the area where each worker routinely performs their duties. The final domain size should not be greater than the smallest area of worker movement. Other considerations for determining domain size and grid spacing resolution may include an evaluation of the concentration gradients across the worker area. The grid spacing used within the domain should be sufficient in number and detail to obtain a representative concentration across the area of interest. When spatial averaging over the deposition area of a pasture, garden, or water body, care should be taken to determine the proper domain size to make sure it includes all reasonable areas of potential deposition. The size and shape of the pasture, garden, or water body of interest should be identified and used for the modeling domain. The grid spacing or resolution used within the domain should be sufficient in detail to obtain a representative deposition concentration across the area of interest. One way to determine the grid resolution is to include an evaluation of the concentration gradients across the deposition area. The HRA shall support all assumptions used, including, but not limited to, documentation of the deposition area (e.g., size and shape of the pasture or water body, maps,

4-61

**O-MBA20L7**

**Air Toxics Hot Spots Program Guidance Manual**

**February 2015**

representative coordinates, grid resolution, concentration gradients, etc.). The use or spatial averaging is subject to approval by the reviewing authority. This includes the size of the domain and grid resolution that is used for spatial averaging of a worksite or multipathway deposition area.

**4.16.4 Meteorological Data**

If meteorological data were not obtained directly from the District, then the report must clearly indicate the data source and time period used. Meteorological data not obtained from the District must be submitted in electronic form along with justification for their use including information regarding representativeness and quality assurance.

The risk assessment should indicate if the District required the use of a specified meteorological data set. All memos indicating the District's approval of meteorological data should be attached in an appendix.

**4.16.5 Model Selection and Modeling Rationale**

The report should include an explanation of the model chosen to perform the analysis and any other decisions made during the modeling process. The report should clearly indicate the name of the models that were used, the level of detail (screening or refined analysis) and the rationale behind the selection.

Also report the following information for each air dispersion model used:

- version number
- selected options and parameters in table form
- Identify the modeling domain(s) and the spacing of receptor grid(s). Grid spacing should be sufficient in number and detail to capture the concentration at all receptors of interest.

**4.16.6 Air Dispersion Modeling Results**

- Maximum hourly and annual average concentrations of chemicals at appropriate receptors such as the residential and worker MEI receptors
- Annual average and maximum one-hour (and 30-day average for lead only) concentrations of chemicals at appropriate receptors listed and referenced to computer printouts of model outputs
- Model printouts (numbered), annual concentrations, maximum hourly concentrations
- Disk with input/output files for air dispersion program (e.g., the AERMOD input file containing the regulatory options and emission parameters, receptor locations, meteorology, etc.)
- Include tables that summarize the annual average concentrations that are calculated for all the substances at each site. The use of tables that present the relative contribution of each emission point to the receptor concentration is recommended. (These tables should have clear reference to the computer

4-62

**O-MBA20L7**

**Air Toxics Hot Spots Program Guidance Manual**

**February 2015**

model which generated the data. It should be made clear to any reader how data from the computer output were transferred to these tables.) [As an alternative, the above two tables could contain just the values for sites of maximum impact (i.e., PMI, MEIR and MEIW), and sensitive receptors, if required. All the values would be found in the Appendices.]

## 5 - Exposure Assessment Estimation of Concentration and Dose

### 5.1 Introduction

This chapter provides a summary of how toxicant ground level air concentrations estimated from air dispersion modeling or monitoring results are used to determine dose at receptors of interest. This chapter includes all the algorithms and data (e.g., point estimates, distributions, and transfer factors) that are needed to determine the substance-specific concentration in exposure media and the dose at a receptor of interest. The determination of exposure concentration and dose precedes the calculations of potential health impacts. See Chapter 8 and Appendix I for information on calculating potential health impacts.

At a minimum, three receptors are evaluated in Hot Spots health risk assessments (HRA) (see Section 4.7); these are:

- the Point of Maximum Impact (PMI),
- the Maximally Exposed Individual Resident (MEIR), and
- the Maximally Exposed Individual Worker (MEIW).

The PMI is defined as the receptor point(s) with the highest acute, 8-hour, chronic, or cancer health impact outside the facility boundary. The facility boundary is defined as the property line. Often the fence is on the property line. The MEIR is typically defined as the existing off-site residence(s) (i.e., house, apartment or other dwelling) with the highest acute, chronic, or cancer health impact. Calculating an 8-hour hazard index is not required for the MEIR, but can be performed at the discretion of the District. The MEIW is typically defined as the existing offsite workplace with the highest acute, 8-hour, chronic, or cancer health impact.

In addition, it may be necessary to determine risks at sensitive receptors (e.g., schools, day care centers, elder care centers, and hospitals). The District or reviewing authority should be consulted in order to determine the appropriate sensitive receptors for evaluation. Some situations may require that on-site receptor (worker or residential) locations be evaluated. Some examples where the health impacts of on-site receptors may be appropriate could be military base housing, prisons, universities, or locations where the public may have regular access for the appropriate exposure period (e.g., a lunch time café or museum for acute exposures). The risk assessor should contact the Air Pollution Control or Air Quality Management District (the District) for guidance about any on-site exposure situations at the emitting facility. These on-site locations should be included in the health risk assessment (HRA). If the facility emits multiple substances from two or more stacks, the acute, 8-hour, chronic, and cancer health impacts at the PMI may be located at different physical locations. The MEIR or MEIW cancer, acute, 8-hour, and chronic receptors may also be at different locations.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

The process for determining dose at the receptor location, and ultimately potential health impacts, will likely include air dispersion modeling, and, with less frequency, air monitoring data. Air dispersion modeling combines the facility emissions and release parameters and uses default or site-specific meteorological conditions to estimate downwind, ground-level concentrations at various (user-defined) receptor locations. Air dispersion modeling is described in Chapter 4 and is presented in detail in the *Air Toxics Hot Spots Program Risk Assessment Guidelines; Technical Support Document for Exposure Assessment and Stochastic Analysis* (OEHHA, 2012a).

In summary, the process of using air dispersion modeling results as the basis of an HRA follows these four steps:

- Air dispersion modeling is used to estimate annual average and maximum one-hour ground level concentrations (GLC). The air dispersion modeling results are expressed as an air concentration or in terms of (Chi over Q) for each receptor point. (Chi over Q) is the modeled downwind air concentration (Chi) based on an emission rate of one gram per second (Q). (Chi over Q) is expressed in units of micrograms per cubic meter per gram per second, or  $(\mu\text{g}/\text{m}^3)/(\text{g}/\text{s})$ . (Chi over Q) is sometimes written as  $(\chi/Q)$  and is sometimes referred to as the dilution factor.
- When multiple substances are evaluated, the  $\chi/Q$  is normally utilized since it is based on an emission rate of one gram per second. The  $\chi/Q$  at the receptor point of interest is multiplied by the substance-specific emission rate (in g/s) to yield the substance-specific ground-level concentration (GLC) in units of  $\mu\text{g}/\text{m}^3$ . The following equations illustrate this point.

$$\text{GLC} = \left( \frac{\chi}{Q} \right) \times (Q_{\text{substance}})$$

$$\frac{\chi}{Q} = (\text{Chi over Q}) \text{ in } \left( \frac{\mu\text{g}/\text{m}^3}{\text{g}/\text{s}} \right), \text{ from model results with unit emission rate}$$

$$Q_{\text{substance}} = \text{substance specific emission rate} \left( \frac{\text{g}}{\text{s}} \right)$$

- The applicable exposure pathways (e.g., inhalation, soil contact, fish consumption) are identified for the emitted substances, and the receptor locations are identified. This determines which exposure algorithms in this chapter are ultimately used to estimate dose. After the exposure pathways are identified, the fate and transport algorithms described in this chapter are used to estimate concentrations in the applicable exposure media (e.g., soil or water) and the exposure algorithms are used to determine the substance-specific dose.
- The dose is used with cancer and noncancer health values to calculate the potential health impacts for the receptor (Chapter 8). An example calculation

5-2

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

using the high-end point-estimates for the inhalation (breathing) exposure pathway can be found in Appendix I. Appendix I and Chapters 5 (this Section) and 8 also contain information on how the annual average and maximum one-hour ground level concentrations are used for chronic, 8-hour, and acute health risk calculations.

The algorithms in this chapter are also used to calculate media concentrations and dose in the rare instance, for the Hot Spots program, when monitoring equipment was used rather than air dispersion modeling to obtain a receptor's substance-specific GLC. One situation that is specific to monitored data is the treatment of results below the sampling method level of detection (LOD). In short, it is standard risk assessment practice when monitoring results are reported both above and below the LOD to use one-half of the LOD for those sample concentrations reported below the LOD. If all testing or monitoring results fall below the LOD, then assessors should contact the District for appropriate procedures. For more information about reporting emissions under the Hot Spots Program, see the ARB's *Emission Inventory Criteria and Guidelines Regulations* (Title 17, *California Code of Regulations, Sections 93300-93300.5*), and the *Emission Inventory Criteria and Guidelines Report* (EICG Report), which is incorporated by reference therein (ARB, 2007).

The recommended model for calculating and presenting HRA results for the Hot Spots Program is the HARP software, available from the Air Resources Board (ARB). More information on HARP and directions for downloading the software can be found on the ARB's web site at <http://www.arb.ca.gov/toxics/harp/downloads.htm>.

### 5.2 Criteria for Exposure Pathway Evaluation

In order to determine total dose to the receptor the applicable pathways of exposure need to be identified. The inhalation pathway must be evaluated for all Hot Spots substances emitted by the facility. A small subset of Hot Spots substances is subject to deposition onto soil, plants, and water bodies. These substances need to be evaluated by the appropriate noninhalation pathways, as well as by the inhalation pathway, and the results must be presented in all HRAs. These substances include semi-volatile organic chemicals and heavy metals. Such substances are referred to as multipathway substances. Two steps are necessary to determine if a substance should be evaluated for multipathway impacts:

1. Determine whether the substance or its group (e.g., dioxins, PAHs) is listed in Table 5.1.
2. Determine if the substance has an oral reference exposure level (REL) listed in Table 6.4, or if it has an oral cancer slope factor listed in Table 7.1. Two other references for checking the presence of oral health factors are OEHHA's website (OEHHA, 2012b) and the *Consolidated Table of OEHHA/ARB Approved Risk Assessment Health Values* on the Air Resources Board website (ARB, 2012). Oral or noninhalation exposure pathways include the ingestion of soil, angler-caught fish, drinking water from surface water sources, mother's milk,

5-3

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

homegrown produce, beef, pork, chicken, eggs and cow's milk. The dermal pathway is also evaluated via contact with contaminated soil.

For all multipathway substances, the minimum exposure pathways that must be evaluated at every residential site (in addition to inhalation) are soil ingestion and dermal exposure. If dioxins, furans, PCBs, PAHs or lead are emitted, then the breast-milk consumption pathway also becomes mandatory. The other exposure pathways (e.g., the ingestion of homegrown produce or angler-caught fish) are evaluated on a site-by-site basis. If the resident can be exposed through an impacted exposure pathway, then it must be included in the HRA. However, if there are no vegetable gardens or fruit trees within the zone of impact for a facility, for example, then the produce pathways need not be evaluated. Note that on-site residential receptors are potentially subject to inhalation and noninhalation exposure pathways. Table 8.2 identifies the residential and worker receptor exposure pathways that are mandatory and those that are dependent on the site-specific decisions. While residents can be exposed through several exposure pathways, worker receptors are only evaluated for inhalation, soil ingestion, and dermal exposure using point estimates.

Table 5.1 shows the multipathway substances that, based on available scientific data, can be considered for each noninhalation exposure pathway. The exposure pathways that are evaluated for a substance depend on two factors: 1) whether the substance is considered a multipathway substance for the Hot Spots Program (Table 5.1), and 2) what the site-specific conditions are. A multipathway substance may be excluded from a particular exposure pathway because its physical-chemical properties can preclude significant exposure via the pathway. For example, some water-soluble substances do not appreciably bioaccumulate in fish; therefore, the fish pathway is not appropriate. In addition, if a particular exposure pathway is not impacted by the facility or is not present at the receptor site, then the pathway is not evaluated. For example, if a fishable water body is not impacted by the facility, or the water source is impacted but no receptor uses it for fishing, then the angler-caught fish pathway is not evaluated.

<sup>a</sup> Cow's milk only; no multipathway analysis for meat and egg ingestion

<sup>b</sup> To be evaluated by pathway in future amendments to the Hot Spots Program

### 5.3 Estimation of Concentrations in Air, Soil, and Water

Once emissions exit the source, the substances emitted will be dispersed in the air. The substances in the exhaust gas with high vapor pressures will remain largely in the vapor phase, and substances with lower vapor pressures will tend to adsorb to fly ash or other particulate matter. The emission plume may contain both vapor phase substances and particulates. A semivolatile organic toxicant can partition into both vapor and particulate phases. Particulates will deposit on vegetation, on soil, and in water at a rate that is dependent on the particle size. Use the 0.02 m/s deposition rate for emission sources that have verifiable particulate matter control devices or for emission sources that may be uncontrolled but only emit particulate matter that is less than 2.5 microns (e.g., internal combustion engines). The following algorithms are used to estimate concentrations in environmental media including air, soil, water, vegetation, and animal products.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### 5.3.1 Air

The ground level concentration (GLC, or  $C_{air}$  as shown in EQ 5.3.1) of a substance in air is a function of the facility emission rate and the dilution factor ( $X/Q$ ) at the points under evaluation.

##### A. Equation 5.3.1: $C_{air} = Q_{substance} \times X/Q$

1.  $C_{air}$  = Ground level concentration ( $\mu\text{g}/\text{m}^3$ )
2.  $Q_{substance}$  = Substance emission rate (g/sec)
3.  $X/Q$  = Dilution factor provided by dispersion modeling ( $\mu\text{g}/\text{m}^3/\text{g}/\text{sec}$ )

##### a. Recommended values for EQ 5.3.1:

1.  $Q_{substance}$  = Facility-specific, substance emission rate
2.  $X/Q$  = For point of interest, site specific, from dispersion modeling

##### b. Assumptions for EQ 5.3.1:

1. No plume depletion
2. Emission rate is constant, i.e., assumes steady state

#### 5.3.2 Soil

The average concentration of the substance in soil ( $C_s$ ) is a function of the deposition, accumulation period, chemical specific soil half-life, mixing depth, and soil bulk density. For simplicity and health protection, the Tier 1 default assumes 70-year soil deposition for the accumulation period at end of 70-year facility lifetime. The risk assessor may also choose a supplemental Tier 2 approach, subject to District approval or reviewing authority approval, in which the assessor applies a soil accumulation period based on the facility's start date of operation (e.g., historical date when emissions began), or the current exposure conditions, and the expected duration of operation.

##### A. Equation 5.3.2 A: $C_s = \text{Dep} \times X / (K_s \times \text{SD} \times \text{BD} \times T_t)$

1.  $C_s$  = Average soil concentration over the evaluation period ( $\mu\text{g}/\text{kg}$ )
2. Dep = Deposition on the affected soil area per day ( $\mu\text{g}/\text{m}^2\text{-d}$ )
3. X = Integral function for soil accumulation (d), see EQ 5.3.2 C below
4.  $K_s$  = Soil elimination constant ( $\text{d}^{-1}$ )
5. SD = Soil mixing depth (m)
6. BD = Soil bulk density ( $\text{kg}/\text{m}^3$ )
7.  $T_t$  = Soil exposure duration or soil accumulation period (d)

5-6

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

##### a: Recommended default values for EQ 5.3.2 A:

1. Dep = Calculated in EQ 5.3.2 B
2. X = Calculated in EQ 5.3.2 C
3.  $K_s$  = Calculated in EQ 5.3.2 D
4. SD = 0.01 (m) for playground setting (soil ingestion and dermal pathways) and 0.15 (m) for agricultural setting (produce and meat pathways)
5. BD = 1,333 ( $\text{kg}/\text{m}^3$ )
6.  $T_t$  = 25,550 (d) = 70 years

##### b: Assumptions for EQ 5.3.2 A:

1. Substances are uniformly mixed in soil.
2. Substances are not leached or washed away, except where evidence exists to the contrary.
3. It is assumed that toxicants accumulate in the soil for 70 years from deposition over the 70 year lifespan of the facility. Use 70-year soil accumulation ( $T_t$ ) for Tier 1 estimation of 9-, 30- and 70-year residential exposure, and 25-year off-site worker exposure.
4. For a receptor ingesting mother's milk, the mother is exposed from birth to 25 years of age; the infant is then born and receives mother's milk for one year. Default assumes 70-year soil accumulation for mother's milk pathway. See Table 5.1 for information on which substances or groups of substances must be evaluated by the mother's milk pathway.

##### B. Equation 5.3.2 B: $\text{Dep} = C_{air} \times \text{Dep-rate} \times 86,400$

1.  $C_{air}$  = Ground level concentration ( $\mu\text{g}/\text{m}^3$ )
2. Dep-rate = Vertical rate of deposition (m/sec)
3. 86,400 = Seconds per day conversion factor (sec/d)

##### a: Recommended default values for EQ 5.3.2 B:

1.  $C_{air}$  = Calculated above in EQ 5.3.1 A
2. Dep-rate = Use 0.02 meters/second for controlled sources, or 0.05 meters/second for uncontrolled sources.

##### b: Assumptions for EQ 5.3.2 B:

1. Deposition rate remains constant. A deposition rate must be used when determining potential noninhalation health impacts. In the absence of facility specific information on the size of the emitted particles, the default values for deposition rate should be used. Currently, the default value of 0.02 meters per second is used for emission sources that have verifiable particulate matter control devices or for emission sources that may be uncontrolled but only emit particulate matter that is less than 2.5 microns

5-7

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

(e.g., internal combustion engines). The 0.05 meters per second default value is used for risk assessment if the emissions are uncontrolled. If other deposition rate factors are used, sufficient support documentation must be included with the HRA.

**C. Equation 5.3.2 C:** 
$$X = [(e^{-K_s \cdot T_f} - e^{-K_s \cdot T_o}) / K_s] + T_i$$

1.  $e = 2.718$
2.  $K_s$  = Soil elimination constant
3.  $T_f$  = End of soil accumulation evaluation period (d)
4.  $T_o$  = Beginning of soil accumulation evaluation period (d)
5.  $T_i$  = Total days of soil exposure (soil accumulation period)  $T_f - T_o$  (d)

**a: Recommended default values for EQ 5.3.2 C:**

- 1:  $K_s$  = Calculated in EQ 5.3.2 D
- 2:  $T_f$  = 25,550 (d) = 70 years. Total soil exposure time at end of facility operation
- 3:  $T_o$  = 0 (d) The initial time (start period) of soil exposure to all receptors that are impacted by the soil pathway.

Note: Under a Tier 2 scenario, the risk assessor may also adjust  $T_f$  and  $T_i$ , subject to District approval, to replicate current soil accumulation and expected accumulation at the end of facility operation.

**D. Equation 5.3.2 D:** 
$$K_s = 0.693 / t_{1/2}$$

1. 0.693 = Natural log of 2
2.  $t_{1/2}$  = Chemical specific soil half-life (d)

**a: Recommended default values for EQ 5.3.2 D:**

1.  $t_{1/2}$  = Chemical-specific. See Table 5.2

### 5.3.3 Water

The water pathway is evaluated if a standing water body (e.g., pond or lake) is impacted by facility emissions and is used as a source for drinking water by food-producing animals or humans, or is a source of angler-caught fish. The average concentration of the substance in water ( $C_w$ ) is a function of direct deposition and material carried in by surface run-off. However, only the contribution from direct deposition will be considered at this time.

**A. Equation 5.3.3 A:** 
$$C_w = C_{depw}$$

1.  $C_w$  = Average concentration in water ( $\mu\text{g/kg}$ )
2.  $C_{depw}$  = Contribution due to direct deposition ( $\mu\text{g/kg}$ )

5-8

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

**B. Equation 5.3.3 B:** 
$$C_{depw} = Dep \times SA \times 365 / (WV \times VC)$$

1. Dep = Deposition on water body per day ( $\mu\text{g/m}^2/\text{d}$ )
2. SA = Water surface area ( $\text{m}^2$ )
3. 365 = Days per year (d/yr)
4. WV = Water volume (kg)
5. VC = Number of volume changes per year

**a: Recommended default values for EQ 5.3.3 B:**

1. Dep = Calculated above in EQ 5.3.2 B
2. SA = Site specific water surface area ( $\text{m}^2$ )
3. WV = Site specific water volume in (kg) (1L = 1 kg)
4. VC = Site specific number of volume changes per year  
(SA, WV, and VC values can be obtained from the appropriate Department of Water Resources (DWR) Regional office)

**b: Assumptions for EQ 5.3.3 B:**

1. With the exception of dilution via number of volume changes per year, all material deposited into the water remains suspended or dissolved in the water column and is available for bioaccumulation in fish.

### 5.3.4 Estimation of Concentrations in Vegetation, Animal Products, and Mother's Milk

Estimates of the concentration of the substance in vegetation, animal products and mother's milk require the use of the results of the air, water, and soil environmental fate evaluation. Plants, animals and nursing mothers will be exposed to the substances at the concentrations previously calculated in Section 5.31 to 5.33 above.

#### 5.3.4.1 Vegetation

The average concentration of a substance in and on vegetation ( $C_v$ ) is a function of direct deposition of the substance onto the vegetation and of root translocation or uptake from soil contaminated by the substance. We currently recommend root translocation only for the inorganic compounds.

**A. Equation 5.3.4.1 A:** 
$$C_v = C_{depv} + C_{trans}$$

1.  $C_v$  = Average concentration in and on specific types of vegetation ( $\mu\text{g/kg}$ )
2.  $C_{depv}$  = Concentration due to direct deposition ( $\mu\text{g/kg}$ )
3.  $C_{trans}$  = Concentration in vegetation due to root translocation or uptake ( $\mu\text{g/kg}$ ) – see EQ 5.3.4.1 C below

5-9

**B. Equation 5.3.4.1 B:**  $C_{\text{depv}} = [\text{Dep} \times \text{IF} / (k \times Y)] \times (1 - e^{-kT})$

1. Dep = Deposition on affected vegetation per day ( $\mu\text{g}/\text{m}^2/\text{d}$ )
2. IF = Interception fraction
3. k = Weathering constant ( $\text{d}^{-1}$ )
4. Y = Yield ( $\text{kg}/\text{m}^2$ )
5. e = Base of natural logarithm (2.718)
6. T = Growth period (d)

**a: Recommended default values for EQ 5.3.4.1 B:**

1. Dep = Calculated above in EQ 5.3.2 B
2. IF = Crop specific:
  - a: Root crops = 0.0
  - b: Leafy crops = 0.2
  - c: Protected crops = 0.0
  - d: Exposed crops = 0.1
  - e: Pasture = 0.7
3. k = 0.1 ( $\text{d}^{-1}$ )
4. Y = 2 ( $\text{kg}/\text{m}^2$ ) for root, leafy, protected, exposed and pasture [CA Department of Food and Agriculture dot maps]
5. T = 45 (d) for leafy crops  
T = 90 (d) for exposed crops

**b: Crop-type definitions for EQ 5.3.4.1 B:**

1. **Leafy** crop category consists of broad-leafed vegetables in which the leaf is the edible part. Examples include spinach, lettuce, cabbage, and kale.
2. **Root** crop category includes vegetables in which the edible portion is underground. Examples are potato, radish, and carrot.
3. **Exposed** produce category consists of crops with a small surface area subject to air deposition. Examples include strawberries, tomato, cucumber, zucchini, green bean and bell pepper.
4. **Protected** produce category consists of crops in which the edible part is not exposed to air deposition (e.g., the exposed skin of the crop is removed and not eaten). Examples are corn, pea, pumpkin and oranges.

Tables H-9 through H-15 in Appendix H provide more examples of various leafy, root, exposed and protected crop types.

**c: Assumptions for EQ 5.3.4.1 B:**

1. No deposition on root or protected crops
2. No uptake and translocation of deposited chemicals onto crops

**C. Equation 5.3.4.1 C: (for inorganic compounds)**

$$C_{\text{trans}} = C_s \times \text{UF}_2$$

1.  $C_s$  = Average soil concentration ( $\mu\text{g}/\text{kg}$ )
2.  $\text{UF}_2$  = Uptake factor based on soil concentration

**a: Recommended default values for EQ 5.3.4.1 C:**

1.  $C_s$  = Calculated above in EQ 5.3.2 A
2.  $\text{UF}_2$  = See Table 5.2

**D. Equation 5.3.4.1 D: (for organic compounds)**

$$\text{UF}_2 = [(0.03 \times K_{\text{ow}}^{0.77}) + 0.82] / [(K_{\text{oc}})(F_{\text{oc}})]$$

1. 0.03 = Empirical constant
2.  $K_{\text{ow}}$  = Octanol:water partition factor
3. 0.77 = Empirical constant
4. 0.82 = Empirical constant
5.  $K_{\text{oc}}$  = Organic carbon partition coefficient
6.  $F_{\text{oc}}$  = Fraction organic carbon in soil

**a: Recommended default values for EQ 5.3.4.1 D:**

1.  $K_{\text{ow}}$  = Chemical specific, see Table 5.2
2.  $K_{\text{oc}}$  = Chemical specific, see Table 5.2
3.  $F_{\text{oc}}$  = 0.1

**b: Assumptions for EQ 5.3.4.1 D:**

1. OEHA currently has no recommended root uptake factors for organic compounds listed in Table 5.2. Evidence suggests this route is insignificant compared to airborne deposition. Nevertheless, if it becomes necessary in specific cases to assess root uptake for an organic compound, Equation 5.3.4.1 D would be the algorithm OEHA recommends using to assess root uptake.

**5.3.4.2 Animal Products**

The average concentration of the substance in animal products ( $C_{\text{ia}}$ ) depends on which routes of exposure exist for the animals. Animal exposure routes include inhalation, soil ingestion, ingestion of contaminated feed and pasture, and ingestion of contaminated water.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### A. Equation 5.3.4.2:

$$C_{fa} = (\text{Inhalation} + \text{Water ingestion} + \text{Feed ingestion} + \text{Pasture/Grazing ingestion} + \text{Soil ingestion}) \times T_{co}$$

1.  $C_{fa}$  = Average concentration in farm animals and their products ( $\mu\text{g/kg}$ )
2. Inhalation, water ingestion, etc. = Dose through inhalation, water ingestion, etc. ( $\mu\text{g/d}$ )
3.  $T_{co}$  = Chemical-specific transfer coefficient of contaminant from diet to animal product ( $\text{d/kg}$ )

#### a: Recommended default values for EQ 5.3.4.2:

1.  $T_{co}$  = See Tables 5.3a and 5.3b

#### b: Assumptions for EQ 5.3.4.2:

1. The  $T_{co}$  for a given chemical is the same for all exposure routes

#### 5.3.4.2.1 Inhalation

#### A. Equation 5.3.4.2.1: $\text{Inhalation} = BR_a \times C_{air}$

1. Inhalation = Dose through inhalation ( $\mu\text{g/d}$ )
2.  $BR_a$  = Breathing rate for animal ( $\text{m}^3/\text{d}$ )
3.  $C_{air}$  = Ground-level concentration ( $\mu\text{g}/\text{m}^3$ )

#### a: Recommended default values for EQ 5.3.4.2.1:

1.  $BR_a$  = See Table 5.4
2.  $C_{air}$  = Calculated above in EQ 5.3.1 A

#### b: Assumptions for EQ 5.3.4.2.1:

1. All material inhaled is 100% absorbed

#### 5.3.4.2.2 Water Ingestion

The water ingestion pathway is applied if there are surface water sources of drinking water, such as springs, ponds or lakes, which are exposed to airborne deposition of facility emissions. Due to the site-specific nature for this exposure pathway, OEHHA recommends that the risk assessor conduct a survey at the site to estimate the fraction of contaminated drinking water ingested by the animals, if such sources exist.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### A. Equation 5.3.4.2.2: $\text{Water ingestion} = WI_a \times FSW \times C_w$

1. Water ingestion = Dose through water ingestion ( $\mu\text{g/d}$ )
2.  $WI_a$  = Water ingestion for animal ( $\text{kg/d}$ )
3.  $FSW$  = Fraction of water ingested from a contaminated body of water (site-specific)
4.  $C_w$  = Average concentration in water ( $\mu\text{g/kg}$ )  
For water 1 kg = 1 L

#### a: Recommended default values for EQ 5.3.4.2.2:

1.  $WI_a$  = See Table 5.4
2.  $FSW$  = Site specific fraction, need to survey water ingestion practices in affected area
3.  $C_w$  = Calculated above in EQ 5.3.3 A

#### 5.3.4.2.3 Feed Ingestion

The fraction of feed intake by cattle, pigs and poultry that is contaminated by facility emissions can vary considerably depending on the manner in which the animals are raised. Due to the site-specific nature for this exposure pathway, OEHHA recommends that the risk assessor conduct a survey at the site to estimate the fraction of contaminated feed eaten by the animals. For a Tier 1 assessment, default values are provided by OEHHA (see Table 5.4 and Table 5.4 footnotes) for estimation of exposure to the animals.

Agricultural mixing depth should be used for calculating soil concentration for feed and pasture contamination.

#### 5.3.4.2.3.1 Feed Ingestion

#### A. Equation 5.3.4.2.3.1: $\text{Feed ingestion} = (1.0 - FG) \times FI \times L \times C_v$

1. Feed ingestion = Dose through the ingestion of feed ( $\mu\text{g/d}$ ) that is harvested after it is impacted by source emissions
2.  $FG$  = Fraction of diet provided by grazing (site-specific)
3.  $FI$  = Feed ingestion rate ( $\text{kg/d}$ )
4.  $L$  = Fraction of locally grown (source impacted) feed that is not pasture (site-specific)
5.  $C_v$  = Concentration in feed ( $\mu\text{g/kg}$ )

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### a: Recommended default values EQ 5.3.4.2.3.1:

1. FG = Default values in Table 5.4 footnote b, although a site-specific survey for the fraction of diet provided by grazing is recommended
2. FI = See Table 5.4
3. L = Default values in Table 5.4 footnote b, although a site-specific survey for fraction of locally grown (source impacted) feed that is not pasture is recommended
4. C<sub>v</sub> = As calculated above in EQ 5.3.4.1 A

#### b: Assumptions for EQ 5.3.4.2.3.1:

1. Feed (FI) transported from an off-site location (i.e., not grown locally) is not contaminated by facility emissions.

#### 5.3.4.2.3.2 Pasture/Grazing ingestion

##### A. Equation 5.3.4.2.3.2: $\text{Pasture/Grazing ingestion} = FG \times C_v \times FI$

1. Pasture/Grazing ingestion = Dose through pasture/grazing (μg/d)
2. FG = Fraction of diet provided by grazing (site-specific)
3. C<sub>v</sub> = Concentration in pasture/grazing material (μg/kg)
4. FI = Feed ingestion rate (kg/d)

#### a: Recommended default values EQ 5.3.4.2.3.2:

1. FG = Default values in Table 5.4 for fraction of diet provided by grazing, although a site-specific survey is recommended
2. C<sub>v</sub> = As calculated above in EQ 5.3.4.1 A
3. FI = See Table 5.4

#### 5.3.4.2.4 Soil ingestion

The feeds provided to dairy and beef cattle may contain small quantities of soil. A larger fraction of soil by weight of food is taken up during grazing. Rooting behavior by pigs with access to soil will result in soil ingestion. Likewise, poultry with free access to soil or pasture will also ingest soil. Defaults for soil ingestion are shown in Table 5.4.

##### A. Equation 5.3.4.2.4 A: $\text{Soil ingestion} = SI_a \times C_s$

1. Soil ingestion = Dose through soil ingestion (μg/d)
2. SI<sub>a</sub> = Soil ingestion rate for animal (kg/d)
3. C<sub>s</sub> = Average soil concentration (μg/kg)

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### a: Recommended default values for EQ 5.3.4.2.4 A:

1. SI<sub>a</sub> = Calculated below
2. C<sub>s</sub> = Calculated above in EQ 5.3.2 A

##### B. Equation 5.3.4.2.4 B: $SI_a = [(1 - FG) \times FS_f \times FI] + [FG \times FS_p \times FI]$

1. FG = Fraction of diet provided by grazing
2. FS<sub>f</sub> = Soil ingested as a fraction of feed ingested
3. FI = Feed ingestion rate (kg/d)
4. FS<sub>p</sub> = Soil ingested as a fraction of pasture ingested

#### a: Recommended default values for EQ 5.3.4.2.4 B:

1. FG = Site specific fraction of diet provided by grazing
2. FS<sub>f</sub> = See Table 5.4
3. FI = See Table 5.4
4. FS<sub>p</sub> = See Table 5.4

#### b: Assumptions for EQ 5.3.4.2.4 B:

1. The transfer coefficient is the same for all exposure routes.
2. Soil ingested in feed (FS<sub>f</sub>) transported from an off-site location (i.e., not grown locally) is assumed not to be contaminated by facility emissions.

#### 5.3.4.3 Bioaccumulation in Angler-Caught Fish

The average concentration in fish (C<sub>f</sub>) is based on the concentration in water and a chemical-specific bioaccumulation factor.

##### A. Equation 5.3.4.3: $C_t = C_w \times BAF$

1. C<sub>t</sub> = Concentration in wet weight tissue (muscle) of fish (μg/kg)
2. C<sub>w</sub> = Concentration in water (μg/kg)
3. BAF = Fish bioaccumulation factor (unitless)

#### a: Recommended default values for Equation 5.3.4.3:

1. C<sub>w</sub> = As calculated above in Equation 5.3.3 A
2. BAF = Chemical-specific; see Table 5.2

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### b: Assumptions for Equation 5.3.4.3:

1. For conversion of a chemical concentration in a volume of water shown as  $\mu\text{g/L}$ , 1 L water = 1 kg water; thus, for concentration of chemical in water,  $\mu\text{g/L} = \mu\text{g/kg}$ .
2. For organic chemicals, BAFs lipid-normalized to adult rainbow trout with 4% lipid content in muscle tissue
3. For organic chemicals, BAFs based on the freely dissolved fraction in water under conditions of average particulate organic carbon and dissolved organic carbon in U.S. lakes and other water bodies
4. For inorganic compounds, BAFs based on wet weight muscle tissue concentration and on the total water concentration of the inorganic compound in water.
5. Contaminant concentrations are uniform in water based on dispersion

#### 5.3.4.4 Bioaccumulation in Mother's Milk

The average concentration of a chemical in mother's milk ( $C_m$ ) is a function of the mother's exposure through all exposure routes (i.e., inhalation, ingestion via food, drinking water, and soil, and dermal absorption via skin contact with soil contaminated with the chemical), the contaminant half-life in the mother's body, and transfer of absorbed chemical to mother's milk. The contaminant half-life in the body and transfer to mother's milk is incorporated in biotransfer coefficients ( $T_{co}$ ) in Equation 5.3.4.4. See the TSD (OEHHA, 2012a), Appendix J for details on development of biotransfer factors. The substances assessed by the mother's milk pathway are shown in Table 5.1.

#### A. Equation 5.3.4.4: $C_m = [(D_{\text{inder}} \times T_{co_{m\_inder}}) + (D_{\text{ing}} \times T_{co_{m\_ing}})] \times BW$

1.  $C_m$  = Concentration in mother's milk (mg/kg-milk)
2.  $D_{\text{inder}}$  = The sum of  $\text{DOSE}_{\text{air}}$  +  $\text{DOSE}_{\text{dermal}}$  through inhalation and dermal absorption (mg/kg-BW-day)
3.  $D_{\text{ing}}$  = The sum of  $\text{DOSE}_{\text{food}}$  +  $\text{DOSE}_{\text{soil}}$  +  $\text{DOSE}_{\text{water}}$  through ingestion (mg/kg-BW-day)
4.  $T_{co_{m\_inder}}$  = Biotransfer coefficient from inhalation and dermal absorption to mother's milk (d/kg-milk)
5.  $T_{co_{m\_ing}}$  = Biotransfer coefficient from ingestion to mother's milk (d/kg-milk)
6. BW = Body weight of mother (Kg)

5-16

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### a: Recommended cancer risk default values for EQ 5.3.4.4:

1.  $D_{\text{ing}}$  = As calculated through ingestion of soil in EQ 5.4.3.1.1 + home-grown produce in EQ 5.4.3.2.1 + home-raised animal products in EQ 5.4.3.2.2 + drinking water in EQ 5.4.3.3.1 + angler-caught fish in EQ 5.4.3.4.1
2.  $D_{\text{inder}}$  = As calculated through inhalation in EQ 5.4.1.1 + dermal exposure in EQ 5.4.2.1
3.  $T_{co_{m\_inder}}$  = See Table 5.5
4.  $T_{co_{m\_ing}}$  = See Table 5.5

#### b: Recommended noncancer risk default values for EQ 5.3.4.4:

1.  $D_{\text{ing}}$  = As calculated through ingestion of soil in EQ 5.4.3.1.2 + home-grown produce and home-raised animal products in EQ 5.4.3.2.3 + drinking water in EQ 5.4.3.3.2 + angler-caught fish in EQ 5.4.3.4.2
2.  $D_{\text{inder}}$  = As calculated through inhalation in EQ 5.4.1.1 + dermal exposure in EQ 5.4.2.2
3.  $T_{co_{m\_inder}}$  = See Table 5.5
4.  $T_{co_{m\_ing}}$  = See Table 5.5

#### c: Assumptions for EQ 5.3.4.4:

1. Default age of mother at birth is 25 years of age, then nurses the infant for 1 year; Use 16<30 year old high-end (95<sup>th</sup> percentile) daily breathing rate and intake rates for  $D_{\text{ing}}$  and  $D_{\text{inder}}$  for estimating dose to mother.
2. For inhalation dose to mother's milk, it is recommended that the EF variate in EQ 5.4.1.1 is left out for calculation of inhalation dose in the mother's milk pathway.
3. Biotransfer coefficient,  $T_{co_{m\_inder}}$ , the same for both inhalation and dermal pathways based on lack of first-pass metabolism through the liver for both of these pathways.
4. Biotransfer coefficient,  $T_{co_{m\_ing}}$ , the same for all ingestion pathways based on first-pass metabolism through the liver.
5. For chemicals in Table 5.5 lacking either an oral or inhalation  $T_{co}$ , use the oral  $T_{co}$  for the absent inhalation  $T_{co}$  (i.e., for PCDDs and PCDFs and dioxin-like PCBs), or the inhalation  $T_{co}$  for the absent oral  $T_{co}$  (i.e., for lead) in Equation 5.3.4.4.
6. The concentration in the mother's milk is determined using the derived approach to risk assessment. This method allows use of the high-end dose point estimate for driving exposure pathways and the average dose point estimates for other exposure pathways. See Sections 8.2.6 (cancer) and 8.3.3 (noncancer) for the description of the methodology on how to implement the derived methodology.

- (1) Averaged log Kow and Koc values determined by most reliable methods (Staples et al., 1997)  
(2) GRAF (Gastrointestinal Relative Absorption Factor). The guidelines allow for adjusting for bioavailability where the evidence warrants. For example, there are good data which indicate that dioxin is not as available to an organism when bound to soil or fly ash matrices relative to when it is in solution or in food. Therefore, a bioavailability factor is incorporated into the model to account for this difference. When information becomes available for other chemicals of concern, this type of bioavailability will be incorporated into the model.  
(3) Measured by Hansch et al. (1985)  
(4) Estimated according to methodology of Lyman et al. (1990)  
(5) To be evaluated for specific default values in future amendments to the Hot Spots Program.

- (1) GRAF (Gastrointestinal Relative Absorption Factor). The guidelines allow for adjusting for bioavailability where the evidence warrants. For example, there are good data which indicate that dioxin is not as available to an organism when bound to soil or fly ash matrices relative to when it is in solution or in food. Therefore, a bioavailability factor is incorporated into the model to account for this difference. When information becomes available for other chemicals of concern, this type of bioavailability will be incorporated into the model.  
(2) Methyl mercury (MeHg) is not represented in the category "mercury & inorganic compounds". The BAF for methyl mercury is orders of magnitude higher than for inorganic mercury. Assessment of MeHg for the fish pathway is not directly applicable to the Hot Spots program, as no facilities are known to emit MeHg directly into the air (OEHHA, 2012; OEHHA, 2006), but it may be formed by action of microbes in sediment. Assessing the methylation of mercury deposited into a water body is difficult, and is also very water body-specific. At this time OEHHA cannot address this issue in the Hot Spots program, but will consider addressing this problem in future amendments of the Guidance.

<sup>c</sup> NA – no data available or was not applicable

**Table 5.4 Point Estimates for Animal Pathway**

Parameter	Beef Cattle	Lactating Dairy Cattle	Pigs	Meat Poultry	Egg-laying Poultry
BW (body weight in kg)	533	575	55	1.7	1.6
BR <sub>a</sub> (inhalation rate in m <sup>3</sup> /d)	107	115	7	0.4	0.4
WL <sub>a</sub> (water consumption in kg/d)	45	110	6.6	0.16	0.23
FI (Food Intake in kg/d)	9	22	2.4	0.13	0.12
DMI <sup>a</sup> and/or pasture grazing <sup>b</sup>	9	22	2.4	0.13	0.12
FS <sub>r</sub> (soil fraction of feed)	0.01	0.01	NA	NA	NA
FS <sub>p</sub> (soil fraction of pasture)	0.05	0.05	0.04	0.02	0.02

<sup>a</sup> Dry matter intake

<sup>b</sup> For beef and dairy cattle, pasture grazing is assumed to be leafy vegetation (grasses, including greenchop) and accounts for half of the cattle's diet (FG=0.5 in Section 5.3.4.2.3). The default assumes on-site pasture grazing contaminated by facility emissions. Fraction of feed or dry matter intake (e.g., hay, grain) grown on-site is assumed to be contaminated by facility emissions and fraction of feed that is grown off-site is not assumed to be contaminated. A default may be used that assumes all feed is grown off-site (L=0 in Section 5.3.4.2.3), but a survey is recommended to verify the fractions of feed grown on-site and off-site.

For pigs with access to soil, but usually confined to a pen, default assumes no pasture grazing (FG=0 in Section 5.3.4.2.3). For feed, estimated intake consists of equal portions of all plant types including exposed, leafy, protected and root in which 10% (L=0.1 in Section 5.3.4.2.3) of the diet is homegrown and contaminated by facility emissions. The fraction of feed that was transported from an off-site location is assumed not to be contaminated by facility emissions.

For poultry including egg-laying and broiler chickens that have access to soil, default assumes no pasture grazing (FG=0 in Section 5.3.4.2.3). Estimated feed intake is composed of equal proportions of all plant types with 5% (L=0.05 in Section 5.3.4.2.3) homegrown and contaminated by facility emissions. The fraction of feed grown off-site and transported to the receptor was not contaminated by facility emissions.

NA - Not applicable. Assume FS<sub>r</sub> is equal to zero.

5-21

**Table 5.5 Mother's Milk Transfer Coefficients (Tco<sub>m</sub>)<sup>a</sup>**

Chemical/chem. group	Tco <sub>m</sub> (day/kg-milk)
PCDDs - oral <sup>b</sup>	3.7
PCDFs - oral <sup>b</sup>	1.8
Dioxin-like PCBs - oral <sup>b</sup>	1.7
PAHs - inhalation <sup>c</sup>	1.55
PAHs - oral	0.401
Lead - inhalation <sup>d</sup>	0.064

<sup>a</sup> These compound classes represent the chemicals of greatest concern for the mother's milk pathway under the Hot Spots program. It is expected that additional transfer coefficients will be developed for other multipathway chemicals in the Hot Spots Program as data becomes available and is reviewed.

<sup>b</sup> Use the oral Tco<sub>m</sub> for the inhalation and dermal pathways. The PCDD, PCDF and dioxin-like PCB Tcos were derived using a Random-effects model from individual Tco<sub>m</sub> estimates for 7 PCDDs, 9 PCDFs and 12 dioxin-like PCBs (See OEHHA, 2012, Appendix J).

<sup>c</sup> Use the inhalation Tco<sub>m</sub> for the dermal pathway

<sup>d</sup> Use the inhalation Tco<sub>m</sub> for the ingestion and dermal pathways

## 5.4 Estimation of Dose

Once the concentrations of substances are estimated in air, soil, water, plants, and animal products, they are used to evaluate estimated exposure to people. Exposure is evaluated by calculating the daily dose in milligrams per kilogram body weight per day (mg/kg/d). The following algorithms calculate this dose for exposure through inhalation, dermal absorption, and ingestion pathways. All chemicals must be assessed for exposure through inhalation. If there are emissions of one or more of the subset of semi- or non-volatile multipathway substances, the soil ingestion pathway and the dermal soil exposure pathway are also assessed. The mother's milk pathway may also be a mandatory pathway depending on the multipathway substance released (See Table 5.1). The other exposure pathways may also need to be assessed if a survey of the exposure site shows they are present (e.g., ingestion of water, home-grown crops, home-raised animal products, and angler-caught fish).

This section contains average and high-end point estimates and data distributions for adults and children for many exposure pathways. The point-estimates and data distributions for children fall within the 3<sup>rd</sup> trimester, 0<2, 2<9, and 2<16 year age groupings. The point-estimates and data distributions for adults fall within the 16<30 and 16-70 year age groupings. When evaluating 9-, 30-, and 70-year exposure durations for cancer risk assessment, assessors will use distributions starting at the third trimester.

Workers are assessed for cancer risk as adults using 8-hour breathing rate point estimates (See Table 5.8). Point estimates for workers are listed under "offsite worker." OEHHA has not developed stochastic distributions for worker exposure. Therefore, there is no Tier 3 stochastic approach for offsite worker cancer risk assessment.

### 5.4.1 Estimation of Exposure through Inhalation

The dose through the inhalation route is estimated for cancer risk assessment and noncancer hazard assessment. Both residential and offsite worker exposures are considered. Since residential exposure includes near-continuous long-term exposure at a residence and workers are exposed only during working hours (i.e., 8 hours/day), different breathing rate distributions are used.

#### 5.4.1.1 Residential Inhalation Dose for Cancer Risk Assessment

Exposure through inhalation is a function of the breathing rate, the exposure frequency, and the concentration of a substance in the air. For residential exposure, the breathing rates are determined for specific age groups, so inhalation dose (Dose-air) is calculated for each of these age groups, 3rd trimester, 0<2, 2<9, 2<16, 16<30 and 16-70 years. OEHHA used the mother's breathing rates to estimate dose for the 3rd trimester fetus assuming the dose to the fetus during the 3rd trimester is the same as the mother's dose. These age-specific groupings are needed in order to properly use the age sensitivity factors for cancer risk assessment (see Chapter 8). A Tier 1 evaluation uses the high-end point estimate (i.e., the 95<sup>th</sup> percentiles) breathing rates for the inhalation

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

pathway in order to avoid underestimating cancer risk to the public, including children. A possible exception for using high-end breathing rates are when there is exposure to multipathway substances and two of the non-inhalation pathways drive the risk, rather than the inhalation pathway (see Chapter 8).

#### A. Equation 5.4.1.1: $\text{Dose-air} = C_{\text{air}} \times \{BR/BW\} \times A \times EF \times 10^{-6}$

1. Dose-air = Dose through inhalation (mg/kg/d)
2.  $C_{\text{air}}$  = Concentration in air ( $\mu\text{g}/\text{m}^3$ )
3.  $\{BR/BW\}$  = Daily Breathing rate normalized to body weight (L/kg body weight - day)
4. A = Inhalation absorption factor (unitless)
5. EF = Exposure frequency (unitless), days/365 days
6.  $10^{-6}$  = Micrograms to milligrams conversion, liters to cubic meters conversion

#### a: Recommended default values for EQ 5.4.1.1:

1.  $\{BR/BW\}$  = Daily breathing rates by age groupings, see As supplemental information, the assessor may wish to evaluate the inhalation dose by using the mean point estimates in Table 5.6 to provide a range of breathing rates for cancer risk assessment to the risk manager.
2. Table (point estimates) and Table 5.7 (parametric model distributions for Tier III stochastic risk assessment). For Tier 1 residential estimates, use 95<sup>th</sup> percentile breathing rates in Table 5.6.
3. A = 1
4. EF = 0.96 (350 days/365 days in a year for a resident)

#### b: Assumption for EQ 5.4.1.1:

1. The fraction of chemical absorbed (A) is the same fraction absorbed in the study on which the cancer potency or Reference Exposure Level is based.

5-24

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### 5.4.1.2 Offsite Worker (MEIW) Inhalation Dose for Cancer Risk Assessment

For worker exposure, the default assumes working age begins at 16 years, and that exposures to facility emissions occur during the work shift, typically up to 8 hours per day during work days. Breathing rates that occur over an 8-hour period vary depending on the intensity of the activity (See Table 5.8), and are used to estimate the inhalation dose. The 8-hour breathing rates may also be useful for cancer risk assessment of children and teachers exposed at schools during school hours.

Another risk management consideration for the offsite worker scenario for cancer assessment of a Hot Spots facility is whether there are women of child-bearing age at the MEIW location and whether the MEIW has a daycare center. Since the third trimester is only a short segment of the 25 year exposure duration used for the MEIW, the resulting risk estimate would not differ significantly. An exception to this assumption is high exposure to carcinogens over a short period, as might occur during short-term projects (see Section 8.2.10). In this case, risk assessment during the third trimester may be warranted. However, if there is onsite daycare at the MEIW, then the risks to the children will be underestimated using the offsite adult worker scenario due to increased exposure (per kg body weight) and increased sensitivity to carcinogen exposure (see Section 8.2.1). In this case, the Districts may wish to include a calculation of inhalation dose for the children in the onsite daycare, assuming they could be there from 0 to age 6 years.

Exposed workers may be engaged in activities ranging from desk work, which would reflect breathing rates of sedentary/passive or light activities, to farm worker activities, which would reflect breathing rates of moderate intensity (See Table 5.9). OEHA recommends default (Tier 1) point estimate 8-hour breathing rates in L/kg-8-hrs based on the mean and 95<sup>th</sup> percentile of moderate intensity activities, 170 and 230 L/kg-8-hrs, respectively, for adults 16-70 years old.

Many facilities operate non-continuously, as in only 8-10 hours per day, but the air dispersion modeling is performed as if the emissions were uniformly emitted over 24 hours a day, 7 days per week. The air dispersion computer model used, including AERMOD and other models, typically calculate an annual average air concentration based on actual operating conditions but also include the hours of nonoperation in the average concentration.

Therefore, there are two components that determine the worker exposure to facility emissions:

- 1) What is the estimated concentration the worker is exposed to (i.e., breathes), during the work shift, and
- 2) What is the amount of time the offsite worker's schedule overlaps with the facility's emission schedule?

There are two approaches to estimating the modeled concentration the worker is breathing during the work shift. The first approach uses a worker adjustment factor (i.e.,

5-26

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

the WAF) to approximate what the worker is breathing based on the modeling run used for residential receptors. The second approach uses a special modeling run with the hourly raw results from an air dispersion analysis and is described in Appendix M.

The first and more basic approach is to obtain the long term average concentration as you would for modeling a residential receptor, then adjusting this exposure concentration using the calculated WAF (EQ 5.4.1.2 B) to estimate the concentration the offsite worker is exposed to during the work shift (shown as  $C_{air} \times WAF$ ) in EQ 5.4.1.2 A). This method is characteristic of a default approach used in a Tier 1 assessment. Once the exposure concentration is determined, the worker's inhalation dose (Dose-air) can be calculated as shown in EQ 5.4.1.2 A).

The second approach for determining the air concentration the worker is exposed to uses a refined modeling run where the hourly raw dispersion model output are post processed to examine the hourly concentrations that fall within the offsite worker's shift. This method provides a more representative estimate of the air concentration, but is more complex, and time consuming than the first method. See Appendix M for information on how to simulate the long term concentration for the offsite worker that can be used to estimate inhalation cancer risk.

The HARP software has the ability to calculate worker impacts using an approximation factor and, in the future, it will have the ability to post process refined worker concentrations using the hourly raw results from an air dispersion analysis.

If the off-site worker's shift does not completely overlap the emission schedule of the facility, then a Discount Factor (DF) may be applied to the WAF. Calculation of the DF is shown in EQ 5.4.1.2 C. The default assumption is that the offsite worker's shift falls completely within the emission schedule of the facility, in which case DF=1. Use of a DF less than 1 requires a survey at the MEIW to verify that some portion of the off-site worker shift is not subject to the facility emissions.

5-27

**A. Equation 5.4.1.2 A:**  $\text{Dose-air} = (C_{\text{air}} \times \text{WAF}) \times \{\text{BR}/\text{BW}\} \times A \times \text{EF} \times 10^{-6}$

1. Dose-air = Dose through inhalation (mg/kg/d)
2.  $C_{\text{air}}$  = Annual average concentration in air ( $\mu\text{g}/\text{m}^3$ )
3. WAF = Worker air concentration adjustment factor (unitless)
4.  $\{\text{BR}/\text{BW}\}$  = Eight-hour breathing rate normalized to body weight (L/kg body weight - day)
5. A = Inhalation absorption factor (unitless)
6. EF = Exposure frequency (unitless), days/365 days)
7.  $10^{-6}$  = Micrograms to milligrams conversion, Liters to cubic meters conversion

**a: Recommended default values for EQ 5.4.1.2 A:**

1. WAF = See EQ. 5.4.1.2 B for formula to calculate WAF, or App. M for refined post-processing modeling to calculate WAF.
2.  $\{\text{BR}/\text{BW}\}$  = For workers, use age16-70 year, 95<sup>th</sup> percentile, moderate intensity 8-hour point estimate breathing rates (see Table 5.8). No worker breathing rate distributions exist for stochastic risk assessment.
3. A = 1
4. EF = 0.68 (250 days / 365 days). Equivalent to working 5 days/week, 50 weeks/year.

**b: Assumption for EQ 5.4.1.2 A:**

1. The fraction of chemical absorbed (A) through the lungs is the same fraction absorbed in the study on which the cancer potency factor is based.
2. The source emits during the daylight hours. Calculate WAF (EQ 5.4.1.2 B) if a special post-processing modeling run described in App. M was not completed. For nighttime emissions and exposure scenarios, see Appendix N.

**B. Equation 5.4.1.2 B:**  $\text{WAF} = (H_{\text{res}} / H_{\text{source}}) \times (D_{\text{res}} / D_{\text{source}}) \times \text{DF}$

1. WAF = Worker adjustment factor (unitless)
2.  $H_{\text{res}}$  = Number of hours per day the annual average residential air concentration is based on (always 24 hours)
3.  $H_{\text{source}}$  = Number of hours the source operates per day
4.  $D_{\text{res}}$  = Number of days per week the annual average residential air concentration is based on (always 7 days)
5.  $D_{\text{source}}$  = Number of days the emitting source operates per week
6. DF = Discount factor, for when the offsite worker's schedule partially overlaps the source's emission schedule

**b: Recommended default values for EQ 5.4.1.2 B:**

1. DF = 1 for offsite worker's schedule occurring within the source's emission schedule. A site-specific survey may be used to adjust the DF using EQ 5.4.1.2 C.

**C. Equation 5.4.1.2 C:**  $\text{DF} = (H_{\text{coincident}} / H_{\text{worker}}) \times (D_{\text{coincident}} / D_{\text{worker}})$

1.  $H_{\text{coincident}}$  = Number of hours per day the offsite worker's schedule and the source's emission schedule coincide
2.  $H_{\text{worker}}$  = Number of hours the offsite worker works per day
3.  $D_{\text{coincident}}$  = Number of days per week the offsite worker's schedule and the source's emission schedule coincide
4.  $D_{\text{worker}}$  = Number of days the offsite worker works per week

Tier 2 adjustments for EQ 5.4.1.2 A-C may be used for:

1. Eight-hour breathing rate. Point estimates in Table 5.8 for lower breathing rates of sedentary/passive and light intensity work activities may be substituted in site-specific Tier 2 scenarios. Table 5.9 can be used to estimate breathing rate intensities for various job activities. Use of different breathing rates requires a survey of the exposed workplace and approval by Air District, ARB and OEHHA.
2. Discount Factor (DF) in EQ 5.4.1.2 C. If a site-specific survey of the offsite worker schedule only partially overlaps with the source's emission schedule, then a DF less than 1 may be calculated. Use of a DF less than 1 requires a survey of the exposed workplace and approval by the Air District or ARB.

The 8-hour breathing rates are based on minute ventilation rates derived by U.S. EPA (2009). U.S. EPA employed a metabolic equivalent (METs) approach for estimating breathing rates. This method determines daily time-weighted averages of energy expenditure (expressed as multipliers of the basal metabolic rate) across different levels of physical activity. The 8-hour breathing rates shown in Table 5.8 are divided into three categories:

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

Sedentary & Passive Activities (METs ≤ 1.5)

Light Intensity Activities (1.5 < METs ≤ 3.0)

Moderate Intensity Activities (3.0 < METs ≤ 6.0)

For example, a METs = 1 is roughly equivalent to energy expenditure during sleep and is close to the basal metabolic rate. A METs activity that is two to three times greater (METs = 2 to 3) is characteristic of light intensity activities, such as administrative office work or sales work as shown in Table 5.9.

Under a Tier 1 scenario, the risk assessor may simply use the 95<sup>th</sup> percentile breathing rate for moderate intensity activities of 230 L/kg-8 hrs in Eq. 5.4.1.2 A to calculate the daily dose via the inhalation route to the worker. In an example of a Tier 2 scenario, the risk assessor surveys the workplace and determines that the worker(s) at the MEIW receptor are primarily sitting at a desk performing administrative-type work on a computer. Referring to Table 5.9, this activity corresponds most closely to "administrative office work" with a mean activity level of 1.7 and a SD = 0.3. This level of activity is considered "light intensity activity" (i.e., 1.5 < METs ≤ 3.0). With the prior approval of the Air District or ARB, the risk assessor may then use the 95<sup>th</sup> percentile breathing rate of 100 L/kg-8 hr for light intensity activities in Equation 5.4.1.2 A.

**Table 5.8. Eight-Hour Breathing Rate (L/kg per 8 Hrs) Point Estimates for Males and Females Combined<sup>a,b</sup>**

	0<2 years	2<9 years	2<16 years	16<30 years	16-70 years
<b>Sedentary &amp; Passive Activities (METs ≤ 1.5)</b>					
Mean	200	100	80	30	30
95 <sup>th</sup> Percentile	250	140	120	40	40
<b>Light Intensity Activities (1.5 &lt; METs ≤ 3.0)</b>					
Mean	490	250	200	80	80
95 <sup>th</sup> Percentile	600	340	270	100	100
<b>Moderate Intensity Activities (3.0 &lt; METs ≤ 6.0)</b>					
Mean	890	470	380	170	170
95 <sup>th</sup> Percentile	1200	640	520	240	230

<sup>a</sup> For pregnant women, OEHHA recommends using the mean and 95<sup>th</sup> percentile 8-hour breathing rates based on moderate intensity activity of 16<30 year-olds for 3rd trimester.

<sup>b</sup> Breathing rates in the table may be used for worker, school, or residential exposures

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

**Table 5.9. METS Distributions for Workplace and Home Activities**

Activity Description	Mean	Median	SD	Min	Max
<b>Workplace Activities</b>					
Administrative office work	1.7	1.7	0.3	1.4	2.7
Sales work	2.9	2.7	1.0	1.2	5.6
Professional	2.9	2.7	1.0	1.2	5.6
Precision/production/craft/repair	3.3	3.3	0.4	2.5	4.5
Technicians	3.3	3.3	0.4	2.5	4.5
Private household work	3.6	3.5	0.8	2.5	6.0
Service	5.2	5.3	1.4	1.6	8.4
Machinists	5.3	5.3	0.7	4.0	6.5
Farming activities	7.5	7.0	3.0	3.6	17.0
Work breaks	1.8	1.8	0.4	1.0	2.5
<b>Household/Neighborhood Activities</b>					
Sleep or nap	0.9	0.9	0.1	0.8	1.1
Watch TV	1.0	1.0	-	1.0	1.0
General reading	1.3	1.3	0.2	1.0	1.6
Eat	1.8	1.8	0.1	1.5	2.0
Do homework	1.8	1.8	-	1.8	1.8
General personal needs and care	2.0	2.0	0.6	1.0	3.0
Indoor chores	3.4	3.0	1.4	2.0	5.0
Care of plants	3.5	3.5	0.9	2.0	5.0
Clean house	4.1	3.5	1.9	2.2	5.0
Home repairs	4.7	4.5	0.7	4.0	6.0
General household chores	4.7	4.6	1.3	1.5	8.0
Outdoor chores	5.0	5.0	1.0	2.0	7.0
Walk/bike/jog (not in transit) age 20	5.8	5.5	1.8	1.8	11.3
Walk/bike/jog (not in transit) age 30	5.7	5.7	1.2	2.1	9.3
Walk/bike/jog (not in transit) age 40	4.7	4.7	1.8	2.3	7.1

Table 5.10 lists some WAFs for a few typical scenarios. For example, if the source is continuously emitting, then the offsite worker is assumed to breathe the long-term annual average concentration during their work shift. The WAF then becomes one and no concentration adjustments are necessary in this situation when estimating the inhalation cancer risk. If the source is non-continuously emitting for 8 hours/day, 5 days/week and the offsite worker's shift completely overlaps the emitting facility's operating schedule, then the WAF would be 4.2:

$$(24 \text{ hrs/day} / 8 \text{ hrs/day}) \times (7 \text{ days/week} / 5 \text{ days/week}) = 4.2$$

If the offsite worker's 8 hour/day shift only overlaps the emitting facility's operation schedule for 4 hrs/day, then the WAF is 2.1 because the DF = 0.5 will reduce the WAF by half: DF = (4 hrs/day / 8 hrs/day) x (5 days/week / 5 days/week) = 0.5

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

**Table 5.10: Example Worker Adjustment Factors (WAF) to Convert a Long-Term Daily Average Emission Concentration to an Off-Site Worker Receptor Exposure**

Off-Site Workers' Shift Overlap with Facility's Emission Schedule <sup>a</sup>	Facility Operating Schedule	Adjustment Factor
8 hrs/day, 5 days/week	Continuous (24 hrs/7 days/week)	1.0
8 hrs/day, 5 days/week <sup>b</sup>	Non-continuous (8 hrs/5 days/week)	4.2
4 hrs/day, 5 days/week	Non-continuous (8 hrs/5 days/week)	2.1

<sup>a</sup> Worker works 8 hours per day, 5 days per week

<sup>b</sup> Workers' work hours completely overlap the facilities operating hours

#### 5.4.1.3 Inhalation Dose for Children at Schools and Daycare Facilities for Cancer Risk Assessment

The 8-hour breathing rates and inhalation dose equations (EQ 5.4.1.2 A-C) may also be used to estimate risk to children when exposures occur while at school or at day care facilities. Breathing rate point estimates to use in Table 5.8 depend on the ages of the children at the exposed schools and day cares. As a Tier 1 default, moderate intensity breathing rates are recommended. Equations 5.4.1.2 A-C is used in the same way to estimate dose in children as it is for workers.

#### 5.4.1.4 Non-Cancer Inhalation Exposure for Workers and Residents

For typical daily work shifts of 8-9 hours, acute, 8-hour and chronic Reference Exposure Levels (RELs) described in Chapter 8 are used in health risk assessments to characterize the noncancer risks using the Hazard Index approach described in Chapter 8 and in OEHHA (2008). Uncertainty factors are already incorporated into the RELs used to assess noncancer risk, as explained in Chapter 8, so all that is needed to evaluate the noncancer hazard is the air concentration that the worker is exposed to. The modeled maximum 1-hour air concentration is determined for acute hazard assessment and the annual average air concentration is determined for chronic hazard assessment. The modeled average air concentration during a work shift is determined for 8-hour hazard assessment using the adjusted annual average air concentration described below.

The 8-hour RELs are primarily designed to address offsite worker inhalation exposure at the MEIW because they better characterize the daily intermittent exposures of workers than the chronic RELs do. They are used in estimating the 8 hour Hazard Index for offsite workers. The 8-hour RELs should be used for typical daily work shifts of 8-9 hours. For further questions, assessors should contact OEHHA, the District, or reviewing authority to determine if the 8-hour RELs should be used in your HRA. Any discussions or directions to exclude the 8-hour REL evaluation should be documented in the HRA.

5-32

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

Note, however, there are only a handful of 8-hour RELs currently adopted for use in the Hot Spots program. Therefore, we also recommend performing chronic noncancer exposure assessment for the offsite worker (MEIW) based on the annual average air concentration at the MEIW. Evaluation of the chronic Hazard Index should help protect workers who routinely work longer than 8 hour shifts. Exposure to multipathway substances also requires noncancer hazard assessment for the dermal and oral soil exposure pathways for offsite workers. Because there are few 8-hour RELs currently available, hazard assessment for the noninhalation pathways for multipathway substances is only applied when estimating the chronic Hazard Index.

In addition, the Districts may wish to determine if there is an onsite daycare at the MEIW and include a calculation of the chronic and 8-hour inhalation dose for children, although onsite hazard assessment is not a requirement for a Hot Spots risk assessment.

As explained in Section 5.4.1.2 for cancer risk, the modeled annual average air concentration is adjusted to the air concentration that the worker is actually exposed to if the facility operates non-continuously. The typical method for this adjustment is by calculating the Worker Adjustment Factor (WAF) shown in EQ 5.4.1.4 B and multiplying this value by the annual average air concentration ( $C_{air}$ , in  $\mu\text{g}/\text{m}^3$ ) in EQ 5.4.1.4 A.

Unlike cancer risk assessment, no discount factor (DF) is applied in noncancer assessment for partial overlap between the worker's schedule and the source's emission schedule. Adjustments for worker vacations, work shifts for shortened weeks (e.g., 1 - 4 days), and worker time away on weekends are also not appropriate.

An alternative refined post-processing method, described in Appendix M, may be used to estimate the air concentration the worker is exposed to during their work schedule. OEHHA may be consulted about the particular chemical involved if it is important to make a more refined analysis.

The equation to adjust the annual average air concentration to a worker 8-hour exposure concentration (i.e., the adjusted annual average ground level concentration) is expressed as:

**A. Equation 5.4.1.4 A:**  $\text{Adjusted } C_{air} (\mu\text{g}/\text{m}^3) = C_{air} \times \text{WAF}$

Where WAF is determined as:

**B. Equation 5.4.1.4 B:**  $\text{WAF} = (H_{res} / H_{source}) \times (D_{res} / D_{source})$

#### a: Assumptions for EQ 5.4.1.4 B:

1. No adjustment of the WAF allowed for partial overlap of the worker's schedule and the source's emission schedule.

Alternatives for calculating off-site worker Adjusted  $C_{air}$  in EQ 5.4.1.4 A-B:

5-33

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

1. Rather than calculate the WAF for a non-continuous emitting facility, a post-processing of the hourly raw dispersion model output and examination of the hourly concentrations that fall within the offsite worker's shift can be conducted to estimate the air concentration the worker is exposed to. This method is a more refined, complex, and time consuming approach, but should result in a more representative exposure concentration. See Appendix M for information on how to simulate the exposure concentration for the off-site worker.
2. For continuously-emitting facilities (i.e., 24 hrs/day, 7 days/week), if an assessor does not wish to assume the worker breathes the long-term annual average concentration during the work shift, then a refined concentration can also be post-processed as described in Appendix M. All alternative assumptions should be approved by the reviewing authority and supported in the presentation of results.

For residential exposure to non-continuously operating facilities, the modeled maximum 1-hour and chronic air concentrations at the MEIR are determined for noncancer hazard assessment. Hazard assessment for repeated 8-hour exposure at the MEIR is not required. Chronic exposure assessment based on the annual average air concentration should adequately protect individuals, in part because residents are considered to be present at the MEIR at or near 24 hrs per day. Many facilities operate for periods longer than 8 hours per day and the hazards are better characterized based on chronic exposure. Nevertheless, differences between 8-hour and chronic exposures (i.e., higher daily 8-hour exposures vs. lower longer daily exposure 24 hrs/day) may result in different toxicological responses including potentially greater toxicological responses with either 8-hour or chronic exposure. There may also be cases such as special meteorological situations (e.g., significant diurnal-nocturnal meteorological differences) where the 8-hour REL will be more protective than the chronic REL. Thus, the air districts may also elect to have an 8-hour hazard assessment performed at the MEIR, using daily 8 hour exposures and the 8 hr RELs.

Eight-hour exposure assessment is not recommended for continuously emitting sources for residential receptors. In this situation it is only necessary to estimate chronic exposure based on the annual average concentration. However, there may be situations where the air district may wish to assess an 8-hour residential exposure to continuously operating facilities, for example, where there are significant differences in modeled concentration of emissions during the day due to diurnal wind patterns.

For estimating the air concentration from non-continuously operating facilities, EQ 5.4.1.4.A is also used to adjust the annual average concentration to what the residents are exposed to. This is the air concentration that the 8-hour REL will be compared to as discussed in Chapter 8. The alternative refined post-processing method described in Appendix M may also be used to estimate residential exposure.

In summary, the requirements for noncancer hazard assessment using the Hazard Index approach at the MEIW and MEIR are as follows.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

For offsite worker exposure:

- Acute hazard assessment based on the maximum 1-hour air concentrations and 1-hour RELs
- Eight-hour hazard assessment based on daily average 8-hour exposure (estimated using adjusted annual average air concentration in EQ 5.4.1.4 A and B or by post-processing method in App. M) for those substances with 8-hour RELs
- Chronic hazard assessment based on annual average exposure and chronic RELs, and oral chronic RELs for noninhalation routes of multipathway substances

For residential exposure:

- Acute hazard assessment based on the maximum 1-hour air concentration and 1-hour RELs
- Eight-hour hazard assessment based on daily average 8-hour exposure not required, but can be performed at the discretion of the air districts for exposure to non-continuously operating facilities based on the adjusted annual average air concentration (EQ 5.4.1.4 A and B or method in App. M). Eight-hour assessments not recommended for exposure to continuously operating facilities
- Chronic hazard assessment based on annual average exposure and chronic RELs, and oral chronic RELs for noninhalation routes of multipathway substances

#### 5.4.1.5 Exposure Frequency and Age Groupings for Noncancer Hazard Assessment

For cancer risk, the basic assumption is that risk is associated with cumulative dose of carcinogen. Thus, the dose used to estimate cancer risk can be adjusted for exposure frequency, as well as time spent within the MEIR or MEIW location. Chronic RELs are not necessarily related to cumulative dose. Thus, adjusting the estimated dose used to calculate hazard index for exposure frequency or time away from the MEIR or MEIW is not appropriate.

The average daily dose for chronic noncancer assessment is based on exposure beginning at birth to 70 years of age, necessitating calculation of a time-weighted average for age 0-2, 2-16 and 16-70 years. Since we are not applying Age Sensitivity Factors for assessing non-cancer hazard, the 3<sup>rd</sup> trimester is not explicitly called out for determining dose, as it is for cancer risk assessment. Rather adult exposure is considered, which would include pregnant women in any trimester. Both inhalation and oral RELs incorporate safety factors to protect sensitive human populations.

#### 5.4.2 Estimation of Exposure through Dermal Absorption

Exposure through dermal absorption (dose-dermal) is a function of the soil or dust loading of the exposed skin surface, the amount of skin surface area exposed, and the concentration and availability of the substance. In the previous edition of OEHA's

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

exposure guidelines document (OEHHA, 2000), we recommended using specified average and high-end point estimate values for four of the variates (body weight, exposed surface area of skin, soil load on skin and frequency of exposure) in the stochastic analysis for dermal dose. This equation required multiplying values together, which could lead to overly conservative exposure estimates when high-end values were used. By combining information from the four variates into one composite distribution, over-conservatism may be avoided.

To this end, OEHHA created a new variate, "annual dermal load", or ADL, which is a composite of the body surface area (BSA) per kg body weight, exposure frequency, and soil adherence variates. Point estimates from the composite "annual dermal load" can be used for point estimate assessments while parameters and information on the type of distribution (e.g., lognormal) can be used for Tier III stochastic risk assessments. For details on the development of the ADL, refer to the Technical Support Document for Exposure and Stochastic Analysis (OEHHA, 2012).

#### 5.4.2.1 Dermal Dose for Cancer Risk Assessment

The dose through residential dermal exposure to contaminated soil varies by age and is calculated for each age group (e.g., 3rd trimester, 0<2 yrs, 2<9 yrs, 2<16 yrs, 16<30 and 16-70 yrs). These age-specific groupings are needed in order to properly use the age sensitivity factors for cancer risk assessment (see Chapter 8). This pathway is also assessed for exposure to offsite workers; a separate ADL for offsite workers is presented in Table 5.11. Children at a MEIW daycare, if present, may also be assessed for exposure if the District deems it advisable.

#### A. Equation 5.4.2.1:

$$\text{Dose}_{\text{dermal}} = \text{ADL} \times \text{Cs} \times \text{ABS} \times 10^{-9} / 365$$

1.  $\text{Dose}_{\text{dermal}}$  = Exposure dose through dermal absorption (mg/kg-d)
2. ADL = Annual dermal load (mg soil/kg BW-yr)
3.  $\text{Cs}$  = Average soil concentration ( $\mu\text{g}/\text{kg}$ )
4. ABS = Fraction absorbed across skin (unitless)
5.  $10^{-9}$  = Conversion factor for chemical & soil ( $\mu\text{g}$  to mg, mg to kg)
6. 1/365 = Conversion factor for ADL from yrs to days

#### a: Recommended default values for EQ 5.4.2.1:

1. ADL = See Table 5.11 (point estimates) & Table 5.12 a-d (distributions)
2.  $\text{Cs}$  = Calculated above in EQ 5.3.2 A
3. ABS = See Table 5.13

#### b: Assumption for EQ 5.4.2.1:

1. The ADL for the third trimester of the fetus is based on the ADL of the mother; when normalized to body weight, we assume that exposure to the

5-36

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

mother and the fetus will be the same. The mother's exposure is based on that of adults 16-30 years of age in Table 5.11 and 5.12d.

2. Exposure frequency (EF) for vacation time spent away from exposure does not appear as a variate in EQ 5.4.2.1, as it is incorporated in the ADL and includes a 2-week vacation per year away from dermal soil exposure for both residents and offsite workers.

Climate will strongly influence people's choice of clothing. Due to California's varied climatic regions and existing data on clothing choices at different temperatures, three levels of climatic conditions, warm, mixed, and cold, are used to describe California's climate regions:

1. A warm climate is characteristic of Southern California areas such as Los Angeles, which can have warm to hot temperatures throughout the year.
2. A "mixed" climate is one that has warm-to-hot temperatures during much of the year (daily highs over 80 degrees are common), roughly from April to October, and cold temperatures (lows near or below freezing) during the remainder of the year. The mountains and central valley are examples of a mixed climate.
3. A cold climate is representative of San Francisco, Eureka, and other northern coastal communities, which have cool temperatures (daily highs of less than 65 degrees) for the majority of the year and can receive a considerable amount of fog and rainfall.

OEHHA recommends consulting the local air district for assistance on selecting the most appropriate climate.

**Table 5.11 Recommended Annual Dermal Load Point Estimates (in mg/kg-yr) for Dermal Exposure**

	3 <sup>rd</sup> Trimester <sup>a</sup>	Children 0<2 yrs	Children 2<9 yrs	Children 2<16 yrs	Adults <sup>b</sup>	Offsite Worker <sup>c</sup>

Polycyclic aromatic hydrocarbons	13

<sup>a</sup> To be determined in future amendments to the Hot Spots Program

Skin permeability is related to the solubility or strength of binding of the chemical in the delivery matrix (soil or other particles) versus the receptor matrix, the skin's stratum corneum. Fractional dermal absorption point estimate values were derived by OEHH from available literature sources for the semi-volatile and nonvolatile chemicals in the “Hot Spots” program. The rationale for the chemical-specific dermal absorption fraction values, and the use of default values in cases where sufficient data are lacking, can be found in Appendix F of the Technical Support Document for Exposure and Stochastic Analysis (OEHH, 2012).

### 5.4.2.2 Chronic Noncancer Dermal Dose

Dermal exposure, and thus annual dermal load (ADL), varies by age group. Therefore, a time-weighted average ADL for age 0-70 years (0-2, 2-16, and 16-70 years) is estimated for chronic residential exposure using ADL values in Table 5.12. This exposure pathway is also assessed for offsite workers using the offsite worker ADL values in Table 5.12d. Children at a MEIW daycare, if present, may also be assessed for exposure if the District deems it advisable. The contribution to the dermal dose is determined for each age group in EQ 5.4.2.2:

5-40

## O-MBA20L7

Air Toxics Hot Spots Program Guidance Manual

February 2015

**A. Equation 5.4.2.2:**  $\text{Dose}_{\text{dermal}} = \text{ADL} \times \text{Cs} \times \text{ABS} \times 10^{-9} \times \text{ED/AT} \times (1/350)$

1.  $\text{Dose}_{\text{dermal}}$  = Exposure dose through dermal absorption (mg/kg/d)
2. ADL = Annual dermal load (mg/kg-yr), age-specific
3. Cs = Average soil concentration (μg/kg)
4. ABS = Fraction absorbed across skin (unitless)
5.  $10^{-9}$  = Conversion factor for chemical & soil (μg to mg, mg to kg)
6. 1/350 = Conversion factor for ADL from yrs to days (Note: this conversion is needed to remove EF, expressed as 350 days/365 days, from the ADLs in Table 5.12a-d)
7. ED = Exposure duration for specified age groups: 2 yrs for 0<2, 14 yrs for 2<16, 54 yrs for 16-70 for residential exposure,
8. AT = Averaging time for residential exposure – 70 yrs

### a: Recommended default values for EQ 5.4.2.2:

1. ADL = See Table 5.11 for point estimates by age group, climate region and receptor type (resident or worker)
2. Cs = Calculated above in EQ 5.3.2 A
3. ABS = See Table 5.13

### b: Recommended off-site worker default modifications to EQ 5.4.2.2:

1. Chronic dermal dose to the off-site worker assumes only adult exposure and is incorporated into the off-site worker ADL in Table 5.12d.
2. A time-weighted average estimate of dose is not necessary and the ED and AT variates are left out of EQ 5.4.2.2 for dermal dose to the worker.

### c: Recommended nursing mother default modifications to EQ 5.4.2.2:

1. For dermal dose to mother's milk, use the ADL for age 16-30 years in Table 5.12d.
2. The ED and AT variates in EQ 5.4.2.2 are left out for dermal dose in the mother's milk pathway.

### d: Assumptions for EQ 5.4.2.2:

1. For cancer risk assessment, Exposure Frequency (EF) for vacation time away from exposure is incorporated into the ADLs shown in Tables 5.11 and 5.12 using the basic assumption that cancer risk is associated with cumulative dose of carcinogen. The dose used to estimate cancer risk can be adjusted for EF, and for time spent within the MEIR or MEIW location. Chronic RELs are not necessarily related to cumulative dose. Thus, adjusting the estimated dose for EF at the MEIR or MEIW is not appropriate, and the unadjusted daily rate is used in EQ 5.4.2.2.
2. For worker exposure, the annual average concentration should not be adjusted to account for worker and facility emission schedules, as done for

5-41

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

inhalation cancer risk assessment. The pollutant will be deposited and accumulate in the soil in the absence or presence of the worker; therefore, the total deposition and soil concentration will be dependent on the annual average air concentration.

For residential chronic exposure, the dermal dose contribution for each age group is summed together to obtain the time-weighted average daily dermal dose for chronic hazard assessment:

$$(\text{ADL age } 0 < 2 \times C_s \times \text{ABS} \times 10^{-9} \times 2 / 70 \times (1/350)) +$$

$$(\text{ADL age } 2 < 16 \times C_s \times \text{ABS} \times 10^{-9} \times 14 / 70 \times (1/350)) +$$

$$(\text{ADL age } 16-70 \times C_s \times \text{ABS} \times 10^{-9} \times 54 / 70 \times (1/350)) = \text{Chronic Dose}_{\text{dermal}}$$

#### 5.4.3 Estimation of Exposure through Ingestion

Exposure through ingestion is a function of the concentration of the substance in the ingested soil, water, and food, the gastrointestinal absorption of the substance, and the amount ingested.

##### 5.4.3.1 Exposure through Ingestion of Soil

There are no distributions for soil ingestion currently recommended. Tier III stochastic risk assessments should include a high-end point estimate of soil ingestion, soil loading, exposure frequency and soil area.

##### 5.4.3.1.1 Soil Ingestion Dose for Cancer Risk

The exposure dose through residential soil ingestion varies by age and is calculated for each age group (e.g., 3rd trimester, 0<2 yrs, 2<9 yrs, 2<16 yrs, 16<30 and 16-70 yrs). These age-specific groupings are needed in order to properly use the age sensitivity factors for cancer risk assessment (see Chapter 8). This pathway is also assessed for exposure to off-site workers. Children at a MEIW daycare, if present, may also be assessed for exposure if the District deems it advisable. The dose from inadvertent soil ingestion can be estimated by the point estimate approach using the following general equation:

5-42

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

**A. Equation 5.4.3.1.1:**  $\text{DOSE}_{\text{soil}} = C_{\text{soil}} \times \text{GRAF} \times \text{SIR} \times 10^{-9} \times \text{EF}$

1.  $\text{DOSE}_{\text{soil}}$  = Dose from soil ingestion (mg/kg BW-day)
2.  $10^{-9}$  = Conversion factor ( $\mu\text{g}$  to mg, mg to kg)
3.  $C_{\text{soil}}$  = Concentration of contaminant in soil ( $\mu\text{g}/\text{kg}$ )
4. GRAF = Gastrointestinal relative absorption fraction, chemical-specific (unitless)
5. SIR = Soil ingestion rate (mg/kg BW-day)
6. EF = Exposure frequency (unitless), (days/365 days)

#### a: Recommended default values for EQ 5.4.3.1.1:

1.  $C_{\text{soil}}$  = Calculated above in EQ 5.3.2 A
2. GRAF = See Table 5.2
3. SIR = See Table 5.14
4. EF = 350 d/year resident, 250 d/year worker

In this approach, it is assumed that the soil ingested contains a representative concentration of the contaminant(s) and the concentration is constant over the exposure period.

The term **GRAF**, or gastrointestinal relative absorption factor, is defined as the fraction of contaminant absorbed by the GI tract relative to the fraction of contaminant absorbed from the matrix (feed, water, other) used in the study(ies) that is the basis of either the cancer potency factor (CPF) or the Reference Exposure Level (REL). If no data are available to distinguish absorption in the toxicity study from absorption from the environmental matrix in question (i.e., soil), then GRAF = 1. The GRAF allows for adjustment for absorption from a soil matrix if it is known to be different from absorption across the GI tract in the study used to calculate the CPF or REL. In most instances, the GRAF will be 1.

5-43

0<2	20	40
2<9	5	20
2<16	3	10
16<30	0.7	3
16 to 70	0.6	3
PICA adult	NR	-

<sup>a</sup> Assumed to be the mother's soil ingestion rate (adult age 16 <30)

\* Soil includes outdoor settled dust

NR = No recommendation

### 5.4.3.1.2 Chronic Noncancer Dose for Soil Ingestion

The soil ingestion rate varies by age. A time-weighted average approach is used to combine soil intake rates of the age groupings (i.e., 0<2 yrs, 2<16 yrs, and 16-70 yrs) to determine the residential soil ingestion dose for chronic noncancer hazard assessment. This pathway is also assessed for exposure to offsite workers using the adult intake values for age 16-70 years in Table 5.14. Children at a MEIW daycare, if present, may also be assessed for exposure if the District deems it advisable. The contribution to the soil ingestion dose by each age group is determined in EQ 5.4.3.1.2:

**A. Equation 5.4.3.1.2:**  $DOSE_{soil} = C_{soil} \times GRAF \times SIR \times 10^{-9} \times ED/AT$

1.  $DOSE_{soil}$  = Dose from soil ingestion (mg/kg BW-day)
2.  $10^{-9}$  = Conversion factor ( $\mu$ g to mg, mg to kg)
3.  $C_{soil}$  = Concentration of contaminant in soil ( $\mu$ g/kg)
4. GRAF = Gastrointestinal relative absorption fraction, unitless; chemical-specific
5. SIR = Soil ingestion rate (mg/kg BW-day)
6. ED = Exposure duration for a specified age group: 2 yrs for 0<2, 14 yrs for 2<16, 54 yrs for 16-70
7. AT = Averaging time for lifetime exposure – 70 yrs

#### a: Recommended default values for EQ 5.4.3.1.2:

1.  $C_{soil}$  = Calculated above in EQ 5.3.2 A
2. GRAF = See Table 5.2
3. SIR = See Table 5.14; use 16-70 age group SIR for workers

5-44

## O-MBA20L7

Air Toxics Hot Spots Program Guidance Manual

February 2015

#### b: Recommended off-site worker default modifications to EQ 5.4.3.1.2:

1. A time-weighted average estimate of dose is not necessary and the ED and AT variates are left out of EQ 5.4.3.1.2 for oral soil dose to the worker.

#### c: Recommended nursing mother default modifications to EQ 5.4.3.1.2:

1. For mother's ingested soil dose to milk, use the SIR for age 16-30 years in Table 5.14.
2. The ED and AT variates in EQ 5.4.3.1.2 are left out for soil ingestion dose in the mother's milk pathway.

#### d: Assumptions for EQ 5.4.3.1.2:

1. For worker exposure, the annual average concentration should not be adjusted to account for overlap of worker and facility emission schedules. The pollutant will be deposited and accumulate in the soil in the absence or presence of the worker; therefore, the total deposition and soil concentration will be dependent on the annual average air concentration.

For residential exposure, the soil ingestion dose contribution for each age group is summed together to obtain the time-weighted average daily soil intake dose for chronic hazard assessment:

$$(SIR \text{ for age } 0<2 \text{ yrs} \times C_{soil} \times GRAF \times 10^{-9} \times 2 / 70) +$$

$$(SIR \text{ for age } 2<16 \text{ yrs} \times C_{soil} \times GRAF \times 10^{-9} \times 14 / 70) +$$

$$(SIR \text{ for age } 16-70 \text{ yrs} \times C_{soil} \times GRAF \times 10^{-9} \times 54 / 70) = \text{Chronic Dose}_{soil}$$

### 5.4.3.2 Exposure through Ingestion of Food

The exposure through food ingestion can be through ingestion of home-grown plant products (categorized as leafy, protected, exposed and root produce), home-raised animals (categorized as meat, cow's milk and eggs), angler-caught fish and mother's milk. When a specific food pathway is a dominant pathway (e.g., homegrown produce), and multiple pathways such as home raised meat, milk, and eggs categories all need to be assessed, the 95<sup>th</sup> percentile default consumption rate for the driving exposure pathway is used, while the mean consumption values for the remaining exposure pathways (i.e., food categories) are used. See Section 8.2.6 for a complete discussion of the methodology on how to implement the derived methodology.

#### 5.4.3.2.1 Dose for Cancer Risk from Home-Grown Produce

Exposure through ingesting home-grown produce ( $DOSE_p$ ) is a function of the type of crop (i.e., exposed, leafy, protected, root), gastrointestinal relative absorption factor, bioavailability and the fraction of plant ingested that is homegrown. The calculation is done for each type of crop, then summed to get total dose for this pathway. The

5-45

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

exposure dose through ingestion of home-grown produce varies by age and is calculated for each age group (e.g., 3rd trimester, 0<2 yrs, 2<9 yrs, 2<16 yrs, 16<30 and 16-70 yrs). These age-specific groupings are needed in order to properly use the age sensitivity factors for cancer risk assessment (see Chapter 8).

#### A. Equation 5.4.3.2.1: $DOSE_p = C_v \times IP \times GRAF \times L \times EF \times 10^{-6}$

1.  $DOSE_p$  = Exposure dose through ingestion of home-grown produce (mg/kg/d)
2.  $C_v$  = Concentration in specific type of crop, i.e., exposed, leafy, protected, root ( $\mu\text{g/kg}$ )
3.  $IP$  = Consumption of specific type of crop (g/kg BW\*day)
4.  $GRAF$  = Gastrointestinal relative absorption factor (unitless)
5.  $L$  = Fraction of plant type consumed that is home-grown or locally grown (unitless)
6.  $EF$  = Exposure frequency (unitless, days/365 days)
7.  $10^{-6}$  = Conversion factors ( $\mu\text{g/kg}$  to mg/g)

#### a: Recommended default values for Equation 5.4.3.2.1:

1.  $C_v$  = Calculated above in EQ 5.3.4.1 A
2.  $IP$  = See Table 5.15 (point estimates) and 5.16a-e (distributions)
3.  $GRAF$  = See Table 5.2
4.  $L$  = Site-specific survey is recommended. Otherwise, see Table 5.17 for Tier I default values
5.  $EF$  = 0.96 (350 d/365 d in a yr)

Once the dose for each type of crop that applies is calculated (See Section 5.3.4.1 for definition of crops types), the doses are summed to get the total dose for the home-grown produce pathway:

Total  $DOSE_p$  =  $DOSE_p$  (leafy) +  $DOSE_p$  (root) +  $DOSE_p$  (exposed) +  $DOSE_p$  (protected)

The total home-grown produce dose will need to be calculated for each age group that applies.

#### 5.4.3.2.2 Dose for cancer risk from home-raised meat, eggs, and cow's milk

Exposure through ingesting home-raised or farm animal products ( $DOSE_{fa}$ ) is a function of the type of food (meat, eggs and cow's milk), gastrointestinal relative absorption factor, bioavailability and the fraction of food ingested that is home-raised. The only meat sources considered here are beef, pork and poultry. Unlike the home-grown produce pathway, the dose is calculated and presented separately for each type of home-raised food. The age-specific groupings to determine dose (3rd trimester, 0<2 yrs, 2<9 yrs, 2<16 yrs, 16<30 yrs or 16-70 yrs) is needed in order to properly use the age sensitivity factors for cancer risk assessment (see Chapter 8).

5-46

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### A. Equation 5.4.3.2.2: $DOSE_{fa} = C_{fa} \times I_{fa} \times GRAF \times L \times EF \times 10^{-6}$

1.  $DOSE_{fa}$  = Exposure dose through ingestion of home-raised animal product (mg/kg/d)
2.  $C_{fa}$  = Concentration in animal product, e.g., beef, pork, poultry, dairy, eggs ( $\mu\text{g/kg}$ )
3.  $I_{fa}$  = Consumption of animal product (g/kg BW-day)
4.  $GRAF$  = Gastrointestinal relative absorption factor (unitless)
5.  $L$  = Fraction of animal product consumed that is home-raised or locally produced (unitless)
6.  $EF$  = Exposure frequency (unitless, days/365 days)
7.  $10^{-6}$  = Conversion factors ( $\mu\text{g/kg}$  to mg/g)

#### a: Recommended default values for EQ 5.4.3.2.2:

1.  $C_{fa}$  = Calculated above in EQ 5.3.4.2 A
2.  $I_{fa}$  = See Table 5.15 (point estimates) and Table 5.16a-e (distributions)
3.  $GRAF$  = See Table 5.2
4.  $L$  = Site-specific survey is recommended. Otherwise, see Table 5.17 for Tier I default values
5.  $EF$  = 0.96 (350 days / 365 days in a year)

#### 5.4.3.2.3 Chronic Noncancer Dose for Ingestion of Food

For oral noncancer hazard assessment, a time-weighted average approach is used to combine food ingestion rates for the age groups (i.e., 0<2, 2<16 and 16-70 yrs) to estimate the chronic dose for residential exposure. The equation used to estimate dose through home-grown produce and home-raised meat/eggs/cow's milk is similar and is shown below in one equation. Similar to the cancer risk dose calculation, home-grown produce is presented as a total dose for all types of crops (See Section 5.4.3.2.1) and home-raised animal product dose is presented separately for each type of animal product that applies (See Section 5.4.3.2.2).

The contribution to the food intake dose is determined for each age group in EQ 5.4.3.2.3:

5-47

## O-MBA20L7

Air Toxics Hot Spots Program Guidance Manual

February 2015

### A. Equation 5.4.3.2.3: $DOSE_{food} = C_{food} \times I_{food} \times GRAF \times L \times 10^{-6} \times ED/AT$

1.  $DOSE_{food}$  = Exposure dose through ingestion of home-grown produce or home-raised animal product (mg/kg/d)
2.  $C_{food}$  = Concentration ( $\mu\text{g/kg}$ ) in produce (e.g., exposed, leafy, protected, root) or animal product (e.g., beef, pork, poultry, dairy, eggs)
3.  $I_{food}$  = Consumption of produce or animal product (g/kg BW-day)
4.  $GRAF$  = Gastrointestinal relative absorption factor (unitless)
5.  $L$  = Fraction of produce or animal product consumed that is home-grown (unitless)
6.  $10^{-6}$  = Conversion factors ( $\mu\text{g/kg}$  to  $\text{mg/g}$ )
7.  $ED$  = Exposure duration for a specified age group (2 yrs for 0<2, 14 yrs for 2<16, 54 yrs for 16-70)
8.  $AT$  = Averaging time for lifetime exposure: 70 yrs

#### a: Recommended default values for EQ 5.4.3.2.3:

1.  $C_{food}$  = Calculated above in EQ 5.3.4.1 A (for home-grown produce) or EQ 5.3.4.2 A (for home-raised animal products)
2.  $I_{food}$  = Age-specific, see Table 5.15 for point estimates
3.  $GRAF$  = See Table 5.2
4.  $L$  = Site-specific survey is recommended. Otherwise, see Table 5.17 for Tier I default values

#### b: Recommended nursing mother default modifications to EQ 5.4.3.2.3:

1. For the mother's dose to milk through ingested food, use the food intake rates for age 16-30 years in Table 5.15 and 5.16d.
2. The ED and AT variates in EQ 5.4.3.2.3 are left out for ingested food dose in the mother's milk pathway.

Following calculation of the intake dose contributions for each age group, the intake rates for home-grown produce and the intake rates for home-raised animal products are summed separately to obtain the residential time-weighted average intake dose for chronic residential exposure to home-grown produce and to home-raised animal products:

$$(I_{food} \text{ for age } 0<2 \text{ yrs} \times C_{food} \times GRAF \times L \times 10^{-6} \times 2 / 70) +$$

$$(I_{food} \text{ for age } 2<16 \text{ yrs} \times C_{food} \times GRAF \times L \times 10^{-6} \times 14 / 70) +$$

$$(I_{food} \text{ for age } 16-70 \text{ yrs} \times C_{food} \times GRAF \times L \times 10^{-6} \times 54 / 70) = \text{Chronic } DOSE_{food}$$

**Table 5.17 Default Values for L in EQs 5.4.3.2.1., 5.4.3.2.2 and 5.4.3.2.3: Fraction of Food Intake that is Home-Produced**

Food Type	Households that Garden <sup>a</sup>	Households that Farm <sup>a</sup>
Avg. Total Veg & Fruits	0.137	0.235
	Households that Garden/Hunt <sup>b</sup>	Households that Farm <sup>b</sup>
Beef	0.485	0.478
Pork	0.242	0.239
Poultry	0.156	0.151
Eggs	0.146	0.214
Total Dairy (Cow's milk)	0.207	0.254

<sup>a</sup> As a default for home-produced leafy, exposed, protected and root produce, OEHHA recommends 0.137 as the fraction of produce that is home-grown. The households that grow their own vegetables and fruits are the population of concern. In rural situations where the receptor is engaged in farming, OEHHA recommends 0.235 as the default value for fraction of leafy, exposed, protected and root produce that is home-grown.

<sup>b</sup> OEHHA recommends the fraction home-raised under "Households that raise animals/hunt" (for beef, pork, poultry (chicken), eggs and dairy (cow's milk), with the exception of rural household receptors engaged in farming. OEHHA recommends that the fractions listed under "Households that farm" be used for the rural household receptors.

## 5.4.3.3 Exposure through Ingestion of Water

Intake of drinking water varies by age on a ml per kg body weight per day basis resulting in differences in exposure dose by age. The age-specific groupings to determine dose are needed in order to properly use the age sensitivity factors for

5-52

# O-MBA20L7

Air Toxics Hot Spots Program Guidance Manual

February 2015

cancer risk assessment (see Chapter 8) and to calculate a time-weighted average dose for chronic noncancer assessment.

## 5.4.3.3.1 Dose for Cancer Risk through Ingestion of Water

DOSE<sub>water</sub> is calculated for each age group (i.e., 3rd trimester, 0<2 yrs, 2<9 yrs, 2<16 yrs, 16<30 yrs and 16-70 yrs), then incorporated into EQ 8.2.5 in Chapter 8 to determine cancer risk through exposure in drinking water.

**A. Equation 5.4.3.3.1:**  $DOSE_{water} = C_w \times WIR \times ABS_{swa} \times Fdw \times EF \times 10^{-6}$

1. DOSE<sub>water</sub> = Exposure dose through ingestion of water (mg/kg BW/d)
2. C<sub>w</sub> = Water concentration (µg/L)
3. WIR = Water ingestion rate (ml/kg BW-day)
4. ABS<sub>swa</sub> = Gastrointestinal relative absorption factor (unitless)
5. Fdw = Fraction of drinking water from contaminated source
6. EF = Exposure frequency (unitless, days/365 days)
7. 10<sup>-6</sup> = Conversion factors (mg/µg)(L/ml)

## a: Recommended default values for EQ 5.4.3.3.1:

1. C<sub>w</sub> = Calculated above 5.3.3 A
2. WIR = See 5.18 (point estimates) and Table 5.19 (distributions)
3. ABS<sub>swa</sub> = Default set to 1
4. Fdw = Default set to 1, although a site-specific survey is recommended for this variate
5. EF = 0.96 (350 days/365 days in a year)

## 5.4.3.3.2 Chronic Noncancer Dose through Ingestion of Water

Because water intake varies by age group, a time-weighted average intake approach is used to determine the daily water ingestion dose for chronic residential exposure. The contribution to the water ingestion dose is determined for each age group (i.e., 0<2, 2<16 and 16-70 yrs) in EQ 5.4.3.3.2.

5-53

## O-MBA20L7

Air Toxics Hot Spots Program Guidance Manual

### A. Equation 5.4.3.3.2:

$$\text{DOSE}_{\text{water}} = C_w \times \text{WIR} \times \text{ABS}_{\text{swa}} \times \text{Fdw} \times 10^{-6} \times \text{ED}/\text{AT}$$

1.  $\text{DOSE}_{\text{water}}$  = Exposure dose through ingestion of water (mg/kg BW/d)
2.  $C_w$  = Water concentration ( $\mu\text{g/L}$ )
3. WIR = Water ingestion rate (ml/kg BW-day)
4.  $\text{ABS}_{\text{swa}}$  = Gastrointestinal absorption factor
5. Fdw = Fraction of drinking water from contaminated source (site-specific)
6.  $10^{-6}$  = Conversion factors (mg/ $\mu\text{g}$ )(L/ml)
7. ED = Exposure duration for a specified age group: 2 yrs for 0<2, 14 yrs for 2<16, 54 yrs for 16-70
8. AT = Averaging time for residential exposure: 70 yrs

#### a: Recommended default values for EQ 5.4.3.3.2:

1.  $C_w$  = Calculated above in 5.3.3 A
2. WIR = See 5.18 (point estimates)
3.  $\text{ABS}_{\text{swa}}$  = Default set to 1
4. Fdw = Default set to 1, although a site-specific survey is recommended for this variate

#### b: Recommended nursing mother default modifications to EQ 5.4.3.3.2:

1. For the dose to mother's milk through water ingestion, use the WIR for age 16-30 years in Table 5.18.
2. The ED and AT variates in EQ 5.4.3.3.2 are left out for ingested water dose in the mother's milk pathway.

The water intake dose contribution for each age group is summed together to obtain the time-weighted average daily residential water ingestion dose:

$$(\text{WIR for age } 0<2 \text{ yrs} \times C_w \times \text{ABS}_{\text{swa}} \times \text{Fdw} \times 10^{-6} \times 2 / 70) +$$

$$(\text{WIR for age } 2<16 \text{ yrs} \times C_w \times \text{ABS}_{\text{swa}} \times \text{Fdw} \times 10^{-6} \times 14 / 70) +$$

$$(\text{WIR for age } 16-70 \text{ yrs} \times C_w \times \text{ABS}_{\text{swa}} \times \text{Fdw} \times 10^{-6} \times 54 / 70) = \text{Chronic Dose}_{\text{water}}$$

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### 5.4.3.4 Exposure through Ingestion of Angler-caught Fish

Exposure through ingestion of angler-caught fish ( $DOSE_{fish}$ ) is a function of the fraction of fish ingested that is caught in the exposed water body, which differs for each age grouping, and the gastrointestinal absorption factor. Ingestion of angler-caught fish on a mg/kg body weight per day basis varies by age resulting in differences in exposure dose by age. The age-specific groupings to determine dose is needed primarily to properly use the age sensitivity factors for cancer risk assessment (see Chapter 8) and to calculate a time-weighted average dose for chronic noncancer assessment.

##### 5.4.3.4.1 Cancer Risk Dose via Ingestion of Angler-Caught Fish

$DOSE_{fish}$  is calculated for each age group separately (i.e., 3rd trimester, 0<2 yrs, 2<9 yrs, 2<16 yrs, 16<30 yrs and 16-70 yrs), then incorporated into EQ 8.2.5 in Chapter 8 to determine cancer risk through exposure to angler-caught fish.

**A. Equation 5.4.3.4.1:**  $DOSE_{fish} = C_t \times I_{fish} \times Gf \times L \times EF \times 10^{-6}$

1.  $DOSE_{fish}$  = Dose via ingestion of angler-caught fish (mg/kg BW-day)
2.  $C_t$  = Concentration in fish muscle tissue ( $\mu\text{g/kg}$ )
3.  $I_{fish}$  = Angler-caught fish ingestion rate (g/kg BW per day)
4.  $Gf$  = Gastrointestinal absorption factor (unitless)
5.  $L$  = Fraction of fish caught at exposed site (unitless)
6.  $EF$  = Exposure frequency (days/365 days)
7.  $10^{-6}$  = Conversion factor (mg/ $\mu\text{g}$ , kg/g)

##### a: Recommended default values for Equation 5.4.3.4.1:

1.  $C_t$  = Calculated above in Equation 5.3.4.7
2.  $I_{fish}$  = See Table 5.20 (point estimates) and Table 5.21 (distributions)
3.  $Gf$  = Default set to 1
4.  $L$  = Default set to 1 for fraction of fish caught locally, although a site-specific survey is recommended for this variate
5.  $EF$  = 0.96 (350 days/365 days in a yr)

##### 5.4.3.4.2 Chronic Noncancer Dose via Ingestion of Angler-Caught Fish

Angler-caught fish consumption varies by age group. A time-weighted average intake for residential consumption over 70 years is used to determine dose for average and high-end exposure. The contribution to the angler-caught fish consumption dose is determined for each age group in EQ 5.4.3.4.2:

5-56

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

**A. Equation 5.4.3.4.2:**  $DOSE_{fish} = C_t \times I_{fish} \times Gf \times L \times 10^{-6} \times ED/AT$

1.  $DOSE_{fish}$  = Dose via ingestion of angler-caught fish (mg/kg BW-day)
2.  $C_t$  = Concentration in fish muscle tissue ( $\mu\text{g/kg}$ )
3.  $I_{fish}$  = Angler-caught fish ingestion rate (g/kg BW per day)
4.  $Gf$  = Gastrointestinal absorption factor (unitless)
5.  $L$  = Fraction of fish caught at exposed site (unitless)
6.  $10^{-6}$  = Conversion factor (mg/ $\mu\text{g}$ , kg/g)
7.  $ED$  = Exposure duration for a specified age group: 2 yrs for 0<2, 14 yrs for 2<16 and 54 yrs for 16-70
8.  $AT$  = Averaging time for chronic exposure – 70 yrs

##### a: Recommended default values for Equation 5.4.3.4.2:

1.  $C_t$  = Calculated above in Equation 5.3.4.7
2.  $I_{fish}$  = See Table 5.20 (point estimates)
3.  $Gf$  = Default set to 1
4.  $L$  = Default set to 1 for fraction of fish caught locally, although a site-specific survey is recommended for this variate

##### b: Recommended nursing mother default modifications to EQ 5.4.3.4.2:

1. For the dose to mother's milk through fish consumption, use the  $I_{fish}$  for age 16-30 years in Table 5.20.
2. The  $ED$  and  $AT$  variates in EQ 5.4.3.4.2 are left out for the dose via fish consumption in the mother's milk pathway.

Following calculation of the angler-caught fish consumption dose contribution for each age group, 0<2 yr, 2<16 yr and 16-70 yr fish consumption doses are summed together to obtain the residential chronic dose:

$$(I_{fish} \text{ for age } 0<2 \text{ yrs} \times C_t \times Gf \times L \times 10^{-6} \times 2 / 70) +$$

$$(I_{fish} \text{ for age } 2<16 \text{ yrs} \times C_t \times Gf \times L \times 10^{-6} \times 14 / 70) +$$

$$(I_{fish} \text{ for age } 16-70 \text{ yrs} \times C_t \times Gf \times L \times 10^{-6} \times 54 / 70) = \text{Chronic } DOSE_{fish}$$

5-57

5.4.3.5 Mother's Milk

Exposure through mother's milk ingestion (Dose-Im) is a function of the average concentration of the substance in mother's milk and the amount of mother's milk ingested. The minimum pathways that the nursing mother is exposed to include inhalation, soil ingestion, and dermal, since the chemicals evaluated by the mother's milk pathway are multipathway chemicals. Other pathways may be appropriate depending on site conditions (e.g., the presence of vegetable gardens or home grown chickens). The compounds currently considered for the mother's milk pathway are:

1. Dioxins and Furans (PCDDs and PCDFs)
2. Polychlorinated biphenyls (PCBs)
3. Polycyclic Aromatic Hydrocarbons (PAHs), including creosotes
4. Lead

These compound classes represent the chemicals of greatest concern for the mother's milk pathway under the Hot Spots program, and for which data are available to estimate transfer coefficients. It is expected that additional transfer coefficients will be developed for other multipathway chemicals in the Hot Spots Program as data becomes available and is reviewed. The nursing mother in the mother's milk pathway is not herself subject to the mother's milk pathway. The summed average daily dose (mg/kg BW-day) from all pathways is calculated for the nursing mother using the equations that follow.

5-58

O-MBA20L7

Air Toxics Hot Spots Program Guidance Manual

February 2015

5.4.3.5.1 *Cancer Risk Dose to Infant via Mother's Milk*

**A. Equation 5.4.3.5.1:**  $\text{Dose-Im} = C_m \times \text{BMI}_{bw} \times \text{EF} \times 10^{-3}$

1. Dose-Im = Dose to infant through ingestion of mother's milk (mg/kg BW per day)
2.  $C_m$  = Concentration of contaminant in mother's milk (mg/kg milk)
3.  $\text{BMI}_{bw}$  = Daily breast-milk ingestion rate (g/kg BW-day)
4. EF = Frequency of exposure (days / 365 days)
5.  $10^{-3}$  = Conversion factor (kg to g)

**a: Recommended default values for EQ 5.4.3.5.1:**

1.  $C_m$  = See EQ 5.3.4.8
2.  $\text{BMI}_{bw}$  = See Table 5.22 for point estimates. For distribution (parametric model) for Tier 3 stochastic risk assessments see Table 5.23.
3. EF = 1 (all 365 days of the first year of birth)

**b: Assumptions for EQ 5.4.3.5.1:**

1. For the MEIR, mother is exposed from birth up to 25 years of age when the infant is born. The exposed infant is then fully breastfed only during the first year of life.
2. For cancer risk assessment, exposure of breast-feeding infants to contaminants in breast milk applies only to the first year of the 0<2 yr age group for calculation of risk to this group, which then can be summed with the risk calculated for the other age groups (See Chapter 8).

5.4.3.5.2 *Chronic Noncancer Dose to Infant via Mother's Milk*

For oral noncancer hazard assessment, exposure of the infant through mother's milk ingestion occurs during the first year of life. After one year of age, the mother's milk pathway is not a factor for noncancer assessment.

5-59

## 6 - Dose-Response Assessment for Noncarcinogenic Endpoints

### 6.1 Derivation of Toxicity Criteria for Noncancer Health Effects

Dose-response assessment describes the quantitative relationship between the amount of exposure to a substance (the dose) and the incidence or occurrence of an adverse health impact (the response). Dose-response information for noncancer health effects is used to determine Reference Exposure Levels (RELs). Inhalation RELs are air concentrations or doses at or below which adverse noncancer health effects are not expected even in sensitive members of the general population under specified exposure scenarios. The acute RELs are for infrequent 1 hour exposures that occur no more than once every two weeks in a given year, although this time frame of exposure does not necessarily apply to chemicals that can bioaccumulate (e.g., dioxins and furans, PCBs, and various metals). The chronic RELs are for 24 hour per day exposures for at least a significant fraction of a lifetime, defined as about 8 years ( $\geq 12$  percent of a 70-year lifespan). The 8-hour RELs are for repeated 8-hour exposures for a significant fraction of a lifetime such as the exposures that offsite workers might typically receive. Eight-hour RELs are only available for 10 chemicals at present, but OEHHHA will develop 8-hour RELs as we re-evaluate our existing RELs to ensure they are protective of children's health, and as we develop RELs for new chemicals. There are oral chronic RELs for some chemicals in the Hot Spots program that are semivolatile or nonvolatile and thus subject to deposition and oral ingestion or dermal exposure. The methodology for developing RELs is similar to that used by U.S. EPA in developing the inhalation Reference Concentrations (RfCs) and oral Reference Doses (RfDs).

Review and revision of RELs to take into account new information and sensitive subpopulations including infants and children is an ongoing process. All draft RELs for individual chemicals revised under the current noncancer methodology will undergo public comment and peer review, as mandated by the Hot Spots Act.

The first step in determining an acute, 8-hour, or chronic REL is to determine a point of departure. The point of departure is preferably determined by the benchmark concentration procedure applied to human or animal studies, but if this method of calculation cannot be used with a particular data set, a no observed adverse effect level (NOAEL) or lowest observed adverse effect level (LOAEL) may be used as the point of departure. The benchmark concentration method (also referred to as the benchmark dose method for oral exposures) is a preferred method to estimate a point of departure because it takes all of the available dose-response data into account to statistically estimate, typically, a 5 percent response rate.

Dosimetric or toxicokinetic adjustments are often made to the point of departure to adjust for differences in dosimetry or kinetics across species or among humans. Time adjustments are generally applied to adjust experimental exposure to the exposure of

interest for the REL (e.g., 1 hour for acute, continuous for chronic). A modified Haber's equation is used where needed to adjust studies with different exposure times to the one-hour period needed for acute RELs. A simple Haber's law ( $C \times T$ ) adjustment for exposure period duration is used for most 8-hour and chronic RELs.

The time and dosimetry adjusted point of departure is divided by uncertainty factors that reflect the limitations in the current toxicology of the chemical. For example, an interspecies uncertainty factor is applied to account for the differences between humans and animals when an animal study is used. An intraspecies uncertainty factor is usually included to account for differences in susceptibility among the human population. In addition, where benchmark dose modeling is not suitable and a NOAEL is not available, a LOAEL to NOAEL uncertainty factor may be applied when the LOAEL serves as the point of departure. If a chronic study is not available to serve as a basis for a chronic REL, then a subchronic uncertainty factor (for chronic and 8-hour RELs only) may also be applied. Finally, if there are data deficiencies, for example, lack of a developmental toxicity study for a chemical, then a database deficiency factor may be applied. The individual uncertainty factors, which range from 2 to 10 depending on the limitations in the data, are multiplied together for a total uncertainty factor. The point of departure is then divided by the total UF to obtain the REL.

The most sensitive toxicological end point is selected as the basis for the REL when there are multiple adverse health effects. The selection of the most sensitive endpoint as the basis for a REL helps ensure that the REL is protective for all health effects. The use of uncertainty factors helps ensure that the REL is protective for nearly all individuals, including sensitive subpopulations, within the limitations of current scientific knowledge. For detailed information on the methodology and derivations for RELs, including guidance on selection of uncertainty factors, see the Air Toxics Hot Spots Risk Assessment Guidelines Technical Support Document for the Derivation of Noncancer Reference Exposure Levels (OEHHHA, 2008).

It should be emphasized that exceeding the acute or chronic REL does not necessarily indicate that an adverse health impact will occur. The REL is not the threshold where population health effects would first be seen. However, levels of exposure above the REL have an increasing but undefined probability of resulting in an adverse health impact, particularly in sensitive individuals (e.g., depending on the toxicant, the very young, the elderly, pregnant women, and those with acute or chronic illnesses). The significance of exceeding the REL is dependent on the seriousness of the health endpoint, the strength and interpretation of the health studies, the magnitude of combined safety factors, and other considerations. In addition, there is a possibility that a REL may not be protective of certain small, unusually sensitive human subpopulations. Such subpopulations can be difficult to identify and study because of their small numbers, lack of knowledge about toxic mechanisms, and other factors. It may be useful to consult OEHHHA staff when a REL is exceeded (hazard quotient or hazard index is greater than 1.0). Chapter 8 discusses the methods used for determining potential noncancer health impacts and Appendix I presents example calculations used to determine a hazard quotient (HQ) and hazard indices (HI).

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

Tables 6.1 through 6.3 list the currently adopted acute, 8-hour, and chronic inhalation RELs. Some substances that pose a long-term inhalation hazard may also present a chronic hazard via non-inhalation (oral, dermal) routes of exposure. The oral RELs for these substances are presented in Table 6.3. Appendix L provides a consolidated listing of all the acute, 8-hour, and chronic RELs with the respective target organs that are approved for use by OEHHA and ARB for the Hot Spots Program. Periodically, new or updated RELs are adopted by OEHHA and these guidelines will be updated to reflect those changes. See OEHHA's web site at [www.oehha.ca.gov](http://www.oehha.ca.gov) (look under "Air", then select "Hot Spots Guidelines") to determine if any new or updated RELs have been adopted since the last guideline update.

### 6.2 Acute Reference Exposure Levels

OEHHA developed acute RELs for assessing potential noncancer health impacts for short-term, one-hour peak exposures to facility emissions (OEHHA, 2008; <http://www.oehha.ca.gov/air/allrels.html>). By definition, an acute REL is an exposure that is not likely to cause adverse health effects in a human population, including sensitive subgroups, exposed to that concentration (in units of micrograms per cubic meter or  $\mu\text{g}/\text{m}^3$ ) for the specified exposure duration on an intermittent basis.

The target organ systems and the acute RELs for each substance are presented in Table 6.1. Many acute RELs are based on mild adverse effects, such as mild irritation of the eyes, nose, or throat, or may result in other mild adverse physiological changes. For most individuals, it is expected that the mild irritation and other adverse physiological changes will not persist after exposure ceases. For RELs that have been recently developed or revised, the notation "sensory irritation" has been added in parenthesis in Table 6.1 for those chemicals that have an acute REL based on sensory irritation of the respiratory system (i.e., nose, throat) and/or eyes.

Other acute RELs are based on reproductive/developmental endpoints, such as teratogenicity or fetotoxicity, which are considered severe adverse effects. The inhalation pathway is the only pathway to assess for acute exposure. Other non-inhalation pathways of exposure are evaluated for worker and residential scenarios where the exposures are chronic or repeated daily in nature. The oral RELs are used to evaluate the non-inhalation pathways of exposure. Noninhalation (oral) RELs are discussed in Section 6.5. Chapter 8 discusses the methods used for determining noncancer acute health impacts. Appendix I presents an example calculation used to determine an HQ and HI.

### 6.3 8-hour Reference Exposure Levels

OEHHA has developed 8-hour RELs for assessing potential noncancer health impacts for exposures to the general public that occur on a recurrent basis, but only during a portion of each day (OEHHA, 2008; <http://www.oehha.ca.gov/air/allrels.html>). Eight-hour RELs are compared to air concentrations that represent an average (daily) 8-hour exposure. They were designed to address off-site worker exposure at the MEIV, but may also be used at the Districts' discretion to characterize 8-hour residential noncancer exposures, particularly for non-continuous facility operations where exposure is based on air concentrations during facility operation (i.e., the zero emission hours are not included) rather than averaged over 24-hours/day, 7 days/week as assessed for chronic exposure. The 8-hour RELs can also be used to assess exposure of students and teachers while at school (OEHHA, 2008). These RELs were developed because of concerns that applying the chronic REL in some scenarios was

6-5

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

overly conservative. By definition, an 8-hour REL is an exposure that is not likely to cause adverse health effects in a human population, including sensitive subgroups, exposed to that concentration (in units of micrograms per cubic meter or  $\mu\text{g}/\text{m}^3$ ) for an 8-hour exposure duration on a regular (including daily) basis.

The RELs, target organ systems, and the averaging time for substances that can present a potential hazard from inhalation for 8 hours on a daily basis are presented in Table 6.2. Chapter 8 discusses the methods used for determining noncancer 8-hour health impacts. Appendix I presents an example calculation used to determine an HQ and HI.

Any substances in Table 6.2 with Development or Reproductive System as a target organ system are represented in HARP and in the Appendix L REL tables under the single endpoint "Reproductive/Development".

**Table 6.2 Eight-Hour Inhalation Reference Exposure Levels (RELs) and 8-Hour Hazard Index Target Organ System(s)**

### 6.4 Chronic Reference Exposure Levels

OEHHA has developed chronic RELs for assessing noncancer health impacts from long-term exposure. (OEHHA, 2008; see also <http://www.oehha.ca.gov/air/allrels.html>) A chronic REL is a concentration level (expressed in units of micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ) for inhalation exposure and in a dose expressed in units of milligrams per kilogram-day (mg/kg-day) for oral exposures) at or below which no adverse health effects are anticipated following long-term exposure. Long-term exposure for these purposes has been defined by U.S. EPA as at least 12% of a lifetime, or about eight years for humans. Table 6.3 lists the chronic noncancer RELs that should be used in

6-6

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

the assessment of chronic health effects from inhalation exposure. Appendix L provides a consolidated listing of all the acute, 8-hour and chronic RELs and target organs that are approved for use by OEHHA and ARB for the Hot Spots Program. Periodically, new or updated RELs are adopted by OEHHA. See OEHHA's web site <http://www.oehha.ca.gov/air/allrels.html> to determine if any new or updated RELs have been adopted since the last guideline update.

The organ system(s) associated with each chronic REL are also presented in Table 6.3. Any substances in Table 6.3 with Development or Reproductive System as a target organ system are represented in HARP and in the Appendix L REL tables under the single endpoint "Reproductive/Development". Chapter 8 discusses the methods used for determining potential noncancer health impacts and Appendix I presents example calculations used to determine a HQ and HI.

<sup>a</sup> These peer-reviewed values were developed under the Toxic Air Contaminant (TAC) Program mandated by AB1807 (California Health and Safety Code Sec. 39650 *et seq.*).

<sup>b</sup> The OEHHA has adopted the World Health Organization Toxicity Equivalency Factor (TEF) scheme for evaluating the cancer risk and noncancer hazard due to exposure to samples containing mixtures of polychlorinated dibenzo-*p*-dioxins (PCDD) (also referred to as chlorinated dioxins and dibenzofurans), polychlorinated dibenzofurans (PCDF) and polychlorinated biphenyls (PCBs). The TEF values are revised from time to time to reflect new data and increased scientific knowledge. Currently OEHHA recommends use of the 2005 revision to the WHO TEF values (WHO<sub>05</sub>-TEF). See Appendix E for more information about the scheme and for the methodology for calculating 2,3,7,8-tetrachlorodibenzo-*p*-dioxin (TCDD) equivalents for PCDD and PCDFs. For

6-10

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

convenience, OEHHA has calculated chronic REL values for speciated PCDDs, PCDFs and PCBs based on the WHO<sub>05</sub> TEF values and the chronic REL for 2,3,7,8-TCDD using the procedure discussed in Appendix E. The chronic REL values can be used to calculate a hazard index when the mixtures are speciated from individual congener ground level concentrations. In those cases where speciation of dioxins and furans has not been performed, then 2,3,7,8-TCDD serves as the surrogate for dioxin and furan emissions.

N/A Not Applicable

### 6.5 Chronic Oral (Noninhalation) Reference Exposure Levels

As specified throughout the guidelines, estimates of long-term exposure resulting from facility air emissions of specific compounds must be analyzed for both inhalation and noninhalation (multipathway) pathways of exposure for humans. Facilities often emit substances under high temperature and pressure in the presence of particulate matter. While some of these substances are expected to remain in the vapor phase, other substances such as metals and semi-volatile organics can be either emitted as particles, form particles after emission from the facility, or adhere to existing particles. Some substances will partition between vapor and particulate phases. Substances in the particulate phase can be removed from the atmosphere by settling and, thus, potentially present a significant hazard via noninhalation pathways.

Particulate-associated chemicals can be deposited directly onto soil, onto the leaves or fruits of crops, or onto surface waters. Exposure via the oral route is the predominant noninhalation pathway, resulting in the noninhalation RELs being referred to as 'oral RELs' in this document. The oral RELs are used for both ingestion and dermal exposures, and are applied using the chronic non-inhalation exposures in the residential scenario and the worker scenarios. The oral RELs are expressed as doses in milligrams of substance (consumed and dermally absorbed) per kilogram body weight per day (mg/kg-day).

Table 6.4 lists the chronic noncancer RELs to be used in the assessment of chronic health effects from noninhalation pathways of exposure. Any substances in Table 6.4 with Development or Reproductive System as a target organ system are represented in HARP and in the Appendix L REL tables under the single endpoint "Reproductive/Development". Appendix L provides a consolidated listing of all chronic RELs and target organs that are approved for use by OEHHA and ARB for the Hot Spots Program. Periodically, new or updated RELs are adopted by OEHHA and these guidelines will be updated to reflect those changes. See OEHHA's web page at <http://www.oehha.ca.gov/air/allrels.html> to determine if any new or updated RELs have been adopted since the last guideline update. Chapter 8 discusses the methods used for determining potential noncancer health impacts and Appendix I presents example calculations used to determine a HQ and HI.

Substance	Chemical Abstract Service No. (CAS)	Chronic Oral REL (mg/kg-day)	Chronic Oral Hazard Index Target Organ System(s)
Selenium and Selenium Compounds (other than hydrogen selenide)	7782-49-2	5.0 x 10 <sup>-3</sup>	Alimentary System (Liver); Cardiovascular System; Nervous System

<sup>a</sup> The OEHHA has adopted the World Health Organization Toxicity Equivalency Factor (TEF) scheme for evaluating the cancer risk and noncancer risk due to exposure to samples containing mixtures of polychlorinated dibenzo-*p*-dioxins (PCDD) (also referred to as chlorinated dioxins and dibenzofurans), polychlorinated dibenzofurans (PCDF), and polychlorinated biphenyls (PCBs). The TEF values are revised from time to time to reflect new data and increased scientific knowledge. Currently OEHHA recommends use of the 2005 revision to the WHO TEF values (WHO<sub>05</sub>-TEF). See Appendix E for more information about the scheme and for the methodology for calculating 2,3,7,8-equivalents for PCDD and PCDFs. For convenience, OEHHA has calculated chronic 'oral' REL values for speciated PCDDs, PCDFs, and PCBs based on the WHO<sub>05</sub> TEF values and the chronic 'oral' REL for 2,3,7,8-tetrachlorodibenzo-*p*-dioxin using the procedure discussed in Appendix E. The chronic 'oral' REL values can be used to calculate a hazard index when the mixtures are speciated from individual congener ground level concentrations. In those cases where speciation of dioxins and furans has not been performed, then 2,3,7,8-TCDD serves as the surrogate for dioxin and furan emissions.

### Air Toxics Hot Spots Program Guidance Manual

February 2015

## 7 - Dose-Response Assessment for Carcinogens

### 7.1 Introduction

Dose-response assessment characterizes the quantitative relationship between the amount of exposure to a substance (the dose) and the incidence or occurrence of injury (the response). The process often involves establishing a toxicity value or criterion to use in assessing potential health risk. The toxicity criterion, or health guidance value, for carcinogens is the cancer potency slope (potency factor), which describes the potential risk of developing cancer per unit of average daily dose over a 70-year lifetime. Cancer inhalation and oral potency factors have been derived by the Office of Environmental Health Hazard Assessment (OEHHA) or by the United States Environmental Protection Agency (U.S. EPA) and approved by the State's Scientific Review Panel on Toxic Air Contaminants. They are available for many of the substances listed in Appendix A (List of Substances) as carcinogens. Table 7.1 and Appendix L list the inhalation and oral cancer potency factors that should be used in multipathway health risk assessments (HRAs) for the Hot Spots Program.

The details on the methodology of dose-response assessment for carcinogens and the approved cancer potency factors are provided in the Air Toxics Hot Spots Risk Assessment Guidelines. Part II. Technical Support Document for Cancer Potency Factors: Methodologies for derivation, listing of available values, and adjustments to allow for early life stage exposures. May, 2009. (OEHHA, 2009; see [http://www.oehha.ca.gov/air/hot\\_spots/tsd052909.html](http://www.oehha.ca.gov/air/hot_spots/tsd052909.html)).

### 7.2 Carcinogenic Potency

Cancer potency factors used for both the inhalation and oral routes in the Hot Spots program are generally the 95% upper confidence limits (UCL) on the modeled dose-response slope at the low dose range. The cancer slope factor assumes continuous lifetime exposure to a substance, and is expressed in units of inverse dose [i.e.,  $(\text{mg/kg/day})^{-1}$ ]. Another common potency expression is in units of inverse concentration [ $(\mu\text{g}/\text{m}^3)^{-1}$ ] when the slope is based on exposure concentration rather than dose; this is termed the unit risk factor. To accommodate the use of age-specific exposure variates, the Hot Spots program has translated the unit risk factors based on concentration to units of inverse dose. This allows calculation of risk for age groupings, as exposure varies with age. It also allows for application of Age Sensitivity Factors for early life exposures.

It is assumed in cancer risk assessments that risk is directly proportional to dose and that, for most carcinogens, there is no threshold for carcinogenesis. The derivation of inhalation and oral cancer potency factors takes into account information on pharmacokinetics, when available, and on the mechanism of carcinogenic action.

7-1

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

Table 7.1 and Appendix L list inhalation and oral cancer potency factors that should be used in risk assessments for the Hot Spots Program. Chapter 8 describes procedures for use of potency factors in estimating potential cancer risk.

### 7.2.1 Inhalation Cancer Potency Factors

The risk assessment methodology and algorithms presented in Chapter 8 express the inhalation cancer slope factors in units of inverse dose (i.e.,  $(\text{mg/kg/day})^{-1}$ ). Breathing rates, expressed in units of liters per kilogram of body weight-day ( $\text{L/kg-day}$ ), are multiplied with the air concentrations, coupled with the appropriate unit conversion factor, to estimate dose in  $\text{mg/kg-day}$ . This allows estimation of average and high-end cancer risk point estimates. Estimation of a distribution of cancer risk based on variability in breathing rate can be obtained by Monte Carlo methods using the distributions of breathing rates in  $\text{L/kg-day}$ , which can then be converted to a dose distribution in  $\text{mg/kg BW}$  based on the intake rate. Unit risk factors [in the units of inverse concentration (i.e.,  $(\mu\text{g}/\text{m}^3)^{-1}$ ), which were used in previous guidelines for the Hot Spots program, are still listed in the TSD (OEHHA, 2009) and may prove useful in other risk assessment applications.

The average daily inhalation dose ( $\text{mg/kg-day}$ ) multiplied by the cancer potency factor ( $\text{mg/kg-day})^{-1}$  will give the inhalation cancer risk (unitless), which is an expression of the chemical's cancer risk during a 70-year lifespan of exposure. For example, an inhalation cancer risk of  $5 \times 10^{-6}$  is the same as stating that an individual has an estimated probability of developing cancer from their exposure of 5 chances per million people exposed. A more complete description of how potential cancer risk is calculated from the exposure dose and cancer potency factors is provided in Chapter 8. Appendix I presents an example calculation for determining cancer risk.

A list of current inhalation potency factors is provided in Table 7.1. Periodically, new or revised cancer potency factors will be peer reviewed by the State's Scientific Review Panel on Toxic Air Contaminants (SRP) and adopted by the Director of OEHHA. For new or updated numbers, consult the OEHHA web site at ([http://www.oehha.ca.gov/air/hot\\_spots/tsd052909.html](http://www.oehha.ca.gov/air/hot_spots/tsd052909.html)) to determine if any new or updated cancer potency factors have been adopted since this guideline update. New cancer potency factors that have been approved by the SRP and adopted by the Director of OEHHA should be incorporated into Hot Spots risk assessment for facilities that emit those chemicals.

### 7.2.2 Oral Cancer Potency Factors

Under the Hot Spots Program, a few substances are evaluated for exposure and risk from non-inhalation pathways – these are referred to as multipathway substances. Multipathway substances have the potential to impact a receptor through inhalation and noninhalation (oral and dermal) exposure routes. These substances include heavy metals and semi-volatile organic substances such as dioxins, furans, and polycyclic aromatic hydrocarbons (PAHs). These substances commonly exist in the particle

7-2

# O-MBA20L7

## Air Toxics Hot Spots Program Guidance Manual

February 2015

phase or partially in the particle phase when emitted into the air. They can therefore be deposited onto soil, vegetation, and water. Noninhalation exposure pathways considered under the Hot Spots Program include the ingestion of soil, homegrown produce, meat, milk, surface water, breast milk, and fish as well as dermal exposure to contaminants deposited in the soil. See Table 5.1 for a list of the multipathway substances.

Table 7.1 and Appendix L list oral cancer potency factors in units of (mg/kg-day)<sup>-1</sup> that should be used for assessing the potential cancer risk for these substances through noninhalation exposure pathways. The cancer risk from these individual pathways is calculated by multiplying the dose (mg/kg-day) times the oral cancer potency factor (mg/kg-day)<sup>-1</sup> to yield the potential cancer risk (unitless) from non-inhalation exposures. Chapter 5 provides all of the algorithms to calculate exposure dose through all of the individual exposure pathways. Appendix I provides a sample calculation for dose and cancer risk using the inhalation exposure pathway.

Three carcinogens (cadmium, beryllium, and nickel), although subject to deposition, are only treated as carcinogenic by the inhalation route and not by the oral route. Therefore, there are no oral cancer potency factors for these substances. However, the oral doses of these substances need to be estimated because of their noncancer toxicity. See Chapters 6 and 8, and Appendices I and L for dose-response factors, and calculations to address these substances.

Air Toxics Hot Spots Program Guidance Manual

Notes for Table 7.1

- # Asbestos: [100 PCM fibers/m<sup>3</sup>] A unit risk factor of 2.7 x 10<sup>-6</sup> (μg/m<sup>3</sup>)<sup>-1</sup> and an inhalation cancer potency factor of 2.2 x 10<sup>-2</sup> (mg/kg BW\*day)<sup>-1</sup> are available (see Appendix C for explanation).
- BaP PAHs and PAH Derivatives: Many have potency equivalency factors relative to benzo[a]pyrene (see Appendix G). For multipathway chemicals, including PAHs, the oral slope factor is considered the same as the inhalation potency factor unless otherwise noted in the Table.
- A Polychlorinated Dibenzo-*p*-dioxins, Polychlorinated Dibenzofurans and speciated polychlorinated biphenyls: (see Appendix E). For convenience, OEHA has calculated cancer potency factors for speciated polychlorinated dibenzo-*p*-dioxin, polychlorinated dibenzofuran and polychlorinated biphenyl congeners using the procedure in Appendix E.
- B Diesel Exhaust is listed as a Toxic Air Contaminant by the Air Resources Board as "Particulate Matter from Diesel-Fueled Engines". (See Appendix D)
- \* Creosote: Can be calculated using Potency Equivalency Factors contained in the benzo[a]pyrene Toxic Air Contaminant document and in Appendix G of these guidelines.
- P1 Polychlorinated Biphenyls (PCBs): High Risk is for use in cases where congeners with more than four chlorines do not comprise less (are greater) than one-half percent of total PCBs. The high risk number is the default for unspeciated PCB mixtures.
- P2 The low risk number is generally not applicable to the Hot Spots program. The Hot Spots program addresses PCBs emitted by stationary facilities. It cannot be assumed that such emissions would occur by simple evaporation. There is a dermal absorption factor applied in evaluation of the dermal pathway for PCBs so the medium risk would not apply to dermal exposure (OEHA, 2009). The water pathway does not include an assumption that PCB isomers are water soluble, so the medium number would not apply to the water pathway.
- P3 Polychlorinated Biphenyls (PCBs): Lowest Risk is for use in cases where congeners with more than four chlorines comprise less than one-half percent of total PCBs. In order for the low number to be used, scientific justification needs to be presented.
- P4 Number in parentheses is the IUPAC #, the PCB nomenclature is IUPAC. For multipathway chemicals, including PCBs, the oral slope factor is considered the same as the inhalation potency factor unless otherwise noted in the Table.

## O-MBA20L7

Air Toxics Hot Spots Program Guidance Manual

February 2015

### 8 - Risk Characterization for Carcinogens and Noncarcinogens and the Requirements for Hot Spots Risk Assessments

#### 8.1 Introduction

Risk characterization is the final step of the health risk assessment (HRA). In this step, information developed through the exposure assessment is combined with information from the dose-response assessment to characterize risks to the general public from emissions. In the Hot Spots program, OEHHA conducts the dose-response assessment during the development of cancer potency factors and Reference Exposure Levels. These are used in conjunction with the exposure estimates to estimate cancer risk and evaluate hazard from noncancer toxicity of emitted chemicals. Under the Air Toxics Hot Spots (Hot Spots) Act, risk characterizations should present both individual and population-wide health risks (Health and Safety Code Section (HSC) 44306). Persons preparing HRAs for the Hot Spots Program should consult the local Air Pollution Control or Air Quality Management District (District) to determine if the District has special guidelines to assist with HRA format or other requirements of the Hot Spots Program.

OEHHA is recommending that a 30-year exposure duration be used as the basis for estimating cancer risk at the maximum exposed individual resident (MEIR) in the Hot Spots Program. This exposure duration represents the time of residency for 90 to 95% of Californians at a single location and should provide adequate public health protection against individual risk. We also recommend including the 9 and 70-year cancer risk at the MEIR as supplemental information. Note that a 70-year exposure duration is required to estimate cancer burden or provide an estimate of population-wide risk.

This chapter provides guidance on how to evaluate the risk characterization component of risk assessments required by the Hot Spots Program. A general summary of the risk characterization components includes the following items and information.

- The locations of the point of maximum impact (PMI), the MEIR, and the maximum exposed individual worker (MEIW) are to be identified. The PMI, MEIW, and MEIR for cancer risk and for noncancer hazard indices (averaging times for acute 1-hour, repeated 8-hour, and chronic hazard indices) may not be the same location; all should be identified.

8-1

## O-MBA20L7

Air Toxics Hot Spots Program Guidance Manual

February 2015

- The location of any specified sensitive receptors (e.g., schools, hospitals, daycare, or eldercare facilities - contact the District or reviewing authority for more information) should be identified
- Estimates of population-wide cancer risk and noncancer hazard

This information must be clearly presented in cross-referenced text, tables, figures, and maps. Chapter 9 provides an outline that specifies the content and recommended format of HRA results. The HARP software is the recommended model for calculating HRA results for the Hot Spots Program. Information on obtaining the HARP software can be found under the Air Toxics Program on the ARB's web site at [www.arb.ca.gov](http://www.arb.ca.gov).

#### 8.1.1 Tiered Approach to Risk Assessment

The tiered approach for risk assessment that is presented in detail in the TSD (OEHHA, 2012) and summarized here should be reviewed prior to conducting the health risk assessment. The tiered approach to risk assessment and the health impacts evaluation described here are included in the HARP software.

The tiered approach provides a risk assessor with flexibility and allows consideration of site-specific differences (Table 8.1). The four-tiered approach to risk assessment is intended to primarily apply to residential cancer risk assessment, both for inhalation and noninhalation pathways. Risk assessors can tailor the level of effort and refinement of an HRA by using either the point estimate exposure assumptions as the basis of the exposure and risk assessment, or both the point estimate and a stochastic treatment of exposure factor distributions.

**Table 8.1 The Tiered Approach to Risk Assessment**

Tier	Description	When Applied
Tier 1	Utilizes OEHHA default point estimates of exposure variates	All risk assessments must include a Tier 1 assessment
Tier 2	Utilizes site-specific point estimates for exposure variates (justified, and approved by OEHHA)	A Tier 2 approach may be presented in addition to Tier 1
Tier 3	Utilizes OEHHA distributions of exposure variates	A Tier 3 approach may be presented in addition to Tier 1
Tier 4	Utilizes site-specific distributions of exposure variates (justified, and approved by OEHHA)	A Tier 4 approach may be presented in addition to Tier 1

8-2

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

Tier 1 is a standard point estimate approach that uses the recommended exposure variate (e.g., breathing or water ingestion rate) point estimates presented in this document. Derivations of these values are described in detail in OEHHA (2012). The results of the Tier 1 evaluations are required to be presented in the risk characterization section for all HRAs prepared for the Hot Spots Program. Thus, persons preparing an HRA using Tier 2 through Tier 4 evaluations must also include the risk characterization results of a Tier 1 evaluation in the HRA.

As discussed in OEHHA (2012), if the risk characterization results from a Tier 1 assessment are above a regulatory level of concern, the risk assessor may want to proceed with more site-specific analysis as described in Tier 2, or use a more resource-intensive stochastic modeling effort described in Tier 3 and Tier 4 (for cancer risk). While further evaluation may provide more information to the risk manager on which to base decisions, the Tier 1 evaluation is useful in comparing risks among a large number of facilities and must be included in all HRAs.

Tier 2 analysis allows the use of available and justifiable site-specific exposure variates (e.g., fish consumption), when presenting the potential health impacts. The site-specific information applied in a Tier 2 assessment must be adequately justified and approved by OEHHA and the District. In Tier 3, a stochastic approach to exposure assessment is taken using the distributions for the exposure pathways presented in the TSD (OEHHA, 2012) and in Chapter 5 of this Guidance Manual. The exposure distributions apply only to a residential receptor and are used only for the determination of cancer risk. OEHHA has not developed exposure intake distributions for workers to use in the offsite worker exposure scenario. Tier 4 is also a stochastic approach for the residential exposure scenario but allows for utilization of site-specific exposure variate distributions if they are justifiable and more appropriate for the site under evaluation than those derived in OEHHA (2012). Alternative site-specific distributions must be approved by OEHHA and the District. For an off-site worker cancer risk evaluation, Tiers 3 and 4 do not apply. Tier 3 and Tier 4 analyses show what a distribution of potential cancer risk may be to an individual or population based on a distribution of exposure inputs (e.g., water ingestion rate) rather than specific point estimates of exposure.

Table 8.2 summarizes OEHHA's recommendations for use of the four Tiers in cancer and noncancer risk assessment.

**Table 8.2 Tiers for Residential and Offsite Worker Cancer and Noncancer Hot Spots Risk Assessments**

Tier	Cancer		Non Cancer Chronic and 8-Hour	
	Inhalation	Noninhalation	Inhalation	Noninhalation
Tier-1	X	X	X	X
Tier-2	X	X		X <sup>b</sup>
Tier-3	X <sup>a</sup>	X <sup>a</sup>		
Tier-4	X <sup>a</sup>	X <sup>a</sup>		

<sup>a</sup> Applies to residential exposure scenario only

<sup>b</sup> Applies to chronic noncancer exposure only

8-3

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

OEHHA has not developed a stochastic approach (Tier 3 or 4) for estimating noncancer health impacts using acute, 8-hour, and chronic Reference Exposure Levels (RELs). Tier 1 is the only option for determining noncancer health impacts from inhalation exposure since calculating the hazard quotient involves dividing the ground level air concentrations for the specified exposure duration by the appropriate RELs. However, chronic noninhalation noncancer risks involve a calculation of dose from oral or dermal pathways to which site-specific evaluations could be considered under a Tier 2 approach.

#### Small foot-print facilities – Tier 2 or Tier 4

Some facilities subject to the Air Toxics Hot Spots Act (e.g., some in the industry-wide categories such as gas stations or dry cleaners) have very small zones of impact. In some of these instances, there will be very few receptors within the zone of impact. It isn't possible to develop special recommendations for exposure variates for all possible exposure scenarios. Alternative breathing rates (point estimates or distributions) may be used as part of Tier 2 or Tier 4 risk assessments with appropriate supporting justification in the case of a very small zone of impact. OEHHA is willing to work with risk managers at ARB and the Districts on this issue.

### 8.2 Risk Characterization for Carcinogens

Cancer risk is calculated by multiplying the daily inhalation or oral dose (calculated in Chapter 5), by a cancer potency factor, the age sensitivity factor, the frequency of time spent at home (for residents only), and the exposure duration divided by averaging time, to yield the excess cancer risk (see section 8.2.4). As described below, the excess cancer risk is calculated separately for each age grouping and then summed to yield cancer risk at the receptor location. A brief description of the age sensitivity factors, exposure duration, and frequency of time spent at home are included in Sections 8.2.1 to 8.2.3 below. These factors are discussed in detail in OEHHA (2009) and OEHHA (2012).

#### 8.2.1 Adjustment for Early Life Stage Exposures to Carcinogens

Studies have shown that young animals are more sensitive than adult animals to exposure to many carcinogens (OEHHA, 2009). Therefore, OEHHA developed age sensitivity factors (ASFs) to take into account the increased sensitivity to carcinogens during early-in-life exposure (Table 8.3). These factors were developed and described in detail in OEHHA (2009). In the absence of chemical-specific data, OEHHA recommends a default ASF of 10 for the third trimester to age 2 years, and an ASF of 3 for ages 2 through 15 years to account for potential increased sensitivity to carcinogens during childhood.

8-4

## O-MBA20L7

Air Toxics Hot Spots Program Guidance Manual

February 2015

**Table 8.3 Age Sensitivity Factors by Age Group for Cancer Risk Assessment**

Age Group	Age Sensitivity Factor (unitless)
3 <sup>rd</sup> Trimester	10
0<2 years	10
2<9 years	3
2<16 years	3
16<30 years	1
16-70 years	1

For specific carcinogens where data indicate enhanced sensitivity during life stages other than the immediate postnatal and juvenile periods, or for which data demonstrate ASFs different from the default ASFs, the chemical-specific data should be used in order to adequately protect public health.

The risk assessments generated under the Air Toxics Hot Spots Act are reviewed by OEHHA. If a risk assessor had data indicating there are no windows of susceptibility early in life or that a different ASF should be used for a specific carcinogen and wanted to use these data, OEHHA would review the material as part of the review of the risk assessment.

### 8.2.2 Fraction of Time Spent at Home for Cancer Risk Assessment

OEHHA and ARB evaluated information from activity patterns databases to estimate the fraction of time at home (FAH) during the day (OEHHA, 2012). This information can be used to adjust exposure duration and cancer risk from a specific facility's emissions, based on the assumption that exposure to the facility's emissions are not occurring away from home. From the third trimester to age <2 years, 85% of time is spent at home (Table 8.4). From age 2 through <16 years, 72% of time is spent at home. From age 16 years and greater, 73% of time is spent at home. Facilities with any school within the  $1 \times 10^{-6}$  (or greater) isopleth should use FAH = 1 for the child age groups (3<sup>rd</sup> Trimester, 0<2 years, and 2<16 years). See Appendix I for an example calculation using the FAH.

**Table 8.4 Recommendations for Fraction of Time at Home (FAH) for Evaluating Residential Cancer Risk**

Age Range	Fraction of Time at Residence
3 <sup>rd</sup> Trimester, and 0<2 years	0.85 <sup>1</sup>
2<16 years <sup>2</sup>	0.72 <sup>1</sup>
16-70 years <sup>3</sup>	0.73

<sup>1</sup> Use FAH = 1 if a school is within the  $1 \times 10^{-6}$  (or greater) cancer risk isopleth

## O-MBA20L7

Air Toxics Hot Spots Program Guidance Manual

February 2015

<sup>2</sup> Also use FAH = 0.72 for 2<9 yr age group.  
<sup>3</sup> Also use FAH = 0.73 for 16<30 yr age group.

The FAH is calculated based on a diary of trips taken over a 24-hour period on the survey day. Ninety-five percent of the diary days were on weekdays. Participants can select "vacation" as one of their trips. However, vacation time represented only a fraction (0.68%) of the over 175,000 trips recorded in the survey. Because much of these vacation trips were presumed to be within-day trips and were only a small fraction of total trips, there is likely little overlap with the Exposure Frequency (EF) variate used in the dose equations in Chapter 5.

### 8.2.3 Exposure Duration for Estimating Cancer Risk to Residents and Off-Site Workers

OEHHA recommends that an exposure duration (residency time) of 30 years be used to estimate individual cancer risk for the maximally exposed individual resident (MEIR) (Table 8.5). OEHHA also recommends that the 30-year exposure duration be used as the basis for public notification and risk reduction audits and plans. The Districts, however, may opt to use the 70 year cancer risk for notification and risk reduction audits and plans.

Note that the 30-year exposure duration starts in the third trimester to accommodate the increased susceptibility of exposures in early life (OEHHA, 2009), and would apply to both the point estimate and stochastic approaches.

**Table 8.5 Summary of Recommendations for Exposure Duration for Individual Cancer Risk at the MEIR and MEIW**

Receptor	Recommendation
Resident (MEIR)	30 years
Resident (supplemental Information)	9 years for central tendency; 70 years for maximum (lifetime)
Worker (MEIW)	25 years

Exposure durations of 9-years and 70-years are also recommended to be evaluated for the MEIR to show the range of cancer risk based on residency periods. If a facility is notifying the public regarding cancer risk, the 9- and 70-year cancer risk estimates are useful for people who have resided in their current residence for periods shorter and longer than 30 years.

The 9-, 30-, and 70-year exposures are chosen to coincide with U.S. EPA's estimates of the average (9 years), high-end estimates (30-years) of residence time, and a lifetime residency (70 years). These estimates are also consistent with what is known about residence time in California. Together, the 9-, 30-, and 70-year cancer risk calculations provide a useful presentation of cancer risk and the relationship to duration of residency and, thus, exposure to a facility's emissions.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

For the maximally exposed individual worker (MEIW), OEHHA recommends using an exposure duration of 25 years to estimate individual cancer risk for the off-site worker scenario (Table 8.5). This duration represents approximately the 95th percentile of job tenure with the same employer in the U.S.

#### 8.2.4 Calculating Residential and Offsite Worker Inhalation Cancer Risk

##### Residential Receptors

For residential inhalation exposure, cancer risk must be separately calculated for specified age groups (Eq. 8.2.4A, see Section 8.2.1), because of age differences in sensitivity to carcinogens and age differences in intake rates (per kg body weight). Separate risk estimates for these age groups provide a health-protective estimate of cancer risk by accounting for greater susceptibility in early life, including both age-related sensitivity and amount of exposure. The following equation illustrates the formula for calculating residential inhalation cancer risk. See Appendix I for a detailed example calculation.

**A. Equation 8.2.4 A:**  $RISK_{inh-res} = DOSE_{air} \times CPF \times ASF \times ED/AT \times FAH$

7.  $RISK_{inh-res}$  = Residential inhalation cancer risk
8.  $DOSE_{air}$  = Daily inhalation dose (mg/kg-day)
9.  $CPF$  = Inhalation cancer potency factor (mg/kg-day<sup>-1</sup>)
10.  $ASF$  = Age sensitivity factor for a specified age group (unitless)
11.  $ED$  = Exposure duration (in years) for a specified age group
12.  $AT$  = Averaging time for lifetime cancer risk (years)
13.  $FAH$  = Fraction of time spent at home (unitless)

##### a: Recommended default values for EQ 8.2.4 A:

5.  $DOSE_{air}$  = Calculated for each age group from Eq. 5.4.1
6.  $CPF$  = Substance-specific (see Table 7.1)
7.  $ASF$  = See Section 8.2.1
8.  $ED$  = 0.25 years for 3<sup>rd</sup> trimester, 2 years for 0<2, 7 years for 2<9, 14 years for 2<16, 14 years for 16<30, 54 years for 16-70
9.  $AT$  = 70 years\*
10.  $FAH$  = See Table 8.4

\*Although AT actually sums to 70.25 years when the 3<sup>rd</sup> trimester (0.25 years) is included, OEHHA recommends rounding AT = 70 years (and rounding residential exposure durations at 9- and 30-years rather than 9.25- and 30.25-years) to simplify the calculation without causing a significant adjustment. Note that the dose for the 3<sup>rd</sup> trimester is based on the breathing rate of pregnant women using the assumption that the dose to the fetus during the 3<sup>rd</sup> trimester is the same as that to the mother.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

Cancer risks calculated above for individual age groups are summed to estimate cancer risk for 9-, 30- and 70-year exposures as shown below. Note that this example includes the Fraction of Time Spent at Home (FAH) for each age grouping.

#### Calculation of Inhalation Cancer Risk from the Third Trimester to Age Nine:

$$RISK_{inh-res} = (DOSE_{air} \text{ third trimester} \times CPF \times 10 \times 0.25/70 \text{ years} \times FAH_{3rd \text{ tri } <2}) + (DOSE_{air} \text{ age } 0<2 \times CPF \times 10 \times 2/70 \times FAH_{3rd \text{ tri } <2}) + (DOSE_{air} \text{ age } 2<9 \times CPF \times 3 \times 7/70 \text{ years} \times FAH_{2<9})$$

#### Calculation of Inhalation Cancer Risk from Third Trimester to Age 30:

$$RISK_{inh-res} = (DOSE_{air} \text{ third trimester} \times CPF \times 10 \times 0.25/70 \text{ years} \times FAH_{3rd \text{ tri } <2}) + (DOSE_{air} \text{ age } 0<2 \times CPF \times 10 \times 2/70 \times FAH_{3rd \text{ tri } <2}) + (DOSE_{air} \text{ age } 2<16 \times CPF \times 3 \times 14/70 \times FAH_{2<16}) + (DOSE_{air} \text{ age } 16<30 \times CPF \times 1 \times 14/70 \text{ years} \times FAH_{16-30})$$

#### Calculation of Inhalation Cancer Risk from Third Trimester to Age 70:

$$RISK_{inh-res} = (DOSE_{air} \text{ third trimester} \times CPF \times 10 \times 0.25/70 \text{ years} \times FAH_{3rd \text{ tri } <2}) + (DOSE_{air} \text{ age } 0<2 \times CPF \times 10 \times 2/70 \times FAH_{3rd \text{ tri } <2}) + (DOSE_{air} \text{ age } 2<16 \times CPF \times 3 \times 14/70 \times FAH_{2<16}) + (DOSE_{air} \text{ age } 16<70 \times CPF \times 1 \times 54/70 \text{ years} \times FAH_{16-70})$$

Expressing cancer risk in “chances per million” is useful as a risk communication tool for the public, but cancer risk can also be expressed in other ways, such as “chances per 100,000” (cancer risk  $\times 10^5$ ) or “chances per 10 million” (cancer risk  $\times 10^7$ ). To convert the resulting cancer risk estimate to chances of developing cancer per million individuals exposed, multiply the cancer risk by  $10^6$ :

$$\text{Cancer risk} \times 10^6 = \text{chances per million}$$

For exposure to multiple carcinogenic substances, Table 8.7 and Table I.5 in Appendix I are examples of how cancer risks of individual substances are summed to determine the total cancer risk.

##### Worker Receptors

For assessment of off-site worker cancer risk at the MEIW, the default assumes working age begins at 16 years. Note that the residential FAH factor in Eq. 8.2.4.A above does not apply for workers. The daily inhalation dose ( $DOSE_{air}$ ) (as calculated in Chapter 5, EQ 5.4.1.2) is based on the adjusted 8-hour concentration at the MEIW (for non-continuous sources) and amount of time the offsite worker's schedule overlaps with the facility's emission schedule. The duration of exposure at the MEIW receptor is 25 years, as discussed in the TSD (OEHHA, 2012).

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### B. Equation 8.2.4 B: $RISK_{inh-work} = DOSE_{air} \times CPF \times ASF \times ED/AT$

1.  $RISK_{inh-work}$  = Worker inhalation cancer risk

#### a: Recommended default values for EQ 8.2.4 B:

1.  $DOSE_{air}$  = Calculated for workers in Eq. 5.4.1.2
2. CPF = Substance specific (see Table 7.1)
3. ASF = 1 for working age 16-70 yrs (See Section 8.2.1)
4. ED = 25 years
5. AT = 70 yrs for lifetime cancer risk

#### Work Locations with Daycare Facilities:

An additional risk management consideration for offsite worker cancer risk assessment of a Hot Spots facility is whether there are women of child bearing age at the MEIW location and whether the MEIW has a daycare center. In the case of women of child-bearing age at the MEIW, the Districts may wish to treat the off-site MEIW in the same way as the residential scenario to account for the higher susceptibility during the third trimester of pregnancy (i.e., use of an  $ASF=10$  for third trimester exposure). If there is onsite daycare at the MEIW, then the risks to the children will be underestimated using the offsite adult worker scenario. In this case, the Districts may wish to include a cancer risk assessment for the children in the onsite daycare, assuming they could be there from 0 to age 6 years (ED = 6 years) and using the appropriate exposure factors to calculate  $DOSE_{air}$ , fraction of time at worksite (e.g., hrs at daycare per 24 hrs), and ASFs in EQ 8.2.4 B to account for the higher susceptibility of infants and children to carcinogens.

Children at a MEIW daycare may also be assessed for noninhalation exposures. Typically, soil ingestion and dermal exposure will be the most common noninhalation pathways. However, all pathways that are present at the daycare should be included. See section 8.2.6 for more discussion of multipathway risk assessment methods.

#### 8.2.5 Calculation of Noninhalation Cancer Risk

A small subset of Hot Spots substances is subject to deposition onto the soil, plants, and water bodies (see Table 5.1). These substances need to be evaluated by the appropriate noninhalation pathways, as well as by the inhalation pathway, and the risk characterization results must be presented in all HRAs. These substances include semi-volatile organic chemicals and heavy metals.

For all multipathway substances, the exposure pathways that must be evaluated at every residential and worker site (in addition to inhalation) are soil ingestion and dermal exposure. If PAHs (and creosotes), lead, dioxins, furans, or PCBs are emitted, then the breast-milk consumption pathway becomes mandatory for residential receptors. OEHHA has developed transfer coefficients for these chemicals from the mother to breast milk (see OEHHA, 2012 for details). The other exposure pathways (e.g.,

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

ingestion of homegrown produce or fish) are only evaluated for residential receptors if the facility impacts that exposure medium and the receptor under evaluation can be exposed to that medium or pathway. For example, if the facility does not impact a fishable body of water within the isopleth of the facility, or the impacted water body does not sustain fish that are consumed by fishers, then the fish pathway will not be considered for that facility or receptor.

Table 8.6 identifies the residential receptor exposure pathways that are mandatory and those that are dependent on the available routes of exposure. Table 8.6 also identifies the three exposure pathways that are relevant for a worker receptor. The cancer risk estimates should be presented in the risk characterization section of the risk assessment for all the appropriate pathways.

**Table 8.6 Mandatory and Site/Route Dependent Exposure Pathways**

Mandatory Exposure Pathways	Site/Route Dependent Exposure Pathways
<ul style="list-style-type: none"> <li>• Inhalation<sup>w</sup></li> <li>• Soil Ingestion<sup>w</sup></li> <li>• Dermal Exposure to Contaminated Soil<sup>w</sup></li> <li>• Breast Milk Consumption<sup>*</sup></li> </ul>	<ul style="list-style-type: none"> <li>• Homegrown Produce Ingestion</li> <li>• Angler-Caught Fish Ingestion</li> <li>• Drinking Water Ingestion</li> <li>• Home-Raised Animal Product Ingestion (Dairy (Cow's) Milk, Meat (Beef, Pork, Chicken) and Egg).</li> </ul>

(w) Identifies the appropriate exposure pathways that should be evaluated for a worker. These pathways are inhalation, dermal exposure, and the soil ingestion pathway.

(\*) If PAHs (including creosotes), lead, dioxins, furans, or PCBs are emitted, then the breast-milk consumption pathway becomes mandatory.

The noninhalation residential cancer risk is calculated using the same steps as inhalation cancer risk described in Section 8.2.4. A dose (see Chapters 4 and 5) from the pathway under evaluation (e.g., soil ingestion) is multiplied by the substance-specific oral slope factor, expressed in units of inverse dose (i.e.,  $(mg/kg/day)^{-1}$ ) (Table 7.1), the appropriate age sensitivity factor (ASF), and exposure duration divided by averaging time to yield the cancer risk for a specified age grouping. Cancer risk for each age group is summed as appropriate for the exposure duration. The FAH factor is relevant only to the inhalation pathway and is not appropriate to use in the noninhalation pathways.

Equation 8.2.5 illustrates the formula for calculating noninhalation cancer risk. Details (data, algorithms, and guidance) for each exposure pathway are presented in Chapter 5 and in OEHHA (2012).

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### A. Equation 8.2.5: $RISK_{noninh} = DOSE_{noninh} \times CPF_{oral} \times ASF \times ED/AT$

1.  $RISK_{noninh}$  = Noninhalation pathway cancer risk
2.  $DOSE_{noninh}$  = Daily dose (mg/kg-day) for a specified non-inhalation pathway for each age group
3.  $CPF_{oral}$  = Oral cancer potency (slope) factor (mg/kg-day<sup>-1</sup>)
4. ASF = Age sensitivity factor for a specified age group (unitless)
5. ED = Exposure duration (in years) for a specified age group
6. AT = Averaging time for lifetime cancer risk

#### a: Recommended default values for EQ 8.2.5:

1.  $DOSE_{noninh}$  = Calculated in Chapter 5 dose algorithms for each age group and for each noninhalation route in Table 8.6 the receptor is exposed to
2.  $CPF_{oral}$  = Substance-specific (see Table 7.1)
3. ASF = See Section 8.2.1
4. ED = Residents: 0.25 years for 3<sup>rd</sup> trimester, 2 years for 0<2, 7 years for 2<9, 14 years for 2<16, 14 years for 16<30, 54 years for 16-70  
= Offsite worker: 25 yrs
5. AT = 70 years

Estimating cancer risk for 9-, 30- and 70-years by summing the individual age-group cancer risks is the same as that shown for the inhalation route in Section 8.2.4. The exception is that the FAH variate is only appropriate for the residential inhalation pathway and is not a factor for oral and dermal exposure pathways.

#### Calculation of Noninhalation Cancer Risk from Third Trimester to Age 30:

$$RISK_{noninh-res} = (DOSE_{noninh} \text{ third trimester} \times CPF \times 10 \times 0.25/70 \text{ years}) + (DOSE_{noninh} \text{ age } 0<2 \times CPF \times 10 \times 2/70) + (DOSE_{noninh} \text{ age } 2<16 \times CPF \times 3 \times 14/70) + (DOSE_{noninh} \text{ age } 16<30 \times CPF \times 1 \times 14/70 \text{ years})$$

To convert this estimated probability of risk to chances per million of developing cancer, multiply the estimated cancer risk for each noninhalation exposure route by 10<sup>6</sup>. This result is useful communication tool to compare risks for each pathway of exposure.

Cancer risk x 10<sup>6</sup> = cancer risk expressed as chances per million

For assessment of the offsite worker the typical noninhalation pathways that apply for worker cancer risk are the dermal exposure pathway and the soil ingestion pathway.

Children at a MEIW daycare may also be assessed for noninhalation exposures. Typically, soil ingestion and dermal exposure will be the most common noninhalation pathways. However, all pathways that are present at the daycare should be included.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### 8.2.6 Multipathway Cancer Risk Methodology

Under a Tier 1 assessment, it is necessary to calculate the total cancer risk from both inhalation and noninhalation exposures if multipathway substances are emitted from the facility. The calculation of cancer risk that includes exposure to a multipathway substance or substances has three steps:

- 1) Calculate cancer risk for the inhalation pathway (EQ 8.2.4 A for residents, EQ 8.2.4 B for off-site workers) for all substances, and the noninhalation pathways that apply (EQ 8.2.5) for all multipathway substances, using high-end point estimates of intake rates.
- 2) For each multipathway substance, identify the two exposure pathways with the highest risk. These are the dominant pathways that are to be assessed using high-end point estimates of intake rates for the total cancer risk. For all other pathways, the average point estimate of intake rates may be used to calculate the pathway cancer risk (See OEHHA (2012) for more information).
- 3) To calculate total cancer risk, all inhalation and noninhalation pathways are summed together for all substances.

The final cancer risk calculation using a combination of high-end and average exposure parameters is referred to as the derived risk in the HARP software. This is described in Chapter 1, Section 1.4.1 of OEHHA (2012). The inhalation route is almost always one of the two dominant pathways in a multipathway cancer risk assessment. Therefore, in most cases only one noninhalation pathway would be calculated using a high-end dose point estimate. For all other pathways, the average point estimate may be used to calculate the pathway cancer risk.

For example, if dermal exposure and soil ingestion risks are calculated, then the cancer risks from these pathways would be summed along with the inhalation cancer risks to give the total cancer risk for the single multipathway substance:

$$\text{Cancer Risk (inhalation)} + \text{Cancer Risk (dermal)} + \text{Cancer Risk (soil)} = \text{Total Risk}$$

The mother's milk pathway also becomes a mandatory pathway to assess risk in nursing infants if the mother is exposed to specific substances (see Table 5.1).

Many facilities will emit multiple carcinogenic substances. If multiple substances are emitted, the substance-specific cancer risks for all exposure pathways are summed to give the (total) multipathway cancer risk at the receptor location. The HARP software will display not only the multipathway risk for each carcinogenic substance, but also show a breakdown of the cancer risk from each exposure pathway. Table 8.7 shows the results of a multipathway risk assessment for a hypothetical facility. While not presented in the following table, it is critical to identify the driving exposure pathways and the driving substances in a multipathway cancer risk assessment when summarizing and presenting the HRA results. See Chapter 9 for more information.

## O-MBA20L7

Air Toxics Hot Spots Program Guidance Manual

February 2015

**Table 8.7 Multipathway Assessment of a Hypothetical Facility 30-Year Cancer Risk**

Substance	Cancer Risk <sup>a</sup>	Cancer risk <sup>b</sup> (chances per million)
Arsenic	$1.1 \times 10^{-5}$ (i) $3 \times 10^{-7}$ (ni)	11 (i) 0.3 (ni)
Benzene	$2.92 \times 10^{-4}$ (i)	292 (i)
2,3,7,8-TCDD (dioxin)	$1.06 \times 10^{-4}$ (i) $5.7 \times 10^{-5}$ (ni)	106 (i) 57 (ni)
1,3-Butadiene	$6.0 \times 10^{-5}$ (i)	6 (i)
<b>Total Facility Cancer Risk</b>	<b><math>4.723 \times 10^{-4}</math></b>	<b>472</b>

<sup>a</sup> As calculated in EQ 8.2.4 A or EQ 8.2.5

<sup>b</sup> Calculated as: cancer risk  $\times 10^5$  = chances per million

i = inhalation pathway contribution

ni = noninhalation pathway contribution

Cancer risk in Table 8.7 for the multipathway substances, arsenic and 2,3,7,8-TCDD, is arranged by the inhalation pathway risk and the sum of all noninhalation pathway risks. The total facility multipathway cancer risk is the sum of all inhalation and noninhalation pathways.

Cancer risks from different substances are treated additively in risk assessment generally, and in the Hot Spots Program in part because many carcinogens act through the common mechanism of DNA damage. The additive assumption is reasonable from a public health point of view. Other possible interactions of multiple carcinogens include synergism (effects are greater than additive) or antagonism (effects are less than additive). The type of interaction is both chemical and dose dependent and in most cases the data are not available to adequately characterize these interactions.

### 8.2.7 Multipathway Cancer Risk for Infant Exposure to Mother's Milk

The mother's milk pathway becomes mandatory if the nursing mother is exposed to one or more of the following multipathway substances: dioxins and furans, PCBs, PAHs including creosotes, and lead. The default assumption inherent in the intake rate is that the infant's only source of food is breast for the first year (e.g., is fully breastfed, see OEHHA, 2012, for details), which is one-half of the 0<2 year age group used in the Hot Spots program. Thus, the cancer risk by the mother's milk pathway will need to be calculated with a modified cancer risk equation using a different exposure duration:

8-13

## O-MBA20L7

Air Toxics Hot Spots Program Guidance Manual

February 2015

### A. Equation 8.2.7: $RISK_{mm} = Dose-Im \times CPF_{oral} \times ASF \times ED/AT$

1.  $RISK_{mm}$  = Infant cancer risk via mother's milk pathway
2. Dose-Im = Daily dose (mg/kg-day) to infant from mother's milk
3.  $CPF_{oral}$  = Oral cancer slope factor (mg/kg-day<sup>-1</sup>)
4. ASF = Age sensitivity factor for infant (unitless)
5. ED = Exposure duration (in years) for infant
6. AT = Averaging time for lifetime cancer risk

#### a: Recommended default values for EQ 8.2.7:

6. Dose-Im = Calculated from EQ 5.4.3.5.2, dose to infant via mother's milk
7.  $CPF_{oral}$  = Substance-specific (see Table 7.1)
8. ASF = 10 (See Section 8.2.1)
9. ED = 1 yr (1<sup>st</sup> yr of 0<2 yr age group)
10. AT = 70 years

Once the cancer risk is determined for the mother's milk pathway for each applicable substance, the pathway risk is summed with other pathway risks.

For Tier 1, the derived approach for cancer risk assessment should be used if the mother's milk pathway applies. As outlined in Section 8.2.6, the two dominant pathways will be calculated using high-end point estimates of intake rates; all additional pathways may be calculated using average point estimates of intake rates. There will be four mandatory pathways to assess (inhalation, mother's milk, soil ingestion and dermal exposure) for cancer risk when exposure to dioxins/furans, PCBs, PAHs including creosotes, and/or lead occurs. Therefore, if the infant is exposed to no other additional site-specific noninhalation pathway(s), only the two dominant pathways among the four will be assessed for cancer risk using high-end point estimates of intake rates; and the others would be assessed using the average point estimate of intake rate.

In short, multipathway cancer risk for a substance is estimated by summing the potential inhalation and noninhalation cancer risks for the receptor location of interest. See the discussion of Tier 1 in Section 8.2.6 or the TSD for more information on the method used to determine the multipathway cancer risk.

### 8.2.8 Cancer Risk Characterization for Stochastic Risk Assessment

Risk characterization for a stochastic risk assessment is similar to that described for the point-estimate approach. However, the stochastic risk assessment produces a distribution of risk that accounts for some of the natural variability in exposure-related factors, such as breathing rates or water intake. The cancer risk distribution for inhalation cancer risk, for example, is generated by multiplying randomly selected values from the breathing rate distribution by the ground level air concentration, and the cancer potency factor. A variation of the Monte Carlo method called Latin hypercube sampling is the method by which the values from the breathing rate distribution are

8-14

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

selected. If noninhalation pathways need to be evaluated, the same process is followed for each pathway and the risk is summed to give an overall inhalation and noninhalation cancer risk distribution. Further, the specification of Age Sensitivity Factors and the need to separately calculate risks require that a Monte Carlo sampling be conducted for each age group and the cancer risk distributions are then summed across age groups.

The HARP software will perform an HRA using a Monte Carlo analysis with either OEHHA-provided or user-provided data distributions and will include the statistics for the distributions. In risk assessments that have chosen to use the distribution of exposure variates, the cancer risk distribution for a 30-year residential exposure duration (MEIR) should be presented in the risk characterization section. We also recommend including the 9 and 70-year cancer risk at the MEIR as supplemental information. Note that a 70-year exposure duration is required to estimate cancer burden or provide an estimate of population-wide risk. A stochastic approach has not been developed for acute, 8-hour, and chronic noncancer health impacts or worker (MEIW) exposures.

#### 8.2.9 Use of Individual Cancer Risk and Population-wide Cancer Risk

Cancer risk for an individual receptor and a representation of population-wide cancer risk are both important components of a risk assessment. The individual receptor approach reflects the exposures that may occur to an individual receptor over a period of time at a specific location. The individual cancer risk approach has some inherent limitations in terms of illustrating and potentially protecting population-based public health. For example, a facility with a small emissions footprint may impact a few individuals with a high individual potential cancer risk; whereas, a facility with a larger emission footprint may have a lower potential cancer risk for an individual receptor but expose many more people to those levels. Since this larger emitting facility can impact many more people, the population-wide health impacts are magnified due to the larger number of people exposed to the facility's emissions. This potential for higher population impacts is not captured by the individual receptor risk methodology. Therefore, the individual and population-wide health impacts should be presented for all facilities to provide a more complete illustration of the facility's health impacts.

##### 8.2.9.1 Population Risk

For facilities with large emission footprints (e.g., refineries, ports, or rail yards, etc.), population-based health impacts are critical to provide a better illustration of the potential impacts of emissions since large numbers of people may be exposed to the emissions. The individual cancer risk approach has some inherent limitations in terms of protecting public health. A small facility with a single stack can impact a few individuals with an individual cancer risk that is unacceptable, whereas a large facility may have an individual cancer risk that is below the acceptable limit for individual risk but exposes many more people. Thus, the population-wide impacts are larger for the large facility. Population-wide risk is independent of individual risk, and assumes that a population (not necessarily the same individuals) will live in the impacted zone over a

8-15

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

70-year period. Thus, a 70-year exposure duration is required for estimates of population-wide risks.

To evaluate population risk, one method that regulatory agencies have used is the cancer burden method to account for the number of excess cancer cases that could occur in a population.

#### Cancer Burden

The cancer burden can be calculated by multiplying the cancer risk at a census block centroid by the number of people who live in the census block, and adding up the estimated number of potential cancer cases across the zone of impact. The result of this calculation is a single number that is intended to estimate the number of potential cancer cases within the population that was exposed to the emissions for a lifetime (70 years).

The cancer burden is calculated on the basis of lifetime (70-year) risks (whereas individual cancer risk at the MEIR is based on 30-year residential exposure). Cancer burden is independent of how many people move in or out of the vicinity of an individual facility. For example, if 10,000 people are exposed to a carcinogen at a concentration with a  $1 \times 10^{-5}$  cancer risk for a lifetime the cancer burden is 0.1, and if 100,000 people are exposed to a  $1 \times 10^{-5}$  risk the cancer burden is 1.

#### Estimate of Population Wide Risk

An estimate of the number of people exposed at various cancer risk levels can provide perspective on the magnitude of the potential public health threat posed by a facility. This approach is intended as a replacement for or addition to the cancer burden calculation used by some Districts in the past. The new approach provides a much easier way for the general public to interpret results when compared to cancer burden estimates. A facility in a sparsely populated area can have a public health impact different from the same facility in a highly populated area; however, under the cancer burden method, those differences may not be seen. Some suggested approaches and methods for performance of a screening or refined population exposure analyses are provided in Section 4.6.

The District or reviewing authority should be consulted before beginning the population exposure estimates and, as results are generated, further consultation may be necessary. Note that a 70-year exposure duration is required to estimate cancer burden or provide an estimate of population-wide risk.

The zone of impact for estimating the number of persons exposed to a cancer risk from facility emissions should be set at a minimum of a  $10^{-5}$  cancer risk level (see Section 4.6.1). Some Districts may prefer to use a cancer risk of  $10^{-7}$  to define the carcinogenic zone of impact. The total number of persons exposed to a series of potential risk levels can be presented to aid risk managers in understanding the magnitude of the potential public health impacts.

8-16

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

The HARP software can provide population-level risk estimates as cancer burden or as the number of persons exposed to a selected (user-identified) cancer risk level at block level centroids.

#### 8.2.9.2 Population Estimates for Noncancer Health Impacts

A noncancer chronic, 8-hour, and acute population estimate of the number of people exposed to acute, 8-hour, and chronic HQs or HIs exceeding 0.5 or 1.0, in increments of 1.0, should also be presented. For example, a facility with a maximum chronic HI of 4.0 would present the number of people exposed to a chronic HI of 0.5, 1.0, 2.0, 3.0, and 4.0. The isopleths used in this determination should be drawn using the smallest feasible grid size. The same methods that are described in Chapter 4 and Section 8.2.9 (for the population exposure estimate for cancer risk) should be used in the chronic, 8-hour and acute population estimates. Population estimates for acute, 8-hour, and chronic health impacts should be presented separately.

#### 8.2.9.3 Factors That Can Impact Population Risk – Cumulative Impacts

Although the Hot Spots program is designed to address the impacts of single facilities and not aggregate or cumulative impacts, there are a number of known factors that influence the susceptibility of the exposed population and thus may influence population risk. Socioeconomic status influences access to health care, nutrition, and outcome after cancer diagnosis. Community unemployment can affect exposure and residency time near a facility. Factors that affect the vulnerability of the population are discussed in the report *Cumulative Impacts: Building a Scientific Foundation* (OEHHA, 2010). Information on many of these factors is relatively easy to obtain at the census tract level. The OEHHA recommends that these types of factors be considered by the risk manager, along with the quantitative measures of population risk. OEHHA is in the process of developing guidance on quantification of the impact of these factors.

#### 8.2.10 Cancer Risk Evaluation of Short Term Projects

The local air pollution control districts sometimes use the risk assessment guidelines for the Hot Spots program in permitting decisions for short-term projects such as construction or waste site remediation. Frequently, the issue of how to address cancer risks from short-term projects arises.

Cancer potency factors are based on animal lifetime studies or worker studies where there is long-term exposure to the carcinogenic agent. There is considerable uncertainty in trying to evaluate the cancer risk from projects that will only last a small fraction of a lifetime. There are some studies indicating that dose rate changes the potency of a given dose of a carcinogenic chemical. In others words, a dose delivered over a short time period may have a different potency than the same dose delivered over a lifetime.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

The OEHHA's evaluation of the impact of early-in-life exposure has reduced some of the uncertainty in evaluating the cancer risk to the general population for shorter-term exposures, as it helps account for susceptibility to carcinogens by age at exposure (OEHHA, 2009).

Due to the uncertainty in assessing cancer risk from very short-term exposures, we do not recommend assessing cancer risk for projects lasting less than two months at the MEIR. We recommend that exposure from projects longer than 2 months but less than 6 months be assumed to last 6 months (e.g., a 2-month project would be evaluated as if it lasted 6 months). Exposure from projects lasting more than 6 months should be evaluated for the duration of the project. In all cases, for assessing risk to residential receptors, the exposure should be assumed to start in the third trimester to allow for the use of the ASFs (OEHHA, 2009). Thus, for example, if the District is evaluating a proposed 5-year mitigation project at a hazardous waste site, the cancer risks for the residents would be calculated based on exposures starting in the third trimester through the first five years of life.

For the MEIW, we recommend using the same minimum exposure requirements used for the residential receptor (i.e., no evaluation for projects less than 2 months; projects longer than 2 months but less than 6 months are assumed to last 6 months; projects longer than 6 months would be evaluated for the duration of the project). Although the off-site worker scenario assumes that the workers are 16 years of age or older with an Age-Sensitivity Factor of 1, another risk management consideration for short-term project cancer assessment is whether there are women of child bearing age at the worksite and whether the MEIW receptor has a daycare center. In this case, the Districts may wish to treat the off-site MEIW in the same way as the residential scenario to account for the higher susceptibility during the third trimester of pregnancy, and for higher susceptibility of infants and children.

Finally, the risk manager may want to consider a lower cancer risk threshold for risk management for very short-term projects. Typical District guidelines for evaluating risk management of Hot Spots facilities range around a cancer risk of 1 per 100,000 exposed persons as a trigger for risk management. Permitting thresholds also vary for each District. There is valid scientific concern that the rate of exposure may influence the risk – in other words, a higher exposure to a carcinogen over a short period of time may be a greater risk than the same total exposure spread over a much longer time period. In addition, it is inappropriate from a public health perspective to allow a lifetime acceptable risk to accrue in a short period of time (e.g., a very high exposure to a carcinogen over a short period of time resulting in a  $1 \times 10^{-5}$  cancer risk). Thus, consideration should be given for very short term projects to using a lower cancer risk trigger for permitting decisions.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### 8.3 Noncancer Acute, 8-Hour, and Chronic Inhalation Health Impacts – the Hazard Index Approach

All substances in the Hot Spots Program that have noncancer health impacts at a receptor must be evaluated through the inhalation pathway. Estimates of noncancer inhalation health impacts are determined by dividing an airborne concentration at the receptor by the appropriate Reference Exposure Level (REL). This is termed the Hazard Index Approach. A REL is used as an indicator of potential noncancer health impacts and is defined as the concentration at which no adverse noncancer health effects are anticipated. When a health impact calculation is performed for a single substance, then it is called the hazard quotient (HQ). Each REL for a substance will have one or more target organ systems (e.g., respiratory system, nervous system, etc.) where the substance can have a noncancer health impact. Thus, all HQs have specified target organ systems associated with them. The sum of the Hazard Quotients of all chemicals emitted that impact the same target organ is termed the Hazard Index. Inhalation RELs for noncancer health impacts have been developed for acute, 8-hour, and chronic exposures to a number of Hot Spots substances. Acute RELs are designed to protect against the maximum 1-hour ground level concentration at the receptor. Eight-hour RELs are designed to protect people with daily 8-hour schedules, such as offsite workers, in an impacted zone. The 8-hour RELs should be used for typical daily work shifts of 8-9 hours. For further questions, assessors should contact OEHHHA, the District, or reviewing authority to determine if the 8-hour RELs should be used in your HRA. Any discussions or directions to exclude the 8-hour REL evaluation should be documented in the HRA. Chronic RELs protect against long-term exposure to the annual average air concentration spread over 24 hours/day, 7 days/week.

OEHHHA has added 8-hour RELs to the set of noncancer RELs that were previously comprised of acute and chronic RELs (OEHHHA, 2008). Specifically, 8-hour RELs are air concentrations at or below which health impacts would not be expected even for sensitive subpopulations in the general population with repeated daily 8-hour exposures over a significant fraction of a lifetime. The 8-hour RELs can be used to evaluate the potential for health impacts (including effects of repeated exposures) in offsite workers, and to children and teachers exposed during school hours. Although not required in the HRA, they could also be applied by the Districts to a residential scenario where a facility operates only a portion of the day and exposure to residences is not adequately reflected by averaging concentrations over a 24 hour day. The number of chemicals with 8-hour RELs will increase as OEHHHA re-evaluates RELs for chemicals under SB-25 to ensure that they are protective of children's health.

Acute, 8-hour, and chronic RELs are needed because the dose metrics and even the health impact endpoints may be different with the different exposure durations of acute, daily 8-hour, and chronic exposures. Also, although chronic REL values are lower or set the same as 8-hour RELs, there are some cases such as special meteorological situations (e.g., significant diurnal-nocturnal meteorological differences) or intermittent exposures where the 8-hour REL may be more protective than the chronic REL.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

Chapter 4 describes air dispersion modeling and both Chapter 6 and Appendix L list the needed dose-response information to evaluate non-cancer hazards. Appendix I presents sample calculations for determining acute HQs and HIs, 8-hour HQs and HIs, and chronic multipathway HQs and HIs. Chapter 9 provides an outline of information required for risk characterization. The HARP software will calculate the HQ and HI for Hot Spots risk assessments.

#### 8.3.1 Calculation of Noncancer Inhalation Hazard Quotient and Hazard Index

To calculate the acute HQ, the maximum 1-hour ground level concentration (in  $\mu\text{g}/\text{m}^3$ ) of a substance at a receptor is divided by the acute 1-hour REL (in  $\mu\text{g}/\text{m}^3$ ) for the substance:

$$\text{Acute Hazard Quotient} = \frac{\text{1-Hour Max Concentration } (\mu\text{g}/\text{m}^3)}{\text{Acute REL } (\mu\text{g}/\text{m}^3)}$$

To calculate the chronic HQ, the annual average ground level concentration of a substance is divided by the chronic REL for the substance:

$$\text{Chronic Hazard Quotient} = \frac{\text{Annual Average Concentration } (\mu\text{g}/\text{m}^3)}{\text{Chronic REL } (\mu\text{g}/\text{m}^3)}$$

To calculate the 8-hour HQ, the adjusted annual average ground level concentration of a substance (represented as "Adjusted  $C_{\text{air}}$ " in EQ 5.4.1.4 A) is divided by the 8-hour REL for the substance:

$$\text{8-hour Hazard Quotient} = \frac{\text{Adjusted Annual Average Concentration } (\mu\text{g}/\text{m}^3)}{\text{8-hour REL } (\mu\text{g}/\text{m}^3)}$$

The daily 8-hour average ground level concentrations used for calculating the 8-hour HQs are derived as described in Chapter 4.

An HQ of 1.0 or less indicates that adverse health effects are not expected to result from exposure to emissions of that substance. As the HQ increases above one, the probability of human health effects increases by an undefined amount. However, it should be noted that a HQ above one is not necessarily indicative of health impacts due to the application of uncertainty factors in deriving the RELs.

If a receptor is exposed to multiple substances that target the same organ system, then the HQs for the individual substances are summed to obtain a Hazard Index (HI) for that target organ.

Table 8.8 is an example of an HRA spreadsheet showing acute inhalation HQs arranged by target organ system for several substances. The bottom row shows the summed HQs by target organ system to derive the HIs.

## O-MBA20L7

Air Toxics Hot Spots Program Guidance Manual

February 2015

**Table 8.8 Individual Hazard Quotients and Total Hazard Index for Acute Inhalation Exposure**

Substance	Reproductive/ Developmental	Nervous System	Cardiovascular System	Respiratory System	Eye
Ammonia				0.6	0.6
Arsenic	0.2	0.2	0.2		
Benzene	0.02				
Chlorine				0.7	0.7
<b>Total Hazard Index</b>	<b>0.22</b>	<b>0.2</b>	<b>0.2</b>	<b>1.3</b>	<b>1.3</b>

A more detailed example of calculating HQs and HIs and of determining noncancer health impacts is shown in Appendix I.

Hazard quotients or HIs for different target organs are not summed together (e.g., do not add the impacts for the eye to the cardiovascular system). Chapter 6 and Appendix L have lists of the organ systems affected by each substance. Unlike the cancer risk algorithms, no exposure duration adjustment (e.g., 9 yrs / 70 yrs) should be made for noncancer assessments.

There are limitations to this method of assessing cumulative noncancer health impacts. The impact on organ systems may not be additive if health effects occur by different mechanisms. However, the impact on organ systems could also be synergistic. An analysis by a trained health professional familiar with the substance's toxicological literature is usually needed to determine the public health significance of an HQ or HI above one. It is recommended that the Air District contact OEHHA if this situation presents itself. For assessing the noncancer health impacts of lead, different procedures are used; please see Appendix F.

### 8.3.2 Calculating Noninhalation (oral) Noncancer Hazard Quotient and Hazard Index

Similar to the situation with multipathway carcinogenic substances, multipathway substances that present a noncancer hazard are assessed by noninhalation routes of exposure (see Table 8.6). Noninhalation routes of exposure are assessed only for chronic exposure. There are no oral acute RELs since it is generally anticipated that health effects from a single exposure via the oral route at typical environmental levels resulting from deposition of facility emissions would be insignificant relative to the inhalation route. The multipathway substances with noninhalation RELs, called chronic oral RELs, are shown in Table 6.4. Similar to inhalation exposure, the hazard quotient

## O-MBA20L7

Air Toxics Hot Spots Program Guidance Manual

February 2015

for a noninhalation pathway is obtained by dividing the dose in milligrams per kilogram-day (mg/kg-day) by the oral REL also expressed in units of mg/kg-day:

$$\text{Chronic Non-inhalation HQ} = \frac{\text{Chronic Noninhalation Dose (mg/kg-day)}}{\text{Chronic Oral REL (mg/kg-day)}}$$

The calculated chronic oral HQs are combined with the chronic inhalation HQs for determining the chronic HIs for each affected target organ (see Section 8.3.4). The point estimates and algorithms for calculating the oral dose for all applicable exposure pathways and receptors (e.g., workers or residents) are explained in Chapter 5.

The chronic oral dose calculated in mg/kg-day is based on a time-weighted average 70-year residential exposure combining the 0<2, 2<16 and 16-70 year age groups. Unlike the assessment of cancer risk, no exposure duration adjustment should be made when estimating HQs. In other words, the variates ED and AT in the cancer risk EQ 8.2.5 in Section 8.2.5 are not used for estimating the noncancer HQs. See Appendix I for an example calculation.

### 8.3.3 Multipathway Noncancer Risk Methodology

To determine multipathway chronic noncancer health impacts, it is necessary to calculate the total hazard index from both inhalation and noninhalation exposures. The calculation of HIs has several steps:

- 1) First, the inhalation HQ is calculated for each substance emitted (Section 8.3.1).
- 2) Second, if the substance has an oral REL, then the non-inhalation HQ is calculated as shown above using high-end point-estimates for intake rates for each noninhalation pathway that applies.
- 3) Third, if there are more than two noninhalation pathways to consider for a multipathway substance, then the oral HQ is calculated using high-end point estimates in the dose equation for the two dominant pathways. For any additional noninhalation pathways, the HQs are calculated using average point estimates in the dose equation. This step applies only to residential receptors.
- 4) Fourth, all noninhalation pathway HQs for a multipathway substance are then summed together by target organ to obtain the total noninhalation HQ for a multipathway substance.
- 5) The final step is to sum the inhalation and noninhalation HQs together by target organ to determine the HIs. This step is displayed in Table 8.9. If there is only one substance, then the multipathway HQ is the same as the HI.

## O-MBA20L7

Air Toxics Hot Spots Program Guidance Manual

February 2015

**Table 8.9 Substance-Specific Chronic Inhalation and Noninhalation Hazard Quotients and the Hazard Index by Target Organ System**

Substance	Respiratory System	Hematologic System	Alimentary System	Endocrine System	Development	Reproductive System	Nervous System	Cardiovascular System	Skin
Ammonia	0.8								
Arsenic					0.04(i) 0.1(ni)		0.04(i) 0.1(ni)	0.04(i) 0.1(ni)	0.04(i) 0.1(ni)
Benzene		0.08			0.08		0.08		
2,3,7,8-TCDD (dioxin)	0.1(i) 0.2(ni)	0.1(i) 0.2(ni)	0.1(i) 0.2(ni)	0.1(i) 0.2(ni)	0.1(i) 0.2(ni)	0.1(i) 0.2(ni)			
Nickel	0.4(i)	0.4(i)	0.1(ni)						
<b>Hazard Index</b>	<b>1.50</b>	<b>0.78</b>	<b>0.40</b>	<b>0.3</b>	<b>0.52</b>	<b>0.30</b>	<b>0.22</b>	<b>0.14</b>	<b>0.14</b>

i = inhalation pathway contribution

ni = noninhalation pathway contribution

Table 8.9 shows the calculated chronic HIs by combining the chronic inhalation HQs and chronic oral HQs. The HQs or HIs for different target organs are not added together (e.g., do not add the impacts for the respiratory system to the nervous system). The noninhalation pathways for TCDD and arsenic in Table 8.9 have all the noninhalation pathways that apply incorporated into their HQ values. For example, the noninhalation value for arsenic (HQs = 0.1) includes at least the soil ingestion and dermal soil pathways in the HQs because these are the mandatory noninhalation pathways to take into account with exposure to a multipathway substance. For TCDD, the mother's milk pathway is an additional mandatory noninhalation pathway to take into account (See Table 5.1). If there are exposures to any of the site-specific pathways, then these would be included too. A more detailed example calculation of HIs is shown in Appendix I.

When exposure to more than two noninhalation pathways occur, using the high-end point estimates of intake rates for only the two dominant noninhalation pathways will lessen the issue of compounding high-end exposure estimates, while retaining a health-protective approach for the more important exposure pathways. It is unlikely that an individual receptor would be on the high-end of exposure for all the non-inhalation intake parameters (exposure pathways).

## O-MBA20L7

Air Toxics Hot Spots Program Guidance Manual

February 2015

### 8.3.4 Summary - Acute, 8-Hour and Chronic Hazard Index Calculation at the MEIR and MEIW

Eight-hour RELs were developed principally for exposure of individuals during 8-hour work schedules. The 8-hour RELs should be used for typical daily work shifts of 8-9 hours. For further questions, assessors should contact OEHA, the District, or reviewing authority to determine if the 8-hour RELs should be used in your HRA. Any discussions or directions to exclude the 8-hour REL evaluation should be documented in the HRA. There are currently only a limited number of substances with an 8-hour inhalation REL. Over time as the science supporting REL values for individual substances is reviewed and the RELs are revised by OEHA, more 8-hour RELs will be developed.

Therefore, for the MEIR, we recommend:

- Estimating the acute Hazard Index based on the maximum 1-hour air concentration and 1-hour RELs
- Estimating the chronic Hazard Index based on the annual average air concentration and the chronic RELs, and the oral RELs for multipathway substances

An 8-hour hazard index based on the daily average 8-hour exposure is not required for the MEIR, but can be performed at the discretion of the District for exposure to non-continuously operating facilities using the adjusted annual average air concentration (See EQ 5.4.1.4 A and B or method in App. M). Eight-hour hazard assessments are not recommended for exposure to continuously operating facilities.

For the MEIW, we recommend:

- Estimating the acute Hazard Index based on the maximum 1-hour air concentration and 1-hour RELs
- Estimating the 8-hour Hazard Index based on daily average 8-hour exposure for those chemicals with 8-hour RELs
- Estimating the chronic Hazard Index based on the annual average air concentration and chronic RELs, and oral RELs for multipathway substances

Until there are 8-hour RELs for many of the Hot Spots substances that have a chronic REL value, we recommend determining the chronic HI for the MEIW to adequately protect the offsite worker.

### 8.3.5 Evaluation of Background Criteria Pollutants

The District should be contacted to determine if the contribution of background criteria pollutants to respiratory health effects is required to be included in an HRA for the Hot Spots Program. If inclusion is required, the methods for calculating the health impact from acute and chronic exposure (respiratory endpoint) is the standard HI approach (see Sections 8.3.1 and 8.3.4). There are currently no 8-hour RELs for criteria

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

pollutants, so 8-hour health impacts from criteria pollutants are not assessed in HRAs. The background criteria pollutant contribution should be calculated if the HI from the facility's emissions exceeds 0.5 in either the acute or chronic assessment for the respiratory endpoint.

The most recent criteria pollutant concentration data should be obtained from the ARB's ambient air monitoring network and can be found in the *California Almanac of Emissions and Air Quality* on their web site at [www.arb.ca.gov](http://www.arb.ca.gov). For determining the criteria pollutant contribution in HI calculations, the annual average concentration data should be taken from a monitoring site near the facility. If background contributions are unavailable, the District may direct the risk assessor to make an alternative assumption. The criteria pollutants that should be included in acute and chronic assessments for the respiratory endpoint are ozone, nitrogen dioxide, sulfur dioxide, sulfates, and hydrogen sulfide.

#### 8.4 Uses of Exposure Duration Adjustments for Onsite Receptors

Onsite workers are protected by CAL OSHA and typically are not evaluated under the Hot Spots program. Exceptions may include a worker who also lives on the facility property such as at prisons, military bases, and universities that have worker housing within the facility. Another scenario where the District may require assessment of on-site worker exposure and risk is when a facility (e.g., airport) has multiple businesses owned by different entities within the facility/property (e.g., rental car agencies, restaurants, etc.). In these situations the evaluation of onsite cancer risks, and/or acute, 8-hour, and chronic noncancer hazard indices is appropriate under the Hot Spots program. If the onsite receptor under evaluation can be exposed through a noninhalation exposure pathway, then that exposure pathway must also be included. When a receptor lives and works on the facility, site, or property, then these receptors should be evaluated and reported under both residential and worker scenarios and the one that is most health-protective should be used for risk management decisions.

The cancer risk estimates for the on-site residents may use a 30-year exposure duration while the 25-year exposure duration is used for a worker. Under a Tier 2 analysis, alternate exposure durations may be evaluated and presented with all assumptions supported. See section 8.2.10 for more discussion of short-term exposures.

Other situations that may require on-site receptor assessment include the presence of locations where the public may have regular access for the appropriate exposure period (e.g., a lunchtime café, store, or museum for acute exposures). The District or reviewing authority should be consulted on the appropriate evaluations for the risk for all onsite receptors.

## 9 - Summary of the Requirements for a Modeling Protocol and a Health Risk Assessment Report

The AB 2588 program is a community right-to-know act. Although risk assessment is a technical field, AB 2588 risk assessments need to be clear and understandable to the educated lay person. An Executive Summary that explains the process and the results of the risk assessment in lay terms is necessary. Clear risk communication is imperative in situations where the facility is required to notify the surrounding community. In addition, the risk assessment is by law reviewed by the local Air Pollution Control or Air Quality Management District (District) and OEHHA in order to ensure that AB 2588 risk assessment procedures have been followed. This chapter clarifies the type of information that is needed for District and OEHHA review of modeling protocols and health risk assessments (HRAs).

The material presented here is intended to promote transparent, consistent presentation and efficient review of the modeling protocol and the health risk assessment report (products). We recommend that persons preparing these products consult with the local District to determine if the District has modeling or HRA guidelines that supersede these products. If the District does not have guidelines for these products, then we recommend Section 9.1 be used for modeling protocols and Section 9.2 be used for the presentation of HRAs. Persons preparing modeling protocols and HRAs should specify the guidelines that were used to prepare their products.

### 9.1 Submittal of a Modeling Protocol

It is strongly recommended that a modeling protocol be submitted to the District for review and approval prior to extensive analysis with an air dispersion model. The modeling protocol is a plan of the steps to be taken during the air dispersion modeling and risk assessment process. We encourage people who are preparing protocols to take advantage of the protocol step and fully discuss anticipated methodologies for any portion of your project that may need special consideration. Below, we have provided an example of the format that may be followed in the preparation of the modeling protocol. **Consult with the District to confirm format and content requirements or to determine the availability of District modeling guidelines before submitting the protocol.**

### 9.1.1 Outline for a Modeling Protocol

#### I. Introduction

Include the facility name, address, and a brief overview describing the facility's operations.

- Provide a description of the terrain and topography surrounding the facility and potential receptors.
- Indicate the format in which data will be provided. Ideally, the report and summary of data will be on paper and all data and model input and output files will be provided electronically (e.g., compact disk or CD).
- Identify the guidelines used to prepare the protocol (e.g., District Guidelines).

#### II. Emissions

**For each pollutant and process whose emissions are required to be quantified in the HRA, list the annual average emissions (pounds/year and grams/second) and the maximum one-hour emissions (pounds/hour and grams/second)<sup>1</sup>. Maximum 1-hour emissions are used for acute noncancer health impacts while annual emissions are used for chronic exposures (i.e., chronic and 8-hour noncancer health impacts or cancer risk assessment).**

- Identify the reference and method(s) used to determine emissions (e.g., source tests, emission factors, etc.). Clearly indicate any emission data that are not reflected in the previously submitted emission inventory report. In this event, a revised emission inventory report will need to be submitted to the District.
- Identify if this will be a multipathway assessment based on emitted substances.

<sup>1</sup> Except radionuclides, for which annual and hourly emissions are reported in Curies/year and millicuries/hour, respectively.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### III. Models / Modeling Assumptions

##### **Specify the model and modeling assumptions**

- Identify the model(s) to be used, including the version number.
- Identify the model options that will be used in the analysis.
- Identify the modeling domain(s) and the spacing of receptor grid(s). Grid spacing should be sufficient in number and detail to capture the concentration at all of the receptors of interest.
- Indicate complex terrain options that may be used, if applicable.
- Identify the source type(s) that will be used to represent the facility's operations (e.g., point, area, or volume sources, flare options or other).
- Indicate the preliminary source characteristics (e.g., stack height, gas temperature, exit velocity, dimensions of volume source, etc.).
- Identify and support the use of urban or rural dispersion coefficients for those models that require dispersion coefficients. For other models, identify and support the parameters required to characterize the atmospheric dispersion due to land characteristics (e.g., surface roughness, Monin-Obukhov length).

#### IV. Meteorological Data

##### **Specify the type, source, and year(s) of hourly meteorological data (e.g., hourly surface data, upper air mixing height information).**

- State how the data are representative for the facility site.
- Describe QA/QC procedures.
- Identify any gaps in the data; if gaps exist, describe how the data gaps are filled.

#### V. Deposition

- Specify the method to calculate deposition (if applicable).

9-3

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### VI. Receptors

##### **Specify the type and location of receptors. Include all relevant information describing how the individual and population-related receptors will be evaluated.**

- Identify and describe the location(s) of known or anticipated potential sensitive receptors, the point of maximum impact (PMI), the maximum exposed individual residential (MEIR), and worker (MEIW) receptors. Identify any special considerations or grids that will be used to model these receptors. This information should correspond with information provided in Section III (e.g., fine receptor spacing of 20 meters at the fence line and centered on the maximum impacts; coarse receptor spacing of 100 meters out to 2,000 meters; extra coarse spacing of 1,000 meters out to 20,000 meters).
- Identify if spatial averaging will be used. Include necessary background information on each receptor including how the domain and spacing will be determined for each receptor or exposure pathway.
- Describe how the cancer burden or population impact estimates are calculated. Clarify the same information for the presentation of noncancer population impacts (e.g., centroids of the census tracts in the area within the zone of impact).
- Specify that actual UTM coordinates and the block/street locations (i.e., north side of 3,000 block of Smith Street), where possible, will be provided for specified receptor locations.
- Identify and support the use of any exposure adjustments (e.g., time at location, diurnal).
- Include the list of anticipated exposure pathways that will be included and indicate which substance will be evaluated in the multipathway assessment. Identify if sensitive receptors are present and which receptors will be evaluated in the HRA.

#### VII. Maps

##### **Identify how the information will be graphically presented.**

- Indicate which cancer risk isopleths will be plotted for the cancer zone of impact (e.g.,  $10^{-7}$ ,  $10^{-6}$  see Section 4.6.1).
- Indicate the hazard quotients or hazard indices to be plotted for the noncancer acute, 8 hour, and chronic zones of impact (e.g., 0.5, 1.0, etc.).

9-4

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### 9.2 Health Risk Assessment Report

The purpose of this section is to provide an outline to assist with the preparation and review of HRAs. This outline specifies the key components that should be included in HRAs. All information used for the report must be presented in the HRA. Ideally, the HRA report and a summary of data used in the HRA will be on paper and all data and model input and output files will be provided electronically (e.g., CD). Persons preparing HRAs for the Hot Spots Program should consult the District to determine if HRA guidelines or special formats are to be followed when preparing and presenting the HRA's results.

If District guidelines or formats do not exist that supersede this outline, then the HRA should follow the format presented here. If the HRA is prepared for other programs, the reviewing authority should be consulted for clarification of format and content. We recommend that those persons preparing HRAs specify the guidelines that were used to prepare their product. **The HRA may be considered deficient by the reviewing authority if components that are listed here are not included.**

##### 9.2.1 Outline for the Health Risk Assessment Report

###### I. Table of Contents

- Section headings with page numbers indicated.
- Tables of tables and Table of figures with page numbers indicated.
- Appendices with page numbers indicated.

###### II. Executive Summary

###### Overview of all relevant information regarding the project or facility.

- Facility identifier number (consult the District).
- Description of facility operations and a list identifying emitted substances including table of maximum 1-hour emissions, and annual average emissions.
- Provide a brief description of acute, 8-hour, chronic, and cancer health impacts of the emitted substances, based on OEHHA's descriptions in the appropriate Technical Support Documents.
- Text presenting overview of dispersion modeling and exposure assessment.
- Text describing estimated cancer risk for carcinogens, noncancer Hazard Quotients and Hazard Indices and a table showing target organ systems by substance for noncancer impacts.

9-5

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

- Summarize the individual and population-wide health impacts including the driving substance(s) and the driving exposure pathways:
  - Location (block/street location; e.g., north side of 3,000 block of Smith Street) and description of the off-site point of maximum impact (PMI), maximum exposed individual resident (MEIR), and maximum exposed individual worker (MEIW).
  - Location (block/street location; e.g., north side of 3,000 block of Smith Street) and description of any on-site receptors that were evaluated at the facility (consult District or agency).
  - Location (block/street location; e.g., north side of 3,000 block of Smith Street) and description of any sensitive receptors that are required by the district or reviewing authorities (consult District or agency).

**NOTE: When presenting information described in the following bullets, cancer risk should be presented separately for a residential 30-year, Tier-1 analysis. Results of other exposure assumptions (e.g., 9 or 70-year) or other tier evaluations should also be presented, and must be clearly labeled. For the Hot Spots Program, while the 30-year exposure duration is recommended as the basis for public notification and risk reduction audits and plans, the District has discretion to use the 70 year exposure scenario for its decisions. In addition, the 70 year cancer risk must be calculated to estimate population-wide impacts.**

- Text presenting an overview of the total cancer risk (including multipathway substances, if present) at the PMI, MEIR, MEIW, and sensitive receptors. Provide a table of cancer risk by substance for the MEIR and MEIW (if applicable). Include a statement indicating which of the substances appear to contribute most to (drive) the potential health impacts. In addition, identify the exposure pathways evaluated in the HRA.
- Provide a map of the facility and surroundings and identify the location of the MEIR, MEIW, PMI, and other locations or receptors of interest.
- Provide a map of 30-year and 70-year cancer risk zone of impact(s), if applicable.
- Text presenting an overview of the acute and chronic noncancer hazard quotients and the (total) hazard indices for the PMI, MEIR, MEIW, and sensitive receptors. Additionally, include 8-hour hazard quotients and hazard indices for the MEIW. Include separate statements (for acute, 8-hour, and chronic exposures) indicating which

9-6

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

of the substances appear to drive the potential health impacts. In addition, clearly identify the primary target organ(s) that are impacted from acute, 8-hour, and chronic exposures.

- Identify any sensitive subpopulations (e.g., child daycare facilities, schools, nursing homes) of concern.
- Table and text presenting an overview of estimates of population exposure (e.g., cancer burden or population estimates from HARP) (consult District or agency) (see Section 8.4).
- Version of the Risk Assessment Guidelines and computer program(s) used to prepare the risk assessment (e.g., HARP).

### III. Risk Assessment Procedures

#### A. Hazard identification

- Table and text identifying all substances emitted from the facility, plus any other substances required by the District or reviewing authority. Include the CAS number of the substance and the physical form of the substance if possible. [The Hot Spots substances are listed in Appendix A, and also in the ARB's Emission Inventory Criteria and Guidelines Regulations (Title 17, California Code of Regulations, Sections 93300-93300.5), and the Emission Inventory Criteria and Guidelines Report (EICG Report), which is incorporated by reference therein (ARB, 1997)].
- Table and text identifying all substances that are evaluated for cancer risk and/or noncancer acute, 8-hour, and chronic health impacts. In addition, identify any multipathway substances that present a cancer risk or chronic noncancer hazard via noninhalation routes of exposure.
- Describe the types and amounts of continuous or intermittent predictable emissions from the facility that occurred during the reporting year. As required by statute, releases from a facility include spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping (fugitive), leaching, dumping, or disposing of a substance into ambient air. Include the substance(s) released and a description of the processes that resulted in long-term and continuous releases.

#### B. Exposure Assessment

This section describes the information related to the air dispersion modeling process that needs to be reported in the risk assessment; the information is also presented in Chapter 4 (see Section 4.15). The District may have specific requirements regarding format and content (see Section 4.14). Sample calculations should be provided at each step to indicate how reported emissions

9-7

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

data were used. Reviewing agencies must receive input, output, and supporting files of various model analyses on computer-readable media (e.g., CD).

#### 1. Information on the Facility and its Surroundings

Report the following information regarding the facility and its surroundings:

- Facility Name
- Location (UTM coordinates and street address)
- Land use type (see Section 2.4)
- Local topography
- Facility plot plan identifying:
  - source locations
  - property line
  - horizontal scale
  - building heights
  - emission sources

#### 2. Source and Emission Inventory Information

##### a. Release Parameters

Report the following information for each release location in table format:

- Release location identification number
- Release name
- Release type (e.g., point, volume, area, line, pit, etc.)
- Source identification number(s) used by the facility for sources that emit out of this release location
- Release location using UTM coordinates
- Release parameters by release type (e.g., shown for point source):
- Stack height (m), stack diameter (building dimensions for downwash, exhaust gas exit velocity (m/s), exhaust gas volumetric flow rate (ACFM), exhaust gas exit temperature (K), etc.

##### b. Source Description and Operating Schedule

The description and operating schedule for each source should be reported in table form including the following information:

- Source identification number used by the facility
- Source name
- Number of operating hours per day and per year (e.g., 0800-1700, 2700 hr/yr)
- Number of operating days per week (e.g., Mon-Sat)

9-8

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

- Number of operating days or weeks per year (e.g., 52 wk/yr excluding major holidays)
- Release point identification number(s) for where source emissions are released
- Fraction of source emissions emitted at each release point by release point ID number

#### c. Emission Control Equipment and Efficiency

- Report emission control equipment and efficiency by source and by substance

#### d. Emissions Data Grouped By Source

Report emission rates for each toxic substance, grouped by source (i.e., emitting device or process identified in Inventory Report), in table form including the following information:

- Source name
- Source identification number
- Substance name and CAS number (from Inventory Guidelines)
- Annual average emissions for each substance (lb/yr)
- Hourly maximum emissions for each substance (lb/hr)

#### e. Emissions Data Grouped by Substance

Report facility total emission rate by substance for all emitted substances listed in the Air Toxics "Hot Spots" Program including the following information:

- Substance name and CAS number (from Inventory Guidelines)
- Annual average emissions for each substance (lb/yr)
- Hourly maximum emissions for each substance (lb/hr)

#### f. Emission Estimation Methods

Report the methods used in obtaining the emissions data indicating whether emissions were measured or estimated. Clearly indicate any emission data that are not reflected in the previously submitted emission inventory report and submit a revised emission inventory report to the district. A reader should be able to reproduce the risk assessment without the need for clarification.

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

#### g. List of Substances

Include tables listing all "Hot Spots" Program substances which are emitted, plus any other substances required by the District. Indicate substances to be evaluated for cancer risks and noncancer effects.

#### h. Exposed Population and Receptor Location

Report the following information regarding exposed population and receptor locations:

- Description of zone of impact including map showing the location of the facility, boundaries of zone of impact, census tracts, emission sources, sites of maximum exposure, and the location of all appropriate receptors. This should be a true map (one that shows roads, structures, etc.), drawn to scale, and not just a schematic drawing. USGS 7.5 minute maps or GIS based maps are usually the most appropriate choices. (If significant development has occurred since the user's survey, this should be indicated.)
- Separate maps for the cancer risk zone of impact and the hazard index (noncancer) zone of impact(s). The cancer zone of impact should include isopleths down to at least the 1/1,000,000 risk level. Because some districts use a level below 1/1,000,000 to define the zone of impact, the District should be consulted. For the noncancer zone of impact, three separate isopleths (to represent chronic, 8-hour, and acute HI) should be created to define the zone of impact for the hazard index from both inhalation and noninhalation pathways greater than or equal to 0.5. The point of maximum impact (PMI), maximum exposed individual at a residential receptor (MEIR), and maximum exposed individual worker (MEIW) for both cancer and noncancer risks should be located on the maps.
- Tables identifying population units and sensitive receptors (UTM coordinates, receptor IDs or index from the modeling, and street addresses of specified receptors)
- Heights or elevations of the receptor points.
- **Spatial averaging:** For each receptor type (e.g., PMI, MEIR, and MEIW, or other location of interest) that will utilize spatial averaging, the domain size and grid resolution must be clearly identified. If another domain or grid resolution other than 20 meters by 20 meters with 5-meter grid spacing will be used for a receptor, then care should be taken to determine the proper domain size and grid resolution that should be used. For a worker, the HRA shall support all assumptions used, including, but not limited to, documentation for all workers

showing the area where each worker routinely performs their duties. The final domain size should not be greater than the smallest area of worker movement. Other considerations for determining domain size and grid spacing resolution may include an evaluation of the concentration gradients across the worker area. The grid spacing used within the domain should be sufficient in number and detail to obtain a representative concentration across the area of interest. When spatial averaging over the deposition area of a pasture, garden, or water body, care should be taken to determine the proper domain size to make sure it includes all reasonable areas of potential deposition. The size and shape of the pasture, garden, or water body of interest should be identified and used for the modeling domain. The grid spacing or resolution used within the domain should be sufficient in detail to obtain a representative deposition concentration across the area of interest. One way to determine the grid resolution is to include an evaluation of the concentration gradients across the deposition area. The HRA shall support all assumptions used, including, but not limited to, documentation of the deposition area (e.g., size and shape of the pasture or water body, maps, representative coordinates, grid resolution, concentration gradients, etc.). The use or spatial averaging is subject to approval by the reviewing authority. This includes the size of the domain and grid resolution that is used for spatial averaging of a worksite or multipathway deposition area.

### 3. Meteorological Data

If meteorological data were not obtained directly from the District, then the report must clearly indicate the data source and time period used. Meteorological data not obtained from the District must be submitted in electronic form along with justification for their use including information regarding representativeness and quality assurance.

The risk assessment should indicate if the District required the use of a specified meteorological data set. All memos indicating the District's approval of meteorological data should be attached in an appendix.

### 4. Model Selection and Modeling Rationale

The report should include an explanation of the model chosen to perform the analysis and any other decisions made during the modeling process. The report should clearly indicate the name of the models that were used, the level of detail (screening or refined analysis) and the rationale behind the selection.

Also report the following information for each air dispersion model used:

- Version number
- Selected options and parameters in table form

- Identify the modeling domain(s) and the spacing of receptor grid(s). Grid spacing should be sufficient in number and detail to capture the concentration at all receptors of interest.

### 5. Air Dispersion Modeling Results

The report should include tables, text, and appendices that clearly present all of the following information

- Maximum hourly and annual average concentrations of chemicals at appropriate receptors such as the residential and worker MEI receptors
- Annual average and maximum one-hour (and 30-day average for lead only) concentrations of chemicals at appropriate receptors listed and referenced to computer printouts of model outputs
- Model printouts (numbered), annual concentrations, maximum hourly concentrations
- Disk with input/output files for air dispersion program (e.g., the AERMOD input file containing the regulatory options and emission parameters, receptor locations, meteorology, etc.)
- Include tables that summarize the annual average concentrations that are calculated for all the substances at each site. The use of tables that present the relative contribution of each emission point to the receptor concentration is recommended. (These tables should have clear reference to the computer model which generated the data. It should be made clear to any reader how data from the computer output were transferred to these tables.) [As an alternative, the above two tables could contain just the values for sites of maximum impact (i.e., PMI, MEIR and MEIW), and sensitive receptors, if required. All the values would be found in the Appendices.]

### C. Health Values Used in Dose-Response and Dose Estimates

- Provide tables of the acute, 8-hour and chronic inhalation RELs, chronic oral RELs (if applicable), and cancer potency factors for each substance that is quantified in the HRA.
- Identify the guidelines (title and date) that were used to obtain these factors, or indicate whether newly approved values obtained from the OEHHA website were used.
- Provide a table of target organ systems for each noncancer substance, including acute (1 hour), 8-hour, and chronic inhalation, and chronic oral (if applicable).

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

- Include tables of the estimated dose for each substance by each exposure pathway at the PMI, MEIR, MEIW, and at any sensitive receptor locations (required by the District).

#### D. Risk Characterization

The Hot Spots Analysis and Reporting Program (HARP) will generate the risk characterization data needed for the outline below. Any data needed to support the risk characterization findings should be clearly presented and referenced in the text and appendices. A listing of HARP output files that meet these HRA requirements is provided in this outline under the section entitled "Appendices". All HARP files should be included in the HRA. Ideally, the HRA report and a summary of data used in the HRA will be on paper and all data and model input and output files will be provided electronically (e.g., CD). Information on obtaining copies of HARP is available on the California Air Resources Board's Internet web site under the Air Toxics Program at [www.arb.ca.gov](http://www.arb.ca.gov).

**NOTE:** The cancer risk for the PMI, MEIR, and sensitive receptors of interest must be presented in the HRA's text, tables, and maps. OEHHA recommends that cancer risk for a 30-year exposure duration be presented for the MEIR, and that cancer risk for 9-year and 70-year exposure durations for the MEIR be presented to provide the risk managers with supplemental information. Note that the assessment of population impacts must be based on a 70-year exposure duration; thus all risk assessments need to estimate cancer risk for a 70-year exposure duration in order to report the number of individuals residing in the risk isopleths, or to calculate cancer burden if the District so requires. In addition, some Districts may opt to make risk management decisions based on a 70-year exposure duration. The MEIW location should use a 25-year exposure period.

All HRAs must include the results of a Tier-1 exposure assessment (see Chapter 2 and 8, or the 2012 TSD). If the reviewing authority specifies that additional exposure periods should be presented, or if persons preparing the HRA would like to present additional information (i.e., exposure duration adjustments or the inclusions of risk characterizations using Tier-2 through Tier-4 exposure data), then this information should be presented in separate, clearly titled, sections, tables, and text.

***The following information should be presented in this section of the HRA. If not fully presented here, then by topic, clearly identify the section(s) and pages within the HRA where this information is presented.***

- Description of receptors to be quantified.
- Table and text providing the location [UTM coordinates, receptor ID number or index from the modeling, and the block/street address

9-13

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

(e.g., north side of 3,000 block of Smith Street)] and description of the PMI, MEIR, and MEIW for both cancer and noncancer risks.

- Separate tables and text providing description of the PMI and MEIR for 30-year cancer risk, and 9- or 70-year cancer risk.
- Tables and text describing MEIW 25-year cancer risk.
- Table and text providing the location [UTM coordinates, receptor ID number or index from the modeling, and the block/street address (e.g., north side of 3,000 block of Smith Street)] and description of any sensitive receptor that is of interest to the District or reviewing authorities (consult District or agency).
- Provide any exposure information that is used for risk characterization (e.g., concentrations at receptors, emissions information, census information, figures, zone of impact maps, etc.). If multipathway substances are emitted, identify the site/route dependent exposure pathways (e.g., water ingestion) for the receptor(s), where appropriate (e.g., MEIR).
- Provide a summary of the site-specific inputs used for each exposure pathway (e.g., water or grazing intake assumptions). This information may be presented in an appendix with the information clearly presented and cross-referenced to the text. In addition, provide reference to the appendix (section and page number) that contains the modeling (i.e., HARP/dispersion modeling) files that show the same information.
- If any exposure parameters were used other than those provided in the Air Toxics Risk Assessment Guidelines: Technical Support Document for Exposure Assessment and Stochastic Analysis (2012), they must be presented in detail. The derivation and data used must be presented so that it is clear to the reviewer. The justification for using site-specific exposure parameters must be clearly presented.
- Table and text presenting the potential multipathway cancer risk by substance, by pathway, and total, at the PMI, MEIR, MEIW, and sensitive receptor locations (required by the District).
- Table and text presenting the acute (inhalation only) and chronic noncancer (inhalation and oral) hazard quotients (by substance, exposure pathways, and target organs) and the (total) hazard indices by substance and target organs for the PMI, MEIR, MEIW, and sensitive receptors. For 8-hour exposure at the MEIW (inhalation only), table and text presenting hazard quotients (by substance, exposure pathways, and target organs) and the (total) hazard indices by substance and target organs. Note:

9-14

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

Chronic noncancer results should be shown with inhalation and oral contributions (shown separately) and for the combined (multipathway) impact.

- Identify any sensitive subpopulations (e.g., child daycare facilities, schools, nursing homes) of concern.
- Table and text presenting estimates of population exposure (e.g., population exposure estimates or cancer burden from HARP) (consult District or agency). Tables should indicate the number of persons exposed to a (total) cancer risk greater than  $10^{-7}$ ,  $10^{-6}$ ,  $10^{-5}$ ,  $10^{-4}$ , etc., and total hazard quotient or hazard index greater than 0.5, 1.0, 2.0, and 3.0, etc. Provide a table that shows excess cancer burden for each population unit and the total excess cancer burden, if cancer burden calculation is required.
- Provide maps that illustrate the HRA results for the three sub-bullet points below. These maps should be an actual street map of the area impacted by the facility with elevation contours and actual UTM coordinates, and the facility boundaries clearly labeled. In some cases the elevation contours will make the map too crowded and should therefore not appear. This should be a true map (one that shows roads, structures, etc.), drawn to scale, and not just a schematic drawing. USGS 7.5-minute maps are usually the most appropriate choice (see Section 4.6).
  - The facility (emission points and boundaries), the locations of the PMI, MEIR, MEIW, and sensitive receptors.
  - Maps of the cancer zone of impacts (e.g.,  $10^{-6}$  or  $10^{-7}$  levels - consult District or Agency). The map should clearly identify the zone of impact for the inhalation pathway, the minimum exposure pathways (soil ingestion, dermal exposure, and breast-milk consumption) if multipathway substances are emitted, and the zone of impact for all the applicable exposure pathways (minimum exposure pathways plus any additional site/route specific pathways) for multipathway analyses. Two maps may be needed to accomplish this. The legend of these maps should state the level(s) used for the zone of impact and identify the exposure pathways that were included in the assessment.
  - Maps of the noncancer hazard index (HI) zone of impacts (e.g., 0.5 or 1.0 - consult District or Agency). The noncancer maps should clearly identify the noncancer zones of impact. These include the acute (inhalation), 8-hour (inhalation), chronic (inhalation), and chronic (multipathway) zones of impact. For clarity, presentation of the noncancer zones of impact may require two or more maps. The

9-15

## O-MBA20L7

### Air Toxics Hot Spots Program Guidance Manual

February 2015

legend of these maps should state the level(s) used for the zone of impact and identify the exposure pathways.

- The risk assessor may want to include a discussion of the strengths and weaknesses of the risk analyses and associated uncertainty directly related to the facility HRA.
- If appropriate, comment on the possible alternatives for control or remedial measures. How do the risks compare?
- If possible, identify any community concerns that influence public perception of risk.
- Sample calculations may be needed for all analyses in the HRA if proprietary software other than HARP was used. The District should be consulted. These calculations should be clearly presented and referenced to the findings they are supporting in the HRA text.
- Version of the Risk Assessment Guidelines and computer program used to prepare the risk assessment.
- If software other than HARP is used for the health assessment modeling, all supporting material must be included with the HRA (e.g., all algorithms and parameters used in a clear, easy to review format).

#### E. References

Include any references used for the HRA in this section.

#### F. Appendices

The appendices should contain all data, sample calculations, assumptions, and all modeling and risk assessment files that are needed to reproduce the HRA results. Ideally, a summary of data used in the HRA will be on paper and all data and model input and output files will be provided electronically (e.g., CD), unless otherwise specified by the district or reviewing authority. All appendices and the information they contain should be referenced, clearly titled, and paginated.

#### **Potential Appendix Topics (if not presented elsewhere in the HRA report):**

- List of all receptors locations (UTM coordinates, receptor ID number or index from the modeling, and the block/street address (e.g., north side of 3,000 block of Smith Street)) for the PMI, MEIR, MEIW, and sensitive receptors.
- List of all emitted substances.
- All emissions files.

9-16

**Air Toxics Hot Spots Program Guidance Manual**

**O-MBA20L7**  
**February 2015**

- List of dose-response factors (Reference Exposure Levels and cancer potency factors).
- All air dispersion modeling input and output files. Detailed discussions of meteorological data, regulatory options, emission parameters, receptor locations, etc.
- Census data.
- Maps.
- Identify the site/route dependent exposure pathways for the receptor(s), where appropriate (e.g., MEIR). Provide a summary of the site-specific inputs used for each pathway (e.g., water or grazing intake assumptions) and the data to support them.
- All calculations used to determine emissions, concentrations, and potential health impacts at the PMI, MEIR, MEIW, and sensitive receptors.
- All HRA model input and output (HARP) files for receptors of concern.
- (Total) cancer and noncancer impacts by receptor, substance, and exposure pathway (by endpoint for noncancer) at all receptors.
- Presentation of alternate risk assessment methods (e.g., alternate exposure durations, or Tier-2 to Tier-4 evaluations with supporting information).

## Air Toxicology and Epidemiology

### ADOPTION OF THE REVISED AIR TOXICS HOT SPOTS PROGRAM TECHNICAL SUPPORT DOCUMENT FOR CANCER POTENCY FACTORS [06/01/09] APPENDIX C UPDATED 2011

The Office of Environmental Health Hazard Assessment (OEHHA) is required to develop guidelines for conducting health risk assessments under the Air Toxics Hot Spots Program (Health and Safety Code Section 44360(b)(2)). OEHHA initially developed Technical Support Documents (TSDs) in 1999-2000 in response to this statutory requirement, including one which listed and described the derivation of cancer potencies for individual air contaminants. OEHHA has developed a revised draft TSD, "Air Toxics Hot Spots Program Technical Support Document for Cancer Potencies," which is designed to replace the original TSDs. The revised TSD presents updated methodology that reflects scientific knowledge and techniques developed since the previous guidelines were prepared, and in particular to explicitly include consideration of possible differential effects on the health of infants, children and other sensitive subpopulations, in accordance with the mandate of the Children's Environmental Health Protection Act (Senate Bill 25, Escutia, Chapter 731, Statutes of 1999, Health and Safety Code Sections 39669.5 et seq.).

[A draft of the TSD was released on June 20, 2008](#) to solicit public comment. The document was then reviewed by the State's Scientific Review Panel on Toxic Air Contaminants (SRP). It was initially presented to the SRP on [October 10, 2008](#). Revised versions of the document reflecting new data and comments from the public and the SRP were discussed at meetings held on December 5, 2008 and May 12, 2009. At the latter meeting, the SRP approved the final versions of the methodology section and the associated appendices.

Following this process, and by this memo, OEHHA is finalizing and adopting the TSD for Cancer Potency Factors. Adoption of the TSD does not automatically affect the existing cancer potency factors for individual air contaminants (which are listed in the appendices to the TSD). These existing cancer potency values are listed in Appendix A to the new TSD, and the toxicological summaries describing their derivation are presented in Appendix B. Any further new or revised cancer potencies approved by the SRP will be adopted and also included in these appendices.

## Air Toxicology and Epidemiology

### NOTICE OF ADOPTION OF AIR TOXICS HOT SPOTS PROGRAM RISK ASSESSMENT GUIDELINES: REVISED TECHNICAL SUPPORT DOCUMENT FOR EXPOSURE ASSESSMENT AND STOCHASTIC ANALYSIS [08/27/12]

The Office of Environmental Health Hazard Assessment (OEHHA) is adopting an updated version of the document, *Air Toxics Hot Spots Program Risk Assessment Guidelines: Technical Support Document for Exposure Assessment and Stochastic Analysis*. The document becomes available on the OEHHA Home Page at <http://www.oehha.ca.gov> on August 27, 2012.

#### BACKGROUND

OEHHA is required to develop guidelines for conducting health risk assessments under the Air Toxics Hot Spots Program (Health and Safety Code Section 44360(b)(2)). OEHHA previously developed Technical Support Documents (TSDs) in response to this statutory requirement, including one in 2000 for exposure assessment. This revised draft TSD replaces the original TSD, and reflects new scientific knowledge developed since the previous guidelines were prepared. We have updated exposure parameters (e.g., inhalation rate, food consumption rate, etc.) based on the most recent data, including exposure factors for infants and children, in accordance with the mandate of the Children's Environmental Health Protection Act (Senate Bill 25, Escutia, Chapter 731, Statutes of 1999, Health and Safety Code Sections 39669.5 *et seq.*). The revised document also updates the approach to assessing dermal exposure.

A draft version of this TSD was released for public comment on [November 7, 2011](#), and was discussed at public workshops in Oakland and Diamond Bar, CA in December 2011. The document was then revised to reflect public comments, and peer reviewed by the State's Scientific Review Panel on Toxic Air Contaminants (SRP). It was initially presented to the SRP on April 5, 2012. A revised version of the document reflecting comments of the SRP was discussed at a second meeting held on [June 25, 2012](#). At the latter meeting, the SRP approved the document describing the RELs and their derivation, subject to some additional editorial changes which have been incorporated into the final version.

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

### 3 Daily Breathing Rates

#### 3.1 Introduction

This chapter presents age-specific breathing rates for use in health risk assessments for short-term exposure to maximum 1-hour facility emissions and for long-term daily average exposures resulting from continuous or repeated 8-hour exposure. The specified age ranges of interest in the "Hot Spots" program are ages third trimester, 0<2, 2<9, 9<16, 16<30 and 30-70 years.

The term ventilation rate has been frequently used for the metric of volume of air inhaled per minute (i.e., mL/min) and is used in this document to describe short-term, one hour exposures. For convenience, the term "breathing rate" is applied throughout this chapter for chronic daily exposure, both to the metric of volume of air inhaled per day (L/day) and the volume of air inhaled per kg body weight per day (L/kg-day). The normalized daily breathing rate in L/kg-day is the preferred metric for use in the "Hot Spots" program. The term "respiratory rate" is not used in this chapter interchangeably with "breathing rate" because respiratory rate usually represents the number of breaths taken per unit time, and not the volume of air taken in per unit time.

The 8-hour breathing rates were developed for specialized exposure scenarios that involve exposures only during facility operations of about 8-12 hours/day. Eight-hour breathing rates reflect exposures to off-site workers or exposures that may occur in schools when class is in session. Ventilation rates for 1-hour exposure were developed to meet the SB-352 mandate for school districts to conduct a risk assessment at school sites located within 100 meters of a freeway or busy roadway. These ventilation rates were developed for exposures to 1-hour maximum facility emissions that may occur during passive activities such as sitting at a desk during class instruction or during higher intensity activities such as play during recess.

OEHHA recommends the breathing rates presented in Section 3.2. Various published methods for deriving daily breathing rates and their advantages and limitations are discussed in Sections 3.3 to 3.7. Where possible, the breathing rates from these reports were re-evaluated to correspond with the five specific age groups used in OEHHA's risk assessment guidelines.

At elevations above 5000 feet, the ventilation rate will increase due to lower air pressure (NOLS, 2012). The respiratory rate at this elevation peaks at one week and then slowly decreases over the next few months, although it tends to remain higher than its normal rate at sea level. There have been a few facilities located at 5000 feet or higher that have been required to produce a Hot Spots risk assessment. However, long-term residents at high altitude will have breathing rates near what is found in residents at sea level. OEHHA does not anticipate any adjustments will be needed to the breathing rates at higher altitudes in California, although the Districts should consider this issue and adjust if needed for very high altitude facilities.

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

### 3.2 Breathing Rate Recommendations

#### 3.2.1 Long-Term Breathing Rates

The recommended long-term daily breathing rate point estimates in Table 3.1 are based on a mean of two different methods used to determine daily breathing rates, the doubly labeled water method and an energy intake approach based on food consumption data from the Continuing Survey of Food Intake of Individuals (CSFII) (See Section 3.5.5). These methods are described in detail below. The recommended distributions for stochastic analysis are presented in Tables 3.2a-b. The breathing rates normalized to body weight are expressed in L/kg-day, and the non-body weight-normalized breathing rates are expressed in m<sup>3</sup>/day. All values were rounded to two or three significant figures.

**Table 3.1. Recommended Point Estimates for Long-Term Daily Breathing Rates**

	3 <sup>rd</sup> Trimester	0<2 years	2<9 years	9<16 years	16<30 years	30-70 years

### 3.2.2 Eight-hour Breathing Rate Point Estimates

The 8-hour breathing rates are based on minute ventilation rates derived by U.S. EPA (2009). The minute ventilation rates, presented in Section 3.6, were multiplied by 480 (60 min x 8) to generate 8-hour breathing rate point estimates shown in Table 3.3. The 8-hour breathing rates may be useful for cancer risk assessment for the off-site worker exposure scenario, and school exposures to facility emissions. They may also be useful for evaluating residential exposures where the facility operates non-continuously. The 8-hour breathing rates vary depending on the intensity of the activity. Exposed individuals may be engaged in activities ranging from watching TV to desk work, which would reflect breathing rates of sedentary/passive or light activities, to yard work or farm worker activities, which would reflect breathing rates of moderate intensity or greater. Breathing rates resulting from high intensity activities generally cannot be sustained for an 8-hour period (see Section 3.6).

OEHHA recommends using point estimate 8-hour breathing rates in L/kg-8-hrs based on the mean and 95<sup>th</sup> percentile of moderate intensity activities, 170 and 230 L/kg-8-hrs, respectively, for adults 16-70 yrs old. Point estimates for lower breathing rates of

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

sedentary/passive and light intensity work activities may be used in site-specific scenarios (i.e., work in which activity is limited to desk jobs or similar work). Pregnant women will generally participate in lower intensity activities than non-pregnant women, but as shown in Tables 3.1 and 3.2, breathing rate normalized to body weight will be slightly greater than breathing rates of adult men and non-pregnant women combined. OEHHA recommends using the mean and 95<sup>th</sup> percentile 8-hour breathing rates based on moderate intensity activity of 16<30 year-olds for third trimester women.

### 3.2.3 Short-term (1-Hour) Ventilation Rate Point Estimates

One-hour ventilation rates (Tables 3.4a-b) were calculated from U.S. EPA (2009) minute ventilation rates (e.g., minute ventilation rate x 60) to meet the SB-352 mandate for school districts to conduct a risk assessment for school sites located within 100 M of a freeway or busy roadway. These ventilation rates allow assessment of exposures to facility emissions during the course of the school day.

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

The age groups for children mostly deviate from those child age groupings designed for AB2588. The age groups attempt to address specific school categories (e.g., kindergarten, grade school, high school) under SB-352. However, if 1-hr ventilation rates are required that fit the AB2588 age groups, 1-hr ventilation rates can be calculated from the 8-hr breathing rates shown in Tables 3.28a-b.

For children at school, MET activity levels equivalent to sitting at a desk during instruction and outside at play can be used as guidance for determining 1-hour breathing rates. As shown in Table 3.26 below, sitting was assigned a MET of 1.5, while play outdoors, recess and physical education had mean MET values in the range

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

of 4.5 to 5.0 (U.S. EPA, 2009). Thus, 1-hour breathing rates based on sedentary/passive or light activities to represent activities within the class room and moderate intensity activities to represent activities during recess and some physical education classes, are recommended.

U. S. EPA (2009) also determined ventilation rates for high intensity activities with MET values  $\geq 6.0$ . The distributions generated by U.S. EPA for hrs/day spent at MET values  $\geq 6.0$  for infants (age 0<2 yrs) suggests that this level of activity is unlikely for this age group. However, there is a subgroup of children in the older child age groups that exercise at this level for at least one hr/day, although this level of activity may not happen all in one hour's time. OEHHHA recommends using 1-hr high intensity ventilatory rates for after-school sports and training that require high energy output such as track, football, tennis etc. This MET category may also be used for demanding sports during physical education classes.

### 3.3 Estimation of Daily Breathing Rates

#### 3.3.1 Inhalation Dose and Cancer Risk

The approach to estimating cancer risk from long-term inhalation exposure to carcinogens requires calculating a range of potential doses and multiplying by cancer potency factors in units of inverse dose to obtain a range of cancer risks. This range reflects variability in exposure rather than in the dose-response. In equation 3-1, the daily breathing rate (L/kg BW-day) is the variate which is varied for each age group.

The general algorithm for estimating dose via the inhalation route is as follows:

$$\text{DOSE}_{\text{air}} = \text{C}_{\text{air}} \times [\text{BR}/\text{BW}] \times A \times \text{EF} \times (1 \times 10^{-6}) \quad (\text{Eq. 3-1})$$

where:

DOSE <sub>air</sub>	= dose by inhalation (mg/kg BW-day)
C <sub>air</sub>	= concentration in air (μg/m <sup>3</sup> )
[BR/BW]	= daily breathing rate normalized to body weight (L/kg BW-day)
A	= inhalation absorption factor, if applicable (default = 1)
EF	= exposure frequency (days/365 days)
1 x 10 <sup>-6</sup>	= conversion factors (μg to mg, L to m <sup>3</sup> )

The inhalation absorption factor (A) is a unitless factor that is only used if the cancer potency factor itself includes a correction for absorption across the lung. It is inappropriate to adjust a dose for absorption if the cancer potency factor is based on applied rather than absorbed dose. The exposure frequency (EF) is set at 350 days per year (i.e., per 365 days) to allow for a two week period away from home each year. (US EPA, (1991). Another factor may come into consideration in the inhalation dose equation, the fraction of time at home (FAH). See Chapter 11 for more details. For cancer risk, the risk is calculated for each age group using the appropriate age sensitivity factors (ASFs) and the chemical-specific cancer potency factor (CPF), expressed in units of (mg/kg-day)<sup>-1</sup>.

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

$$\text{RISK}_{\text{air}} = \text{DOSE}_{\text{air}} \times \text{CPF} \times \text{ASF} \times \text{ED}/\text{AT} \quad (\text{Eq. 3-2})$$

RISK is the predicted risk of cancer (unitless) over a lifetime as a result of the exposure, and is usually expressed as chances per million persons exposed (e.g.,  $5 \times 10^{-6}$  would be 5 chances per million persons exposed).

The dose-response phase of a cancer risk assessment aims to characterize the relationship between an applied dose of a carcinogen and the risk of tumor appearance in a human. This is usually expressed as a cancer potency factor, or CPF, in the above equation. The CPF is the slope of the extrapolated dose-response curve and is expressed as units of inverse dose (mg/kg-d)<sup>-1</sup>, or inverse concentration (μg/m<sup>3</sup>)<sup>-1</sup>.

Exposure duration (ED) is the number of years within the age groupings. In order to accommodate the use of the ASFs (OEHHHA, 2009), the exposure for each age grouping must be separately calculated. Thus, the DOSE<sub>air</sub> and ED are different for each age grouping. The ASF, as shown below, is 10 for the third trimester and infants 0<2 years of age, is 3 for children age 2<16 years of age, and is 1 for adults 16 to 70 years of age.

ED = exposure duration (yrs):	
0.25 yrs for third trimester	(ASF = 10)
2 yrs for 0<2 age group	(ASF = 10)
7 yrs for 2<9 age group	(ASF = 3)
14 yrs for 2<16 age group	(ASF = 3)
14 yrs for 16<30 age group	(ASF = 1)
54 yrs for 16-70 age group	(ASF = 1)

AT, the averaging time for lifetime cancer risks, is 70 years in all cases. To determine lifetime cancer risks, the risks are then summed across the age groups:

$$\text{RISK}_{\text{air}}(\text{lifetime}) = \text{RISK}_{\text{air}}(\text{3rdtrn}) + \text{RISK}_{\text{air}}(\text{0<2 yr}) + \text{RISK}_{\text{air}}(\text{2<16 yr}) + \text{RISK}_{\text{air}}(\text{16-70yr}) \quad (\text{Eq. 3-3})$$

As explained in Chapter 1, we also need to accommodate cancer risk estimates for the average (9 years) and high-end (30 years) length of time at a single residence, as well as the traditional 70 year lifetime cancer risk estimate. For example, assessing risk in a 9 year residential scenario assumes exposure during the most sensitive period, from the third trimester to 9 years of age and would be presented as follows:

$$\text{RISK}_{\text{air}}(\text{9-yr residency}) = \text{RISK}_{\text{air}}(\text{3rdtrn}) + \text{RISK}_{\text{air}}(\text{0<2 yr}) + \text{RISK}_{\text{air}}(\text{2<9 yr}) \quad (\text{Eq. 3-4})$$

For 30-year residential exposure scenario, the 2<16 and 16<30 age group RISK<sub>air</sub> would be added to the risk from exposures in the third trimester and ages 0<2yrs. For 70 year residency risk, Eq 3-3 would apply.

#### 3.3.2 Methods for Estimating Daily Breathing Rates

Two basic techniques have been developed to indirectly estimate daily breathing rates: the time-activity-ventilation (TAV) approach and an energy expenditure derivation

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

method. Ideally, daily breathing rates would be directly measured. However, the equipment for direct measurement is bulky and obtrusive and thus impractical for measuring breathing rates over an entire 24-hour period, especially on children performing their typical activities. Thus, ventilation measurements are typically taken for shorter time periods under specific conditions (e.g., running or walking on a treadmill).

The TAV approach relies on estimates or measurements of ventilation rates at varying physical activity levels, and estimates of time spent each day at those activity levels. An average daily breathing rate is generated by summing the products of ventilation rate (L/min) and time spent (min/day) at each activity level.

The second approach derives breathing rates based on daily energy expenditure and was first proposed by Layton (1993). Layton reasoned that breathing rate is primarily controlled by the amount of oxygen needed to metabolically convert food into energy the body can use. Because the volume of oxygen required to produce one kcal of energy and the ratio of the volume of oxygen consumed to the volume of air inhaled per unit time are both constant values, the amount of energy a person expends is directly proportional to the volume of air the person breathes. Layton (1993) developed an equation that models this relationship and that can be used to derive breathing rates from energy expenditure data:

$$VE = H \times VQ \times EE \quad (\text{Eq. 3-5})$$

where:

VE = the volume of air breathed per day (L/day),  
H = the volume of oxygen consumed to produce 1 kcal of energy (L/kcal),  
VQ = the ratio of the volume of air to the volume of oxygen breathed per unit time and is referred to as the breathing equivalent (unitless)  
EE = energy (kcal) expended per day

Layton calculated an H value of 0.21 L/kcal for noninfant children. Arcus-Arth and Blaisdell (2007) calculated essentially the same H value of 0.22 L/kcal from data of non-breastfed infants based on food surveys. For VQ, Layton calculated a value of 27 from adult data. Children have different respiratory minute ventilation rates, as well as other respiratory parameter values, relative to adults. Therefore, children's VQ values can be different from those of adults. Arcus-Arth and Blaisdell (2007) calculated VQ values for children from which daily breathing rates can be derived (Table 3.5).

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

**Table 3.5. Mean VQ Values Calculated for Children**

	Weighted mean VQ	Recommended VQ
Infants 0-11 mo.	nd <sup>a</sup>	33.5
Boys & girls 1-3 yrs	nd <sup>a</sup>	33.5
Boys & girls 4-8 yrs	33.5	33.5
Boys 9-18 yrs	30.6	30.6
Girls 9-18 yrs	31.5	31.5

<sup>a</sup> Insufficient or no data

Three variations of estimating EE have been used based on conversion of metabolic energy to derive a breathing rate: (1) from the caloric content of daily food intake, (2) as the product of basal metabolic rate (BMR) and ratios of average daily energy expenditure to BMR, and (3) as time-weighted averages of energy expenditure (expressed as multiples of BMR) across different levels of physical activity during the course of a day. Published reports applying these variations in metabolic energy conversion to arrive at breathing rates using Layton's equation are summarized below.

In addition to using energy intake data with Layton's method to derive breathing rates, an approach called the doubly labeled water (DLW) technique has also been used to derive total energy expenditure and is summarized below. The DLW data have been shown to be quite accurate, but the approach has only been applied to specific sub-populations.

### 3.4 Available Daily Breathing Rate Estimates

There are a number of sources of information on daily breathing rates for various age groups and other subpopulations that have been derived via the methods described above. Some sources have compiled breathing rates from other studies.

#### 3.4.1 Traditional Breathing Rate Estimation

The book Reference Man (Snyder et al., 1975), a report by the International Commission on Radiological Protection (ICRP), presents breathing rates based on about 10 limited studies. Using an assumption of 8 hour (hr) resting activity and 16 hr light activity and the breathing rates (see Table 3.6), ICRP recommended daily breathing rates of 23 m<sup>3</sup>/day for adult males, 21 m<sup>3</sup>/day for adult females, and 15 m<sup>3</sup>/day for a 10 year old child. In addition, assuming 10 hr resting and 14 hr light activity each day, ICRP recommends a daily breathing rate of 3.8 m<sup>3</sup>/day for a 1 year old. Finally, assuming 23 hr resting and 1 hr light activity, ICRP recommends a daily breathing rate of 0.8 m<sup>3</sup>/day for a newborn. The breathing rates estimated by the ICRP used sources that had a small sample size and were limited in scope. Table 3.6 is the minute volume data upon which the daily breathing rates were based.

## O-MBA20L7

FINAL, August, 2012

**Table 3.6. Minute Volumes from ICRP'S Reference Man <sup>a</sup>**

	Resting L/min (m <sup>3</sup> /hr)	Light Activity L/min (m <sup>3</sup> /hr)
Adult male	7.5 (0.45)	20 (1.2)
Adult female	6.0 (0.36)	19 (1.14)
Child, 10 yr	4.8 (0.29)	13 (0.78)
Child, 1 yr	1.5 (0.09)	4.2 (0.25)
Newborn	0.5 (0.03)	1.5 (0.09)

<sup>a</sup> Data compiled from available studies measuring minute volume at various activities by age/sex categories

This report provided the approach used in traditional risk assessment, in that a single estimate of daily breathing was employed, often 20 m<sup>3</sup>/day for a 70-kg person.

### 3.4.2 Daily Breathing Rate Estimates Based on Time-Activity-Ventilation (TAV) Data

#### 3.4.2.1 Marty et al. (2002)

Marty et al. (2002) derived California-specific distributions of daily breathing rates using estimates and measurements of ventilation rates at varying physical activity levels, and estimates of time spent each day at those activity levels. Two activity pattern studies were conducted in which activities of a randomly sampled population of 1762 adults and 1200 children were recorded retrospectively for the previous 24 hours via telephone interview (Phillips et al., 1991; Wiley et al., 1991a; Wiley et al., 1991b; Jenkins et al., 1992). Measured breathing rates in people performing various laboratory and field protocols were conducted by Adams et al. (1993). The subjects in this study were 160 healthy individuals of both sexes, ranging in age from 6 to 77 years. An additional forty 6 to 12 year olds and twelve 3 to 5 year olds were recruited for specific protocols.

For adults, each activity was assigned to a resting, light, moderate, moderately heavy, or heavy activity category to reflect the ventilation rate that could reasonably be associated with that activity. For children there were only resting, light, moderate, and heavy activity categories. The ventilation rates were classified into similar levels (e.g., the lying down protocol was considered the resting category of ventilation rate). The measured ventilation for each individual in the lab and field protocols was divided by that person's body weight. For each individual, the time spent at each activity level was summed over the day. The mean ventilation rate for each category (resting, etc.) was then multiplied by the summed number of minutes per day in that category to derive the daily breathing rate for each category. The breathing rates were then summed over categories to give a total daily breathing rate. The moments and percentiles for the raw derived breathing rates as well as for the breathing rates fit to a gamma distribution are presented in Tables 3.7 and 3.8 for the combined group of adolescents and adults (i.e., >12 years age) and for children (<12 years age). OEHHHA staff also derived distributions of breathing rates for the equivalent of a 63-kg adult and

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

an 18-kg child. These breathing rates form the basis of the current risk assessment guidelines (OEHHA, 2000), which this document is revising.

**Table 3.7 Children's (<12 Years) Daily Breathing Rates (L/Kg-Day)**

	Moments and Percentiles from Empirical Data	Moments and Percentiles, Fitted Gamma Parametric Model	Breathing Rate Equivalent for a 18 kg Child, m <sup>3</sup> /Day (Empirical Data)

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

**Table 3.8 Adult/Adolescent (>12 Years) Breathing Rates (L/kg-Day)**

	Moments and Percentiles from Empirical Data	Moments and Percentiles, Fitted Gamma Parametric Model	Breathing Rate Equivalent for a 63 kg Adult, m <sup>3</sup> /Day
N	1579		
Mean	232	233	14.6
Std Dev	64.6	56.0	4.07
Skewness	2.07	1.63	
Kurtosis	6.41	6.89	
<b>%TILES</b>	<b>L/kg-day</b>		
1%	174	(Not calculated)	11.0
5%	179	172.3	11.3
10%	181	178.0	11.4
25%	187	192.4	11.8
50%	209	218.9	13.2
75%	254	257.9	16.0
90%	307	307.8	19.3
95%	381	342.8	24.0
99%	494.0	(Not calculated)	31.1
Sample Max	693		43.7

Advantages of these rates are that the activity pattern data were from a large randomly sampled population of California adults and children, and that ventilation rates were normalized by body weight for each individual in the ventilation rate study. However, body weight information was not available for the activity pattern subjects. Measured breathing rates during specified activities were also collected from California participants with the intention that the data would be used in conjunction with the activity pattern data to derive daily breathing rates.

Limitations include the use of one-day activity pattern survey data that may tend to overestimate long-term daily breathing rates because both intraindividual variability and interindividual variability are poorly characterized. However, intraindividual variability is believed to be small relative to interindividual variability, which would make the breathing rate distributions reasonably accurate for chronic exposure assessment. Despite these limitations, the derived breathing rates were reasonably similar to those measured by the doubly-labeled water method (described in (OEHA, 2000)).

Because the time-weighted average method involves professional judgment in assigning a breathing rate measured during a specific activity to various other types of activities, some uncertainty is introduced into the resulting daily breathing rates. Lastly, there is a paucity of breathing rate data for specific activities in children in the 3 to 6

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

year age range, and no data for children and infants younger than 3 years old. Thus, only a broad age range (i.e., < 12 years old) could be used for estimating daily breathing rates in children. Daily breathing rates cannot be reliably estimated from this study for children and infants over narrow age ranges, such as the critical 0<2 year age group.

### 3.4.2.2 Allan et al. (2008)

Allan et al. (2008) also estimated breathing rates for specified age groups by the TAV approach, but employed a greater number of time-activity data sets than that used by Marty et al. (2002). This study updated TAV inhalation rate distributions from a previous report by Allan and Richardson (1998) by incorporating supplemental minute volume and time-activity data, and by correlating minute volume with metabolic equivalents (METs) for performing the physical activities at the time of measurement. Published time-activity and minute volume data used by Marty et al. (2002) were also used by the authors to develop the distributions (Wiley et al., 1991a; Wiley et al., 1991b; Adams, 1993), but also a number of other reports primarily conducted in the USA and Canada.

Their TAV approach calculated mean expected breathing rates for five different activity levels (i.e., level 1 – resting; level 2 – very light activity; level 3 – light activity; level 4 – light to moderate activity, level 5 – moderate to heavy activity). For infants, only three levels of activity were defined (i.e., sleeping or napping, awake but not crying, and crying).

Probability density functions describing 24-hour inhalation rates were generated using Monte Carlo simulation and can be described with lognormal distributions. Table 3.9 presents the estimated breathing rates in m<sup>3</sup>/day for males and females (combined) by age groupings commonly used in Canada for risk assessment purposes. In their report, Allan et al. (2008) also provided breathing rates for males and females separately. However, breathing rate distributions adjusted for body weight (m<sup>3</sup>/day-kg) were not included in the report.

**Table 3.9. Allan et al. (2008) TAV-Derived Daily Breathing Rates (m<sup>3</sup>/Day) for Males And Females Combined**

Age Category	Males and Females Combined (m <sup>3</sup> /day)			
	Mean + SD	50%-ile <sup>a</sup>	90%-ile <sup>a</sup>	95%-ile <sup>a</sup>
Infants (0-6 mo)	2.18 ± 0.59	2.06	2.87	3.12
Toddlers (7 mo-4 yr)	8.31 ± 2.19	7.88	10.82	11.72
Children (5-11 yr)	14.52 ± 3.38	13.95	18.49	19.83
Teenagers (12-19 yr)	15.57 ± 4.00	14.80	20.09	21.69
Adults (20-59 yr)	16.57 ± 4.05	15.88	21.30	22.92
Seniors (60+ yr)	15.02 ± 3.94	14.35	19.72	21.36

<sup>a</sup> Percentiles provided courtesy of Allan (e-mail communication)

Allan et al. (2008) compared the breathing rate distribution derived by the DLW method (see below, Table 3.12) to their TAV breathing rate probability density function results and found that there appeared to be longer tails in the upper bounds for all age groups except teenagers and infants for the TAV method, suggesting the TAV distribution gives

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

a better representation of the more exposed members of the population such as athletes. For teenagers, the TAV and DLW distributions show considerable overlap. But for infants, lower breathing rates were observed by the TAV approach compared with the DLW approach. The authors could not explain this discrepancy. Unlike the Marty et al. (2002) study, daily breathing rates could be estimated in infants and toddlers. However, there is still a shortage of TAV data in children in the younger age groups relative to adults.

Uncertainty was reduced by grouping activities by expected METs. However, Allen et al. (2008) noted that there is still uncertainty about actual physical exertion at an activity level because of the way some source studies grouped activities (e.g., grouping walking with running). Uncertainty was also reduced by using, wherever possible, studies that documented all activities over a multi-day period rather than studies that considered only a few hours of behavior. Nevertheless, there is some uncertainty in combining data from disparate studies and in assigning ventilation rates to activities that are not described by energy expenditure levels. In particular, interpolations and extrapolations were used to fill in minute volume data gaps and may have resulted in overestimates or underestimates. For example, minute volume data for some activity levels in toddlers and children were considered insufficient to adequately characterize their minute volumes.

### 3.4.3 Daily Breathing Rate Estimates Based on Energy Expenditure

As discussed above, Layton (1993) developed a mathematical equation to estimate daily breathing rates based on energy expenditure. The paper also presented examples of breathing rates that had been derived using this method.

#### 3.4.3.1 Layton (1993)

Layton took three approaches to estimating breathing rates from energy estimates. The first approach used the U.S.D.A.'s National Food Consumption Survey (1977-78) data to estimate energy (caloric) intake. The National Food Consumption Survey used a retrospective questionnaire to record three days of food consumption by individuals in households across the nation, and across all four seasons. Layton recognized that food intake is underreported for individuals 9 years of age and older in these surveys and therefore adjusted the reported caloric intake for these ages. These data are no longer the most current population based energy intake data available. Further, the breathing rates are not normalized to body weight.

The second approach to estimating breathing rates multiplied the BMR estimated for a given age-gender group by the estimated ratio of energy intake to basal metabolic rate (EFD/BMR) for that age-gender group. The BMR can be determined as a linear function of body weight, after accounting for gender and age. An activity multiplier can then be applied which is derived from previously reported ratios of daily food intake to BMR. The advantages of this approach include linking breathing rates to BMR, which is valuable since breathing rates are considered to be determined primarily by BMR.

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

However, the BMR for each age-gender group was calculated from equations derived from empirical but non-representative data. Further, these data were collected using techniques that may be outdated (e.g., for the 0-3 year age group, 9 of the 11 studies were conducted between 1914 and 1952). These data may no longer be representative of the current population. The EFD/BMR ratios for males and females over 18 years of age were estimated from data collected over one year in one study while those for other age groups were estimated based on the consistency of the value in calculating energy expenditures similar to other studies. Average body weights do not capture the variability of body weights in the population. Thus the BMR values may not be as accurate as current technology can provide nor are they representative of the population.

Layton's third approach to calculate daily breathing rates involves the metabolic equivalent (MET) approach, which is a multiple of the BMR and reflects the proportional increase in BMR for a specific activity. For example, the MET for standing is 1.5 (i.e., 1.5\*BMR), and the MET for cycling and swimming is 5.3. Layton categorized METs into 5 levels (from light activity with a MET = 1 to very strenuous activities with a MET = 10). MET levels were then assigned to each activity in a study that had categorized activities by energy expenditure level and recorded the time study participants spent at each activity. The energy expended at each activity was converted to a breathing rate and then summed over the day to give a daily breathing rate. However, the time-activity data used in this approach were only available for ages over 18 years.

The results of Layton's approaches are presented in Table 3.10. Layton did not report statistical distributions of the breathing rates that he derived. Other limitations, for our purposes, are that the breathing rates in Table 3.6 are not representative of the current U.S. population, are not normalized to body weight, and were for broad age ranges. In addition, no distributions were reported in the paper.

**Table 3.10. Layton (1993) Estimates of Breathing Rate Based on Caloric and Energy Expenditure**

Method	Breathing Rate – Men m <sup>3</sup> /day	Breathing Rate – Women m <sup>3</sup> /day
Time-weighted average lifetime breathing rates based on food intake	14	10
Average daily breathing rates based on the ratio of daily energy intake to BMR	13-17 (over 10 years of age)	9.9-12 (over 10 years of age)
Breathing rates based on average energy expenditure	18	13

Finley et al. (1994) presented probability distributions for several exposure factors, including inhalation rates. Based on the data Layton used to derive point estimates via his third approach (i.e., with energy expenditure equivalent to a multiple of BMR), Finley

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

et al. (1994) expanded on Layton's results to develop a probability distribution for breathing rate for several age groups (Table 3.11).

**Table 3.11. Selected Distribution Percentiles from Finley et al. (1994) for Breathing Rates by Age**

Age Category (years)	Percentile (m <sup>3</sup> /day)		
	50th	90th	95th
<3	4.7	6.2	6.7
3 -10	8.4	10.9	11.8
10 – 18	13.1	17.7	19.3
18 – 30	14.8	19.5	21.0
30 – 60	11.8	15.4	16.7
>60	11.9	15.6	16.7

Because Finley largely used the same data as Layton to develop breathing rate distributions, the same limitations apply.

### 3.4.3.2 Arcus-Arth and Blaisdell (2007)

Arcus-Arth and Blaisdell (2007) derived daily breathing rates for narrow age ranges of children and characterized statistical distributions for these rates. The rates were derived using the metabolic conversion method of Layton (1993) and energy intake data (calories consumed per day) from the Continuing Survey of Food Intake of Individuals (CSFII) 1994–1996, 1998 conducted by the USDA (2000). The CSFII provided the most recent population based energy data at the time. The CSFII dataset consisted of two days of recorded food intake for each individual along with self-reported body weights. The individual data allowed for the assessment of interindividual variability. Because one-day intakes may be less typical of average daily intake, the two-day intakes were averaged to obtain a better estimate of typical intake available from these limited repeated measures. The CSFII energy intakes were weighted to represent the U.S. population. The rates were intended to be more representative of the current U.S. children's population than prior rates that had been derived using older or non-representative data.

The premise for Layton's equation is that breathing rate is proportional to the oxygen required for energy expenditure. While there are no energy expenditure data that are representative of the population, there are population representative energy intake data (i.e., calories consumed per day). Energy intake data can be used in Layton's equation when energy intake equals energy expenditure. Energy intake is equal to energy expended when the individual is neither gaining nor losing body weight (i.e., all energy intake is expended). Because the percentage of daily energy intake that is needed to result in a discernible change in body weight for adults is very small, it can be assumed that for adults energy intake equals energy expended. However, in young infants, a significant portion of their daily energy intake is deposited in new tissue (e.g., adipose, bone and muscle). The deposited energy is referred to as the energy cost of deposition (ECD). Therefore, the daily energy intake needed for normal growth of infants is used

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

both for energy expenditure (EE) and ECD (i.e., energy intake = EE + ECD). If the breathing rate is to be estimated by the caloric intake approach for growing infants, the ECD must be subtracted from the total daily energy intake in order to determine an accurate breathing rate.

Accounting for the ECD is primarily important for newborn infants (Butte et al., 1990; Butte et al., 2000). For example, at ages 3 and 6 months the energy cost for growth constituted 22 and 6%, respectively, of total energy requirements. In older children the energy cost is only 2-3% of total energy requirements. By the age of 25 years in males and 19 years in females, the ECD has essentially decreased to zero and remains at that level throughout adulthood (Brochu et al., 2006a).

Because Layton's equation requires only energy expenditure to derive the breathing rate, a small modification to Eq. 3-5 is made when deriving the infant breathing rate using the caloric intake approach:

$$VE = H \times VQ \times (TDEI - ECD) \times 10^{-3} \quad (\text{Eq. 3-6})$$

where:

TDEI = Total daily energy intake (kcal/day)  
ECD = Daily energy cost of deposition (kcal/day)

Arcus-Arth and Blaisdell (2007) subtracted the ECD from the TDEI to give a more accurate estimate of energy expended. The ECD for each month of age for infants up to 11 months of age was estimated from Scrimshaw et al. (1996). Although there is typically a burst of growth just prior to and during adolescence, Arcus-Arth and Blaisdell did not subtract the ECD during adolescence because investigators considered it negligible relative to total energy intake (Spady, 1981; Butte et al., 1989).

Layton (1993) reported on the bias associated with underreporting of dietary intakes by older children. He calculated a correction factor for this bias (1.2) and multiplied the daily energy intake of each child nine years of age and older by 1.2. Arcus-Arth and Blaisdell, having evaluated the literature and finding Layton's adjustment to be reasonable, likewise multiplied daily energy intake of adolescent ages by 1.2.

Arcus-Arth and Blaisdell (2007) also evaluated the numerical values used by Layton for the VQ and H conversion factors in his metabolic equation. Their estimated value for the conversion factor H was similar to that found by Layton. However, they found data in the literature indicating that other values of VQ may be more specific to children than those used by Layton (see Table 3.5). The VQ values Arcus-Arth and Blaisdell calculated were used to derive breathing rates.

Non-normalized (L/day) and normalized (L/kg-day) breathing rates shown in Tables 3.8a-e) were derived for both children and adults from the CSFII dataset using the methodology described in Arcus-Arth and Blaisdell (2007). Briefly, the CSFII used a multistage complex sampling design to select individuals to be surveyed from the population. The CSFII recommended using a Jackknife Replication (JK) statistical

method (Gossett et al., 2002; Arcus-Arth and Blaisdell, 2007), which is a nonparametric  
technique that is preferred to analyze data from multistage complex surveys.

For each age group, the mean, standard error of the mean, percentiles (50th, 90th, and  
95th) of non-normalized and normalized breathing rates, derived as described, are  
presented in Tables 3.12a and 3.12b, respectively. Child breathing rates are for males  
and females combined, except for the 9-18 yr adolescent age group breathing rates  
shown at the bottom of the tables.

Ideally, breathing rates and other variates used in risk assessment should be as representative as possible of the exposed population. Population representative daily energy (caloric) intake can be estimated from national food consumption surveys, such as the CSFII and the National Health and Nutrition Examination Survey (NHANES). These surveys can be analyzed to provide results that are representative of the nation

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

and of several subpopulations, including narrow age groups. The sample sizes are large with these surveys and thus provide relatively robust results, which is of particular concern for the tails of probability distributions.

Limitations for the CSFII energy intake-derived breathing rates include the underreporting of food intakes discussed above. Underestimation of energy intake leads to underestimation of breathing rates. Another limitation is that only two days of food intake data had been collected. Although collection of two consecutive days of food intake is an improvement over earlier collections of one day of food intake, the repeated measures in the survey were still too limited to reduce the impact of daily variations in food intake and would tend to overestimate the upper and lower percentiles. Typical intake is not captured by the caloric intake of two days, and breathing rate and dietary intake on any given day are not tightly coupled.

### 3.4.3.4 US EPA (2009) Metabolic Equivalent-Derived Daily Breathing Rate Estimates

Similar to one of the approaches Layton (1993) used to estimate the breathing rate, U.S. EPA employed a metabolic equivalent (METs) approach for estimating breathing rates. This method determines daily time-weighted averages of energy expenditure (expressed as multipliers of the basal metabolic rate) across different levels of physical activity. METs provide a scale for comparing the physical intensities of different activities. Recent energy expenditure data including the 1999-2002 NHANES and U.S. EPA's Consolidated Human Activity Database (CHAD) were used that considers variability due to age, gender, and activities. NHANES (CDC, 2000; 2002) was used as the source of body weight data, and CHAD (U.S. EPA, 2002) was the central source of information on activity patterns and METs values for individuals. The 4-year sampling weights assigned to the individuals within NHANES 1999-2002 were used to weight each individual's data values in the calculations of these statistics.

Data were grouped into age categories and a simulated 24-hour activity pattern was generated by randomly sampling activity patterns from the set of participants with the same gender and age. Each activity was assigned a METs value based on statistical sampling of the distribution assigned by CHAD to each activity code. Using statistical software, equations for METs based on normal, lognormal, exponential, triangular and uniform distributions were generated as needed for the various activity codes. The METs values were then translated into energy expenditure (EE) by multiplying the METs by the basal metabolic rate (BMR), which was calculated as a linear function of body weight. The VO<sub>2</sub> was calculated by multiplying EE by H, the volume of oxygen consumed per unit energy.

The inhalation rate for each activity within the 24-hour simulated activity pattern for each individual was then estimated as a function of VO<sub>2</sub>, body weight, age, and gender. Following this, the average inhalation rate was calculated for each individual for the entire 24-hour period, as well as for four separate classes of activities based on METs value (sedentary/passive [METs less than or equal to 1.5], light intensity [METs greater than 1.5 and less than or equal to 3.0], moderate intensity [METs greater than 3.0 and less than or equal to 6.0], and high intensity [METs greater than 6.0]. Data for

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

individuals were then used to generate summary tables with distributional data based on gender and age categories (Tables 3.13a and 3.13b). No parametric distributional assumptions were placed on the observed data distributions before these statistics were calculated.

US EPA (2009) described the strengths and weaknesses of their approach. The strengths of this metabolically-derived method include nationally representative data sets with a large sample size, even within the age and gender categories. This approach also yields an estimate of ventilation rate that is a function of VO<sub>2</sub> rather than

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

an indirect measure of oxygen consumption such as VQ as other researchers have used.

Another strength is that the breathing rates included a BMR component which had been derived from NHANES body weights and to which NHANES sampling weights were linked. The BMR component of the breathing rates was representative of the population because of the sampling weights. That is, the degree of association between body weight and breathing rate was incorporated into the distribution of breathing rate distributions.

However, the degree of association between breathing rate and other characteristics (e.g., race, geographic region) was not incorporated into the distributions (US EPA, 2009). These non-body weight characteristics can be highly associated with variability in activity patterns. Although BMR may contribute the greatest percent to the quantitative breathing rate value, the variability in breathing rates is most likely driven by differing levels of physical activity by different persons. Because the activity data was collected over a 24-hour period, day-to-day variability is not well characterized (US EPA, 2009; US EPA, 2011). The outcome is that the simulated 24-hour activity pattern assigned to an NHANES participant is likely to contain a greater variety of different types of activities than one person may typically experience in a day.

Furthermore, because the simulated activity profiles did not consider possible limits on the "maximum possible METS value" that would account for previous activities, ventilation rates may be overestimated (US EPA, 2009). This happens, in part, because the MET approach does not take into consideration correlations that may exist between body weight and activity patterns. For example, high physical activity levels can be associated with individuals of high body weight, leading to unrealistically high inhalation rates at the upper percentiles levels (US EPA 2011). The result is that the central tendency of the MET breathing rates may be fairly representative of the population, but the breathing rates may not appropriately capture the variability within the population. This limitation was probably most evident in children <3 years of age where the data used to calculate BMR values may be less representative of the current population (US EPA, 2009).

### 3.4.4 Daily Breathing Rate Estimates from Doubly Labeled Water Measurements

In another method used to quantify human energy expenditure, published doubly-labeled water (DLW) energy expenditure data can be used in conjunction with Layton's equation to convert metabolic energy to daily inhalation rates (Brochu et al., 2006a; 2006b; Stifelman, 2007). In the DLW method, isotopically labeled water containing <sup>2</sup>H<sub>2</sub>O (i.e., heavy water) and H<sub>2</sub><sup>18</sup>O is given orally to the study participant. The isotopes then distribute in the body and disappear from body water pools by dilution from new unlabeled water into the body, by the excretion of the labeled isotope from the body, or by the production of CO<sub>2</sub>. The difference in disappearance rates between the two isotopes represents CO<sub>2</sub> production over an optimal period of 1–3 half-lives (7 to 21 days in most human subjects) of the labeled water. CO<sub>2</sub> production is an indirect

FINAL, August, 2012

measure of metabolic rate and can be converted into units of energy using knowledge of the chemical composition of the foods consumed.

A major advantage of the DLW method is that it provides an index of total energy expenditure over a period of 1 to 3 weeks, which is a more biologically meaningful period of time compared to the other methods, and can reduce the impact of daily variations in physical activity or food intake (IOM, 2005). In addition, the DLW method is non-invasive, requiring only that the subject drink the stable isotopes and provide at least three urine samples over the study period. Thus, measurements can be made in subjects leading their normal daily lives (i.e., free-living individuals). The DLW method is considered to be the most accurate method for determining the breathing rate of an individual (IOM, 2005).

A disadvantage is that the DLW method is expensive to undertake, and that essentially all the available studies investigated different age ranges but the subjects were not randomly selected to be representative of populations. However, measurements are available in a substantial number of men, women and children whose ages, body weights, heights and physical activities varied over wide ranges.

DLW measurements of total daily energy expenditures (TDEE) include basal metabolism, physical activity level, thermogenesis, and the synthetic cost of growth (Butte et al., 2000). The synthetic cost of growth is the energy that is expended to synthesize the molecules that will be stored. This is different from the energy deposited for growth (ECD), which is the energy intake that is deposited in the body for new tissue. The ECD is an important factor in newborn infants and is not accounted for in DLW measurements. Thus, the derivation of breathing rates using Layton's equation does not require an adjustment to subtract out the ECD to determine TDEE, as was necessary for deriving the breathing rates of infants by the caloric intake approach (Section 3.5.3.2).

### 3.4.4.1 Brochu et al. (2006a,b)

Brochu et al. (2006a) calculated daily inhalation rates for 2210 individuals aged 3 weeks to 96 years using DLW energy expenditure data mainly from the IOM (2005). The IOM database is a compilation of DLW-derived energy expenditure results and other raw data from individuals collected from numerous studies. Breathing rates were estimated for different groups of individuals including healthy normal-weight males and females with normal active lifestyles (n=1252), overweight/obese individuals with normal active lifestyles (n=679), individuals from less affluent societies (n=59), underweight adults (n=34), and individuals during various extreme physical activities (n=170). Normal weight adults age 20 yrs and above were categorized as having BMIs between 18.5 and 25 kg/m<sup>2</sup>. Overweight/obese adults had BMIs above 25 kg/m<sup>2</sup>. For children and teenagers aged 4 to 19 yrs, BMIs corresponding to the 85<sup>th</sup> percentile or below were considered normal. The breathing rate data were presented as 5<sup>th</sup>, 10<sup>th</sup>, 25<sup>th</sup>, 50<sup>th</sup>, 75<sup>th</sup>, 90<sup>th</sup>, 95<sup>th</sup>, and 99<sup>th</sup> percentile values as well as mean and SEM values for the derived inhalation rates for narrow age groups ranging from 1 month to 96 years. A partial

<sup>a</sup> Percentiles based on a normal distribution assumption for all age groups

Comparing the largest subgroups (i.e., overweight/obese individuals vs. normal-weight individuals), Brochu et al. observed that overweight/obese individuals inhaled between 0.8 to 3.0 m<sup>3</sup> more air per day than normal-weight individuals, but their physiological daily breathing rates are 6 to 21% lower than that of their leaner counterparts when

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

expressed in  $\text{m}^3/\text{kg}\cdot\text{day}$ . Also of interest is that the daily inhalation rates (in  $\text{m}^3/\text{kg}\cdot\text{day}$ ) of newborns and normal-weight infants aged 2.6 to less than 6 months are 2.1 to 5.1 times higher than those of normal-weight and overweight/obese adults aged 18 to 96 years with normal lifestyles.

Besides the lack of randomly selected individuals representative of a population for estimating energy expenditure, much of the DLW data used to derive the breathing rate percentiles relied heavily on adults with sedentary lifestyles (Black et al., 1996). Occupations of many participants included professionals, white collar workers or other sedentary occupations, and almost no participants were in manual labor occupations that are known to result in higher breathing rates. Although a small group of athletic individuals appear to be included in the DLW database by Brochu et al. (2006a), it was suggested by Black et al. (1996) that not enough participants involved in manual labor are represented in the DLW database. This may result in breathing rate percentiles that are lower than what might be obtained from a population-based study. Nevertheless, as noted above, the DLW method provides an index of total energy expenditure over a period of 1 to 3 weeks, which is a better determinant of long-term breathing rate than other methods described that rely on 1 to 2 days of energy intake or expenditure to estimate long-term breathing rates. Thus, the DLW method is considered to be the most accurate method for determining an average daily breathing rate of a free-living individual.

### 3.4.4.2 Stifelman (2007)

Using energy expenditure data based on extensive DLW measurements from two sources (FAO, 2004a; 2004b; IOM, 2005), Stifelman (2007) calculated inhalation rates with Layton's equation for long-term physical activity levels categorized as active to very active individuals. The breathing rate data are presented in Table 3.15 in one year age groupings for infants and children and in three age groupings for adults up to age 70.

17	18.2 – 21.2	13.3 – 16.2
18	18.6 – 21.5	13.2 – 16.1
19-30	17.0 – 19.7	13.4 – 15.2
31-50	16.2 – 18.9	12.8 – 14.5
51-70	15.1 – 17.8	12.0 – 13.8

Physical activity levels (PALs) were categorized into four levels of activity by the IOM, two of which were the active and very active levels. A PAL is the ratio of total energy expended (TEE) divided by the basal metabolic rate, defined as the minimum level of energy needed to support essential physiologic functions in free-living people. Stifelman (2007) also calculated the breathing rate associated with each level, as shown in Table 3.16. It is believed unlikely that the PAL "very active" category (i.e., PAL range 1.9-2.5) would be exceeded over a duration of years. PALs exceeding the IOM and FAO ranges are generally not sustainable over long periods of time, but can be quite high for limited periods of time (Westerterp, 2001). For example, highly trained athletes during periods of high-intensity training competition, including cross-country skiers and Tour de France bicycle racers, can reach a PAL of 3.5-5.5.

The IOM and FAO PALs describe a range of 1.4-2.5 in accord with ranges of sustainable PALs described by others, including people actively engaged in non-mechanized agriculture, deployed military personnel, and long-distance runners (Stifelman, 2007; Westerterp, 2001; Westerterp, 1998; Black et al., 1996; Haggerty et al., 1994). Individuals among the general population exceeding PALs of 2-2.5 for long

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

periods of time are expected to experience negative energy balance (i.e., weight loss) mainly because an important limit to sustainable metabolic rate is the energy intake (Westerterp 1998; Westerterp, 2001).

**TABLE 3.16. IOM Physical Activity Categories, Associated Breathing Rates and Equivalent Walking Distance**

PAL Category	PAL midpoint value (range)	Breathing rate midpoint value	Equivalent walking distance (km/day) <sup>a</sup>
Sedentary	1.25 (1.0-1.39)	14.4 m <sup>3</sup> /day	0
Low active	1.5 (1.4-1.59)	15.7 m <sup>3</sup> /day	3.5
Active	1.75 (1.6-1.89)	17.3 m <sup>3</sup> /day	11.7
Very active	2.2 (1.9-2.5)	19.4 m <sup>3</sup> /day	26.9

<sup>a</sup> Equivalent walking distance in addition to energy expended during normal daily life, based on a 70 kg adult walking 5-6 km per hour. Adapted from Stifelman (2007) and Brooks et al. (2004)

Based on the DLW data, Stifelman's analysis indicates that human energy expenditure occurs within a fairly narrow range of activity levels (PAL in the range of 1.4-2.5), and that for breathing rates estimated by the DLW method, a breathing rate of 19.4 m<sup>3</sup>/day (equivalent to a PAL of 2.2) is near the maximum energy expenditure that can be sustained for long periods of time in adults. This finding supports the idea that the traditional 20 m<sup>3</sup>/day is an upper end breathing rate (Snyder et al. (1975).

The narrow range in breathing rates was found to be consistent with the daily energy expenditure estimated from the adult breathing rate distribution in Marty et al. (2002) where the range is slightly over 2-fold between the 5<sup>th</sup> and 95<sup>th</sup> percentile in Table 3.7. A roughly 2-fold range in between the 5<sup>th</sup> and 95<sup>th</sup> percentiles is also exhibited in the MET-derived breathing rates by US EPA (2009).

### 3.4.4.3 Limits of Sustainable Breathing Rates Derived from PALs

As noted above, DLW studies have shown that a PAL of approximately 2 to 2.5 in the general population of adults is the limit of sustainable energy expenditure for long periods of time (Westerterp, 2001; IOM, 2005; Stifelman, 2007). The PAL of novice athletes training for endurance runs and soldiers during field training falls within this range (Westerterp, 1998; 2001). The PAL has been found to be twice the upper limit (PALs = 3.5 to 5.5) in professional endurance athletes in the most demanding sports (cross-country skiing and cycling) during training and competition. The PALs of these professional athletes are in the right tail of the breathing rate distribution of the general population (Westerterp, 2001). However, the high PALs are not expected to be sustained at these high levels when averaged over years.

Knowing the average basal energy expenditure (BEE) for adults and the upper range of daily energy expenditure, the upper limit of long-term daily breathing rates for the general population can be estimated from Layton's equation (eq. 3.1). Marty et al. (2002) observed that the 95<sup>th</sup> percentile breathing rate should be found within this PAL range of 2 to 2.5. Thus, it might be reasonable to compare the 95<sup>th</sup> percentile adult

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

breathing rate calculated by other methods to the breathing rates derived from an upper limit PAL range of 2 to 2.5.

Table 3.17 show the expected breathing rates of adults in a PAL range of 2.0 to 2.5. The mean BEE in kcal/day for the adult age groups is obtained from Brooks et al. (2004). Mean weights for the adult age groups were also obtained from this reference in order to convert breathing rates in L/day to L/kg-day. The results from the DLW-derived energy expenditure data suggest that for normal weight adults (i.e., adults with BMIs within the healthy range of 18.5 to 25), the upper limit of breathing rates for males and females combined would be 16,629 to 20,787 L/day, or 256 to 320 L/kg-day.

**Table 3.17. Description of the Normative Adult DLW Data from Brooks et al. (2004) for Persons with a Healthy BMI, and the Resulting Calculations of Breathing Rate Within the Sustainable PAL Range of 2.0 to 2.5**

	Age years	n	Mean BEE kcal/d	TEE limits <sup>a</sup> kcal/d	Breathing rate L/d	Mean weight kg	Breathing rate L/kg-d
Males	19-30	48	1769	3538 - 4423	20,060 - 25,078	71.0	283 - 353
	31-50	59	1675	3350 - 4188	18,995 - 23,746	71.4	266 - 333
	51-70	24	1524	3048 - 3810	17,282 - 21,603	70.0	247 - 309
	19-70 <sup>b</sup>	-	-	-	18,582 - 23,229	-	263 - 328
Females	19-30	82	1361	2722 - 3403	15,434 - 19,295	59.3	260 - 325
	31-50	61	1322	2644 - 3305	14,991 - 18,739	58.6	256 - 320
	51-70	71	1226	2452 - 3065	13,903 - 17,379	59.1	235 - 294
	19-70 <sup>b</sup>	-	-	-	14,675 - 18,344	-	249 - 311
Males/females <sup>c</sup>	19-70	-	-	-	16,629 - 20,787	-	256 - 320

<sup>a</sup> Sustainable PAL range (2.0 to 2.5) multiplied by mean BEE equals the daily total energy expenditure (TEE) that can be sustained over long periods of time.

<sup>b</sup> 19-70 yr breathing rates calculated as a weighted average from the three smaller age groupings

<sup>c</sup> Average breathing rates of males and females combined, assuming each gender represents 50% of the population.

Although the PAL limits were estimated for adults, it might also be useful to estimate high-end sustainable breathing rates for adolescents using the same assumption that a PAL of 2 to 2.5 represents the limit of sustainable energy expenditure over a long-term period. Some of the highest daily breathing rates in L/day were calculated for adolescents from the CSFII caloric intake data (Arcus-Arth and Blaisdell, 2007).

For deriving adolescent breathing rates from the mean BEE in Brooks et al. (2004) for 14-18 year olds, an upper limit of sustainable energy expenditure would be in the range of 3458-4323 kcal/d for males, and 2722-3403 kcal/d for females. Using Layton's equation to derive the breathing rates from these daily energy expenditures, sustainable upper limit breathing rates of 22,221-27,780 L/day for adolescent males, and 18,006-22,511 L/day for adolescent females were calculated. After normalizing for weight using the mean weights for the 14-18 year age groups in Brooks et al. (2004),

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

upper range daily breathing rates of 378-472 L/kg-day for males and 332-513 L/kg-day for females were calculated.

### 3.4.5 Compilations of Breathing Rate Data

In the US EPA (2011) Exposure Factors Handbook, ranges of measured breathing rate values were compiled for infants, children and adults by age and sex. Table 3.18 presents the recommended breathing rate values for males and females combined for specific age groups up to age ≥81 yrs based on the average of the inhalation rate data from four recent key studies: Brochu et al. (2006a); U.S. EPA, (2009); Arcus-Arth and Blaisdell, (2007); and Stifelman (2007). The Table represents the unweighted means and 95<sup>th</sup> percentiles for each age group from the key studies. U.S. EPA noted that there is a high degree of uncertainty associated with the upper percentiles, including the 95<sup>th</sup> percentile shown in Table 3.18, thus they should be used with caution. The upper percentiles represent unusually high inhalation rates for long-term exposures, but were included in the handbook to provide exposure assessors a sense of the possible range of inhalation rates for children.

**Table 3.18. US EPA (2011) Recommended Long-Term Exposure (More than 30 Days) Breathing Rate Values for Infants and Children (Males and Females Combined) Averaged From Four Key Studies**

Age Group	Mean m <sup>3</sup> /day	Sources Used for Means	95 <sup>th</sup> Percentile m <sup>3</sup> /day	Sources Used for 95 <sup>th</sup> -ile

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

### 3.5 OEHHA-Derived Breathing Rate Distributions for the Required Age Groupings Using Existing Data.

The summarized published reports provide breathing rate distributions by month/year of age or in specific age groups, but seldom in age groups applicable to OEHHA's age groupings for cancer risk assessment. However, individual data were obtainable from the CSFII food intake study and the DLW database in the IOM (2005) report, from which breathing rate distributions could be derived in the specific age groups of third trimester, 0<2, 2<9, 2<16, 16<30, and 16-70 years. In addition, the U.S. EPA's breathing rate distributions based on the MET approach, shown in Tables 3.13a and 3.13b, can be merged to obtain the necessary age group breathing rates.

#### 3.5.1 OEHHA-derived breathing rates based on CSFII energy intake data

In Tables 3.19a-e, non-normalized (L/day) and normalized (L/kg-day) breathing rates for the specific OEHHA age groups were derived for both children and adults from the CSFII dataset using the Jackknife Replication statistical method (Arcus-Arth and Blaisdell, 2007). Breathing rates for pregnant women, for determination of third trimester breathing rates, are presented in Section 3.5.4.

In addition, each age group was also fit to a lognormal distribution using Crystal Ball® (Oracle Corp., Redwood Shores, CA, 2009). Crystal Ball® was also used to determine the best parametric model fit for the distribution of breathing rates for each age group. The Anderson-Darling test was chosen over other goodness-of-fit tests available in Crystal Ball® because this test specifically gives greater weight to the tails than to the center of the distribution. OEHHA is interested in the tails since the right tail represents the high-end (e.g., 95<sup>th</sup> percentile) breathing rates.

### 3.5.2 OEHHA-derived breathing rates based on the IOM DLW Database

The Institute of Medicine (IOM) 2005 dietary reference report includes an extensive database that is a compilation of DLW-derived energy expenditure results and other raw data for individuals collected from numerous studies. An advantage of this dataset over the U.S. EPA MET approach and the TAV approaches is that individual data on energy expenditure are matched with the weight and age of the individuals. The disadvantage is that the data are not necessarily representative of a random sample of a population.

When breathing rates were calculated from the energy expenditure data, it became apparent that there were some extreme individual breathing rates that did not appear physically possible. Using the results from the PAL limits (Section 3.4.4.3), breathing rates with a PAL greater than 2.5 were removed. Additionally, some breathing rates were below the expected BMR for an individual. Based on evidence that energy expenditure during sleep is 5 to 10% lower than the BMR, derived breathing rates that were 10% or more below the expected BMR were also removed (Brooks et al., 2004). However, relatively few individuals were removed due to an extreme breathing rate; <1 to 6% of the values were removed from any one age group.

Rather than assume a normal distribution for the age groupings as Brochu et al. (2006a) had done, OEHHA arranged the data to be more representative of a population by weighting the energy expenditure data by age and gender. The modeled populations were weighted towards an equal number of persons per year of age and the assumption was used that males and females in a population are at a ratio of 50:50. In addition, the IOM database separated individuals by weight, or more specifically, by body mass index

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

(BMI). Children 3 to 18 years of age are considered at risk of overweight when their BMI is greater than the 85<sup>th</sup> percentile, and overweight when their BMI is greater than the 95<sup>th</sup> percentile (Kuczmarski et al., 2000). Thus, the IOM (2005) placed overweight/obese children in a separate dataset. For the modeled populations, an 85:15 weighting for normal:overweight children in the 2<9 and 2<16 age groups was used. Adults (>19 years of age) were placed in the overweight/obese dataset if they had BMIs of 25 kg/m<sup>2</sup> and higher by the IOM. The results from USDA's 1994-96 Diet and Health Knowledge Survey (Tippett and Cleveland, 2001) found that 54.6% of the U.S. population have a BMI of 25 kg/m<sup>2</sup> or greater (n=5530). Thus, for the adult age groups (16<30 and 16-70 yrs), 45:55 weighting for normal:overweight adults was used to model the populations.

For infants, the source of the raw data in the IOM (2005) database was from Butte et al. (2000), a DLW study conducted at the Children's Nutrition Research Center in Houston, TX. Butte et al. (2000) monitored energy expenditure in 76 healthy infants by the DLW method up to six times during the study, at 3, 6, 9, 12, 18, and 24 months of age, generating a total of 351 measurements that fell within the OEHHA-specified 0<2 year age group. Thus, many of the infants were tested more than once during the study period. Following each administration of DLW by mouth, urine samples were collected over 10 days and analyzed for the hydrogen and oxygen isotopes to calculate energy expenditure.

The percentage of breast-fed infants at ages 3, 6, 9, 12, 18, and 24 months were 100%, 80%, 58%, 38%, 15%, and 5%, respectively in the Butte et al. (2000) study. The racial distribution by maternal lineage was 55 white, 7 African American, 11 Hispanic, and 3 Asian infants. The NCHS growth reference (Hamill et al., 1979) was used to evaluate the adequacy of growth in these infants. The growth performance of these infants was comparable with that of other breast-fed and formula-fed infant populations in whom socioeconomic and environmental constraints would not be expected to limit growth. Relative to the NCHS reference and compared with other breast-fed and formula-fed study populations, the growth of the children was considered satisfactory by the researchers.

Although the study did not choose subjects representative of any particular population, the range of activities that individuals of this age engage in is not as variable as the range of activities engaged in by older children and adults. In addition, even though many of the infants were tested more than once during the study period, repeated measures on the same individuals can reduce the amount of intraindividual variability in the distribution of measurements because a better estimate of typical energy expenditure is captured. Considering the limitations, the study results were judged by OEHHA to be similar enough to a randomly sampled population to calculate distributional statistics for breathing rate.

An additional observation from Butte et al. (2000) was that total energy expenditure measurements differed by age and by feeding group, but not by sex, when adjusted for weight. As expected, PAL increased significantly with age from 1.2 at 3 months to 1.4 at 24 months.

## O-MBA20L7

FINAL, August, 2012

Breathing rates determined by the DLW method for women in their third trimester of pregnancy are presented separately in Section 3.5.4.

To obtain the daily breathing rate distributions for all age groups shown in Table 3.20a-e, OEHHA fit the data to a lognormal distribution using Crystal Ball® and sampled 250,000 times using Latin-Hypercube. The lognormal distribution is commonly used in stochastic risk assessment and has been found to be a reasonable parametric model for a variety of exposure parameters, including breathing rate. Latin-Hypercube analysis in Crystal Ball® was also used to determine the best parametric model fit for the distribution of breathing rates. The Anderson-Darling statistic was used for the goodness-of-fit test because it gives greater weight to the tails than to the center of the distribution.

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

### 3.5.3 OEHA Age Group Breathing Rate Distributions Derived From U.S. EPA (2009) MET Approach

In Tables 3.21a-e, non-normalized (L/day) and normalized (L/kg-day) breathing rates for the specific OEHA age groups were derived for both children and adults from the data included in the U.S. EPA (2009) report and presented above. Values for males and females were combined by taking weighted averages for each age range provided, assuming that the numbers of males and females in the population are equal. Ages were combined by the same means to create the age ranges of toxicological interest to the "Hot Spots" program.

The breathing rates used in preparation of the U.S. EPA report were derived by selecting an activity pattern set from a compilation of daily activity pattern sets (CHAD) and assigning them to a person in NHANES of the same sex and age group, although the age groups are fairly narrow for the very young (i.e., 3-month or 1-year intervals), the older age groups consist of broad age categories (i.e., 3 to 5 year intervals). These broad age groups include periods, for example 3 to <6 years, when activity can vary greatly by year of age. In addition, NHANES calculates a "sampling weight" for each participant, which represents the number of individuals in the population with the same set of these characteristics. When an individual in CHAD is matched to an individual in NHANES only on sex and age group, the set of characteristics that belonged to the CHAD individual are ignored, which could result in significantly different weighting. Thus the derived breathing rates cannot be considered representative of the population.

For these reasons and other limitations of the EPA data, as stated in Section 3.3.3.3, OEHA chose to fit a selected set of parametric distributions to the percentile data given by U.S. EPA, rather than attempting to use the raw data to determine the best fit parametric model. A gamma distribution was fit to each age group using Crystal Ball®, which is usually one of the better fitting distributions for the right-skewed distributions typical of intake variability. The gamma distribution is a three parameter distribution with fewer shape constraints than two parameter distributions such as a lognormal distribution.

75%-ile	245	18,924
90%-ile	278	21,443
95%-ile	299	23,128

<sup>a</sup> Breathing rate data for this age range were given as 16<71 years of age

A limitation in calculating these breathing rates is that equal weighting by year of age was assumed when merging the U.S. EPA breathing rates into larger age groups used by OEHHA. However, this may not be a significant factor for the smaller age groups (i.e., 3rd trimester, 0<2, 2<9, 2<16, 16<30 yr old age groups), but could affect the breathing rate estimate for the 16-70 year olds. This is because a random sample of the population would find proportionally fewer adults in the 61 to 70 year age range, for example, compared to 21 to 30 year age range.

Another limitation is that merging the U.S. EPA age groups into the OEHHA age groupings does not yield the precise age range for 2<9 and 16 to <30 year olds. The actual age range in the US EPA data used to get the 16 to <30 year olds is 16 to <31, which we do not consider a significant deviation. However, the actual age range in the US EPA data used to get the 2 to <9 year olds is 2 to <11 years. The addition of 9 and 10 year olds would slightly reduce the normalized breathing rate in L/kg-day because younger children (i.e., 2<9 year olds) have higher normalized breathing rates than older children (i.e., 9-10 year olds). Alternatively, addition of 9 and 10 year olds to the 2<9 year age group would slightly increase the absolute breathing rate in L/day due to

3-42

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

higher volumes of air breathed per day by 9 and 10 year olds compared to younger children.

### 3.5.4 OEHHA-Derived Third Trimester Breathing Rates

For third trimester exposure, OEHHA calculated breathing rates using the assumption that the dose to the fetus during the third trimester was the same as that to the mother. Both the CSFII and DLW data sets included data from pregnant women that could be used to calculate breathing rates (Table 3.22). The DLW data included a code for trimester of pregnancy, while the CSFII data did not. Thus, breathing rates by the CSFII method was estimated using data for women in all stages of pregnancy with no means for separation by stage of pregnancy. OEHHA believes this would not underestimate the third trimester breathing rates, since the CSFII breathing rate data tend to overestimate the breathing rate in the upper (e.g., 95<sup>th</sup> percentile) and lower percentiles for the reasons cited in Section 3.4.3.2. Since breathing rate increases over the course of pregnancy, we felt that we could successfully combine these data with the DLW data and produce a reasonable set of point estimates for the third trimester.

In order to create a set of breathing rate data suitable for use in a stochastic risk assessment for third trimester pregnant women, we selected 1,000 observations from each set of data, normalized and non-normalized, using a Monte Carlo simulation in Crystal Ball®. Because the data sets from the two sources were similar in size, a relatively small set of simulated data was sufficient. We combined these data to create two sets of pooled data (see Section 3.2 above). We then fit a parametric distribution to each of the pooled samples, using Crystal Ball® and the Anderson-Darling goodness-of-fit test.

### 3.5.5 Summary of Long-Term Daily Breathing Rate Distributions

Table 3.23 presents a summary of the long-term daily mean and high end (i.e., 95<sup>th</sup> percentile) breathing rates derived by OEHHA from different sets of energy expenditure data. The breathing rate distributions for women in their third trimester of pregnancy are presented separately in Table 3.22 above. The MET- (non-normalized only), CSFII- and DLW-derived breathing rates in Table 3.22 are based on the best fit parametric models for each age group, although little variation in the breathing rate was observed between models within each breathing rate method. Also included are data from TAV studies that estimated breathing rates in age groupings reasonably similar to that used by OEHHA.

As noted in Table 3.23, some of the age groupings for the MET-derived breathing rates, and all age groups in the TAV-derived breathing rates do not precisely reflect the age ranges used in the "Hot Spots" program. This was primarily due to methodological differences in data collection which did not allow individual breathing rates matched with the age of the individual. However, the differences in the age ranges were small

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

enough in many cases to allow a rough comparison among the various breathing rate estimation methods, so they were included in the table.

<sup>a</sup> U.S. EPA metabolic equivalent (MET) approach breathing rate point estimates shown were derived using the best fit parametric model from Tables 3.20a-e.

<sup>b</sup> All MET-derived breathing rates for the 2<9 yr age group actually represent 2<11 yr olds.

<sup>c</sup> All MET-derived breathing rates for the 16<30 yr age group actually represent 16<31 yr olds.

<sup>d</sup> CSFII food intake-derived breathing rate point estimates shown were derived using the best fit parametric model as presented in Tables 3.18a-e.

<sup>e</sup> Doubly-labeled water-derived (DLW) breathing rate point estimates shown were derived using the best fit parametric model as shown in Tables 3.19a-e.

<sup>f</sup> Time-activity-ventilation (TAV) breathing rate point estimates are from Table 3.3 (Marty et al. 2002) and Table 3.5 (Allan et al., 2008).

<sup>g</sup> The breathing rate point estimates from Table 3.3 actually represent an age range of about 3 to <12 yrs old. The non-normalized breathing rate point estimates in L/day is the equivalent for an 18 kg child.

<sup>h</sup> The breathing rate point estimates from Table 3.4 actually represent an age range of 12 to 70 years old. Non-normalized breathing rate point estimates in L/day are the equivalent for a 63 kg adult.

<sup>i</sup> Breathing rate point estimates were derived from Table 3.5 and represent an age range of 12 to 60+ years. The point estimates were calculated assuming equal weighting for each age group (12-19 yrs, 20-59 yrs, 60+ yrs) and combined. Breathing rates in Table 3.5 were available only in L/day, so the non-normalized point estimates were both divided by the mean body weight for the 16-70 age group (80.3 kg) to generate breathing rates in L/kg-day.

The DLW energy expenditure data likely result in daily breathing rates that are slightly lower in some cases than what would be expected in a random population sample, particularly for adults (Black et al., 1996). On the other hand, U.S. EPA (2008) observed that the upper percentile breathing rates for the MET and CSFII approaches are unusually high for long-term daily exposures. Based on the limits of sustainable daily breathing rates for adolescents and adults discussed in Section 3.4.4.3, the 95th percentile breathing rates in Table 3.22 appear to be above sustainable limits for some age groups. For example, the CSFII-generated upper percentile breathing rates are

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

highest in the age groups containing older adolescents. The 16<30 year age group upper percentile breathing rate from the CSFII study is 377 L/kg-d. This breathing rate is above the sustainable breathing rate (based on PAL) of 283-353 L/kg-d for males 19-30 years of age shown in Table 3.16 (but is not above the sustainable breathing rates for the subgroup of males and females 14-18 yrs of age with a breathing rate of 332-513 L/kg-d).

A limitation of the estimated PALs for daily breathing rates determined in Tables 3.15 and 3.17 is that the participants used in the study may not reflect a random sample of the population. Nevertheless, the observed PAL of novice athletes training for endurance runs and soldiers during field training falls within this range of 2.0-2.5 (Westerterp, 1998; 2001). Thus, the breathing rates based on physical activity limits should be accurate for the general population, with the exception of professional endurance athletes in the most demanding sports (cross-country skiing and cycling) during training and competition.

With the advantages and disadvantages of the breathing rate datasets described in Section 3.2, OEHHA recommends using a daily breathing rate point estimates based on a mean of the DLW and CSFII approaches. The main benefit is the use of individual data from these two datasets, including individual body weights, which can be combined into one distribution. In order to create a set of breathing rate data suitable for use in a stochastic risk assessment of long-term daily average exposures, OEHHA combined data for each age range within the two sources of breathing rate data, CSFII and DLW. We selected an equal number of observations from each source for the five age ranges, normalized and non-normalized, using a Monte Carlo simulation in Crystal Ball® to create pooled data for each group. We then fit a parametric distribution to each of the pooled samples, using Crystal Ball® and the Anderson-Darling goodness-of-fit test.

For infants 0<2 yrs of age, OEHHA used the DLW data by Butte et al. (2000) for combining with CSFII study 0<2 yr data. This longitudinal study followed a group of about 40 infants collecting urine every 3 months after DLW administration from age 3 months to two years of age. The sample size was not considered large enough to use this data exclusively for determining the 0<2 yr breathing rates, so was combined with CSFII data of infants in the same age range.

### 3.6 8-Hour Breathing Rates

Specialized exposure scenarios for estimating cancer risk to offsite workers, neighborhood residents, and school children may involve evaluating exposure in the 8-12 hour range. Therefore, 8-hour breathing rates were estimated for exposed individuals engaged in activities that bracket the range of breathing rates including minimal inhalation exposure such as reading a book and desk work, and high breathing rates such as farm work or yard work, that can be reasonably sustained for an 8-hour period.

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

As part of the development of average daily breathing rates, U.S. EPA (2009) used existing data on minute ventilation rates (in ml/min or ml/kg-min) for a range of activities and assigned MET values depending on the intensity level of activity:

- Sedentary/Passive Activities: Activities with MET values no higher than 1.5
- Light Intensity Activities: Activities with MET values exceeding 1.5 to  $\leq 3.0$
- Moderate Intensity Activities: Activities with MET values exceeding 3.0 to  $\leq 6.0$
- High Intensity Activities: Activities with MET values exceeding 6.0

An additional ventilation rate distribution was developed for sleeping/napping only, although the sedentary/passive activity category (MET values  $\leq 1.5$ ) also includes sleeping and napping. Table 3.23 shows selected MET values for various workplace activities and activities in the home or neighborhood that were used to calculate daily breathing rates by U.S. EPA (2009).

3-47

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

In order to obtain minute ventilation rates that represent age ranges used in risk assessment for the "Hot Spots" program, age groups in Tables 3.25a-b were weighted equally by year of age and combined by OEHHA. The male and female data were also merged assuming 50:50 ratio in the California population. Two of the age groups combined from the U.S. EPA MET data do not exactly reflect the age ranges used by OEHHA, but they were judged reasonably close enough to use (i.e., combined MET ages 2 to <11 yrs represents OEHHA's 2<9 yr age group; combined MET ages 16 to <31 yrs represents OEHHA's 16<30 yr age group).

**Table 3.25a. Minute Ventilation Rates for OEHHA Age Groups in L/kg-min (Males and Females Combined)**

	0<2 years	2<9 years	2<16 years	16<30 years	16-70 years
<b>Sedentary &amp; Passive Activities (METs ≤ 1.5)</b>					
Mean	0.41	0.21	0.17	0.07	0.07
95 <sup>th</sup> Percentile	0.52	0.29	0.24	0.09	0.09
<b>Light Intensity Activities (1.5 &lt; METs ≤ 3.0)</b>					
Mean	1.01	0.52	0.42	0.16	0.16
95 <sup>th</sup> Percentile	1.25	0.70	0.56	0.21	0.21
<b>Moderate Intensity Activities (3.0 &lt; METs ≤ 6.0)</b>					
Mean	1.86	0.97	0.79	0.36	0.35
95 <sup>th</sup> Percentile	2.40	1.33	1.09	0.49	0.48

**Table 3.25b. Minute Ventilation Rates for OEHHA Age Groups in L/min (Males and Females Combined)**

	0<2 years	2<9 years	2<16 years	16<30 years	16-70 years
<b>Sedentary &amp; Passive Activities (METs ≤ 1.5)</b>					
Mean	3.88	4.67	4.94	4.85	5.27
95 <sup>th</sup> Percentile	5.60	6.22	6.66	6.73	6.96
<b>Light Intensity Activities (1.5 &lt; METs ≤ 3.0)</b>					
Mean	9.61	11.34	11.79	11.92	12.56
95 <sup>th</sup> Percentile	13.57	14.80	15.67	16.15	16.24
<b>Moderate Intensity Activities (3.0 &lt; METs ≤ 6.0)</b>					
Mean	17.70	21.25	22.58	26.08	26.95
95 <sup>th</sup> Percentile	25.74	28.07	30.25	37.67	37.65

From these tables, the 8-hour breathing rates were calculated by OEHHA based on age groupings used in the Hot Spots program and are presented in Section 3.2. Eight-hour breathing rates based on high intensity activities (MET values >6.0) were not considered here because even at the 95<sup>th</sup> percentile, U.S. EPA (2009) showed that individuals spent only about 1 hour or less per day at this intensity. For moderate intensity activities, the 95<sup>th</sup> percentile was at or near 8 hours/day for some age groups. For women in their third trimester of pregnancy, we are recommending using 8-hour breathing rates based on moderate intensity activities.

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

### 3.7 Short-term (1-Hour) Ventilation Rates

SB-352 mandates school districts to conduct a risk assessment for school sites located within 100 meters of a freeway or busy roadway, and also mandates that the AB-2588 risk assessment guidance be used in the risk assessment. Assessing cancer risks due to exposure at a school site requires less than 24 hour breathing rates. OEHHA recommends breathing rates derived from the USEPA (2009) age-specific ventilation rates for these purposes.

The U.S. EPA ventilation rates were developed for various levels of activity and can be used to estimate inhalation cancer risk from short-term maximal emissions from facilities. Breathing rates for children at school can range from sedentary in the classroom to active on the playground or sports field. OEHHA assumes that in some cases, a day care facility will be present on the school site where children may be as young as 0<2 years of age. The age ranges that U.S. EPA (2009) presents are useful for estimating the impact of early-in-life exposure for school-age children. Classroom instructors (i.e., adults) are also considered under SB-352. If the soil ingestion or dermal pathways need to be assessed, OEHHA recommends the exposure variates presented elsewhere in this document. The public health protective approach is to assume that all daily dermal and soil ingestion exposure occurs at school.

As discussed in Section 3.6 above, U.S. EPA (2009) used existing data of ventilation rates (in ml/min or ml/kg-min) from a range of activities and assigned MET values depending on the intensity level of activity. Table 3.26 shows MET values various school-related activities collected from the CHAD database (U.S. EPA, 2009).

**Table 3.26. METS Distributions for School-Related Activities**

Activity Description	Mean	Median	SD	Min	Max
Passive sitting	1.5	1.5	0.2	1.2	1.8
Use of computers	1.6	1.6	0.2	1.2	2.0
Do homework	1.8	1.8	-	1.8	1.8
Use library	2.3	2.3	0.4	1.5	3.0
Attending day-care	2.3	2.3	0.4	1.5	3.0
Attending K-12 schools	2.1	2.1	0.4	1.4	2.8
Play indoors	2.8	2.8	0.1	2.5	3.0
Play outdoors	4.5	4.5	0.3	4.0	5.0
Recess and physical education	5.0	5.0	1.7	2.0	8.0

For OEHHA's purposes, the minute ventilation rates of males and females from Tables 3.24a-b were combined assuming a 50:50 proportional population distribution, and some age groups were combined assuming equal number of individuals in the population per year of age (Table 3.27a-b). For the SB-352, the child age groups were 0<2 years (infants), 2<6 years (preschool, kindergarten), 6<11 years (grade school), 11<16 (junior high and high school). From these minute ventilation rates, 1-hour ventilation rates are derived and presented in Section 3.2.

## O-MBA20L7

Technical Support Document for Exposure Assessment and Stochastic Analysis,  
FINAL, August, 2012

**Table 3.27a. Minute Ventilation Rates for SB352 School Sites in L/kg-min (Males and Females Combined)**

	0<2 years	2<6 years	6<11 years	11<16 years	16-70 years
<b>Sedentary &amp; Passive Activities (METs ≤ 1.5)</b>					
Mean	0.41	0.28	0.16	0.10	0.07
95 <sup>th</sup> Percentile	0.52	0.38	0.23	0.14	0.09
<b>Light Intensity Activities (1.5 &lt; METs ≤ 3.0)</b>					
Mean	1.01	0.69	0.38	0.24	0.16
95 <sup>th</sup> Percentile	1.25	0.90	0.54	0.32	0.21
<b>Moderate Intensity Activities (3.0 &lt; METs ≤ 6.0)</b>					
Mean	1.86	1.26	0.73	0.47	0.35
95 <sup>th</sup> Percentile	2.40	1.72	1.03	0.65	0.48
<b>High Intensity Activities (METs ≥ 6.0)</b>					
Mean	-	2.27	1.37	0.92	0.64
95 <sup>th</sup> Percentile	-	3.12	1.87	1.34	0.93

**Table 3.25b. Minute Ventilation Rates for SB352 School Sites in L/min (Males and Females Combined)**

	0<2 years	2<6 years	6<11 years	11<16 years	16-70 years
<b>Sedentary &amp; Passive Activities (METs ≤ 1.5)</b>					
Mean	3.88	4.56	4.76	5.43	5.27
95 <sup>th</sup> Percentile	5.60	5.95	6.43	7.47	6.96
<b>Light Intensity Activities (1.5 &lt; METs ≤ 3.0)</b>					
Mean	9.61	11.31	11.36	12.62	12.56
95 <sup>th</sup> Percentile	13.57	14.38	15.14	17.24	16.24
<b>Moderate Intensity Activities (3.0 &lt; METs ≤ 6.0)</b>					
Mean	17.70	20.75	21.64	24.98	26.95
95 <sup>th</sup> Percentile	25.74	27.16	28.79	34.17	37.66
<b>High Intensity Activities (METs ≥ 6.0)</b>					
Mean	-	37.34	41.51	48.69	50.10
95 <sup>th</sup> Percentile	-	49.66	58.50	69.62	73.23

No high intensity minute ventilation rates are included in Tables 3.25a-b for infants age 0<2 yrs. The distributions generated by U.S. EPA (2009) for hrs/day spent at MET values ≥6.0 for infants (age 0<2 yrs) suggest that this level of activity for a 1-hr duration is unlikely for this age group.

SB-352 is also designed to protect adults working at the schools, including pregnant women. For women in their third trimester of pregnancy, OEHHA is recommending using ventilation rates of moderate intensity activities based on the same reasoning cited above in Section 3.6.

*Air Quality Comments for Event Ctr – Mission Bay Blocks 29-32 FEIR, San Francisco CA  
Autumn Wind Associates, Inc. 916.719.5472  
Oct. 30, 2015*

**I. Introduction**

Autumn Wind Associates provides this letter in response to air quality related information contained in the recently released Final EIR for the Event Center and Mixed-Use Development at Mission Bay Blocks 29 – 32 (hereinafter referred to as “Events Center” or “project”); we submit this comment letter at the request of Tom Lippe, Esq.

We continue to have serious concerns with certain portions of the EIR’s air quality analysis and mitigation, and specifically take issue here with a number of the Lead Agency’s responses to our comments submitted in August on the DSEIR. Details are provided below.

**II. BAAQMD’s NSR-Derived Thresholds of Significance Used by the Lead Agency Continue to Under-Represent Project Emissions Significance**

In our comments submitted previously on the DSEIR, we noted that the BAAQMD’s CEQA thresholds of significance, applied by the Lead Agency to evaluate the Event Center project’s emission impacts, were developed non-scientifically from NSR values that were designed to counterbalance anticipated growth in stationary source facility emissions under the jurisdiction of the BAAQMD. An inherent problem with using NSR emission thresholds for constructing CEQA thresholds is that the 9-county air basin’s stationary sources represent no more than a small percentage of the total emissions inventory.

Vehicle emissions within the basin, by contrast, represent the lion’s share of criteria pollutants and are chiefly responsible for the basin’s ozone nonattainment designations that stretch back decades. Similarly, the region’s nonattainment of particulate standards has been heavily influenced by vehicle emissions. To exemplify, fully 84% of NO<sub>x</sub> (ozone precursor) emissions in the Bay Area air basin are emitted by vehicles<sup>1</sup>, and not by stationary sources. The region has been designated nonattainment for PM<sub>2.5</sub>; fine particulate is generated almost entirely by combustion (including internal combustion occurring in vehicle engines), and monitored values

<sup>1</sup> A “vehicle” is typically characterized by its being self-propelled, and includes both onroad and offroad applications. See Table 4, pg. 6 for distribution of BAAQMD’s annual average emissions by major source categories; “Bay Area Emissions Inventory Summary Report: Criteria Air Pollutants Base Year 2011” at [http://baaqmd.gov/~media/Files/Planning%20and%20Research/Emission%20Inventory/BY2011\\_CAPSummary.ashx?la=en](http://baaqmd.gov/~media/Files/Planning%20and%20Research/Emission%20Inventory/BY2011_CAPSummary.ashx?la=en)

## O-MBA20L7

*Air Quality Comments for Event Ctr – Mission Bay Blocks 29-32 FEIR, San Francisco CA  
Autumn Wind Associates, Inc. 916.719.5472  
Oct. 30, 2015*

in the region continue to climb annually; 28% of the total inventory is attributed to vehicles. Importantly, population (people) regionally continues its historical growth in lockstep with numbers of vehicles and vehicle-miles-traveled; despite substantial advances in technical on-vehicle controls and reductions in tailpipe emissions of both NOx and particulates over the years, the region continues to exceed federal and state air quality standards.

As we noted previously, establishing CEQA thresholds of significance levels using NSR levels is to automatically undercut emission reductions that should be obtained from each new “indirect source” (such as the Event Center that will attract new vehicle trips and related emissions) subject to CEQA review. By using outdated, non-scientifically designed NSR values, CEQA thresholds adopted by BAAQMD and borrowed for use by OCII will automatically underrepresent air emission significance, particularly when evaluated against past nonattainment designations and PM2.5 ambient air monitoring values that, despite recession effects, continue to reflect a slowly worsening trend line.

At FEIR pg. 13.13-15, the Lead Agency states that ozone levels have declined 17% over the last 20 years, despite increases in VMT and vehicle population numbers. The implicit rationale here is that improvements in regional ozone numbers reflect validly-set CEQA threshold values and are to answer for some of that gain, yet this is not true. No evidence is provided by the Lead Agency to show that ambient air ozone monitoring data to support the 17% figure is linked causally to the levels at which the CEQA thresholds, based on under-representative NSR thresholds have been set for NOx and ROG precursor pollutants. Real reductions in NOx emissions over the last 20 years attributable by use of the District’s CEQA NOx threshold on land use cases will represent, at mostly, only a tiny sliver of the total improvement picture if it represents any all. What answers for that 17% improvement statistic is not the District’s CEQA thresholds that were set on the under-representative NSR lbs/day values, but the extraordinary reductions availed by increasingly stringent tailpipe standards invoked at the state and federal levels over the last five decades.

NOx and ROG are ozone precursors, and vehicle emissions controls and their related regulations and improvements have focused on them almost exclusively across the last several decades. To exemplify the gains, federal NOx tailpipe standards for cars dropped (becoming more stringent) 35% in 1977, then 50% more in 1981, then another 40% off the 50% in 1994, then another 50% from there in 1999, then, from that 1999 level another 77% through 2009 model year. For SUVs, vans, and heavier trucks between 6000-8500 lbs, NOx reductions were imposed with a 10% reduction required in 1994, and then with an additional 65% - 95% depending on vehicle

type by 2009<sup>2</sup>. By comparison, the BAAQMD’s NSR thresholds in 1999<sup>3</sup>, shown at FEIR pg. 13.13-15, were set at 15 tons per year for ROG, NOx, and PM10, equating to 80 lbs/day. Those NSR trigger levels would drop, once, to ten tons a year roughly a decade later, and CEQA thresholds upon which they were based were reduced similarly to current levels (54 lbs/day each for ROG, NOx; PM2.5; 82 lbs/day PM10). For the daily NOx threshold in effect now, this represents a 32.5 % reduction from the NSR-based 1999 threshold. How relevant was that to improving regional air quality, as judged by the 17% statistic? Comparing that reduction to the percentage NOx reductions contributed by increasingly stringent federal tailpipe emission standards, the Bay Area’s tailpipe onroad NOx, formative of ozone air pollution, decreased by at least sixteen times that amount on a percentage basis. (32.5% NOx threshold value decrease vs. decrease in NOx onroad tailpipe standards of 35% x 50% x 40% x 50% x 77%, or a net reduction of almost 97% via onroad NOx standards.)

Clearly, any inference by the Lead Agency in the FEIR that the CEQA thresholds, having been set arbitrarily on under-representative NSR thresholds, are to account for the 17% regional improvement in ozone air pollution over the past 20 years is unsupported by the evidence. In fact, it can and should be argued that only a 17% regional ozone improvement, as judged against the stunning improvements in mobile source emission reductions provided by federal and state regulation, is a clear and obvious indictment of the growth in indirect source emissions (including the 17 tons of ozone precursors likely underestimated for the Event Center project) resulting from BAAQMD’s improperly designed, under-representative CEQA thresholds of significance.

Further underscoring that mobile source criteria pollutants are decreasing not from local air agency programs but as a result of state and federal ones, the most recent summary report, the BAAQMD’s “Bay Area Emissions Inventory Summary Report: Criteria Pollutants Base Year 2011”, at pg. 13 attributes regional ROG (an ozone pre-cursor) improvements:

“CARB regulations on mobile sources have also significantly reduced ROG emissions. On-road motor vehicle emissions have declined over the years despite annual increases in Vehicle Miles Travelled (VMT). This is due to the fleet turnover, with newer, lower emitting vehicles replacing older, higher emitting ones. The introduction of Reformulated Gasoline Phase II (RFGII) in 1996 and the introduction of Enhanced Inspection and

Maintenance program (Smog Check II) in the Bay Area, which started in October 2004, have resulted in further reductions.”

At pg. 14, NOx strategies and improvements for the Bay Area are identified:

“Reductions in NOx emissions prior to 2011 were due in part to Air District regulations on combustion sources including refineries and power plants. Tighter emission controls on motor vehicles also significantly reduce NOx emissions. Smog Check II, introduced in the Bay Area in 2004, played an important role in achieving NOx reductions, as it requires that vehicles are tested and that failing vehicles are repaired. NOx emissions from on-road motor vehicles will continue to decline due to fleet turnover. CARB’s aggressive regulations on on-road heavy duty diesel trucks, buses, and construction equipment will continue to reduce NOx and diesel particulate matter.”

This excerpt reinforces the BAAQMD’s historical and largely exclusive focus on 1) imposing NOx reductions on the same stationary sources that represent only a very small margin of the air basin’s NOx inventory; and 2) continuing the historical reliance on the State and federal government for Smog-Check, cleaner vehicle tailpipe standards, and other “aggressive regulations” to reduce both NOx and PM engine emissions.

BAAQMD’s CEQA thresholds, adopted for use by OCII on the Events Center project EIR, have been and remain under-representative quantitatively based on non-scientific derived NSR thresholds. NSR-derived CEQA thresholds will fail to adequately counterbalance land use growth-related increases in new, indirect source (vehicle) emissions of the Events Center, along with emissions from other land use projects in the Bay Area, subject to CEQA review, and those land use projects will generate thousands of tons of emissions on an annual basis no differently—aside from being greatly under-evaluated by use of the District’s lax CEQA thresholds-- than those highly regulated local stationary sources operating under routine, severe restrictions by the air district.

In conclusion, use of the BAAQMD’s CEQA thresholds to evaluate the Event Center project’s impact significance for both onroad and offroad emissions have been based on under-representative NSR daily emission offset levels, and those levels, applied to evaluate the Events Center’s air impacts, will understate their significance to local and regional air quality. This is no more appropriate than the Lead Agency’s implication that the region’s 17% improvement in

regional ozone over a 20-year period is attributable to those under-representative CEQA thresholds.

### III. NBA-Game Vehicle Trips Associated with Oracle Arena Appear To Have Not Been Relinquished For Use by SF Warriors at Proposed Events Center

At FEIR 13.13-45, the Lead Agency has again repeated its contention that basketball-related games at the Oracle Arena in Oakland represent existing baseline vehicle emissions which, already existing, are transferable to the new SF arena. The FEIR’s air emissions estimates rely on this baseline argument to avoid disclosing greater emission offsets that would otherwise be necessary to reduce the project’s emissions to less than significant levels.

“These trips occur now so they are part of the existing baseline condition. It is reasonable to assume that the Oracle Arena will not be host to another NBA franchise in the Bay Area, so no new vehicle emissions associated with NBA basketball games would be expected in the region. This assumption is supported by substantial evidence and vetted by OCII. The assumption was also accepted by the California Air Resources Board when it approved the project sponsor’s analysis of greenhouse gas emissions pursuant to its AB 900 application.”...

“The Specific Plan (Oakland Coliseum Area Specific Plan Final EIR) is based on Oakland’s assumption that all three current City of Oakland sports franchises (the Raiders, the A’s and the Warriors) will make independent business decisions to remain in Oakland, and at the Coliseum District, and that each of the sports franchises will have new, separate venues for their games. Consequently, the assumptions within the Coliseum Area Plan Final EIR are entirely different from those of the proposed project.

However, as we noted in our previous comments Oakland has clearly identified at various locations in its August 2014 Coliseum Area Specific Plan DEIR that it has assumed that its baseline involves retention of the Warriors, and hence EIR emissions estimates are predicated on that fact.

The issue here is not whether the Warriors intend to move to the new SF Events Center and that some existing vehicle trips will move with them, but whether the game-related vehicle trips the Events Center EIR has claimed in its emissions calculations and for mitigation value are transferable from the Oracle Arena. If the modernizing and expansion of the area, inclusive of

Oct. 30, 2015*

the Oracle Arena, intends to keep those trips on their books (and the Coliseum SPA DEIR indicates they will), they cannot then also be claimed for application to the SF Event Center project (as they have been). We continue to contend that they cannot be applied in the Events Center project because they have not been relinquished by the existing facility that is anticipated within the Coliseum redevelopment process, and there is no evidence (a letter from the City of Oakland, a clear statement in the Coliseum SPA DEIR that they have not continued to count those NBA-franchise related vehicle trips, etc.) provided in the SF Events Center EIR to that effect. The Coliseum SPA DEIR anticipates modernizing the existing Oracle Arena with no substantive change in location, and retention of the NBA franchise or recruitment of a non-NBA sports team. At Coliseum SPA DEIR pg. 4.4-59 baseline emissions were identified for 2013. Further, the Oakland DEIR was released in July 2014, a year prior to issuance of the SF Events Center DEIR, and at least four months prior to the release of the Event Center NOP. Coliseum SPA DEIR pg. 4.4-59:

“CalEEModTM 2013.2.2 was used to evaluate (...) criteria pollutant emissions for (...) existing criteria pollutant emissions from the Coliseum District area (“Existing No Project”, or “2013 Baseline”).”

Showing in the screenshot below, Coliseum SPA DEIR pg. 4.2-61, Table 4.2-7 provides baseline operational emissions for the Coliseum project, inclusive of existing Warriors game trips, for the 2013 baseline year, and then again for the 2035 baseline year. According to the DEIR:

“Table 4.2-7 shows estimated average daily and annual maximum criteria emissions under current conditions (2013 Baseline), as well as the emissions projected from current land uses at the Coliseum District as they would occur in 2035 (2035 Baseline). These projected 2035 baseline emissions are based on a continuation of existing land uses, **vehicle trips, and VMTs**. (Emphasis added) Over time, regulatory changes at the state level are projected to go into effect, resulting in improvements primarily to vehicle exhaust emissions.”

ROG	26	21	-5
NOx	30	11	-19
PM <sub>10</sub> Total	9	9	0
PM <sub>2.5</sub> Total	3	3	0
Emissions (pounds/day)			
Pollutant	2013 Baseline	2035 Baseline	Baseline Increment
ROG	144	115	-29
NOx	165	62	-103
PM <sub>10</sub> Total	52	50	-2
PM <sub>2.5</sub> Total	17	15	-2

**Abbreviations:**  
CalEEMod™ = California Emissions Estimator Model  
CEQA = California Environmental Quality Act

Immediately after, the DEIR states:

“Table 4.2-8 shows average daily and maximum annual projected 2035 criteria air pollutant emissions with the Coliseum District project, compared with 2013 Baseline emissions levels, and the incremental increase of emissions. The table shows that for each criteria pollutant, in the year 2035, the development will emit more pollutants than the City’s threshold.”

A screenshot of Table 4.3-8 is provided:

CEQA = California Environmental Quality Act  
NO<sub>x</sub> = nitrogen oxides

The Coliseum SPA DEIR has made it abundantly clear in written and graphical form that it has assumed retention of the Warriors at their present Oakland area site or recruitment of a replacement non-NBA team, counted those related vehicle trips and their attendant air pollution impacts, and it has provided baseline emissions data for 2013 for estimation of emissions for the proposed Coliseum development, with Arena renewal, that reflects that retention. In Table 4.2-8 immediately above, the "Project Increment" column represents the difference between the Warrior's emission baseline values, inclusive of game-related trips that have been ongoing at the facility for decades, and the 2035 future-case projection. Nothing has been provided to show that the Oakland EIR has relinquished its historical NBA-franchise trips, and thus those "existing" trips and their emissions must not then be applied as, in effect, a credit in the SF EIR, since an automatic under-representation and under-mitigation of the Event Center's total, significant operational emissions (largely caused by vehicle trip emissions) will then occur. While this helps the Event Center Applicant since fewer emission offsets will need to be acquired to bring the project's significant emissions down to sub-threshold levels, it is not appropriate under CEQA.

## O-MBA20L7

Air Quality Comments for Event Ctr – Mission Bay Blocks 29-32 FEIR, San Francisco CA  
Autumn Wind Associates, Inc. 916.719.5472  
Oct. 30, 2015

No information is found in Table footnotes or surrounding to reflect that trips factored into the 2013 baseline were somehow relieved of the increment of historical Warrior game-related trips that must be carefully accounted for in the CEQA review process for both projects, nor has the SF Events Center EIR ever provided actual evidence that the Oakland Coliseum project has relinquished or abandoned those baseline Warrior trips, already studied and accounted for under CEQA, to the Oracle Arena as it is redeveloped and expanded. Unless the SF Events Arena project can provide factual information from Oakland Coliseum SPA EIR administrators that shows that trip emissions associated with the long-established NBA-style games at the Oracle Arena will not continue with the Warriors or any other similar sports team, and that the Coliseum project has abandoned any intent to have a replacement sports team for the purposes of estimating the emissions of the redeveloped, new arena proposed for the Coliseum Specific Plan Area, the SF Events Center cannot claim or use any measure of them for their emissions estimates or for mitigation offsetting.

Finally, CARB's AB 900 GHG streamlined analysis process for large (>\$100 million) projects is not part of the CEQA process used to estimate and evaluate the proposed SF Arena's environmental impacts, does not afford the public effective review and input, nor is it subject to administrative review. Without evidence provided in the SF Events Center EIR of a potential for double-claimed Warriors trips, CARB likely erred if they assumed that Oracle Arena NBA trip emissions were wholly fungible with and transferable to the SF EIR. Before the SF Events Center can legitimately claim any benefit from Oracle's NBA-related vehicle trips for reducing its new, estimated vehicle emissions under CEQA, they must have been "taken off the books" in Oakland in order to prevent what would in effect be a double-counting. As we noted previously, those Oracle-based NBA trips cannot be transferred to San Francisco's proposed Events Center if they have been retained "on the books" in Oakland. Nothing in the FEIR proves otherwise.

13  
[LC-AQ-5]

### IV. Project Mitigation to Reduce Construction and Operational Emissions Is Flawed

At FEIR pg. 13.13-53 the Lead Agency rebuffs concerns that Tier 2 engines and Tier 4 engines required in the SDEIR of all 195 pieces of project-related construction equipment may not provide adequate emission reductions:

"As a part of the implementation guidance, the City Planning Department presents the results of a statewide data summary gathered by the California Air Resources Board as part of compliance with the In-Use Off-Road Diesel Regulation. The data indicate the

14  
[LC-AQ-2]

## O-MBA20L7

*Air Quality Comments for Event Ctr – Mission Bay Blocks 29-32 FEIR, San Francisco CA  
Autumn Wind Associates, Inc. 916.719.5472  
Oct. 30, 2015*

available construction equipment at various engine tier levels. These data indicate that in 2014 approximately 59 percent of all off-road equipment in the state were operating with Tier 2 engines or better. Given that the majority of equipment statewide is capable of complying with the conditions of Mitigation Measure M-AQ-1, it is reasonable to conclude that the measure represents feasible mitigation.”

No information has been provided in the SDEIR or FEIR as evidence, other than the statistic excerpted above, that all 195 pieces of project construction equipment will be available for work at the Event Center at all times necessary during the 26-month long construction process. Rather than contacting major construction firms expected to bid on the project to determine actual Tier 2 or better equipment availability, the Lead Agency has belatedly decided to rely on nothing more than the belatedly-developed statistic excerpted above. In actuality, this statistic reflects serious flaws; it acts as another example of the Lead Agency’s inexperience with construction vehicles and practices.

A statistical average may look good on paper but it cannot ensure provision of all 195 pieces of equipment that must meet the FEIR MM-AQ-1’s Tier, VDECs, and NOx requirements---only actual, compliant equipment available for use at the project will. Why did the Lead Agency fail to conduct a survey of construction firms that could be expected to bid on Event Center work? No information is provide in the EIR that actual fleets which can be expected to work at the Events Center project are available to meet the requirements of the mitigation measure. Further, the statistic provided by the Lead Agency does not say that 59% of all construction equipment vehicles in CA will meet Tier 2 or better status--rather, it says that all **offroad** vehicles do (as of 2014). All offroad vehicles are not all construction vehicles; in fact, construction vehicles are a small subset of all offroad vehicles. Moreover, the rate of compliance for construction vehicles, particularly large, expensive, long-lived ones (scrapers, excavators, pile drivers, etc.) will be far lower than the average for all **offroad** vehicles that include such non-construction equipment as ground support vehicles at airports, agricultural forklifts, and myriad other offroad, non-construction equipment types. Because the statistic represents all offroad vehicles in CA and not construction vehicles, it cannot be used to even roughly determine the proportion of construction vehicles supposedly available to the project with Tier 2 engines, VDECs, and 40% NOx control; hence, the statistic is irrelevant to the Events Center project environmental review and does nothing to refute our concerns expressed clearly at the SDEIR review stage. This is a major flaw, but others are no less important.

14  
[LC-AQ-2]  
cont.

## O-MBA20L7

*Air Quality Comments for Event Ctr – Mission Bay Blocks 29-32 FEIR, San Francisco CA  
Autumn Wind Associates, Inc. 916.719.5472  
Oct. 30, 2015*

Rather than relying solely on the FEIR’s statistic to respond to public concerns of construction mitigation challenges, the construction equipment list for the project found at FEIR Vol 6, pg. 413 of 1669 should have been used by the Lead Agency for comparisons to CARB offroad construction vehicle and equipment databases, and then, more importantly, to develop a survey of construction companies capable of working on the project for their compliant equipment lists. Other CEQA projects, particularly in the Sacramento area<sup>4</sup>, have involved detailed surveys of construction firms to determine their equipment compliance mitigation potential and availability. Just as importantly, CARB offroad regulations (as of 2011) no longer require VDECs be installed on all Tier 2 vehicles, nor will OSHA restrictions permit such due to sight-and-visibility concerns<sup>5</sup>. In reality, it is a near-certainty that all 195 pieces of offroad, each required to be Tier 2 or better engines *and* equipped with VDECs *and* producing 40% NOx reduction, will be unavailable—and unattainable-- for compliance with the mitigation’s requirements.

While the FEIR’s offroad emissions mitigation is unlikely to meet the Tier 2 or better requirement with mandatory VDECs, it is also virtually certain to fail the mandated 40% NOx reduction required of each piece of equipment. To an even worse extent than the VDECs requirement, the mitigation measure’s linked NOx decrement is not practicably obtainable since there are no CARB-approved VDECs products that will provide highly effective particulate filtering with that level of NOx destruction. While the Cleaire Longview product would produce DPM control with 25% NOx destruction, it was limited to onroad vehicles only, no CARB certifications were obtained after early 2013, and Cleaire has been out business for some time. Cleaire’s offroad counterpart product, the Lonestar product, was designed to produce similar emission benefits, but was limited to certain years of rubber-tired construction vehicles only. (We note that the construction equipment list for the Events Center project at FEIR Vol 6, pg. 413 of 1669, lists use of scrapers, excavators, and other types of construction equipment that are tracked, not rubber-tired.) The Johnson-Mathey EGRT product, capable of Level III particulate control with 40% NOx destruction has been CARB-certified for certain pre-2003 onroad trucks only. The Nett BlueMax DPF-SCR product, while producing substantial reductions of NOx and particulate, is certified only for certain-year stationary gensets. Finally, the ECS DPF catalyst with use of an aqueous diesel product will produce only Level II particulate control with 20% NOx destruction; however, the PuriNOx diesel fuel product has not been available for a number of years and thus that option is not viable.

## O-MBA20L7

Air Quality Comments for Event Ctr – Mission Bay Blocks 29-32 FEIR, San Francisco CA  
Autumn Wind Associates, Inc. 916.719.5472  
Oct. 30, 2015

As written, the Events Center EIR's MM-AQ-1 requires that every piece of offroad construction equipment used at the project will be mitigated with required use of Tier 2 engines equipped with VDECs and 40% NOx reduction if similarly-equipped Tier 4 and then, next, Tier 3 equipment are not available. The measure mandates without exception that every piece of equipment to be used at the Events Center project, regardless of Tier, will include VDECs that must produce a collateral 40% NOx reduction. To our knowledge, there are no VDECs products, CARB-certified for use in CA, which will provide that level of NOx destruction. Further, we stress that M-AQ-1 requires the specified level of NOx destruction on both Tier 3 and 4 engines, and thus later model engines with relatively lower NOx emissions (due to more stringent emission standards) would still need to produce the 40% NOx decrement taken against either their respective Tier 3 or Tier 4 NOx certification levels.

We have provided here a screenshot of a relevant portion of M-AQ-1 from SDEIR pg. 5.4-35:

TABLE M-AQ-1-1 OFF-ROAD EQUIPMENT COMPLIANCE STEP-DOWN SCHEDULE		
Compliance Alternative	Engine Emission Standard	Emissions Control
1	Tier 4 Interim	ARB NOx VDECs (40%) <sup>52</sup>
2	Tier 3	ARB NOx VDECs (40%)
3	Tier 2	ARB NOx VDECs (40%)

**How to use the table:** If the requirements of (A)(1)(b) cannot be met, then the project sponsor would need to meet Compliance Alternative 1. Should the project sponsor not be able to supply off-road equipment meeting Compliance Alternative 1, then Compliance Alternative 2 would need to be met. Should the project sponsor not be able to supply off-road equipment meeting Compliance Alternative 2, then Compliance Alternative 3 would need to be met.

b) All off-road equipment shall have engines that meet either U.S. Environmental Protection Agency (USEPA) or California Air Resources Board (CARB) Tier 4 off-road emission standards. If engines that comply with Tier 4 off-road emission standards are not commercially available, then the project sponsor shall provide the next cleanest piece of off-road equipment as provided by the step down schedules in Table M-AQ-1-1.

As the compliance alternatives above indicate, all tiered engines must be equipped with VDECs that will provide both particulate filtering and a reduction (against the particular engine's

14

13

## O-MBA20L7

Air Quality Comments for Event Ctr – Mission Bay Blocks 29-32 FEIR, San Francisco CA  
Autumn Wind Associates, Inc. 916.719.5472  
Oct. 30, 2015

applicable emission standard determined by year of manufacture) of NOx by 40%. While this is almost certainly unattainable, SDEIR Table 5.4-8 (Mitigated Average Daily Construction-Related Emissions) clearly shows that the project has assumed it would, and has made a related emissions reduction claim for both particulate and NOx benefits to result from the mitigation measure's Compliance Alternatives. Because the construction industry in CA does not yet have enough Tier 4 offroad vehicles to readily supply all equipment types to large projects under concurrent construction such as the Events Center project<sup>6</sup>, because Tier 2 vehicles are not required by CARB to be equipped with VDECs, and because OSHA restrictions prevents all construction vehicles from being retrofitted with VDECs, M-AQ-1's mandated application of the related components to every piece of project-related construction equipment is probably unattainable.

Further, the requirement that each Tiered level of equipment have VDECs that will provide collateral reductions of 40% NOx appears to be impossible based on the unavailability of NOx destruction technology for construction equipment and as reflected by CARB's certified-VDEC listings. Finally, other than for what has turned out to be an inapplicable statistic, we remain unable to find substantive information in the Events Center FEIR, in response to our earlier-expressed concerns regarding M-AQ-1, that proves construction fleets in CA can meet the measure's requirements and that demonstrates that certified technologies are available in CA to provide the EIR's mandated and claimed emission reductions. As written, M-AQ-1 requirements and claimed emission reductions are likely unattainable; if this is correct, the flawed measure cannot be enforced nor will it provide the emission benefits claimed in the EIR to reduce the project's impacts to less than significant levels. M-AQ-1 and related emission benefits (NOx, PM10/2.5, reduced health risks) claimed for reductions of the project's impacts must be revised, with results recirculated for public review and comment.

### V. Use of a Qualified 3<sup>rd</sup> Party Specialist or Engineer Is Needed to Ensure Actual Mitigation-Required Construction Eqpt Emission Reductions

At FEIR pg. 13.13-55 the Lead Agency contends that a potential conflict of interest posed by the Project Sponsor's "review role in the mitigation measure" is negated by their requirement that the Construction Emissions Control Plan be reviewed or approved by OCII or its "designated representative". OCII argues that "air quality specialists" at SF Planning are capable of verifying

<sup>6</sup> Phase IV of the Folsom Dam Auxiliary Spillway project, US Army Corps of Engineers, has provided about 95% compliance with Tier 4 equipment mitigation, but without the Events Center EIR's mitigation to also provide 40% NOx benefit.

## O-MBA20L7

*Air Quality Comments for Event Ctr – Mission Bay Blocks 29-32 FEIR, San Francisco CA  
Autumn Wind Associates, Inc. 916.719.5472  
Oct. 30, 2015*

Event Center construction fleets for compliance with the project's mitigation measures, pointing to unspecified experience with, for example, a harbor hoteling project, and "familiarity with modeling programs" used for air quality analysis. We note that the Lead Agency has used the term "air quality specialists" and not "Air Quality Specialists", indicating that their job descriptions likely reflect non-technical Planner skillsets rather than those required for an air quality agency engineering or specialist position involved with evaluating and verifying VDECs and CARB certifications; evaluating and verifying NOx reduction claims emissions for offroad construction equipment; evaluating and verifying engine Tiers on all pieces of offroad construction equipment; and ensuring that each and every piece of onsite equipment is verified and tracked regularly for hours of operation at the project site. Hands-on experience with construction vehicles of all types and vintages, emission control technologies, CARB regulations and aftermarket retrofit certification requirements, possessing CARB certification for performing visible emissions evaluations for construction equipment opacity violations, and other technical, hands-on, construction-related skillsets will be required to ensure that every piece of offroad construction equipment used at the Events Center project meets the highly-specific and technical requirements of M-AQ-1 for every day such equipment is used at the jobsite; it is highly improbable that a "planner" would possess such skillsets.

Further, "familiarity" can indicate little more than a vague awareness and thus it connotes little substance. As we argued in our comments previously, the Lead Agency should rely for onsite verification of the project's mitigation measures, in detail, on BAAQMD personnel or on an independent, trained, professional environmental specialist or engineer with expertise in air emissions, construction vehicles, and emissions control technologies and strategies used to control and reduce construction equipment emissions. The environmental compliance professional should be onsite daily, with weekly assessments in reports delivered to OCII. Based on a lack of experience with construction equipment, its availability, and with practicable construction mitigation, it is apparent that OCII has constructed M-AQ-1 in ways that are fundamentally flawed and the measure is unenforceable. Accordingly, OCII's choice of SF Planning personnel, or their own, to ensure compliance and enforcement of the project's air quality mitigations is likely to be similarly flawed. If OCII refuses to require use of highly qualified air pollution control personnel to ensure compliance and enforcement of M-AQ-1 and other air quality mitigations, we believe the MMRP must be amended to provide for regular (bi-weekly or monthly) independent audits provided by BAAQMD or a private, professional air quality consultant to verify equipment lists and details with actual vehicles on the project site; the auditor would have specialized training in visible emissions, air quality regulations, vehicle emissions and control technologies used in construction equipment, etc. Without such third-

party verification the project will likely not produce the required emission reductions that have been claimed in the EIR in order to reduce the project's impact significance levels.

### VI. Renewable Diesel Should Have Been Made Mandatory in Construction and Operational Mitigation Measures

No substantive explanation is provided in the FEIR for why the Lead Agency has failed to require use of renewable diesel to mitigate offroad construction equipment emissions and for use in emergency standby generators. As we pointed out in our previous comments renewable diesel is readily available, and it provides criteria and carbon emission reduction benefits that cannot be matched by the biodiesel mentioned in the EIR, it routinely costs less than biodiesel, and in many cases it costs less or is on par with costs for regular diesel.

At FEIR 13.13-61 the Lead Agency has applied conditions to the use of renewable diesel in emergency standby gensets that reflects its inexperience and reluctance to require use of available technology that has demonstrated clear cost-effective emission benefits within the region. As we pointed out in comments on the SDEIR, renewable diesel is available at multiple locations throughout central and northern CA at costs on par with conventional diesel (and routinely less than the less-effective biodiesel mentioned by the Lead Agency in the Events Center EIR), its substantial carbon benefits are unmatched against regular diesel or biodiesel, and it produces positive reductions compared with regular diesel in particulate (-34%), NOx (-18%)<sup>7</sup>, and other pollutant reductions needed by the Events Center project. Use of renewable diesel in existing or new diesels requires no retrofitting and either does not affect performance or improves it incrementally. The Lead Agency's concern that renewable diesel's NOx benefit may be lost as a result of 12 miles of transport (see FEIR pg. 13.13-57) to the Event Center borders on the ludicrous, since traditional diesel (particularly from imported crude) is transported a greater distance, and because the Lead Agency has failed altogether to verify traditional diesel's transport distance to the Events Center for comparison purposes.

Renewable diesel's primary benefit is its extremely low carbon intensity; the Propel renewable diesel product we discussed in previous comments has zero land use or other indirect carbon intensity effect, and its (direct) carbon intensity (CI) is 68% less than traditional diesel's CI value; why, then, has OCII not embraced renewable diesel's carbon benefits that, importantly, will help offset the project's actual GHG emissions and criteria pollutant emissions? Renewable diesel is

readily fungible with traditional diesel for storage and has better product life characteristics. Its use in construction and onroad diesels requires no adjustments or adaptations, it is locally available, and it is functionally transparent with traditional diesel for use in diesel engines.

While the Lead Agency has refused to embrace renewable diesel for the Events Center project, its own parent agency has not. San Francisco's mayor publicly announced that the City-and-County had committed to 100% renewable diesel use last July, with full transition by the end of 2015<sup>8</sup>. The City of Walnut Creek committed to 100% use of renewable diesel previously, and relies on it exclusively now.<sup>9</sup> If the City of Walnut Creek and the City and County of San Francisco, with their experts in diesel technology and fleet management, and with ready access to BAAQMD air quality expertise, have embraced the multiple air and energy benefits of renewable diesel, what explains the Lead Agency's intransigent failure (FEIR pg. 13.13-57) to require its use in the Event Center's air quality mitigations? CEQA requires the use of all reasonable, feasible mitigations for the reduction of the project's significant air quality impacts; the Lead Agency's tepid response to renewable diesel is, against the evidence of its considerable benefits that has been readily available since prior to issuance of the project's SDEIR, inadequate to ensure its use on the project.

Further, if the "OCII or the City's air quality specialists" lack the expertise necessary to have already reviewed and selected renewable diesel as they should have (based on the City's adoption of it prior to issuance of the Events Center FEIR), and for what appear to be fatal flaws built into M-AQ-1 (as pointed out elsewhere in this comment letter), we again propose the project's use of a highly qualified, independent and unconflicted, professional environmental consultant, or BAAQMD specialist or engineer, with relevant expertise to ensure use of and compliance with the Event Center's air quality mitigations and to ensure the use of all reasonable, feasible options (including renewable diesel) for every day of the project's construction process.

### VII. The Lead Agency's Efforts on Behalf of the Applicant To Force Reduced BAAQMD Emission Offset Fees Jeopardizes the Project's Emission Reductions

<sup>8</sup> City and County of SF; press release dated July 21, 2015; <http://sfgov.org/news/2015-07-21/green-city-mayor-announces-use-renewable-fuel-city-fleet>

*Air Quality Comments for Event Ctr – Mission Bay Blocks 29-32 FEIR, San Francisco CA  
Autumn Wind Associates, Inc. 916.719.5472  
Oct. 30, 2015*

At FEIR pg. 13.13-67 the Lead Agency appears to have rejected NOx offset fees estimated for the Events Center project, provided by BAAQMD:

SF Planning has been in communication with BAAQMD with regard to its suggestion that a higher fee may be warranted to offset project emissions to a less than significant level and found that BAAQMD could not establish that an increased rate beyond that of the Carl Moyer Program plus a five percent administrative fee could meet the "rough proportionality" standard required under CEQA.

No evidence is provided in the FEIR that identifies the criteria used by SF Planning to determine that costs for the Applicant's emission credits provided by the BAAQMD would be unable to meet the "rough proportionality" CEQA standard; this information must be provided for the public's review.

At SDEIR pg. 5.4-41, M-AQ-2b appears to have been written to require the Event Center's use of BAAQMD NOx credits:

"Mitigation Measure M-AQ-2b would require the project sponsor to pay an offset mitigation fee to the BAAQMD to fund emissions reduction projects that would reduce emissions of ozone precursors to below the applicable thresholds."

Based on information found in the FEIR, it appears that the Planning Department and BAAQMD have not resolved their disagreement on the costs for offsets to be provided by BAAQMD. It also appears that the Lead Agency has designed the above-referenced measure such that the project must acquire 17 tons (appearing to be underestimated based on comments noted elsewhere in this comment letter) of ozone precursor emission credits from BAAQMD. Found primarily at FEIR pg. 13.13-66, the Lead Agency appears to have indicated its intent to require the Events Center Applicant to pay no more than average emissions credit value established under the statewide Carl Moyer program. Nothing, however, requires that a local air district charge that value or less for emissions credits it establishes under the Program, nor can it since the average cost-effectiveness program values are established by actual supply-and-demand factors that float with market conditions that differ regionally and over time. The BAAQMD cannot be forced by the Lead Agency or the Applicant to provide credits at a price they feel is reasonable based on statewide or other averages. Further, lower cost tons in Sacramento or the San Joaquin valley are not relevant to the case at hand because the geographical equivalent of the "rough

Oct. 30, 2015*

proportionality” CEQA argument the Lead Agency has made would prevent their use for the Events Center project.

It seems that the Lead Agency clearly has the cart before the horse now. It first established that the project must purchase emission offsets from BAAQMD, but then later decided that their fees were not in “rough proportionality” (without providing any evidence or criteria as to what they consider “rough proportionality”) to the value of those same credits sold in other locations of the State—despite that the dollar values of those 17 tons of precursor emission credits to be found in Sacramento or the San Joaquin valley or elsewhere were made irrelevant by CEQA’s requiring that mitigation and impact be co-located as closely as possible. Notwithstanding the Lead Agency’s discourse that carries across both FEIR pages noted above, the FEIR’s response never settles the uncertainty of whether the BAAQMD will provide what the Lead Agency believes are the necessary tons of offsets needed by the project or how the Applicant’s fees of \$321,646 will buy those tons that the BAAQMD has indicated that it will sell for appreciably more. As written, the FEIR has failed to settle the issue and provide the reasonable level of certainty that the project’s emissions will actually be mitigated to less than significant levels beginning with construction startup. This is not acceptable under CEQA, and it is not appropriate that the Lead Agency attempt to dictate what market-based emission offsets/credits that it does not control are worth.

### VIII. Emission Offsets Required for the Project May Be Unacceptably Short-Lived

At FEIR pg. 13.13-67, the Lead Agency has not responded substantively or meaningfully to our earlier-expressed concern that emission offset credits for the Events Center project, created with short-term emission projects, will fail to provide durable emission benefits for the Events Center across its lifetime. Nothing in CEQA provides that short-term credits of several years duration would be adequate to offset the Events Center project across its 30 – 50 year lifetime, nor has the Lead Agency provided any evidence to the contrary. From FEIR pg. 13.13-67:

Another commenter states that the offset amount presented on page 5.4-41 of the SEIR would only offset a single year of emissions. This assertion is incorrect. Emissions offset programs replace existing high-polluting engines with cleaner more efficient engines and the incremental benefit of these replacements are realized for successive years into the future until the original engine would have reached the end of its useful life or its operation is prohibited by regulation (e.g., California Code of Regulations, Title 13,

Division 3, § 2449(d)(2) (in-use off-road diesel regulation)). Other offset programs, such as the shoreside power unit implemented by the Port of San Francisco pursuant to the Final EIR for the 34th America’s Cup and James R. Herman Cruise Terminal and Northeast Wharf Plaza (Case No. 2010.0493E) continue to offset hoteling emissions of diesel ships in dry dock at Pier 70.

As noted elsewhere in our comments, the BAAQMD is required by Events Center EIR to provide precursor emission reductions to offset the 17 tons estimated in the EIR as required for the project<sup>10</sup>. However, whether those credits are produced by the BAAQMD or another entity proximate to the project area, the FEIR fails to require that they be derived from long-lived projects. As currently written in the EIR’s M-AQ-2b, it is possible that BAAQMD will fund short-duration projects with the Events Center offset fees, or, based on our expressed concerns that BAAQMD offsets may not ultimately be acquired for the project due to SF Planning’s disagreements with them over offset values, another credit-generating project approved by the Lead Agency may deliver only short-duration benefits. This would not provide the long-term emission reductions needed for the Events Center’s offsets.

In fact, the Moyer Program has funded projects that traditionally have provided emission credits for no more than an average of nine years, and the average life of all Moyer projects, including onroad projects of the type identified for possible application to the Events Center project, is seven years<sup>11</sup>. 2011 Moyer Program Guidelines require that the maximum project life for offroad compression-ignition equipment replacement projects is five years except that for excavators, skid steer loaders and rough-terrain forklifts the maximum is three years, and for crawler tractors, off-highway tractors, rubber-tired dozers, and workover rigs it is a maximum of 7 years<sup>12</sup>. Marine projects may be undertaken but with no more than a sixteen year life. Even at their longest, Moyer project emission credits purchased only once for the Event Center project will last no more than a minor portion of the project’s planned lifetime.

<sup>10</sup> As noted elsewhere in this comment letter, we argue that onroad and offroad emissions for the Event Center EIR have been underestimated as a result of a double-claim for existing vehicle trip emissions attributed historically to the Oakland Oracle arena, and because mitigations for operational and construction equipment contain unacceptable flaws and, with M-AQ-1’s requirements, those flaws result in unattainable and unenforceable components.

Autumn Wind Associates, Inc. 916.719.5472  
Oct. 30, 2015*

As currently devised, the Events Center EIR does not proscribe the purchase and use of short-term project (as little as one-year) emission offsets by the Applicant, nor does it prevent use of any combination of project emissions that would not match contemporaneously with Events Center significant emissions emitted at any point over its decades of planned life. Neither does the FEIR excerpt shown above provide information that disputes our previously submitted comment that mobile source credit-generating products, undertaken with Moyer funds, must be relatively short-term since project vehicles typically are rendered obsolete by new vehicles with lower emissions levels moving regularly into the marketplace. Rather than disputing our contention, the FEIR actually appears to have done no more than repeat it. This is not acceptable.

The Lead Agency has failed to define "successive years" in the excerpt above, nor has it identified a minimum project life for credits that it will approve for offsetting the Events Center significant emissions. Nowhere does the Lead Agency discuss purchase and use of successive emission reduction projects over the years so that the Events Center will always have adequate numbers of tons of reductions to offset its significant tons of emissions. Moreover, it has refused to prohibit use of short-term Moyer Project emission offsets that would last no more than a few years, despite the Events Center's emissions lasting decades longer. As currently written, M-AQ-2b provides no certainty that the project's tons of significant ozone precursors will be fully mitigated across their lifetime; in all likelihood, emission credits will provide no more than several years of emission reductions before their engendering Moyer projects expire.

For the reasons stated in this letter we believe that the Event Center EIR, amended after the DSEIR review, continues to reflect significant shortcomings that will result in unmitigated, significant, and excessive air quality impacts during the project's construction and then across its operational lifetime. Due to serious issues with M-AQ-1's construction, we believe that it cannot practicably provide the emission reductions claimed for it, and that the benefit of emissions from trips already on the books and associated with the Oakland Oracle Arena, to reduce the complement of all new Event Center trip-related emissions, is not acceptable under CEQA. In addition, serious questions remain regarding costs, availability, and sustained durability of tons of emission credits, likely underestimated due to flaws noted in this letter, that will be needed by the project to reduce its ozone precursor impacts to less-than-significant levels.

Re: Public Records Act/Sunshine Ordinance Request

Dear Mr. Rahaim and Custodian of Records for the Successor Agency:

This office represents the Mission Bay Alliance, an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project").

Pursuant to the California Government Code sections 6250 et seq and the San Francisco Sunshine Ordinance, Sec. 67.24, I request copies of the following records:

1. All records relating to monitoring or enforcement of compliance with mitigation measures adopted to reduce potentially significant air quality impacts of development projects approved by the City, the Redevelopment Agency of the City and County of San Francisco, or the Successor Agency to the Redevelopment Agency of the City and County of San Francisco, including any records reflecting audits of such compliance.

You may fully comply with this request by the traditional method of making the requested records available for inspection and copying.

Alternatively, you may fully comply with this request by both posting the requested records to the web page maintained by OCII at <http://www.gsweventcenter.com/>, and providing a written response stating the exact title of the hyperlink or hyperlinks on the web page that access the requested records.

EXHIBIT D

Responsive records that are withheld from inspection should be specifically and separately identified in writing and accompanied by the claimed justification for withholding, as provided by California Government Code section 6255 and San Francisco Sunshine Ordinance Sec. 67.27, stating the nature of the document withheld and the basis for such withholding.

Should you contend that any portion of a particular document is exempt from disclosure, I request that the exempt portion be redacted and the remaining portions be produced. I reserve the right to object to any decision to withhold materials, or portions of documents.

I also request copies of public records in electronic form where available, and in hard copy where copies in electronic form are not available.

In accordance with Section 6253(c) of the California Government Code and Section 67.25 of the San Francisco Sunshine Ordinance, please respond to my request within ten (10) days.

Any questions regarding my public records act request should be addressed to the undersigned.

Thank you in advance for your prompt attention and timely cooperation on this matter.

Very truly yours,

Thomas N. Lippe

Re: Public Information Request - air quality mitigation compliance ...

O-MBA20L7

1. Do you have a specific start and end date for the records (i.e. only records after X date and before Y date)?

The last 10 years.

2. Can your request be narrowed to a particular geographical area or areas (e.g., Mission Bay)?

Downtown, Mission Bay, SOMA, Eastern Neighborhoods, Embarcadero and the Waterfront.

3. Are there particular types of "monitoring or enforcement" documents that you are looking for?

Yes. With respect to all construction projects in these areas for which the EIR identified significant air quality impacts from construction activities that could not be entirely avoided, the City, Redevelopment Agency, or the Successor Agency would have adopted mitigation measures to reduce the projects' significant air quality impacts and would have adopted a Mitigation Monitoring and Reporting Plan ("MMRP"). These MMRPs should have resulted in the generation of reports documenting the project's compliance, or lack thereof, with these adopted air quality impact mitigation measures. I want to obtain these reports.

4. Are there particular types of "development projects" in which you are interested?

All construction projects in these areas for which the EIR identified significant air quality impacts from construction activities that could not be entirely avoided, and for which the City, Redevelopment Agency, or the Successor Agency adopted mitigation measures to reduce the projects' significant air quality impacts and a Mitigation Monitoring and Reporting Plan ("MMRP")

5. Is there any other information that might narrow or more accurately focus our search for records?

Not at this time.

Thank you for your attention to this request.

Regards,

Tom Lippe

On 9/11/2015 5:20 PM, Oerth, Sally (CII) wrote:

Dear Mr. Lippe,

In your request dated August 13, 2015 you ask for "[a]ll records relating to monitoring or enforcement of compliance with mitigation measures adopted to reduce potentially significant air quality impacts of development projects approved by the City, the Redevelopment Agency of the City and County of San Francisco, or the Successor Agency to the Redevelopment Agency of the City and County of San Francisco."

After beginning a search of our records, we have determined that this extremely broad request will require considerable City resources in order to respond. For example, a search of "all records relating to monitoring and enforcement" would require a search of all projects that have included mitigation measures and received environmental review clearance from the Planning Department or Redevelopment Agency (now OCII) since the California Environmental Quality Act was enacted in 1979. The City and Redevelopment Agency have approved hundreds, if not thousands of projects in that time. Records *relating* to monitoring and enforcement would not be limited to the hundreds or thousands of environmental documents themselves, but would conceivably include any document that even referenced air quality impacts or mitigation. In addition, many of these records are maintained offsite. The effort to retrieve off-site record for hundreds or thousands of projects, and search those records for any documents relating to air quality, will be time-consuming and unnecessarily involve use of scarce public resources.

The courts have applied a "rule of reason" to public records requests. See *Buck v. Gregory*, 65 Cal.2d 666, 676 (1967) (public records states are "subject to an implied rule of reason" and "inherent reasonableness limitations"). A department may apply this rule of reason when a request is so burdensome, persistent, or sweeping that it unreasonably impinges on a department's ability to perform its public duties. We would like to work with you in narrowing the request to identify the subject matter in which you are interested in order to conserve public resources. To that end, and in an effort to help ensure that we are providing you with the specific records you are interested in reviewing, we would be grateful if you could further clarify your request by writing to Christine Lamorena and Sally Oerth with responses to the following questions:

1. Do you have a specific start and end date for the records (i.e. only records after X date and before Y date)?

3 of 5

10/31/2015 2:44 PM

Re: Public Information Request - air quality mitigation compliance ...

**Subject: Responses to Comment on Draft Subsequent Environmental Impact Report for Event Center and Mixed Use Development at Mission Bay Blocks 29-32. SCN:2014112045**

P15003

Dear Mr. Lippe:

Per your request, I have reviewed the Responses to Comment ("the RTC") on the Draft Subsequent Environmental Impact Report (hereinafter "the DSEIR") on the above referenced Project in the City and County of San Francisco (hereinafter "the City"). As I was a commenter on the DSEIR in regard to matters involving transportation and circulation in a letter dated July 26, 2015 which was transmitted as Exhibit 1 to your comment letter of July 27, 2015, my current comments focus on the responses to my own comments, those of yourself and affiliated consultant Larry Wymer. In addition, several others including representatives of BARTD, Caltrans, Caltrain, UCSF and other have filed comments that parallel and reinforce our own. I address the responses to those comments as well.

My qualifications to perform this review were thoroughly documented in my letter of comment on the DSEIR dated July 26, 2015 and are incorporated herein by reference.

My current comments follow. They are organized in the order the City chose to respond to my and others, not in order of comments or order of importance.

#### Section 13.11.3, Response TR-2a

This section, in part, replies to our comments now labeled by the City as O-MBA10L4-15 and O-MBA10L4-17.

#### Re MBA10L4-15:

MBA10L4-15 points out that while the DSEIR evaluated the Project's transportation *with* implementation of a Special Events Transit Service Plan in the context of six different event scenarios, it only evaluates the Project's transportation impacts *without* the a Special Events Transit Service Plan in the context of *only one* event scenario (without Giants game but with Basketball game). It requests the analysis *without* the a Special Events Transit Service Plan in the context of for *all six* of the event scenarios that were evaluated assuming the Special Events Transit Service Plan was in place.

There are several problems with the City's reply to this comment.

- The reply claims that the scenario of an overlapping evening game at AT&T Park with a Basketball event at the proposed Project without the Special Event Transit Services Plan taking place is a "worst-of-the-worst scenarios" that could only happen about 9 times a year, and then only if Muni were unable to deliver those services. However, with the Project located just a block from the emergency entrances to the UCSF hospitals, "worst-of-the-worst scenarios" are germane considerations for potential impacts on patient access to emergency facilities and the ordinary or special access/egress of emergency service providers.
- Despite the City's assertion that funding of Muni's Special Event Transit Services Plan is guaranteed, this funding is dependent on allocation of General Funds and discretionary transportation funds to this purpose, with such future allocations not guaranteed.
- The response also points to Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring as providing measures that could be implemented in the event Muni's Special Event Transit Services Plan is not implemented. However, many of the potential action measures in M-TR-18 are vague and conditional, and strict monitoring and enforcement is unlikely if the City through Muni has failed to deliver its promised Special Event Transit Services Plan.
- The response, although admitting no quantitative analysis of an overlapping Giants event at AT&T Park with an evening Basketball event at the Project and without implementation of the Muni Special Event Transit Services Plan was prepared, claims that the DSEIR essentially covers this situation for intersections and freeway ramps by having quantitatively analyzed the scenario of an evening Basketball Event with no Giants Event and no Special Event Transit Services Plan (Impacts TR-18 and TR-19) by virtue of having stated that these impacts would be additive to impacts in the "existing conditions without evening Giants event scenario" (Impacts TR-2 and TR-3) or to Impacts TR-11 and TR-12 (existing conditions with a Giants Event at AT&T Park). The problem with this is that the simple statement that the impacts are additive provides the public with no measure of the severity of the combined impacts.

## O-MBA20L7

Mr. Tom Lippe  
November 2, 2015  
Page 3

- The response also notes that Impact TR-20 presents Muni transit impacts for the weekday evening Basketball scenario without an overlapping Giants game or implementation of the Muni Special Event Transit Services Plan and adds text stating as follows: "Impacts to the T Third and 22 Filmore would be in addition to the significant impacts identified for the proposed project with implementation of the Muni Special Event Transit Services Plan in Impact TR-13 for conditions with an overlapping SF Giants evening game." It then concludes, "The revision does not change the analysis or conclusions presented in the SEIR." The problem with this part of the response, like that related to the impacts on intersections and freeway ramps is that the simple statement that the impacts are additive fails to inform the public of the extent of the change in severity of the impacts.
- With regard to failure to consider cumulative scenarios that lack implementation of the Muni Special Event Transit Services Plan, this failure is not remedied by addition of text to the SEIR that specify that cumulative analysis for the Basketball game scenarios include assumption of implementation of the Muni Special Event Transit Services Plan. Since the SETSP is not guaranteed funding in perpetuity and there is no assurance that Muni vehicles and personnel resources will be able to be devoted to this special service in lieu of serving regular transit needs, this change in language does not relieve the deficiency of the SEIR's failure to consider the cumulative scenario in absence of the Muni Special Event Transit Services Plan.

As a consequence of these flaws, Response TR-2a related to MBA10L4-15 is inadequate.

### Re MBA10L4-17

Comment O-MBA10L4-17 is part of a stream of comment demonstrating why the DSEIR is inadequate for having unreasonably understated the amount of weekday evening arena event access travel would occur during the evening commute peak hour (see our comment now labeled O-MBA10L4-16 for related discussion). Responding to this apart from the related issues in O-MBA10L4-16 evades the compelling nature of the joint comments that the DSEIR has understated the numbers of weekday evening basketball event attendees actually traveling on the transportation system in the evening commute peak hour (5 to 6 PM).

As to the direct substance of the comment and response, the DSEIR's decision to base the analysis of weekday evening games on a presumed starting time of 7:30 was predicated on experience over 3 seasons when the Warriors were a poor to marginal team and games starting earlier in the evening (at about 6 pm) averaged only 2.5 games per season. The comment documented that based on the 2014/2015 season performance, the combined total of weeknight regular season and playoff games starting at 6 pm (the normal start time for nationally televised weeknight games played on the West Coast) could easily be 16 games per season

20  
[LC-TR-1]  
cont.

## O-MBA20L7

Mr. Tom Lippe  
November 2, 2015  
Page 4

over the next several years or beyond. The inadequacies of the SEIR reply are as follows:

- The reply notes that the 2 to 3 preseason and up to 16 postseason games - number variable - (and in actuality, though not admitted in the response, a number of regular season games as well) could have a 6pm weekday start time. It also admits that such games would worsen traffic in the weekday peak commute period from conditions reported in the SEIR (failing to admit also adversely impacting transit and also failing to quantify the increase in severity of impacts on weekday pm commute peak. It claims that these start times are driven by such factors as TV deals, other team's travel schedules and outcomes of postseason series that are beyond the abilities of the Warriors to control - although it is nonsense for the response to imply that those considerations make the Project's significant impacts in the circumstances of these earlier-start events any less significant.
- The response claims that the quality of the team will vary from year to year and claims that this will make the situation of large numbers of national telecasts that might start at 6 pm inconsistent over the time horizon considered in the SEIR. This is a speculation not consistent with precedent. Once a team has achieved an iconic status and national following (as the Warriors have done in the recent season with winning the league championship and the most valuable player award and with the shiny new venue comprised by the Project reinforcing that iconic status), the number of nationally televised weeknight games (6 pm starts) is likely to increase over the next several seasons, and to reoccur despite hiccups in individual seasons (witness the pervasive national attraction to the Lakers and Celtics despite several bad seasons, or, in another sport, Notre Dame football). Moreover, the project arena may be used for other major weekday capacity events such as the NCAA basketball tournament quarter- and semi-finals that would have start times dictated by national TV (that is, 6 pm). Hence, the response's conclusion that "it is unlikely that this scenario [a large number of nationally televised weekday games starting at 6 pm] would occur on a regular basis during the time horizon addressed by the SEIR" is non-factual, speculative and inconsistent with the good faith effort to disclose impact that CEQA demands.
- Finally, the response claims that "consistent with common practice in the transportation planning profession, the SEIR includes an analysis of the highest demand with the most frequent conditions for evening events ...". We agree that the 7:30 start time is probably the most frequent weekday evening start time likely to occur. But the SEIR is in error and misleading in proclaiming that it is consistent with common practice in the transportation planning profession to only study the high-demand situation that occurs most frequently. In fact, when a high demand scenario that is not the most frequently occurring but is one that occurs frequently enough to be significantly impactful, it is the common practice in the transportation planning

20  
[LC-TR-1]  
cont.

## O-MBA20L7

Mr. Tom Lippe  
November 2, 2015  
Page 5

profession to study that frequent-enough circumstance as a separate scenario on a CEQA or other analysis. A good example of this is normal transportation planning practice with respect to major regional shopping centers. Studies are performed for an average weekday, and because shopping centers have their highest travel peaks on Saturday, for an average Saturday; these are the most frequently occurring peak conditions. But because shopping center travel has its highest peaks in the Thanksgiving to day-after-New Year holiday season and because the peaks in that approximately 38 day season occur frequently enough to be significantly impactful on their own and pose impacts of different severity than on the average weekday and average Saturday, normal transportation planning practice is to evaluate holiday shopping season weekday and Saturday impacts as separate scenarios. Another example is in the Napa Valley. There, it is the practice to evaluate a project's transportation impacts for the average weekday and average Saturday (which are the most frequently occurring impact situations) and to also evaluate impacts in the "crush" (harvest) season as a separate case as well because those impacts, occurring over a four to six week period are frequent enough and of such severity in comparison to annual averages to warrant consideration as a separate impact case.

- This matter cannot be dismissed as a disagreement among experts. A compelling argument that the SEIR should have evaluated a case scenario for weeknight capacity Basketball games starting at 6 pm is the fact that the SEIR did evaluate a scenario where there are an overlapping capacity Basketball event at the proposed Project and a Giants game at AT&T Park on a weekday evening. The SEIR claims that that type of overlapping event is likely to occur only about 9 times per year. It is obvious that, if a nine times per year occurrence rate is sufficient to require the SEIR to evaluate the Project in the context of that overlapping scenario, then the SEIR should also evaluate the weeknight 6 pm Basketball start scenario which is likely to occur more than 9 times per year in many years of operation.
- The fact that two hospital emergency entrances and the entries for emergency caregivers are located within a block of the Project site make the need for the SEIR to specifically evaluate impacts and mitigation in the 6 pm weekday event start scenario all the more compelling.

Hence, considering all of the above, the SEIR should have evaluated weekday Basketball events starting at 6 pm and is inadequate for not having done so.

### Section 13.11.3, Response TR-2b

This section purports to respond to our comments now labeled by the City as O-MBA10L4-2, O-MBA10L4-20, O-MBA10L4-39A and those of Caltrans (A-Caltrans-5) and others. These comments concern the SEIR's lack of analysis at intersections

Page 6

and freeway ramps that are on obvious approach and/or departure routes to/from and that are obviously or potentially capacity-challenged already.

The response begins by reciting the 6 freeway ramps and their related surface street intersections where analysis was conducted, a point not at issue in the comment. The key point of the comment is the locations the SEIR failed to analyze, not the places it did so. The reply continues, adding that the depth and approach is similar to other studies of completed and ongoing major project studies in San Francisco, and noting that the 1998 Mission Bay FSEIR did not address freeway ramp operations and queuing at all. However, what other studies did or didn't do is immaterial. What is material is what this SEIR should have studied but failed to do, and the response attempts to evade this.

The response continues for two paragraphs describing the configurations and conditions at the I 280 Mariposa off-ramp - one of the locations the SEIR did study. This section, not related to the issue of the ramps and ramp intersections that the SEIR should have but failed to study, concludes by observing that the LOS F conditions on the off ramp in the evening peak hour would be cured by Mitigation Measure M-TR-11c involving stationing a PCO at the ramp terminus intersection and waving traffic turning right to Mariposa eastbound through the traffic signal at the end of the off-ramp. But that conclusion is completely speculative. This commenter was a long term Giants season ticket holder at AT&T Park and this particular off ramp was on my normal route to the Park. The problem there is not that the signal causes queues to back up the ramp and onto the freeway mainline. It is that once a driver reaches the end of the ramp and has a green light, there is often no place to turn to on Mariposa because eastbound traffic is queued all the way back from Third Street. So placing a PCO there will be largely useless.

The response then discusses the I-80 westbound off-ramp to Fifth Street, and concludes that mitigation measure M-TR-2b, vague measures of unquantifiable effect to encourage travel by non-automotive modes would reduce the Project's impacts at this location. Again, this discussion of a location the SEIR did study is irrelevant to the issue that the SEIR should have but failed to study other locations - unless the implicit message is that, had it done so and discovered impacts, it would have just proposed vague, unquantifiable and ineffectual mitigations and declared the impacts mitigated.

Finally, after four lengthy paragraphs of largely irrelevant matter, the reply turns to the subject of the intersections and ramps that should have been studied and were not. The response notes that under CEQA Guidelines § 15130, defining the location or locations for study "*is within the lead agency's reasonable discretion*" and fundamentally claims that in defining what intersections and ramps were analyzed in this SEIR the City has exercised reasonable discretion. However, this assertion is undermined by content in the comments demonstrating that by prior and ongoing

21

Mr. Tom Lippe  
November 2, 2015  
Page 7

studies in the general area and by common observation, the City knew or should have known that certain intersections and ramps in the SOMA and Mission Bay area that are on logical access and egress routes to the Project site are capacity challenged and are likely to be adversely impacted by the Project, yet it did not study them in the SEIR. Hence, rather than exercising "*reasonable discretion*" as required by CEQA Guidelines, the City, in failing to study these locations, abused its discretion and failed to undertake the good faith effort to disclose impact demanded by CEQA.

That the City has failed to exercise reasonable discretion in this matter is reinforced by two considerations.

- Two UCSF hospitals are located a block from the Project site. Many of the intersections and ramps on logical access/egress routes to/from the Project that, at the City's discretion, the SEIR failed to analyze are on the advised emergency access routes from various points in the City and region to the hospitals and are posted on the UCSF web site. In excluding these intersections and ramps, the City clearly ignored public safety impacts of that decision.
- The State of California Department of Transportation (Caltrans) has commented on the DSEIR as follows. "Project-related queuing impacts on nearby State facilities should be analyzed" (see comment now labeled in SEIR A-Caltrans-5). Caltrans clearly believes the DSEIR has not assessed impacts on a sufficient number of freeway mainline, ramps and ramp intersections that are likely to be impacted by the Project. Caltrans opinion is due the same deference in this matter as that of the City.

The City's response continues, attempting to explain why individual or groups of intersections and ramps were excluded from study in the DSEIR. For example, the response cites 9 intersections along the Embarcadero and 15 along or east of Fourth Street that we claimed should have been studied. It claims that because the Project is shifted to its current location farther south-west from the originally proposed location on Piers 30-32, the primary routes to and from the Project site from Downtown, SOMA, the northern parts of the City and from the North Bay and the I-80 ramps would be shifted farther west, away from these intersections. But this is not true. Except for the relatively few instances in which there is a concurrent evening Giants game at AT&T park, the routes along the Embarcadero and along and east of Fourth Street remain the most effective and imageable routes to the currently proposed Project site and the parking facilities that serve it from much of the Downtown, SOMA, northern parts of the City, the North Bay and the I-80 ramps to and from the East Bay. Those paths are only likely to be altered on evenings with a concurrent Giants game. And if a massive shift of traffic further west was assumed in the City's thinking as it scoped the current SEIR and excluded the intersections along the Embarcadero and on and east of Fourth on that assumption, why didn't it add more intersections in the Eighth Street corridor (including but not

O-MBA20L7

Mr. Tom Lippe  
November 2, 2015  
Page 8

limited to the ramps and intersections at Eighth and Harrison, Eighth and Bryant) and other intersections in the Van Ness, Franklin, Gough, Octavia corridors for example? The City has no good answer.

The response also claims that traffic passing through the Embarcadero intersections and the intersections along and east of Fourth would be less significant because a survey of baseball attendees at AT&T park *suggested* that many attendees who worked Downtown or in SOMA and drove to work left their cars at their commute parking locations and walked, used transit or took cabs to and from the ballpark. This type of data is of course irrelevant because those considerations should have already been taken into account in the SEIR's assumptions about mode split to the park from those districts. Moreover, this type behavior is likely to become increasingly uncommon as surface parking in those districts disappears and is replaced by parking garages that tend to close earlier than parkers could travel back to them at the conclusion of ballpark or arena events.

The response also cites new study of a single intersection, that of Eighth and Bryant as exemplar of why additional study intersections are not justified. This intersection is an anomalously complex intersection, and the effects of its complexities on traffic operations are difficult to replicate in theoretical delay/level of service calculations. Part of the complexity is that Eighth Street, which is one-way southbound north of Brannan becomes two-way south of Brannan. The complexity is compounded because columns that support I-80 as it crosses above Eighth between Bryant and Brannan are located in the center of Eighth Street and force southbound drivers that want to turn left at Brannan or go through or right there to pick the correct lane before departing the heavily congested intersection of Eighth and Bryant. Moreover, from this point of choice, drivers' views of what choices they must make before moving along Eighth toward Brannan are obscured by the columns and I-80 structure. In general, calculations of LOS at one location are poor predictors of delay/LOS conditions somewhere else. Moreover, in this case, the unique geometrics of the subject intersection and their unusual effects on driver behavior make the outcome of theoretical delay/LOS calculations anomalous rather than exemplar of anything elsewhere.

The City's response is clearly grasping straws to avoid analyzing the full array of intersections and ramps that, in a good faith effort to disclose impact, the SEIR should have evaluated. The City's response to the subject comment set is inadequate, and in continuing to evade analysis of potentially adversely affected freeway segments, intersections and ramps, the SEIR is defective and unsuited for certification.

### Section 13.11.3, Response TR-2c

Response TR-2c replies to our comments O-MBA10L4-21 and -22, and those of others that the DSEIR understates transit and traffic impacts because it is based on outdated traffic and transit data unrepresentative of existing conditions at the time of filing the Notice of Preparation (NOP) for the SEIR.

The initial point in the response in Response TR-2c is to deny that the baseline data relied upon in the DSEIR was stale, and to claim that the City and its consultants took steps to assure that they relied upon data as up-to-date as feasible. This assertion is factually untrue.

Here we briefly review the facts of the situation, first with regard to transit data.

- The NOP for the Project was circulated on November 19, 2014.
- The data document relied on in the DSEIR transit impact analysis for Muni operations in the City states that this data was collected in the fall of 2010 and at some time in 2011.
- The data relied upon for services in the regional transit corridors serving the City was drawn from a SFMTA TEP project published in October 2012. Obviously, the regional transit corridor data published in that study reflects observations some time before October, 2012.
- Since those times of data collection, there have been a large number of development projects completed and occupied in the C-3, SOMA and Mission Bay and yet others were approved and under construction. In addition, the recovering economy has added considerable numbers of riders to the local and regional transit systems.

Clearly the transit data relied upon in the DSEIR was stale at the time the analysis was performed and this should have been obvious to the City and its consultants. Moreover, contrary to the claim in Response TR-2c that the City and its consultants took steps to assure that they relied upon data as up-to-date as feasible, new information released as part of Response TR-2c makes obvious that this is not the case.

- Several weeks before the DSEIR was circulated, the City issued updated summarizations of Muni patronage data and regional transit service data.
- Several weeks before the DSEIR was circulated, the City had BART patronage data that was very current – actually through April, 2015.

Yet the City did not update the transit analysis in light of this data before circulating the DSEIR or even acknowledge the existence of newer data in any way in that document. This is improper.

Response TR-26 does not present in full the new transit data set, the San Francisco Planning Department Memorandum *Transit Data for Transportation Impact Studies* dated May 15, 2015. Instead it presents a composite table compiled from the

## O-MBA20L7

Mr. Tom Lippe  
November 2, 2015  
Page 10

information in the cited memorandum (Table 5.2-43) sourced to Advant Consulting/Fehr & Peers/LCW Consulting and dated 2015. This composite table omits key data from the actual May 15, 2015 San Francisco Planning Department Memorandum (a copy of which is appended hereto as Exhibit 1) that indicate the data reflected therein were collected in 2013 for Muni operations and in 2012 for regional transit operations. This raises two key issues:

- Although the revised analysis presented in Response TR-2c is based on newer data, that data is also stale.
- In omitting, in the summary table published in Response TR-2c, the notations indicating the dates on which the newer data was collected, the response either deliberately or inadvertently misleads the public to believe the analysis in the response is based on current 2015 data, which it is not.

Although Response TR-2c mentions having BART's April, 2015 ridership data and claims to have relied on it, there is no evidence in the response of how and where the SEIR made use of it in any way. Although the City has placed the raw BART of April ridership data, ascribed to a May 1, 2015 submission by Val Menotti, BART Chief Planning & Development Officer, on the SEIR web site, the transmittal narrative is not presented nor is its translation into the regional screenline format relied on in the SEIR. We hereby demand that the conversion of the subject BART ridership data release be provided to the Mission Bay Alliance and its consultants in the format of the regional screenline analysis of the SEIR and that the period of comment be extended beyond the date of its provision to allow adequate time for review and comment on its implications. We also note that BART's own letter of comment on the DSEIR (now Comment A-BART) in its second paragraph of comment (a paragraph the SEIR ignores rather than enumerating for response (see SEIR page COM-19) notes as follows: "Given strong job expansion in San Francisco, BART has experienced unprecedented ridership growth (~25% over the last four years) which creates a number of peak period capacity challenges." This statement clearly demonstrates that any reliance on regional transit data as old as 2012 (which the SEIR continues to rely on) is an inaccurate portrayal of the background conditions on which the Project imposes impacts. Response TR-2c claims to have used the April, 2015 BART data

Response TR-2c presents a reassessment of impacts on the 22 – Fillmore and the T-Third lines based on the purportedly 'new' baseline data set and finds that deficiencies on these lines are not Project impacts because the Project's contribution to ridership does not exceed 5 percent of total ridership at the maximum load points. However, this finding of lacking a ridership contribution in excess of 5 percent at the maximum load point comes about only because of the failure to consider the scenario of weekday Basketball event starts at 6 pm and the SEIR's illogical refusal to consider that there is an offset between the time attendees pass through the arena turnstiles and the time those attendees are traveling on and impacting the transportation system (see our comments O-MBA10L4-17, O-MBA10L4-7, O-

22  
[LC-TR-3]

22  
[LC-TR-3]  
cont.

O-MBA20L7

Mr. Tom Lippe  
November 2, 2015  
Page 11

MBA10L4-16 and our comments herein with respect to Response to Comments TR-2a and TR-2d. Had either or both the 6 pm game start scenario and the proper offset between arena turnstile passage time and time traveling on the transportation system been considered, there would be much more Project travel on the subject lines during the pm peak commute hour (5-6 pm) than is considered in the SEIR and significant impacts on these lines would be disclosed.

Response TR-2c claims that use of the updated transit data does not result in any changes to impact determination for Muni transit presented in Impact TR-4. This conclusion is incorrect and misleading because the analysis was not performed on *adequately updated* (still stale) transit ridership data and because it was performed without considering reasonable Project contributions to evening commute peak hour transit ridership (because of failure to consider a 6 pm game start scenario and failure to consider the offset between time riding transit and time passing through arena turnstiles for the 7:30 game start scenario).

Response TR-2c also opines that, since ridership figures for the 22 Fillmore and T Third routes were obtained from SFMTA and reflect City's plans for changing the 22-Fillmore and completing the Central Subway by year 2020, the SEIR analysis for these lines accounts for development that occurred and is probable to occur through 2020. However, we note that the planning studies for those transit service changes on those lines were performed several years ago and the SEIR presents no clear evidence whether or not the SFMTA projections for those transit projects reasonably reflects the development boom that has occurred in the C-3, SOMA and Mission Bay in the intervening years and whether or not job infill in existing development due to a revitalized economy was reflected.

A final section of Response TR-2c attempts legalistic evasion of the issue of stale existing conditions data. This section starts by stating: "*Overall the transit impact analysis presents a reasonable representation of transit conditions based on available data for the Muni and regional transit providers and additional analysis is not required. Nor have commenters identified any flaws in the analysis that built upon the transit impact analysis.*" This statement is contrary to fact. Four year old data collected at a time when the job and development economy was just starting to begin recovering from a period of stagnation and decline is clearly not representative of conditions after four subsequent years of aggressive development and job boom. And for our part, in our comment letter of July 26, 2015 comprises 27 pages identifying flaws in the analysis that are compounded by the flawed and outdated transit data base assumed as "existing" conditions in the DSEIR. The response goes on to state: "*Although a somewhat different, and yet technically plausible, approach might have been possible, the City's approach is abundantly supported by substantial evidence and represents a reasonable exercise of technical judgment. In general, a lead agency's determination regarding how 'existing physical conditions without the project' could 'most reasonable be measured' is 'quintessentially a*

22  
[LC-TR-3]  
cont.

O-MBA20L7

Mr. Tom Lippe  
November 2, 2015  
Page 12

*discretionary determination*". This statement misrepresents the issue in order to bend the framing of it to fit legal case precedents which are then cited in the response. However, this is absolutely not a technical disagreement about how to go about collecting or reasonably measuring existing transit conditions data. The issue is that the old transit data the City had on hand is simply not representative of the transit conditions that existed in late November, 2014 when the NOP was circulated.

With regard to the issue of stale traffic data (Comment O-MBAL4-21), Response TR-2c reiterates that the DSEIR adjusted the original counts to account for the opening of the UCSF Medical Center Phase 1 and the Public Safety Building that were nearing completion after the traffic counts were taken. This adjustment for those buildings was acknowledged in our comment O-MBAL4-21 and is not a matter of question. Response TR-2c goes on to state that subsequent traffic counts taken at three intersections in April 2015 confirm that the adjustments to the earlier traffic counts reasonably reflect the added traffic associated with the newly opened facilities cited above. This point is also not challenged in our comment, at least with respect to the three particular intersections counted. However, Response TR-2c then concludes: "*Because the adjusted volumes used in the analysis were similar to or higher than those collected in the field in April 2015, it can reasonably be inferred* [emphasis added] *that the traffic volumes used in the existing and existing plus project analyses also adequately reflect any changes that may be associated with newly completed projects further afield (e.g., in SoMa).*" The idea that this conclusion can reasonably be inferred is utter nonsense. The DSEIR made no attempt to quantify what projects in northern Mission Bay, SOMA and the C-3 were completed after 2013 or nearing completion by early 2015, how much traffic they would generate and where most of that traffic would go and what study intersections it would affect. The intersections that were counted in April 2015 (Third with Sixteenth, Fourth with Sixteenth and Fourth with Mariposa) are indeed "*far afield*", being well to the southeast from new developments in northern Mission Bay, the SOMA and C-3 and are unlikely to be affected much by developments in those areas<sup>1</sup>. But other intersections in the Project's scope of study are much closer to those development areas and are likely to be considerably more affected by traffic generated by the uncounted developments there as well as increased traffic to/from those areas due to job growth within existing uses due to the improved economy. The April 2015 counts do nothing more than show the SEIR traffic adjustments for UCSF Medical Center Phase 1 and for the Public Safety Building came reasonably close to getting it right for those particular facilities and those particular intersections. They carry no inference for other new development and for other study intersections farther afield.

<sup>1</sup> This is because traffic from northern Mission Bay, the SOMA and C-3 would likely take other routes journeying to and from the southeast that would not pass through the 3 intersections counted in April 2015.

## O-MBA20L7

Mr. Tom Lippe  
November 2, 2015  
Page 13

Because of these considerations, Response TR-2c is inadequate and the comment that the SEIR traffic baseline is stale remains unrefuted.

### Section 13.11.3, Response TR-2d

Response TR-2d concerns our comments now O-MBA10L4-7, O-MBA10L4-7, Caltrans (A-Caltrans-1) and others.

Our comments concern the fact that the DSEIR relies on turnstile data<sup>2</sup> on time of arrival at the Golden State Warriors current venue site (Oracle Arena) and other basketball venues to estimate how many attendees traveling to a game with a 7:30 PM start time would be traveling on the area transportation system in the 4 to 6 PM peak commute period versus in the 6 to 8 PM early evening peak shoulder period without considering the reasonable offsets between the time attendees enter the "paid" areas of the arena and the time when they were actually traveling on the transportation system.

Response TR-2d begins by stating as follows: *"For reasons explained below, the City disagrees with those comments and stands by its analysis, which reflects a number of evidence-backed, conservative assumptions. While some of the points raised in the comments seem intuitively believable, actual data from comparable situations show that the comments have exaggerated the likely numbers of people would arrive [sic] before 6 pm for a 7:30 pm event."*

Let us parse this introductory section of the response before moving to the further details.

Re: *"points raised in the comments seem intuitively believable",*

- It is undeniable fact that attendees occupy capacity on the transportation for a period of time that depends on the length of their journey and mode and that the period they occupy capacity on the transportation system occurs before the time they pass through the arena turnstiles.
- It is undeniable fact that even for attendees who go directly through the turnstiles into the paid section of the arena at the end of their trip to the site, there is a time offset between the time when they stop occupying capacity on the transportation system - when they debark onto the T Third platform, or the 22 Fillmore stop or find a parking place nearby or perhaps even start walking from BART, Caltrain or the other Muni-Metro lines - and the time they pass through the turnstiles.
- It is fact that some attendees wait outside the venue, perhaps to meet up with companions traveling separately (possibly to hand them their tickets, just soak in the atmosphere of the crowd arriving or for other reasons). So the

<sup>2</sup> The time attendees actually enter the "paid" areas of the arena.

22  
[LC-TR-3]  
cont.

23  
[LC-TR-4]

## O-MBA20L7

Mr. Tom Lippe  
November 2, 2015  
Page 14

time these attendees occupy capacity on the transportation system is even more offset than those who enter the arena directly.

- It is fact that some choose to have drinks or meals at restaurants and bars outside the venue before entering the arena and that the offset between when these attendees occupy capacity on the transportation system and the time they pass through the arena turnstiles is even greater yet.

These considerations are not just *"intuitively believable"*; they are undeniable fact and the SEIR's analysis has failed to take them into account.

Re: *"the comments have exaggerated the likely numbers of people would arrive [sic] before 6 pm for a 7:30 pm event."*

The fact that time of arena event attendees' time on the transportation system is offset from the time they pass through the arena turnstiles for the reasons stated above is not a newly-discovered concept or theory; it is a fact the City and its consultants knew or should have known. It is the City's responsibility to have reasonably considered the offset factors in the SEIR and, based on that, reasonably estimated the number of arena attendees who would be impacting the transportation system during the evening commute peak hour in the case of a weekday evening arena event starting at 7:30 pm. We have made a reasoned effort to estimate how many attendee's travel to such an evening event would be offset into the evening commute peak hour. The City and its consultants have made absolutely no attempt to consider the offset factors in estimating impacts of travelers to a 7:30 pm arena event start on the transportation system in the evening commute peak hour. Hence, the City is in no position to opine that our reasonable estimate based on those offset factors is *"exaggerated"* since it didn't try to make such an estimate at all.

Re: *"the City disagrees with those comments and stands by its analysis..."*

This is an attempt to transform what is a matter of fact into a disagreement among experts in the hope that courts will grant deference to the City's opinion in the matter. However, since this is a clear matter of fact, the response is inadequate and the City has refused to make the good faith effort to disclose impact that CEQA demands.

Here we consider of details of Response TR-2d.

Response TR-2d in the last paragraph of Volume 4, page 13.11-41 states:

"As shown in the table on SEIR p. TR-37 of Volume 3 of the SEIR, multiple basketball

venues from various sources were evaluated to derive the arrival patterns at the

23  
[LC-TR-4]  
cont.

## O-MBA20L7

Mr. Tom Lippe  
November 2, 2015  
Page 15

proposed project arena. Of these, two locations (Oracle Arena in Oakland and Barclays Center in Brooklyn) separately reported arrivals occurring more than one and a half hour prior to the start of a basketball game. The remaining facilities reported all arrivals occurring more than one hour before to the start of a game, most likely because those occurring more than one and a half hour prior to the game represent a small fraction of the total attendance. The average percentage of arrivals occurring between 5:00 and 6:00 p.m. for those instances where arrivals occurring more than one and a half hour prior to the start of a basketball game (i.e., between 5:00 and 6:00 p.m. for a typical game starting at 7:30 p.m.) is less than 2.5 percent. Thus, to account for potential daily variability in arrival patterns, as well as the additional time it may take for attendees to enter to the event center after their arrival at the site or nearby vicinity, the SEIR conservatively assumed that more than twice as many attendees as the average (i.e., 5 percent) would arrive between 5:00 and 6:00 p.m."

This section of the response is misleading in several respects. Although Volume 3, page TR 37 presents 7 data sets obtained for 6 NBA basketball venues, examination reveals all of the data is turnstile entry data and only 3 of the data sets for 2 venues provided useful data measuring turnstile arrival times earlier more than 1.5 hours before game start time (which would definitely put travel by those attendees into the 5 to 6 pm evening commute peak period). One of those is for the Warriors at their current venue, Oracle Arena, and shows only 1 % of attendees arriving more than 1.5 hours before game start time. The other two are for the first two years of operations of the Barclays Center in Brooklyn which respectively showed 2.0 and 4.1 percent of attendees arriving more than 1.5 hours before the start of an evening basketball game.

Let us put this data in perspective. The Oakland-Alameda Coliseum complex on which the Oracle Arena sits has a total of almost 10,000 parking spaces, more than enough spaces to accommodate the entire Arena capacity attendance if attendees arrived at two persons per car occupancy. This facility is noted for tailgating before basketball games as well as before other events. In addition, persons arriving at the complex by BART can readily be observed joining friends who drove and parked at their tailgates. Because of this, the observed 1 percent of attendees turnstile count for Oracle is probably under-representative of the numbers of attendees who actually arrive on the premises more than 1.5 hours before game start by a factor of 25- to 30-fold or so.<sup>3</sup>

The other data sets from Brooklyn show turnstile counts at the Barclays Center more than 1.5 hours before game start at 2 percent in the initial year and 4.1 percent in the second year of operation. These percentages likely reflect in part attendees unfamiliar with a new venue and adapting their pregame behavior as they become more knowledgeable. But neither of the two years turnstile data provides any

<sup>3</sup> We note that it would not have been difficult or costly for the City, its consultants or the Project sponsor to have taken aerial photos of parking at the complex 1.5 hours before game start and again some time after game start, counted the cars in each, and used the relative numbers as a reasonable surrogate measure of what percentage of attendees arrive 1.5 hours before event start.

23  
[LC-TR-4]  
cont.

## O-MBA20L7

Mr. Tom Lippe  
November 2, 2015  
Page 16

indication of how many of the attendees actually arrived in the vicinity of the Barclays Center more than 1.5 hours before event start (hence actually traveling on the transportation system in the pm commute peak period).

The SEIR takes these three data sets, averages them, finds them to be less than 2.5 percent of total attendees, doubles that to 5 percent and assumes that becomes a "conservative" estimate covering all the considerations why attendees might have arrived in the Project area 1.5 hours or more before event start (hence been traveling on the transportation system in the pm peak commute hour.). The problem with this is, there is nothing that connects the turnstile percentage of attendees entering the arena more than 1.5 hours before event start to the percentage who arrive near the venue site 1.5 hours before or indicates that double that turnstile count is a "conservative" estimate of that latter item. The claimed "evidence backed, conservative assumptions" the City claims to have made in this matter has no direct quantified or quantifiable relationship to the "evidence" the SEIR cites. The City, its consultants or the Project sponsor could easily have easily and inexpensively measured attendee arrivals to the Warriors current venue environs (the Oakland Alameda Coliseum property) via motor vehicle and BART, but they failed to do so. By 'deeming this unnecessary' as it does on page 13.11-42, Response TR-2d expresses preference for the SEIR's own unsubstantiated guess as to how many attendees of a 7:30 pm start basketball event are actually traveling on the transportation in the pre-6 pm evening commute peak hour rather than having reliably measured data. And that guess is highly favorable to the Project since the low number of travelers in it minimize the chance of Project impacts on the transportation system being disclosed for the pm commute peak hour. The response is inadequate and inconsistent with the good faith effort to disclose impact that CEQA demands.

### Section 13.11.3, Response TR-2f

Response TR-2f replies to our comments O-MBA10L4-3, O-MBA10L4-4, O-MBA10L4-23, O-MBA10L4-24, and O-MBA10L4-27. The first and fourth of these comments relate to the SEIR's failure to define the severity of the Project's traffic impacts. The second and third of these comments relate to failure to evaluate impacts at intersections under PCO control and the fifth relates to the SEIR's failure to account for the effects of train passage in the analysis of the intersection of Sixteenth, Seventh and Mississippi. Both of these latter matters also ultimately go to the issue of failure to define severity of impacts.

With regard to the failure to address changes in severity to impacts at locations already operating under conditions qualifying as impacted, the first three paragraphs of the response are padding, reciting definitions of LOS that are not in dispute in the comments. The next three paragraphs of the response on page are legalistic arguments about whether CEQA requires disclosure of distinctions in severity to

23  
[LC-TR-4]  
cont.

24  
[LC-TR-6]

# O-MBA20L7

Mr. Tom Lippe  
November 2, 2015  
Page 17

impacts where conditions are already in a state considered impacted. Without engaging in the argument of legal matters, we can state that from an engineering perspective, distinctions in severity of impacts represented by changes in delay in the LOS/delay computations are highly significant. If the computations at a ramp or intersection already at LOS F show changes of a couple seconds of delay or so, this is hardly perceptible to drivers and is not indicative of meaningful change in severity of impact. But if the computations show changes of, for example, a half-minute or a minute or more, this is indicative of a dramatic change in severity that is highly perceptible and involves potential for queue blockages of additional lanes or upstream locations. Since the calculation procedures are capable of generating these estimates of delay and distinction of severity, this information should not be suppressed and ignored – doing so appears to be inconsistent with the good faith effort to disclose impact that CEQA demands.

The response goes on for four more paragraphs discussing the evolution of LOS computation techniques, the City's practices in use of them, and the technical meaningfulness of them. The single point in these paragraphs worthy of consideration can be summarized as follows: Calculation procedures to determine delay have been validated for instances where the subject location is below or slightly above capacity; in circumstances where capacity is greatly exceeded the validation is less strong and therefore the delay predictions are less reliable. We acknowledge this. But it is still clear if, say, an intersection or ramp is a couple seconds over the LOS F threshold in the existing condition and addition of project traffic computes to add a half minute or minute or more of delay, those are significant changes in severity. This is regardless of the fact, because of the lower reliability of the delay calculation in the LOS F zone, that if the traffic were actually added in the field and the changes in delay were measured, the results might be 27 seconds added instead of a half-minute or 55 seconds added instead of a minute.

Response TR-2f continues for another page-and-a-half of irrelevant speculation that in the future, consideration of LOS/delay may be excluded from CEQA consideration. For the present, LOS is a CEQA consideration, the City has relied on it and that portion of the response can safely be dismissed.

Response TR-2f continues, replying to the issues in O-MBA10L4-4, O-MBA10L4-23, concerning failure to evaluate LOA/delay impacts at intersections under PCO control. This comment concerns specific tables in DSEIR Volume 1 that are explicitly identified in the comments, Tables 5.2-47 and 5.2-48, respectively located on pages 5.2-172 and 5.2-174. These tables have no entries for LOS or delay at certain intersections, with the normal space for delay and LOS entries in those tables filled with the notation "PCO Controlled". The response points to completely different tables, Tables 5.2-34, 5.2-35 and 5.2-36 as having delay and LOS entries for those intersection locations. This response evades the following questions:

- What is LOS and delay at the times these intersections are PCO controlled?

24  
[LC-TR-6]  
cont.

# O-MBA20L7

Mr. Tom Lippe  
November 2, 2015  
Page 18

- Does the SEIR conclude that PCO control mitigates significant impacts at these locations or do they remain significantly and unavoidably impacted? The response is inadequate.

The final portion of Response TR-2f concerns the apparent lack considering the effect of Caltrain train movements on delay and LOS at the intersection of Seventh, Sixteenth and Mississippi. The response confirms that the SEIR analysis did not attempt to analyze the effect of Caltrain train movements on the LOS/delay compiled for the intersection of Seventh-Sixteenth and Mississippi. It points out that the SEIR analysis shows that with the reductions in general traffic lanes associated with the 22 Fillmore Transit Priority project, together with Project traffic, with or without overlapping Giants games, this location would be at LOS F. It then claims that, because the computation of delay is less reliable when LOS F conditions are already evident, there would be no point to attempting to further quantify the situation with respect to the effects on the subject intersection by Caltrain movements on the immediately adjacent grade crossing of Sixteenth. This absurd response ignores and attempts to evade the key point of the comment which is that had Caltrain movements been considered, there is a good prospect the analysis might have shown that traffic on Sixteenth would queue to an extent that might obstruct the intersections of Sixteenth with Owens, Sixteenth with Fourth, and even Sixteenth with Third. Since these locations are on a critical emergency and regular access route to the UCSF hospitals it is imperative that such an analysis be done (a good case for micro-simulation) and the SEIR is critically deficient for having failed to perform it.

## Section 13.11.3, Response TR-2g

This response replies to our comments O-MBA10L4-3-13a and O-MBA10L4-18 which concerns the criteria the City uses to define impacts on transit.

To our comment that the ordinary transit impact criterion, ridership in excess of 85 percent of screenline capacity based on scheduled service, or by scheduled line service where an individual line evaluation is ordered, is unreasonable and unrealistic. Our reasoning is based on the fact that Muni rarely, if ever actually delivers the effective capacity of full scheduled service due to missed runs, bunching and skip-stopping and other issues related to lack of schedule reliability or on-time performance. The response describes how passengers are counted, but this clearly does not include those left standing at bus stops and LRT platforms. It also claims that the procedure takes into account the schedule reliability and on-time performance issues, but demonstrates no clear way that this is true. It also fails to address the issue that, when only a screenline analysis is performed, this assumes the excess capacity on one line is available to serve the excess ridership on another, while in reality, most people's travel patterns are well served by only a single line.

24  
[LC-TR-6]  
cont.

25  
[LC-TR-7]

O-MBA20L7

Mr. Tom Lippe  
November 2, 2015  
Page 19

The response then moves to a key issue, that the City has relaxed the normal threshold of impact from 85 percent to 100 percent of capacity for this particular Project. One of our criticisms is that relaxation of the normal threshold of significant impact for one favored project is inconsistent with the good faith effort to disclose impact that CEQA demands. The response's reply to this is that San Francisco already did the same for the 34<sup>th</sup> America's Cup competition event and New York City does it all the time for large special events. But the America's Cup competition is/was fundamentally different from the proposed Project in that it involved large-attendance spectator event competition occurring over just a few days in a single year; the Project involves events on over 200 days per year repeated over many, many years. Moreover, the fact that nobody noticed that the City changed the rules for that specific event does not make it right then and does not justify making a special change of the impact criteria for this Project or for any project. As regards to what New York City does for transit impact criterion with respect to large special events there, that is irrelevant to San Francisco.

A key issue identified in the comments is that while event-attendees may tolerate 100 percent-of-capacity crush loads (a justification the DSEIR used for the relaxed impact criterion), the problem is that this imposes a special misery on the people who are normal users of the affected lines at the times. Response TR-2g fails to address this relevant point. Furthermore, the issue of who the regular riders who are adversely impacted when special event attendees overcrowd and slow the operation of the affected transit lines has Social Justice implications. We explore this topic, which the SEIR fails to address, below.

Other commenters provide evidence that the community south of the Project site served by the T Third line is a disadvantaged community that is adversely impacted by the effects of transit services to the Project that create social justice issues unaddressed in the SEIR. Here we discuss transit operations considerations that lend support to the assertion that the SEIR has failed to address social justice issues.

- Regular users of the T Third will suffer unpleasant overcrowding due to event-goers in the pre-event and post-event periods, having to deal with scarcity of seating and uncomfortable sharing of standing space with boisterous pre-event goers and over-exuberant or angrily depressed (and often liquor-fueled) departing event goers.
- The City's decision to reduce the threshold of significant impact from the normal 85 percent of capacity to 100 percent of capacity exacerbates the overcrowding impacts on the regular user community.
- Special T Third shuttle services to the Project site that turn back near the intersection of Sixteenth and Third occupy time slots that could be filled by runs that serve the community to the south in this corridor.

25  
[LC-TR-7]  
cont.

TRAFFIC • TRANSPORTATION • MANAGEMENT

5311 Lowry Road, Union City, CA 94587 tel: 510-489-9477 fax: 510-489-9478

O-MBA20L7

Mr. Tom Lippe  
November 2, 2015  
Page 20

- Heavy boardings and alightings associated with event arrival and departure travel increase station dwell times, slowing service to normal users south of the Project site. Delays associated with shuttle operation turn-backs do the same. Also, turn-backs tend to create big gaps in service south of the Project site, as is reportedly already evidenced as the result of Giants games.
- Reconstruction of the T Third station platform near the intersection of Third with Sixteenth to accommodate Project crowds, a reconstruction that will require over a year, will inevitably delay T Third services to the disadvantaged community to the south over the duration of the construction period. At times this may even require substitution of inferior bus services.

All of these constitute transit operational reasons why the SEIR should have included a Social Justice Impact section that has not been provided.

Section 13.11.3, Response TR-2h

This response replies to our comments O-MBA5-6, O-MBA10L4-9, O-MBA10L4-10, O-MBA10L4-11, O-MBA10L4-12, O-MBA10L4-26 and O-MBA10L4-36 and those of others. The points of these comments are summarized as follows:

- The cumulative analysis, pegged to Year 2040, 25 years from now, is purely speculative.
- While a speculative look at conditions 25 years hence is not objectionable, overlooking a cumulative scenario 10 years hence misses the most active concerns of the current residents of San Francisco and the region, hence the SEIR is defective as an information document.
- Absent inclusion of a shorter time-frame cumulative analysis, the long-term cumulative analysis deludes the public as to the nearer-term cumulative consequences of the Project.
- Given the rapid pace of development approvals including frequent planning and zoning variances, a 25 year forward cumulative analysis based on General Plan development quantifications is irrelevant.
- The transportation planning forecast tool used to prepare the travel forecasts for the 2040 cumulative analysis has a greater validation error (by a factor of 2) than the threshold of Project cumulative impact.
- The City is actively planning massive changes to the transportation network that would substantially alter (seemingly to the Project's detriment and to make it more impactful) transportation conditions in the immediate Project vicinity and that are as reasonably foreseeable as the plan development totals relied on in the 2040 analysis. The SEIR has failed to assess these transportation network changes.
- The SEIR uses an improper baseline for assessing cumulative transportation impacts. It assesses the Project's impacts relative to 2040 conditions that are assumed to exist without the Project. Per CEQA, it should evaluate the Project's impacts, in combination with those of other present and

25

## O-MBA20L7

Mr. Tom Lippe  
November 2, 2015  
Page 21

reasonably foreseeable future projects on the existing environment. The essential difference is that what the SEIR has done is to compare a projection to a projection. CEQA requires comparison of a joint projection to a known (the existing condition). These are different things.

Response TR-2h begins with a laborious 4-page description of the City's ordinary practices in cumulative analysis and of the SF-CHAMP transportation model. The discussion fails to address any of the issues in the comments and, in particular, the SF-CHAMP model's calibration error being double the threshold of impacts that it is being relied upon to disclose.

Response TR-2h continues in an attempt to justify the distant year cumulative analysis as follows:

The 2040 cumulative horizon year is preferable to shorter period because the 25 - year horizon year more accurately accounts for land use changes and their associated transportation network changes, as well as other planned transportation improvements. Future growth occurs according to the vagaries of variable economic conditions, development trends, changing sponsor development priorities, and legal actions that delay or curtail proposed development, and therefore, short - term land use growth patterns cannot be accurately predicted in five - year increments. In particular, redevelopment projects such as those included in the 2040 growth forecasts (e.g., Mission Bay Plan, Candlestick Point - Hunters Point Shipyard Plan, redevelopment of Pier 70 and Seawall Lot 337), often take longer than anticipated to be completed. For example, the Mission Bay Plan was anticipated to be substantially built - out by 2015, which is the cumulative analysis year for transportation conditions in the Mission Bay FSEIR; however, construction of development is still underway and the UCSF Mission Bay campus is anticipated to be completed by 2019. Nearby, the Candlestick Point - Hunters Point Shipyard Phase II Development Plan identified completion of about 3,100 residential units by 2017; however, only about 240 of the 3,100 residential units are anticipated to be completed by the end of 2015. Construction of development part of the Pier 70 project is anticipated to continue through 2030. Thus, because larger multi - year development proposals would be built over a number of years, a future cumulative analysis year considers completion of buildout of these projects. Therefore, the cumulative impact analysis presented on SEIR pp. 5.2 - 208 - 5.2 - 232 (i.e., Impact C - TR - 1 though Impact C - TR - 10) adequately reflects the proposed project's impacts in combination with other past, present, and reasonably foreseeable future projects, and a different or additional cumulative analysis year is not warranted.

This response begs the question: If all this is true, why didn't the City use a 50, 60 or 100 year period for the cumulative analysis. The response, although seemingly filled with factual information, is nonsense relative to the issues.

Also, nothing in the response addresses the final bulleted point above or its elaboration in the original comments. CEQA requires evaluation of the

TRAFFIC • TRANSPORTATION • MANAGEMENT

cumulative condition, including the Project in combination with other foreseeable in comparison to the existing environment, not a comparison of two hypothetical future conditions.

### Section 13.11.6 – Response TR-5

This response relates to comments by BART (Comments A-BART-1, -4, -5, -7, -8, and -9) and ourselves (O-MBA10L4-19) supplying a station-level analysis of impacts on BART that was critically missing in the DSEIR. This station-level analysis provides completely new information, including Table 13.11-2, and conclusions that were previously missing. Consequently, the information should be available for review for the full 45 day review period in Recirculated Draft status under CEQA.

### Section 13.11.6 – Response TR-8

This response replies to our comment O-MBA10L4-28 concerning truck loading. The response indicates that new (un-numbered and untitled) figures showing truck turning templates for each loading are presented with the response. It is not evident if and where the said figures are actually provided. Hence, the response is inadequate.

### Section 13.11.6 – Response TR-9

This reply responds to our comment and those of others regarding access impacts to emergency vehicles attempting to reach UCSF hospitals located in the immediate vicinity of the Project. The response consists of a repetition and elaboration of the description of the ineffectual measures that prompted the comment rather than proposing clear mitigation to resolve the issues. We note that the critical traffic LOS deficiency at the intersection of Seventh, Sixteenth and Mississippi, which is on advertised emergency routes to the UCSF hospitals is unmitigated and that the SEIR analysis at this location has failed to consider the effects of train crossings of Sixteenth Street, which could cause traffic on Sixteenth to queue into the intersections of Sixteenth with Owens and Sixteenth with Fourth, which are intersections crucial to hospital access, both emergency and normal. The response is inadequate.

### Section 13.11.6 – Response TR-10

This response, which concerns construction impacts, is merely a reprise of the inadequate information and findings in the DSEIR that prompted our and several other comments. Of particular concern is the failure to address construction impacts associated with the reconstruction of the LRT station by the Project site on Third

**RE: Responses to RTC - Responses to Comments on the Draft Subsequent Environmental Impact Report-  
Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (SCN:2014112045)**

Mr. Lippe,

This letter summarizes my responses to the Response to Comments published on October 23, 2015. These are the professional opinions of Larry Wymer, licensed California Traffic Engineer (#1955).

**OPINION 1 - The DSEIR's Transportation and Circulation analysis does not adequately analyze the entirety of the study area impacted by the development**

**OPINION 2 - The DSEIR's Transportation and Circulation analysis does not analyze impacted study intersections and ramps in the SoMa and North Mission Bay areas, most notably those between Market Street and King Street**

I maintain the opinion that the study area should be expanded beyond those assumed within the SEIR to the SoMa area to incorporate relevant travel patterns which would exist for both the proposed project and the "the previous proposed arena site as described within the memorandum report titled "Travel and Parking Demand Estimates for the Proposed Event Center and Mixed Use Development at Piers 30-32 and Seawall Lot 330" which was dated August 9, 2013.

The RTC states that my comment:

*"...noted that because some of the basketball game attendees would be arriving from the San Francisco downtown and Financial District areas, they would be required to pass through SoMa to arrive at the project site, so that additional intersections in the SoMa area would have to be evaluated. Mode of travel and place of origin surveys of baseball game attendees conducted by the SF Giants, as well as available parking occupancy surveys, suggest that many of those game attendees that drove to work at their jobs in the Financial District and SoMa areas, tend to walk, ride transit, or take a taxi to AT&T Park, leaving their cars at their commuter parking locations in order to avoid the evening commute congestion that*

*typically occurs near I-80 and AT&T Park and having to re-park their cars at game-day rates. It is likely*

*that a similar condition would occur with the proposed project, with many of those working in downtown*

O-MBA20L7

*riding Muni or special event shuttles, and taking taxis or TNC vehicles2, such as Uber or Lyft to the event center, rather than driving and having to park again with limited space availability."*

The SEIR itself, as noted within Table 1 of my original comment letter (provided below) identified several corridors to/from the SoMa neighborhood with substantial trip percentages up to 32% of project traffic.

**Table 1  
Project Vehicle Trip Patterns to Major Parking Facilities  
North Mission Bay & South SoMa**

Figure	Page	Figure Title	Trip Assignment Along Roadway			
			Seventh St s/o Townsend St	Fourth St s/o Townsend St	King St e/o Third St	from WB I-80 to Fifth St
5.2-14A	5.2-95	Project Vehicle Trip Patterns to Major Parking Facilities - Inbound Weekday PM Peak Hour - No Event and Convention Event	18% / 22%	7% / 7%	5% / 11%	8% / 7%
5.2-14B	5.2-96	Project Vehicle Trip Patterns to Major Parking Facilities- Outbound Weekday PM Peak Hour - No Event and Convention Event	19% / 19%	7% / 12%	5% / 5%	8% / 8%
5.2-14C	5.2-97	Project Vehicle Trip Patterns to Major Parking Facilities - Inbound Saturday Evening Peak Hour - No Event	20%	8%	5%	9%
5.2-14D	5.2-98	Project Vehicle Trip Patterns to Major Parking Facilities - Outbound Saturday Evening Peak Hour - No Event	20%	8%	5%	7%
5.2-14E	5.2-99	Project Vehicle Trip Patterns to Major Parking Facilities - Inbound Weekday and Saturday Peak Hours - Basketball Game Without a SF Giants Evening Game	31% / 32%	13% / 13%	9% / 11%	29% / 30%
5.2-14F	5.2-100	Project Vehicle Trip Patterns to Major Parking Facilities - Outbound Weekday Late Evening Peak Hour - Basketball Game Without a SF Giants Evening Game	31%	13%	11%	20%

Source: "Event Center and Mixed Use Development at Mission Bay Blocks 29-32" DSEIR (June 5, 2015)

It is not reasonable to discount the trips clearly represented by these trip pattern percentages established within the SEIR as irrelevant or unworthy of analysis because they may not be entirely comprised of trips within personal vehicles of those traveling through the SoMa area from the financial district. Even if attendees utilize alternate transportation such as taxis, Uber or Lyft, they will still be new trips added to the roadways which will potentially significantly impact intersections north of the area studied.

The RTC also states:

*"The previously proposed center at Piers 30-32 was located at the intersection of The Embarcadero and*

*Bryant Street, with very different access patterns compared to the proposed project."*

While true, generally the same level of traffic will be generated by both alternatives, and trips originating from the financial district would still be required to travel through the SoMa area. While admittedly traveling along some different arterials through the SoMa district, the previous analysis considered intersections within SoMa whereas the SEIR does not.

Please feel free to give me a call if you have any questions.

**Subject: Response to Comments on the Event Center and Mixed-Use Development  
Project at Mission Bay Blocks 29-32**

Dear Mr. Lippe:

We have reviewed the October 23, 2015 Event Center and Mixed-Use Development at Mission Bay Blocks 29-32 Project ("Project") Final Subsequent Environmental Impact Report (FSEIR), which includes responses to comments ("Responses") we made on the June 2015 Draft Environmental Subsequent Impact Report (DSEIR). The Response fail to address the potential for transport of PCB-contaminated sediment to San Francisco Bay. The FSEIR should not be certified until best management practices that are specific to the prevention of PCB transport in stormwater are included as mitigation.

#### PCB-Specific BMPs Need to be Identified

Our comments noted the detection of PCB in soil at the Project site and the need to implement measures during soil-disturbing construction activities to prevent the transport of contamination to San Francisco Bay via stormwater. Response HYD-2 simply states that stormwater BMPs for PCBs must be consistent with best available technology economically achievable to meet requirements of the California Construction General Permit (p. 13.21-12). However, the Response does not specify BMPs that would meet this requirement. It is key that certification of the FSEIR is upheld until BMPs specific to preventing the spread of PCB contamination are identified.

The San Francisco Bay PCB total maximum daily loads (TMDL) established by the San Francisco Bay Regional Water Quality Control Board (Water Board) call for stormwater agencies, including the City and County of San Francisco, to achieve wasteload allocations by 2030 for PCBs. The allocations are implemented through NPDES permits issued to Bay Area municipalities which are based on the premise that BMPs will reduce PCBs in stormwater runoff to the maximum extent practicable.

Because PCBs have been detected in Project site soils, and because the Project is located so close to the Bay, we commented on the need to better assess PCBs in soil that would have resulted from past land use. The Response makes no provisions for conducting that assessment and instead relies solely on the

1

33  
[LC-HYD-3]

O-MBA20L7

idea that unidentified BMPs will suffice in reducing PCB-contaminated stormwater runoff. This is not good enough, especially with the understanding that PCB contamination in San Francisco Bay is a growing concern. In fact, San Jose recently sued Monsanto Corporation over liabilities for cleanup of PCB-contaminated stormwater that flows into the South Bay. A similar lawsuit was brought against Monsanto recently by the City of San Diego.<sup>1</sup>

As mitigation, the FSEIR should include the results of a full evaluation of PCB contamination in Project site soils. Soil sampling should be included as part of the evaluation to target areas where PCBs may have been released or spilled. The study should be conducted under the oversight of the San Francisco Bay Regional Water Quality Control Board to ensure investigation procedures are adequate in assessing PCB contamination at the Project site.

The FSEIR should also identify BMPs that will be effective in reducing PCB loading to the San Francisco Bay. The following measures have been identified in a "toolbox" by the San Francisco Estuary Institute as BMPs that would be effective in reducing loading of PCBs to the Bay.

- Source control BMPs:
  - Use of street sweeping to control sediment accumulation.
- Treatment control BMPs:
  - Use of infiltration trenches and basins to prevent or reduce stormwater runoff;
  - Use of swales, buffer strips, and bioretention to slow flow and increase sediment deposition; and
  - Using media filters, inlet inserts, hydrodynamic separators to trap sediment.

The FSEIR should reference this toolbox and should identify how these specific BMPs will be deployed and maintained. To ensure implementation of PCB-specific BMPs, the FSEIR should include language that would require the preparation of semi-annual reports to the City of San Francisco that would document the deployment and the maintenance of the BMPs.

Sincerely,

Matt Hagemann, P.G., C.Hg.

**Subject: Response to Comments Review**  
**Mission Bay Subsequent Environmental Impact Report**  
**San Francisco, California**

Dear Mr. Soluri,

At your request, we prepared observations for specified sections of the Response to Comments Review Mission Bay Subsequent Environmental Impact Report (DSEIR, "Response"). In preparing this document we have reviewed the responses for the following Water Quality sections HYD-3, HYD-4, as well as the associated UTIL-5, and UTIL-6.

In general, these new analyses and discussions do not appear to support the conclusions and findings, or provide adequate responses to the prior public comments in these Sections. Given the short time available for these comments, we would recommend requesting an extension to be able to more fully review the Lead Agency responses and their analyses from a technical perspective to be able to provide comments on more sections or expand on our comments.

### HYD-3 Water Quality – Waste Water System Improvements

The Response acknowledges that building schedules for other projects such as UCSF – Phase 2 Medical Center may result in wastewater system tolerance exceedances.

The commenter writes that:

*“While the system can currently accommodate project-related wastewater flows as discussed in Impact UT-5, the capacity of the Mariposa Sanitary Pump Station could be exceeded as future projects are implemented, including UCSF’s Phase 2 Medical Center.”*

The respondent then acknowledges several assumptions outlined below.

- SFPUC will implement permanent pump station, etc. “as soon as feasible”
- Schedule for improvement is currently unknown
- Completion (of improvements) could occur aft the proposed project is operation

*“It is assumed that the SFPUC will implement the permanent pump station and associated force main and conveyance piping improvements at the Mariposa Pump Station as soon as feasible, but the schedule for these improvements is currently unknown and completion could occur after the proposed project is constructed and operational.”*

Again, the Response assumes SFPUC would make necessary operational and piping changes to accommodate additional flows in the interim in order to remain in compliance with RWQCB permits. The respondent further states that system approvals by the RWQCB would ensure that water quality of the Bay would be protected. This appears to be an unmitigated project impact.

*“In the event that additional future wastewater flows would exceed the pump station capacities before the needed wastewater system improvements could be completed, it is assumed that the SFPUC would make internal operational or piping changes to accommodate the additional flows in the interim in order to remain in compliance with RWQCB permit requirements. The interim system modifications would be subject to the approval of the RWQCB under the terms of the Bayside NPDES permit. Approval by the RWQCB would ensure that water quality of the Bay would be protected during the interim period.”*

The Response concludes that interim modifications are operation or internal and would therefore not result in any physical environmental effects.

*“Any interim system modifications are assumed to be operational or internal to the existing pump stations and therefore would not result in any physical environmental effects.”*

## O-MBA20L7

Review of Response to Comments  
Mission Bay Subsequent Environmental Impact Report  
San Francisco, California

BSK Project E0906601S  
November 2, 2015  
Page 3

The response defers water quality issues by saying this assessment was addressed in different sections of the DSEIR, however, acknowledged potential for wastewater systems capacity exceedance is by definition a water quality issue and a CEQA Utilities impact. The response even acknowledges this by presenting the SFPUC interim contingency plans outlining the wastewater re-routing system. If this plan proves insufficient as the result of system loading, etc., what happens to excess wastewater the system is not designed to handle? Either there will be upset conditions which will cause environmental impacts associated with sewage or there will be upgrades to the water treatment system(s) which have undisclosed environmental effects and no clear funding.

35  
[LC-HYD-4]  
cont.

### HYD-4 Changes in Effluent Quality

The respondent has simply laid out the statutory implications of failing to meet the terms of the NPDES permit. There is no evidence or guarantee that the terms will be met, and what steps would be needed to avoid the environmental impacts if they are not met.

36  
[LC-HYD-1]

### UTIL-6 Description of Interim Improvements

The response identifies that the interim improvements have already occurred and were not associated with the project, however further identifying that the proposed project would have needed the same improvements to accommodate the project. Yet, even more improvements will be required beyond the interim improvements:

*“The SFPUC has concluded that long-term permanent improvements to the Mariposa Pump Station will be required in order to handle anticipated, cumulative future flows. As noted in Impact C-UT-2 of the SEIR (p. 5.7-15), the SFPUC has not identified a timetable for completing the long term improvements to the Mariposa Pump Station, and has not developed specific plans or designs for construction of the proposed improvements.”*

37  
[LC-UTIL-2]

The project appears to attempt to have it both ways, the capacity is sufficient, after having built the interim improvements for the current project, yet close enough to the physical limits of these improvements that it is likely to need significant re-engineering in the near, but indeterminate future. It appears that the project is attempting to avoid the current impact analysis and not have to deal with its cumulative impacts.

**Subject: DRAFT Biological Resources Response to Comments Review  
 Mission Bay Subsequent Environmental Impact Report  
 San Francisco, California**

Dear Mr. Soluri:

Per your request, BSK Associates (BSK) reviewed publicly available documents associated with the Responses to Comments Draft Subsequent Environmental Impact Report ("Response" and DSEIR respectively) on the Golden State Warriors Event Center and Mixed-Use Development at Mission Bay Blocks 29-32. BSK reviewed these documents for potential project impacts related to biological resources (following the California Environmental Quality Act [CEQA] Appendix G). The Responses to Comments Draft SEIR, and its related supporting documents were reviewed, and replied to as needed for clarification or rebuttal. Additional scientific and technical resources prepared by others were also reviewed as needed.

#### SUMMARY

In our opinion, the Responses by the Office of Community Investment and Infrastructure failed in part or in total to respond to our original analyses in several areas. In general, the biological elements of the Response (and provided supporting analyses) lacked technical foundation, ignored or misconstrued our analytical points, or conflated technically correct elements in such a way as to lead to incorrect interpretations. Response BIO-1, General Approach to the Analysis, was not addressed in detail since we believe that no substantive changes have been made to the Biology section and our prior comments still apply. Additional comments that relate back to the BIO-1 Response are also found in the following comments.

#### ECOLOGICAL CONDITIONS RESPONSE REVIEW SECTION 13.19 BIOLOGICAL RESOURCES

##### Response BIO-2: Setting

The response states, "The commenters' observations and review of ecological conditions are noted and are not inconsistent with the setting information presented in the Initial Study." (p. 13.19-11)

This assertion attempts to state that our prior analysis of the Project setting was correct, but still somehow incorrect. There is an open water body feature in the middle of the site that meets *both* state and federal wetland multi-parameter criteria, yet according to the Response this doesn't need to be fully described in the environmental setting or identified in the Project Description. This error in failing to provide and maintain an accurate site setting and its description continues through the analysis, and also within the findings:

"Portions of the site are unutilized, including a depressed area (measuring approximately 320 feet by 280 feet) created by an excavation and backfill associated with a prior environmental cleanup on the site." (COMMISSION ON COMMUNITY INVESTMENT AND INFRASTRUCTURE RESOLUTION NO. 70-2015, Adopting Finding 2. Project Site, no page numbers.)

The "depressed area" is also filled with water, that water is maintained permanently, and had to have a trench cut to it in order to drain the surrounding self-maintained wetland features. (See BSK prior comments, and BSK Wetland Delineation.) Furthermore, buried within the Response, there is a simplified description of the setting that includes the pond that is much more accurate than the Project Description, yet even that description still fails to identify its wetland characteristics. The effect of this continuing error in defining the environmental setting as it relates to wetlands, listed species and the habitats, is that the project impacts on the environment for the wetland and water features and their associated habitats are not disclosed in a manner that are either accurately identified or the project mitigated in any substantive way.

For example, several thousand pages within the Response document it more clearly identifies that there is water in the "excavation" and it functions as habitat: "The aquatic habitat on the project site consists of an isolated ponded excavation less than an acre in size created by past soil remediation activities." and "Limited opportunities for colonization by either California red-legged frog or western pond turtle since soil remediation of the site was conducted in 2005 means that the likelihood for these species to be present are slim given the extent of development in the project vicinity and absence of nearby occupied habitat from which individuals could disperse to the project site." (p. 13.19-14)

The description of the environmental setting is inaccurate, it fails to identify that there are wetland features and aquatic habitat, and the public and certifiers would have no idea that these wetland features and habitat existed unless they poured through several thousand pages of contradictory descriptions.

Biological Resources Response Review  
Mission Bay Subsequent Environmental Impact Report  
San Francisco, California

BSK Project E0906601S  
November 2, 2015  
Page 3

### Response BIO-3: Special-Status Species and BIO-4: Sensitive Natural Communities

The Special-Status Response indicates that the provided multiple reconnaissance-level surveys are essentially equivalent to a protocol-level survey for attempting to identify that listed species do not occupy the site. This assertion is simply incorrect, as described by the very citations provided by BSK and the Response itself, and the provided analysis is replete with technical inconsistencies that again do not demonstrate the absence of listed species (WRA 2015<sup>1</sup>). This analysis is discussed in detail in the following section. The Sensitive Natural Communities response and its supporting analysis present a mischaracterization of the potential project impacts to listed species, the steelhead. No allegation was made by us that the interior of the site was suitable or subject to use by steelhead. Conversely, Critical Habitat which was not identified in the DSEIR, is now identified in the Response, but its ecological dimensions are mischaracterized.

The potential use of the site by other listed species was exclusive to as the California red-legged frog ([CRLF] *Rana draytonii*) and steelhead trout (*Oncorhynchus mykiss*). The report specifically does not assess the potential for use of the site by the western pond turtle (WPT). Therefore the Response mischaracterizes the study.

#### Site Surveys

The report does not provide the credentials and experience of the WRA wildlife biologist Claire Woolf, so it is impossible to ascertain the qualifications of this person. The report does not cite the use of the any survey methods or protocols, other than the site was 'traversed' on foot. For illustration, even the screening-level biological assessment of a site like this typically follows a variable intensity vehicular (to screen for sensitive bird species) and pedestrian survey to identify rare plants, to flush hidden and more secretive species and identify tracks, scat and burrows. In addition, even if the methods had been described, and protocols had been followed, the survey dates did not appropriately span the correct periods to assess for the (local) listed plant species.

Regardless, the efforts that have gone into this series of screening-levels surveys could have been protocol-level surveys completed by experts to definitively assess the site use by listed species. Protocol-level surveys are the only means by which a biological scientist can assert a negative species finding (absence). The protocol for floristic surveys, even if they had been completed, is clear: "a single field season does not constitute evidence(.)" (CDFG 2009; See Table 2 Special-Status Animal Species Reported or With Potential to Occur Near the Event Center and Mixed-Use Development Area at Mission Bay Blocks 29-32. P 13.19-15).

<sup>1</sup> [http://www.gsweventcenter.com/GSW\\_RTC\\_References/2015\\_1001\\_WRA.pdf](http://www.gsweventcenter.com/GSW_RTC_References/2015_1001_WRA.pdf)

## O-MBA20L7

Biological Resources Response Review  
Mission Bay Subsequent Environmental Impact Report  
San Francisco, California

BSK Project E0906601S  
November 2, 2015  
Page 4

For example, USFWS 2005 Survey Guidance for the CRLF was simply not followed. In cases where protocol-level surveys are unavailable, focused species-specific surveys (not to be confused with a focused survey that *only* looks for CNDDB listed species) by experts are the appropriate methodological approach. There is no evidence that this approach was followed either.

The report is silent on any aquatic species use, and on observations (or the absence of observations) for the CRLF and WPT. For example, a qualified biologist completing a survey for CRLF would have identified that there were, or were not, eggs, egg masses, tadpoles, or frogs visible; and, similarly, provide specific identification of the presence or absence of tracks/drag marks at/near basking locations for the WPT. The report is entirely silent on the aquatic community, which should have included the presence or absence of small fish, macroinvertebrates (aquatic insects), various worm species, and other prey sources. These are just a few of the types of observations that should have been made and why a follow-on species specific survey is different from a reconnaissance-level survey, and, why this precise approach was requested in our original analysis and comments.

It appears that the analysis uses protocol-level survey citations as inferential indications that these methods were applied, where they have not. The Response to Comments reiterates in the footnotes our earlier list of protocols and focused survey citations (See BSK 2015), yet again fails to apply these to the project as requested: California Native Plant Society (CNPS), 2014. Inventory of Rare and Endangered Plants (online edition, v8-02). Sacramento, California. <http://www.cnps.org/cnps/rareplants/inventory/> (accessed September 10, 2014). CDFG, 2009. Protocols for Surveying and Evaluating Impacts to Special-Status Native Plant Populations and Natural Communities. California Natural Resources Agency. November 24. USFWS, 2005. Revised Guidance on Site Assessments and Field Surveys for California Red-legged Frog.

For example, following the above cited protocol explains both why wetlands are special status natural communities and how to survey for special status plants [CDFG 2009]:

"Most types of wetlands and riparian communities are considered special status natural communities due to their limited distribution in California. These natural communities often contain special status plants such as those described above. These protocols may be used in conjunction with protocols formulated by other agencies, for example, those developed by the U.S. Army Corps of Engineers to delineate jurisdictional wetlands or by the U.S. Fish and Wildlife Service to survey for the presence of special status plants."

Furthermore, the survey protocol specifies:

"It is appropriate to conduct a botanical field survey when:

## O-MBA20L7

Biological Resources Response Review  
Mission Bay Subsequent Environmental Impact Report  
San Francisco, California

BSK Project E0906601S  
November 2, 2015  
Page 5

Natural (or *naturalized*) vegetation occurs on the site, and it is unknown if special status plant species or natural communities occur on the site, and the project has the potential for direct or indirect effects on vegetation; or(.)" (*Emphasis added for clarity.*)

Yet, there is no evidence in the record that this special-status plant botanical survey was ever completed. The provided screening level effort only apparently reviewed the California Natural Diversity Database (CNDDB). Despite the admonition by the protocols, and the CNDDB's user agreement, that the use of the CNDDB is neither a substitute for a careful technical approach or all inclusive. For example, per the cited protocol, "every plant taxon that occurs on site is identified to the taxonomic level necessary to determine rarity and listing status." This was not completed, or if it was it, was not provided. These comments are simply provided for brief illustration, as it does not appear that the biologist intended to assert that the survey was anything more than a reconnaissance, as noted in the title. In any case the provided study and the CEQA analysis are not sufficient to determine the absence of the identified listed species and of assessing the potential environmental impacts on listed species.

### Fisheries

For fisheries, the Response and the analyses mischaracterize the site and the designated Critical Habitat. The WRA report states that: "[the pond] is not conducive to the survival of steelhead due to elevated temperatures and low oxygen conditions evident by the dominance of filamentous algae in the depression. Steelhead would not be able to survive conditions such as those present in the depression." While those impressions are self-evident for steelhead trout, which are sensitive to environmental factors (and were never asserted by BSK to use the pond in the first place), the report makes no mention of the measurement of temperature or dissolved oxygen (DO) and neither of these can be visually estimated. Measurement of temperature and DO are easily and commonly accomplished in the field.

The Response, however, conflates these *ad hoc* field observations for trout with all other "aquatic species." The pond is not clearly suitable habitat for trout. However, there are aquatic plant species within the pond, and likely several other organisms, do use the ponds but those observations were not reported. Instead, the analysis in the Response makes a claim from literature: "Algae blooms occupy the entirety of ponded water within the depression. Such conditions can result in low dissolved oxygen concentration that is inhospitable and even lethal to aquatic organisms." (p. 13.19-14) There are many kinds of algae, some are toxic, but most are not. However, the field work does not identify which algae occupy the pond, the DO concentration or temperature.

### Critical Habitat

The Responses' second fisheries analysis goes on at length that aquatic Critical Habitat does not include the terrestrial portions of the site, and implies in one case and then contradicts itself later that the Bay bordering the site is also not steelhead Critical Habitat. The physical area described in the analysis as "excluded" is the surrounding watershed proper and not the Bay, which is unambiguously Critical

40

BSK

## O-MBA20L7

Biological Resources Response Review  
Mission Bay Subsequent Environmental Impact Report  
San Francisco, California

BSK Project E0906601S  
November 2, 2015  
Page 6

Habitat and specifically the habitat which could be harmed by the project, as described in our original analysis (ESA<sup>2</sup>). There are Bays within the steelhead Critical Habitat analysis that have been specifically excluded, such as Suisun, but the *provided* analysis is simply incorrect for *San Francisco Bay*. See the analysis' cited NMFS letter: "Critical habitat was designated for CCC steelhead on September 2, 2005 (70 FR 52488) and includes PCEs essential for the conservation of CCC steelhead. Critical habitat in estuaries is defined by the perimeter of the waterbody as displayed on standard 1:24,000 scale topographic maps or the elevation of extreme high water, whichever is greater." (p. 28) The Bay is suitable and occupied habitat for steelhead "Steelhead of this size can withstand higher salinities than smaller fish (McCormick 1994), and are more likely to occur for longer periods in tidally influenced estuaries, such as San Francisco Bay." (p. 25)

Indeed the analysis identifies a single selection from the life history and impact analysis of the NMFS letter, ignoring the numerous other passages that describe potential migratory exposure to the site, *while* singularly failing to mention that one of the reasons for listing critical habitat is because habitat quality in the Bay had been impacted by projects such as the proposed arena: "Habitat degradation in the action area is primarily due to altered and diminished freshwater inflow, shoreline development, shoreline stabilization, non-native invasive species, discharge and accumulation of contaminants," (pgs. 37-39 and 40 respectively.)

There are the very same impacts that we have pointed out related directly to both the site-specific risk of contaminants degrading Critical Habitat, as well as clear cumulative effects from the project:

"The San Mateo HU is located on the coast immediately south of the Golden Gate Bridge and includes several small creeks including San Gregorio and Pescadero Creeks." "The Team concluded that these occupied areas contained one or more PCEs (i.e., spawning, rearing, or migratory habitat) for this ESU and identified management activities that may affect the PCEs, including agriculture, agricultural and non-agricultural water withdrawals, urbanization, non-hydro dams, and road building and maintenance."

The issue of the Critical Habitat designation, within the Bay is clear:

"We now conclude that it is possible to delineate some estuarine areas in California (e.g., the San Francisco-San Pablo-Suisun Bay complex, Humboldt Bay, and Morro Bay) that are occupied and contain essential habitat features that may require special management considerations or protection. Such estuarine areas are crucial for juvenile salmonids, given their multiple functions as areas for rearing/feeding, freshwater-saltwater acclimation, and migration (Simenstad *et al.*, 1982; Marriott *et al.* 2002). In many areas, especially the San Francisco Bay estuary, these habitats are occupied by multiple

<sup>2</sup> [http://www.gsweventcenter.com/GSW\\_RTC\\_References/2012\\_1001\\_ESA.pdf](http://www.gsweventcenter.com/GSW_RTC_References/2012_1001_ESA.pdf)

Page 7

ESUs. Accordingly, we are proposing to designate specific occupied estuarine areas as defined by a line connecting the furthest land points at the estuary mouth.”

The Response analysis cites a letter from the National Oceanographic Atmospheric Administration - National Marine Fisheries Service (NOAA-NMFS) in an attempt to diminish the perception of the possible exposure of the fish to the site, by stating that the population splits its migration mainly to the north of the site, when instead it provides a perfect illustration of the sort of trustee agency review that should be considered for the project’s impacts on the estuary’s environment, *a concurrence letter which the applicant has failed to secure*. (p. 13.19-21) This is the sort of biological analysis (Biological Assessment) and concurrence letter that the project *should get* to establish its potential impacts on a listed fish and its designated Critical Habitat. The Response fails to identify that the applicant or Lead Agency can simply request this concurrence from the federal fishery agencies and thus settle this issue.

The analysis attempts to imply that somehow the listed steelhead trout, and its habitat, is somehow not germane by the proposed site development. This is despite its identification by NOAA-NMFS as using for foraging and migration, these waters having been federally designated Critical Habitat, and the listing and designation as a result of its population decline by exposure to development and toxics.

This logical hand waving is a result of the project’s failure to even identify that it was adjacent to occupied critical habitat (see BSK’s prior comments.) Instead, the cited analysis by ESA, now attempts to conflate the spawning habitat of the designated *stream* critical habitat with the project site. (ESA 2015)

For example: “San Mateo Bayside HSA...was excluded from designated critical habitat for Central California Coastal steelhead DPS.” The analysis states that its conclusion “is further supported” by the finding that the San Mateo Bayside HSA was excluded, as if there was any relevance to that fact. We concur that the conditions of those blocks are not suitable for steelhead, they are unlikely to have occupied that site after Mission Bay was completely filled in, do not currently live on those blocks, and are unlikely to occupy the site until sea level rise/and or the predicted tsunami elevations are reached (see also BSK comments).

Nowhere has anyone attempted to state or otherwise imply that somehow the Mission Bay Blocks 29-32 are a migratory fish passage, are access to a spawning stream, or are an isolated lake capable of holding an steelhead Evolutionary Significant Unit. However, clearly, and without ambiguity, the site is adjacent to, and influences both directly and indirectly, designated, occupied, critical habitat. Also that, NOAA-NMFS has clearly identified that they migrate and occupy adjacent to the site in the San Francisco Bay/Estuary.

The analysis required to demonstrate the nature and the extent of the project’s impacts to the aquatic environment and on listed fish populations under CEQA (IV Biological Resources, a) and their critical habitat (IV Biological Resources, f), has not been completed. We understand that there remain significant impacts, and that the project should complete a Biological Assessment and submit this to the

NOAA-NMFS and the California Department of Fish and Wildlife as a part of its analysis to either demonstrate that it has no significant impacts, or that it has impacts and has provided suitable mitigation, or made a finding of significant and unavoidable impact.

### Sensitive Natural Communities

Similarly, the Response fails to adequately even define the Sensitive Natural Community at the site, completely ignoring the emergent wetland which was specifically identified by its own consultants (ESA 2014), as well as our prior analysis assessing Sensitive Natural Communities. Please note that there is limited Response provided for the whole list of BSK-identified communities, but focusing on just one:

“California identifies one of these habitat types as sensitive: *Bulboschoenus maritimus* (Salt marsh bulrush marshes) Alliance, status S3<sup>3</sup> (S3 = Vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation from the state.)” (BSK initial comments on the DSEIR.)

The Response states that the site does not qualify due to a lack of density of *Bulboschoenus maritimus* by simply asserting that the density is not enough, without any supporting analysis and then goes on to say that regardless, there is plenty of that particular Sensitive Natural Community in the Bay.

The Response does finally acknowledge that ruderal sites can be habitat for rare plants, but its study fails to follow the rare plant protocol identified in its own citations. (See CNPS And CDFG.) In fact, no evidence of the qualifications of the surveyor and experience with the listed rare plants is provided. Furthermore, the Response provided a specific rebuttal to its own prior comments that ruderal and impacted sites might not have rare plants. (p. 13.19-19) Indeed rare plants can be found in many settings that are not the historic, pre-urbanization ideal condition, which the Response even specifically identifies for one of the species in question, Franciscan manzanita (*Arctostaphylos franciscana*). This species was at a previously unidentified location within freeway median. Yet, even this finding of a rare plant in an unlikely, highly disturbed location is apparently not a cautionary discovery and the Response sees no need for an appropriate survey. By refusing to complete the proper, definitive surveys, and by ignoring documented Sensitive Natural Communities, the project has impacts that remain unanalyzed and thus unmitigated.

### Response BIO-5: Wetlands

The basic premise of the Response is that there simply is no reversion, since at any time the site could have been developed, and the pit filled in (p. 13.19-31). Again, as stated in the initial BSK assessment of site conditions, that particular line of argument fails to acknowledge again that the site was not

Page 9

consistent with the Order and the Revised Remedial Management Plan (RRMP) at the time it did not backfill the pit [[grammar makes this unclear]]. The Response ignores the BSK rebuttal that by the DSEIR's own logic, no site could ever revert since all that is required to demonstrate that it was not reverted would be an assertion of future development potential. All of the discussion regarding waters definitions has already been rebutted by BSK's detailed analysis. No substantive new information has been provided by the Response. The only new information in the Response is that they believe that state wetland laws only apply to federal wetlands and waters, which BSK showed previously it does not, and state wetland law is vastly more expansive and subject to different, state authorities. (p. 13.19-34)

41  
[LC-BIO-1]  
cont.

### Response BIO-6: Avian Impact

Foraging habitat losses are dismissed out of hand, despite various consultant's bird observations, and a specific assessment of available replacement habitat provided by BSK in its comments. (p. 13.19-30, 13.19-47 and 48) Then the Response analysis goes on to identify that replacement habitat is going to be made available by the project: "...while not included under the project purview, the adjacent, planned Bayfront Park will likely include landscaped and natural areas that offer similar or improved foraging and cover opportunities for local birds that would offset any perceived habitat loss associated with the proposed project development." It appears that despite its protestations, the Project is attempting to mitigate for its impacts without disclosing the impact, thresholds, and the details of the relevant Mitigation and Monitoring. (p. 13.19-38 and 13.19-47 and 48)

42  
[LC-BIO-4]

Incremental, cumulative impacts to wetlands, foraging, and nesting habitat are exactly why CEQA has a cumulatively considerable analysis in order to identify and mitigate these losses. Even then, where the project identifies it could directly kill birds through its construction impacts, it still gets that mitigation wrong for ground nesting birds.

### MITIGATION MONITORING & REPORTING PROGRAM

The DSEIR analysis, at a minimum, should have been fully developed to acknowledge the Clean Water Act (CWA) and Porter-Cologne (and other regulatory requirements), as well as the numerous state and federal wetland policies and regulations that apply to this site. It remains our opinion that the DSEIR continues to fail to identify and mitigate for the project impacts to waters and wetlands at the site; as well as the potential impacts to biological resources within and around the site through contact with hazardous waste. The following section goes into each of these issues in greater detail.

43  
[LC-HYD-5]

44  
[LC-BIO-1]

The sole mitigation for the loss of the water and wetlands, habitat and Biological Resources, is as follows: (Initial Study Section E13)

45  
[LC-BIO-4]

M-BI-4a: Preconstruction Surveys for Nesting Birds To the extent practicable, vegetation removal and grading of the site in advance of new site construction shall be performed between September 1 and January 31 in order to avoid breeding and nesting season for birds. If these

BSK

## O-MBA20L7

Biological Resources Response Review  
Mission Bay Subsequent Environmental Impact Report  
San Francisco, California

BSK Project E0906601S  
November 2, 2015  
Page 10

activities cannot be performed during this period, a preconstruction survey of *onsite vegetation* for nesting birds shall be conducted by a qualified biologist. (Emphasis added.)

Onsite vegetation is an inappropriate and overly narrow distinction. Birds nest on the ground as well as in shrubs and grasses, including species such as the previously identified juvenile killdeer (*Charadrius vociferous*) and Canada geese (*Branta canadensis*) which were observed at the site. Even the prior Response Section identifies that all birds nesting at the site should be protected from construction impacts: "Potential impacts to urban birds protected under the Migratory Bird Treaty Act and nesting in the excavations or vegetation within the entirety of project site are mitigated by implementation of Mitigation Measure M-BI-4a (Preconstruction Surveys for Nesting Birds), as discussed in the Initial Study for non-special-status wildlife. (See Initial Study, pp. 81-83.)" (p. 13.19-37) Although it also fails to identify the unvegetated, non-excavated areas, which comprise the majority of the site.

45  
[LC-BIO-4]  
cont.

Finally, there needs to be a full protocol-level survey for the listed plants, including San Francisco manzanita (*Arctostaphylos franciscana*) during the appropriate season, to make an identification of the site's plants by an qualified botanist with field experience in the identification of that and other local listed species. If special-status species are identified at the site a Worker Environmental Awareness Plan should be put into effect.

46  
[LC-BIO-3]

### Stormwater Mitigation

The biological effects of stormwater on the environment are not properly analyzed. The offered responses to comments regarding stormwater mitigation are particularly ironic given that the site has demonstrably failed to maintain its Best Management Practices (BMPs) and has visible waste material literally clogging its stormwater drains. (See BSK comments.) The concept that simply stating that a BMP will work, without analyzing the nature of the impacts, and without maintaining those BMPs calls into question every part of the DSEIR that relates to sediment, toxins and wildlife exposures. For illustration, the BMPs at the site currently are not properly maintained and have been filled in or partly filled in with sediment, or breached completely. However, even if these sediment BMPs had been installed correctly and maintained, they do nothing for dissolved-fraction toxic chemicals. The project fails to implement the sediment BMPs correctly and does not even offer readily implementable BMPs for dissolved-fraction chemicals found at the site.<sup>4, 5, 6, 7</sup> Yet, the Response states unequivocally, "Any potential effects associated with contaminated stormwater runoff into San Francisco Bay would be avoided during construction through compliance with the Construction General Permit and implementation of a Stormwater Pollution Prevention Plan (SWPPP) as described in the Section 13.21, Response HYD-2." (p.

**LIMITATIONS**

Our review was limited to the above-described aspects as they are identified in the project environmental documents provided or otherwise made available for review. Additional information related to the project may be available through other sources, but were not reviewed for the purposes of this analysis.

The observations, assessment and recommendations submitted in this report are based upon the data obtained from listed reports prepared by others, limited field investigation, and site observations. The report does not reflect variations which may occur beyond the assessed area. BSK's services were performed in a manner consistent with the level of care and skill ordinarily exercised by other professionals practicing in the same locale and under similar circumstances at the time the work is performed. No warranty, either expressed or implied, is included. The findings of the field observation may have a potential for negative impact(s) on the value or suitability of the site for some purposes. BSK cannot assume liability for any such negative impact(s). Permitting requirements or permit interpretations may change over time. The findings of this report are valid as of the present. However, changes in the conditions of the site can occur with the passage of time, whether caused by natural processes or the human-induced changes on this property or adjacent properties. In addition, changes in applicable or appropriate standards or practices may occur, whether they result from legislation, governmental policy, or the broadening of knowledge.

We appreciate the opportunity to be of service to Soluri Meserve and trust that this correspondence provides you with the information necessary at this time. Please contact us with any questions regarding the review comments presented this letter.

Respectfully submitted,  
BSK Associates

## O-MBA20L7

### Technical Memorandum

**Subject:** Proposed Warrior Arena Wetland Features  
**Date:** July 16, 2015  
**To:** Soluri Meserve  
1010 F St, Ste. 100  
Sacramento, CA 95814  
**From:** BSK Associates  
BSK Associates  
3140 Gold Camp Drive, #160  
Rancho Cordova, CA 95670  
**Re:** BSK Project Number E0906601S

The purpose of this memorandum is to provide description and an assessment of the site's waters and wetland conditions at Blocks 29-32, Mission Bay Project in San Francisco, California (Vicinity Map Figure 1).

BSK Associates (BSK) provided a screening-level site visit of the proposed project area to assess its condition from the public right-of-way, shown on Figure 2. A combination variable intensity, pedestrian and vehicular survey was made of the site perimeter and of areas of the project site clearly visible from the public right-of-way on June 30, 2015. The approach, assumptions, significance evaluation, and results are summarized below.

#### SITE OBSERVATIONS

The proposed project footprint consists of two large paved areas (Southwest parking lot approximately 79,910 sq.ft./1.83 ac. and Northeast parking lot approximately 91,776 sq.ft./2.11 ac.)<sup>1</sup> currently being used as paid parking lots; an area of soil stockpiles (31,066 sq.ft./0.71 ac) on the eastern edge of the property (Terry A. Francois Boulevard); and an adjoining large open field, open water (22,115 sq.ft./0.51 ac) and wetland swale complex, (904 sq.ft./0.02 ac.) (closest to the Southwest parking lot) shown on Figure 2. A series of photographs were taken of the site and the adjoining areas (Attached Photo Plates).

At the time of observation, the open water area encompassed the majority of the water feature, with a patchy, but substantial fringe of palustrine emergent (predominately alkali bulrush [*Bolboschoenus maritimus*]) and riparian plants (willows [*Salix sp.*]). The visible forb layer was

Page 2

typical of this sort of site. The plants were concentrated on the two narrow ends of the water feature. The narrower channel and the seasonal wetlands apparent from the aerial photographs (Figures 2a-i) were not clearly visible from the site perimeter fence(s).

Numerous native birds were observed within, and in some cases flying to and from the water body. Several Canada geese (*Branta canadensis*) were seen, including what appear to be adult plumage juveniles; three killdeer (*Charadrius vociferous*), including two juveniles; a female mallard and a juvenile (*Anas platyrhynchos*); several crows (*Corvus brachyrhynchos*); two non-native Eurasian collared-doves (*Streptopelia decaocto*); and numerous non-native rock doves/pigeon (*Columba livia*). The site has significant use for nesting and foraging by these bird species.

#### WATERS AND WETLAND FEATURE HISTORY

The site is within the footprint of the historic Mission Bay, which has been filled in over time (ESA 2014; Pg. 1). The original Bay muds are still found below the site, as evidenced by the site soil borings (LTR 2015; Pg. 13 and Figures A-2 and A-3). The excavation intercepted local shallow groundwater and is evidently maintained by that natural source (LTR 2015; Pg. 14). The site also has seasonal wetland features which appear to be dominated by stormwater. It is not clear that these seasonal features would not be maintained for far longer in the spring, but they have been captured through an excavated trench apparently intended to drain them to the open water body (ESA 2014; Pg. 2). The site "remedial" activities thus captured the local water table and allowed for the expression of open water and wetland features (ESA 2014; Pg. 2). The ESA analysis goes on to specifically identify that the: "...deeper excavation and surrounding shallow depressions within the proposed project site are features that exhibit hydrology and vegetation characteristics of wetlands. Hydric soil is presumed present due to the year-round inundation and presence of obligate wetland plants." (ESA 2014; Pg. 3)

For additional purposes of comparison, BSK has provided a time-series of aerial photos of the site using Google Earth historic imagery for the period spanning 1938 through 2013 (Figures 2a, through 2i). The imagery provides a clear indication of vegetation through its distinct shape, and indications of both reflectance and morphology for water features. The time series does not provide information for the missing intervals, and so the relative changes of feature geometry (relative position and size) over time are used to confirm persistence of those features.

July 1938 - The site has numerous apparent industrial uses, ranging from warehousing and tank storage, to railroads (Figure 2i). There is a ruderal area on the site on the northwestern corner.

July 1946 - These conditions appear similar to 1938 (Figure 2h).

48

San Francisco, California

BSK Project E09066015  
July 14, 2015  
Page 3

June 21, 1987 - The site has similar activities, but with new buildings, less rail facilities and what appears to be a small concrete batch plant and material storage area on the western edge of the site (Figure 2g).

September 25, 2001 - These details are much clearer, with the inclusion of a large soil stockpile on the eastern edge of the site (Figure 2f). On October 5, 2005, the site has had most of the buildings removed and several large stockpiles, as well as a large parking area (Figure 2e). The apparent interception of the local water table in one of the excavated areas is visible (See WRA 2014; ESA 2014; and LTR 2015).

February 2007 - The large excavation and a single large water feature are visible, by March 2007, that feature was approximately 87,000 sq.ft./2 ac. (Figure 2d).

May 6, 2009 - There are two large parking lots visible and the main excavation has been filled through the middle such that it now has two features, and numerous small seasonal water features (Figure 2c). On April 3, 2011, the apparent open water and seasonal wetland features have naturalized with several areas of vegetation growing in around them (Figure 2b).

January 1, 2013 - The water features are again fully flooded and consist of two large wetted areas (Figure 2a). According to the aerial photograph, the total waters and wetland area was approximately 31,000 sq.ft./0.71 ac. on October 24, 2014. The available Google Earth historic imagery supports the history of water body formation and maintenance over time.

### WATERS AND WETLANDS

The Clean Water Act (CWA) is the primary federal law in the United States governing water pollution and regulating water quality standards for surface waters. The basis of the CWA was enacted in 1948 (the Federal Water Pollution Control Act), but the Act was significantly reorganized and expanded in 1972. Both the US Army Corps of Engineers (USACE) and the US Environmental Protection Agency (USEPA) administer elements of these laws, but typically the USACE provides the waters and wetlands delineation protocols, administers the permitting program for wetland-impacting projects, and the USEPA provides oversight. Federal waters and wetland policy differs in several key regards from California, although there is much similarity. California also has a role in the CWA wetland permitting process through the 401 Certification process.

The term "wetlands" from a 404 perspective generally means those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands typically include swamps, marshes, bogs, and similar areas. These are typically identified using a three-part test, examining the presence of water, wetland

Page 4

(hydric) soil, and wetland dependent (hydrophytic) vegetation, following specific guidance(s). The federal CWA section 404(b)(1) Guidelines list both wetlands and mud flats as types of "special aquatic sites".

In California, the State Water Resources Control Board (State Water Board) is responsible for establishing policy on State waters and wetlands. The policy is implemented through regulations established by the State Water Board and nine Regional Water Quality Control Boards (in the site's case the San Francisco Regional Water Quality Control Board). The Boards also administer the CWA 401 Certification, which in some cases covers only portions of wetlands, and the Water discharge Requirements (WDR) for the non-Federal portions, if present. There are additional specific statutes and orders that also define or promote policy objectives regarding California's wetlands, such as EO-W-59-93<sup>2</sup> and California Department of Fish and Game Streambed Alteration Agreement, among others. In addition, Porter-Cologne Water Quality Control Act (Cal. Water Code, Div. 7) can apply to coastal wetland projects (§ 13142.5), in particular to unabated chemical discharges from construction or chemical waste stockpiles.

A wetland under California's regulations contains the following features:

An area that is covered by shallow water or where the surface soil is saturated, either year-round or during periods of the year; Where that water coverage has caused a lack of oxygen in the surface soil; and, has either no vegetation or plants of a type that have adapted to shallow water or saturated soil. Some examples are fresh water marshes, bogs, riparian areas, vernal pools, coastal mud flats and salt marshes.

In addition, wetlands according to the CA Coastal Commission are defined as land where the water table is at, near, or above the land surface long enough to promote the formation of hydric soils or to support the growth of hydrophytes, and shall also include those types of wetlands where vegetation is lacking and soil is poorly developed or absent as a result of frequent and drastic fluctuations of surface water levels, wave action, water flow, turbidity or high concentrations of salts or other substances in the substrate. Such wetlands can be recognized by the presence of surface water or saturated substrate at some time during each year and their location within, or adjacent to, vegetated wetlands or deep-water habitats (14 CCR 13577(b)). Furthermore, given the special salinity conditions associated with wetlands within the coastal zone, they also means lands which may be covered periodically or permanently with shallow water and include saltwater marshes, freshwater marshes, open or closed brackish water marshes, swamps, mudflats, and fens (Cal. Pub. Res. Code § 30121).

In this case, there are both a permanent water body and a seasonal feature (possibly a small complex) with wetland characteristics by the admission of the experts who prepared the

environmental documentation for the project. These characteristics clearly meet the definitions contained in the various regulations, including 14 CCR 13577(b), Cal. Pub. Res. Code § 30121. The open water feature and its hydrophytic vegetation was verified in the field, and through the use of aerial photos, showing their presence over time, both by season and by year.

### Federal Jurisdiction

Wetlands created by human actions fall under a couple of discrete classes under Federal jurisdiction. Most typically these are agricultural features that are caused by the movement of water from one location to another, such as a dam providing water to a canal constructed in uplands. In this case however, the site was originally a tidal mudflat or estuary wetland which has since reverted back to a wetland (ESA 2014). In addition, even if it was not originally a water or wetland, it currently meets those adjacency, and direct hydrologic connectivity requirements under the Final Clean Water Rule (2015; 33 CFR Part 328 and 40 CFR Parts 110, 112, 116, 117, 122, 230, 232, 300, 302, and 401); and, even manmade wetlands and water bodies have restrictions on discharges under 33 CFR 323.4(b).

There are Federal exemptions for specific construction associated activities. These exemptions (33 CFR 323.4 - Discharges not requiring permits) are invalidated, however: "If any discharge of dredged or fill material resulting from the activities listed in paragraphs (a) (1) through (6) of this section contains any toxic pollutant listed under section 307 of the CWA such discharge shall be subject to any applicable toxic effluent standard or prohibition, and shall require a section 404 permit." (33 CFR 323.4(b)).

The site's water and soils include several chemicals identified under CWA section 307 as toxic pollutants (BBL 2006; LTR 2015).<sup>3</sup> Those chemicals include the following 12 Priority Pollutants found in the in the LTR Phase II (LTR 2015; Table 4 and Table 5):

1. Benzene
2. Naphthalene
3. Cyanide
4. Antimony
5. Arsenic
6. Chromium
7. Copper
8. Lead
9. Mercury
10. Nickel
11. Selenium
12. Zinc

Technical Memorandum  
Blocks 29-32, Mission Bay  
San Francisco, California

BSK Project E09066015  
July 14, 2015  
Page 6

Therefore, the site is *not exempted* under 33 CFR 323.4 because it contains 12 of the chemicals identified as priority pollutants under section 307.

The site's consultant, WRA, in a separate analysis, has attempted to claim exemption from the CWA under yet a different test (without identifying that any exemption is *invalidated* by the section 307 test described above (WRA 2014; Pg. 2)). WRA states that: "1986 (51 Fed. Reg. 41206) (e) Water-filled depressions created in dry land incidental to construction activity and pits excavated in dry land for the purpose of obtaining fill, sand, or gravel unless and until the construction or excavation operation is abandoned and the resulting body of water meets the definition of waters of the United States."

This explanation, instead of demonstrating how the site may be exempted as an incidental construction feature, provides documentation that clearly shows how that feature has been abandoned. Therefore the exemption also does not apply on that basis. The site owner's clear and continuing failure to backfill the feature and its abandonment for the past decade, despite being under Order No. R2-2005-0028 and its RRMP, is on its face abandonment and its clear reversion to the definition of waters, wetlands and/or other special aquatic site.

Indeed, there is no merit to the further argument made by WRA (Pg. 4) that: "As described in the RWQCB Order No. R2-2005-0028, the Project Area was to be excavated and backfilled in preparation for future development as part of the overall Mission Bay redevelopment plan." The site was not backfilled. It should be noted by WRA's argument there could never be a case for reversion under the CWA, because any naturalized feature would simply 'be ready' for some postulated future backfilling. The provided analysis fails to show: 1. How the feature has not reverted and 2. How the exemption override under 33 CFR 323.4 does not apply due to the presence of section 307 toxic chemicals. Regardless, WRA is simply silent on the open water and wetland features in context of the State water and wetland policy and applicable regulations.

### California Jurisdiction

California does not have the same exemptions in its waters and wetland framework as exist under the CWA. California derives its authority from different sources (Porter-Cologne Water Quality Control Act) for its policies, and includes all man-made features under its jurisdiction. Therefore the site's water features, regardless of origin, appear to be regulated and protected waters of the State and wetlands.

### SITE ABANDONMENT AND HAZARDOUS CHEMICALS

The site "remedial" activities captured the local water table and allowed for the expression of wetland characteristics and the site has naturalized over time (ESA 2014; Pg. 2). These activities have resulted in the creation of stockpiles of material that in some cases: "...contains

contaminants that exceed hazardous waste threshold concentrations and will require special handling and disposal." adjacent or near to these wetland features (TWR 2015; Pg 1). These activities took place over several years culminating in a Phase II remedial action that left the excavated area open and abandoned in 2005 (LTR 2015; Pg. 6). The Revised Risk Management Plan (RRMP, BBS; Pg. 2-3 and 2-3) infers that the excavation was backfilled, however, it was not.

The RRMP further identifies that: "1. Because North Terminal, Parcel X4, OAS and 16th Street East OUs are currently under development, interim risk management measures (IRMMs) designed for undeveloped parcels are not relevant to the protection of human health on those OUs. If development ceases or areas are created with uncovered native soils, IRMMs may again be necessary." (BBS 2006; Table 1) The development of the site still has not occurred, and there is no evidence that the IRMMs have been applied.

The site's open water and wetland features are thus a direct result from the abandonment of a site cleanup allowed to revert back to a natural state for approximately a decade. Not only did natural features evolve in response to this abandonment, but the very abandonment created conditions that may have exposed wildlife to a variety of hazardous chemicals (LTR 2015).

### CONCLUSIONS

The site has active wildlife use, open water and various forms of wetland features according to our observations (as well as those observations made by others), and appears to be subject to both State and Federal regulations associated with the protection of these species, their habitat, and these features (ESA 2014). These regulations have several requirements that apply to the protection of wildlife and waters, including but not limited to, the Migratory Bird Treaty Act, the federal Clean Water Act, Section 404, and the State's various Clean Water Act responsibilities, and its own Porter-Cologne requirements. It is our opinion that the appropriate course of action for this site include:

1. The site owner immediately ceases the placement of any and all fill material, including hazardous materials, into any of the water and wetland features, until those wetlands have been delineated using the appropriate protocols; the appropriate State and Federal Permits have been secured; and, the appropriate compensatory mitigation has been implemented.
2. The site owner immediately ceases the uncontrolled runoff from the staged covered, and any hazardous material piles, into these features.
3. The protection of wildlife that occupy the site be established through the implementation of a Worker Environmental Awareness Plan, and that Plan includes protection breeding birds and their offspring.

### LIMITATIONS

The observations, assessment and recommendations submitted in this report are based upon the data obtained from existing reports prepared by others, limited field investigation, and site observations. The report does not reflect variations which may occur beyond the assessed area. BSK's services were performed in a manner consistent with the level of care and skill ordinarily exercised by other professionals practicing in the same locale and under similar circumstances at the time the work is performed. No warranty, either expressed or implied, is included. The findings of the field observation may have a potential for negative impact(s) on the value or suitability of the site for some purposes. BSK cannot assume liability for any such negative impact(s). Permitting requirements or permit interpretations may change over time. The findings of this report are valid as of the present. However, changes in the conditions of the site can occur with the passage of time, whether caused by natural processes or the human-induced changes on this property or adjacent properties. In addition, changes in applicable or appropriate standards or practices may occur, whether they result from legislation, governmental policy, or the broadening of knowledge.

Respectfully submitted,  
BSK Associates

Draft Wetland Delineation Report  
Proposed Warriors Project  
San Francisco, California

BSK Project E0906601S  
October 29, 2015  
Page 1

1. INTRODUCTION

BSK Associates (BSK) completed a waters assessment and wetland delineation under the direction of Soluri-Meserve for the proposed Mission Bay development project site (Blocks 29-32). The site is owned by the Golden State Warriors after a recent sale from Salesforce.Com, Inc. The purpose of the delineation was to identify potential wetland features within the project footprint. BSK is requesting a Preliminary Jurisdictional Determination (JD) for the purposes of verification of “waters” and the wetland features at this proposed project site. The purpose of this report is to provide supporting description and an assessment of the site’s waters and wetland conditions at Blocks 29-32, Mission Bay Project in San Francisco, California (Vicinity Map Figure 1). The approach, assumptions, significance evaluation, and results are detailed below.

2. GENERAL SITE DESCRIPTION

The approximately 12-acre proposed project site (hereinafter the “site”) is located in San Francisco, CA on bounded by 3rd, 16th and South Streets, and Terry Francois Blvd (to the east). This site has also been identified as parcel lots 29-32 within the greater Mission Bay South Development (Site Map Figure 2). The site vicinity and location figures are provided at the end of this report. The “Area of Potential Effect” (APE) is within the central and southwestern portion of the site. The site is bounded by urban development on all four sides, including parking lots on two sides (west and north). The eastern and northeastern sides of the site have staged piles of previously identified potentially hazardous materials (BBL 2006 and LTR 2015).

The terrain is nearly flat, although the western third of the site slopes steeply towards the pond area. The majority of the site is disturbed, with several large areas of barren soil, intermixed with low density non-native annual ruderal and grassland habitats. Within that disturbed area, there are wetland features which are further described in this study.

The APE contains features with wetland characteristics, including a series of swales (approximately 904 sq.ft./0.02 acre) that radiate from the east to the west into to an approximately 22,115 sq.ft./0.51 acre open water pond feature. This pond feature is located approximately 702 feet from the open water of the Bay, with the swales located between the pond and the Bay.

2.1 Waters and Wetland Feature History

The site is within the footprint of the historic Mission Bay, which has been filled in over time (ESA 2014; Pg. 1). The original Bay muds are still found below the site, as evidenced by the site soil borings (LTR 2015; Pg. 13 and Figures A-2 and A-3). The pond intercepts local shallow groundwater and is evidently maintained by that natural source (LTR 2015; Pg. 14). The site also has seasonal wetland features which appear to be dominated by stormwater influences. It is not clear that these seasonal features would not

BSK Project E0906601S  
October 29, 2015  
Page 2

be maintained for far longer in the spring, but they have been captured through an excavated trench apparently intended to drain them to the pond (ESA 2014; Pg. 2). The ESA analysis goes on to specifically identify that the: "...deeper excavation and surrounding shallow depressions within the proposed project site are features that exhibit hydrology and vegetation characteristics of wetlands. Hydric soil is presumed present due to the year-round inundation and presence of obligate wetland plants." (ESA 2014; Pg. 3)

For additional purposes of comparison, BSK has provided a time-series of aerial photos of the site using Google Earth historic imagery for the period spanning through 2013 (Figures 3, 4 and 5). The imagery provides a clear indication of vegetation through its distinct shape, and indications of both reflectance and morphology for water features. The time series does not provide information for the missing intervals, and so the relative changes of feature geometry (relative position and size) over time are used to confirm persistence of those features.

May 6, 2009 - There are two large parking lots visible and the main pond feature has been filled through the middle such that it now has two features, and numerous small seasonal water features (Figure 3).

On April 3, 2011, the apparent open water and seasonal wetland features have naturalized with several areas of vegetation growing in around them (Figure 4).

January 1, 2013 - The water features are again fully flooded and consist of two large wetted areas (Figure 5). According to the aerial photograph, the total waters and wetland area was approximately 31,000 sq.ft./0.71 ac. on October 24, 2014. The available Google Earth historic imagery supports the history of water body formation and maintenance over time.

### 3. REGULATORY BACKGROUND

Any person, firm, or agency planning to alter or work in navigable waters of the U.S., including planning to discharge dredged or fill material, must first obtain authorization from the USACE. Permits, licenses, variances, or similar authorization may also be required by other federal, state, and local statutes. Section 10 of the Rivers and Harbors Act of 1899 prohibits the obstruction or alteration of navigable waters of the U.S. without a permit from the USACE (33 U.S.C. § 403). Section 301 of the Federal Water Pollution Control Act and Amendments of 1972 (CWA) prohibits the discharge of pollutants, including dredged or fill material, into waters of the U.S. without a Section 404 permit from USACE (33 U.S.C. § 1344). State Water Quality Certification may be required by the Regional Water Quality Control Board before other permits are issued. If a proposed project will result in the alteration of a California lake or streambed, the California Department of Fish and Wildlife (CDFW) require notification prior to commencement, and may require a Lake or Streambed Alteration Agreement.

Page 3

According to the Code of Federal Regulations, the definition of "waters of the U.S." includes:

- (1) All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
  - (2) All interstate waters including interstate wetlands;
  - (3) All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation or destruction of which could affect interstate or foreign commerce.
  - (5) Tributaries of waters identified in paragraphs (a) (1) through (4) of this section;
  - (6) The territorial seas;
  - (7) Wetlands adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (a) (1) through (6) of this section.
- (33 C.F.R. § 328.3)

This approach to the waters determination extent has been modified somewhat with recent revisions under the Clean Water Rule, now subject to litigation<sup>1, 2</sup>:

- (8) All waters located within the 100-year floodplain of a water identified in paragraphs (a)(1) through (3) of this section and all waters located within 4,000 feet of the high tide line or ordinary high water mark of a water identified in paragraphs (a)(1) through (5) of this section where they are determined on a case-specific basis to have a significant nexus to a water identified in paragraphs (a)(1) through (3) of this section.

And, a more detailed nexus test:

- "(5) Significant nexus. The term significant nexus means that a water, including wetlands, either alone or in combination with other similarly situated waters in the region, significantly affects the chemical, physical, or biological integrity of a water identified in paragraphs (a)(1) through (3) of this section.

<sup>1</sup> [http://www2.epa.gov/sites/production/files/2015-05/documents/fact\\_sheet\\_summary\\_final\\_1.pdf](http://www2.epa.gov/sites/production/files/2015-05/documents/fact_sheet_summary_final_1.pdf)

<sup>2</sup> <http://www2.epa.gov/cleanwater/clean-water-rule-litigation-statement>

## O-MBA20L7

Draft Wetland Delineation Report  
Proposed Warriors Project  
San Francisco, California

BSK Project E0906601S  
October 29, 2015  
Page 4

The term “in the region” means the watershed that drains to the nearest water identified in paragraphs (a)(1) through (3) of this section. For an effect to be significant, it must be more than speculative or insubstantial. Waters are similarly situated when they function alike and are sufficiently close to function together in affecting downstream waters. For purposes of determining whether or not a water has a significant nexus, the water’s effect on downstream paragraph (a)(1) through (3) waters shall be assessed by evaluating the aquatic functions identified in paragraphs (c)(5)(i) through (ix) of this section. A water has a significant nexus when any single function or combination of functions performed by the water, alone or together with similarly situated waters in the region, contributes significantly to the chemical, physical, or biological integrity of the nearest water identified in paragraphs (a)(1) through (3) of this section. Functions relevant to the significant nexus evaluation are the following:

- (i) Sediment trapping,
- (ii) Nutrient recycling,
- (iii) Pollutant trapping, transformation, filtering, and transport,
- (iv) Retention and attenuation of flood waters,
- (v) Runoff storage,
- (vi) Contribution of flow,
- (vii) Export of organic matter,
- (viii) Export of food resources, and
- (ix) Provision of life cycle dependent aquatic habitat (such as foraging, feeding, nesting, breeding, spawning, or use as a nursery area) for species located in a water identified in paragraphs (a)(1) through (3) of this section.”

However, that rule is held in abeyance and follows the historic application of applying relevant case law, applicable policy, and the best science and technical data on a case-by-case basis in determining which waters are protected by the Clean Water Act, until litigation over the subject matter is resolved.

Wetlands are defined as:

“...those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions.”

(USACE 1987, p. 9, citing Federal Register 1980, 1982)

The USACE and the Environmental Protection Agency issued the U.S. Army Corps of Engineers Jurisdictional Determination Form Instructional Guidebook on May 30, 2007, to provide guidance based on the Supreme Court’s decision regarding *Rapanos v. United States* and *Carabell v. United States* (USACE, 2007a, p. 6).

Proposed Warriors Project  
San Francisco, California

BSK Project E0906601S  
October 29, 2015  
Page 5

The decision provides new standards that distinguish between traditional navigable waters (TNWs), relatively permanent waters (RPWs), and non-relatively permanent waters (non-TNWs). Wetlands adjacent to non-TNWs are subject to CWA jurisdiction if: the water body is relatively permanent, or if a water body abuts a RPW, or if a water body, in combination with all wetlands adjacent to that water body, has a significant nexus with TNWs (USACE, 2007a, pp. 6 to 7). The significant nexus analysis assesses the flow characteristics and functions of the water on the “chemical, physical, and biological integrity of downstream traditional navigable waters” (USACE, 2007b, p. 6).

### 4. METHODOLOGY

BSK conducted a fenceline wetland delineation at the site on June 30, 2015. A combination variable intensity, pedestrian and vehicular survey was made of the site perimeter and of areas of the project site clearly visible from the public right-of-way. During the site visit, BSK staff followed to the wetland delineation process set forth in the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region, Version 2.0 (USACE, 2008) and verified using the adjacent zone’s Western Mountains, Valleys, and Coast Region (Version 2.0). These methods include vegetation identification using the USACE State of California 2014 Wetland Plant List (USACE, 2014), including vegetation densities, soil classifications, plant species classification to the extent possible given the site access conditions. Some features could only be identified using desktop analysis of available aerial imagery. Because of documented hazardous wastes and the fact that permission to enter the site was not available, the BSK wetland scientist performed a visual survey from adjacent public roads and right of ways. Because of this limited access, qualified wetland scientists worked with BSK’s GIS specialists to identify and estimate the extent of the features remotely, using topographic maps and aerial photography. Animal and plant species observed during the site visit are included in Table 1 at the end of this report.

Wetlands were differentiated from uplands based upon visible hydrology, soil patterns, and vegetative characteristics, as well as observations by workers in a prior assessment (ESA 2014). The wetland boundaries were determined by site-specific characteristics that would result in the best representation of all three parameters using the available information.

#### 5.1.1 Hydromorphic Vegetation

Hydromorphic vegetation was evaluated by a field assessment and comparing plant species with the USACE State of California 2014 Wetland Plant List (USACE, 2014). This list determines the possibility of whether plants are found in wetlands, uplands, or both. After classification, the USACE “rapid test” was conducted to determine the hydromorphic vegetation parameter.

Draft Wetland Delineation Report  
Proposed Warriors Project  
San Francisco, California

BSK Project E0906601S  
October 29, 2015  
Page 6

### 5.1.2 Wetland Hydrology

It should be noted that the site was surveyed during a "drought year" (USBR, 2014). This requires "Difficult Wetland Situations" procedures (USACE, 2008). Surveys conducted during drought years require a slight variation in the approach to wetland delineation. This approach provides a better estimate of wetland potential based on the three parameters (wetland hydrology, hydric soils, hydrophytic vegetation) during a drought. Indicators A1, B1, B4, B6, B7, B8 and B10 were identified.

### 5.1.3 Hydric Soil

Hydric soils were not possible to assess given the nature of this assessment. However, ESA identified hydric soils but did not specify their Munsell color codes (ESA 2014).

## 5.2 Wetlands and Other Waters of the U.S.

Wetlands and other waters were described using the Cowardin classification system (Cowardin *et al.* 1979). As described above, approximate wetland boundaries were assessed by using the available characteristics and the supplemental features that demonstrated USACE characteristics for wetland and adjacent upland areas. All features that potentially met USACE wetland criteria were recorded as polygons and recorded on Figure 2. The boundaries of wetlands were extrapolated from the field map by following topographic contours, clear hydrologic boundaries, and wetland vegetation boundaries.

Cowardin's wetland classification is as follows, Wetlands are lands transitional between terrestrial and aquatic systems where the water table is usually at or near the surface or the land is covered by shallow water. Wetlands must have one or more of the following three attributes: (1) at least periodically, the land supports predominantly hydrophytes; (2) the substrate is predominantly undrained hydric soil; 2 and (3) the substrate is non-soil and is saturated with water or covered by shallow water at some time during the growing season of each year (Cowardin *et al.* 1979).

Other waters of the U.S., were delineated using the methods described above and supported by the use of 'A Field Guide to the Identification of the Ordinary High Water Mark in the Arid West Region of the Western United States' (USACE 2008a), and in USACE Regulatory Guidance Letter No. 05-05 (USACE 2005), where appropriate. These methodologies provided an approach for identifying the lateral limits of other waters of the U.S., using stream geomorphology and vegetation (USACE 2008a). Indicators of the ordinary high water mark (OHWM) evaluated in the field included natural lines impressed on banks, stain lines, depositional features, shelving, changes in soil character, changes in vegetation, destruction of terrestrial vegetation, and the presence of litter and debris. A clear debris line and shelf was visible.

Draft Wetland Delineation Report  
Proposed Warriors Project  
San Francisco, California

BSK Project E0906601S  
October 29, 2015  
Page 7

## 5. OBSERVATIONS

The approximately 12-acre site includes two large paved areas (Southwest parking lot approximately 79,910 sq.ft./1.83 ac. and Northeast parking lot approximately 91,776 sq.ft./2.11 ac.) currently being used as paid parking lots; an area of soil stockpiles (31,066 sq.ft./0.71 ac) on the eastern edge of the site (Terry A. Francois Boulevard); and an adjoining large open field, open water (22,115 sq.ft./0.51 ac) and wetland swale complex, (approximately 904 sq.ft./0.02 ac.) (closest to the Southwest parking lot) shown on Figure 2.

At the time of observation, the unvegetated, open water area encompassed the majority of the water feature, with a patchy, but substantial fringe of palustrine emergent (predominately alkali bulrush [*Bolboschoenus maritimus*]) and riparian plants. The visible forb layer was typical of this sort of ruderal site. The plants were concentrated on the two narrow ends of the water feature. The narrower channel and the seasonal wetlands apparent from the aerial photographs (Figures 3, 4 and 5) were not clearly visible from the site perimeter fence(es). Using the Cowardin classification, the pond feature appears to presumptively meet the Palustrine Aquatic Bed, algal class.

In terms of its biological use and wetland habitat function, numerous native birds were observed within, and in some cases flying to and from the water body. Several Canada geese (*Branta canadensis*) were seen, including what appear to be adult plumage juveniles; three killdeer (*Charadrius vociferous*), including two juveniles; a female and a juvenile mallard (*Anas platyrhynchos*); several crows (*Corvus brachyrhynchos*); two non-native Eurasian collared-doves (*Streptopelia decaocto*); and numerous non-native rock doves/pigeon (*Columba livia*). The site has significant use for nesting and foraging by these bird species.

The approximately 12-acre project site, where vegetated, is primarily non-native (ruderal) grassland habitat. The APE is almost exclusively comprised of the herb stratum. It is bounded by urban development on all four sides. The drainage patterns for the entire property are complex but from observations, including the aerial photos, it appears that the bare ground portion and parts of the paved parking lots provide the contributing watershed for the pond.

The western portion of the site contains the most visible potential wetland characteristics and therefore, it was analyzed for wetland characteristics within the APE (approximately 0.53 acres). The features are connected by a large ditch excavated to apparently drain the swale. The wetland surface is concave with a roughly rectangular shape in this area and approximately 30-40 feet across at the widest section.

Aerial imagery from 2008 and 2010 identifies the east of the pond with standing water. The seasonal feature is much larger than mapped because it appears that it has been newly drained into the pond feature through a large trench. This satisfies the wetland hydrology parameter "B7" and meets the wetland hydrology criterion. This plot was located within a seasonal wetland.

### 6. DISCUSSION

As a part of the delineation process, a preliminary search of the relevant historic and modern records of the project area was completed by BSK. Those records include National Wetland Inventory (NWI) and Soil Conservation Service (SCS) maps and Federal Emergency Management Agency (FEMA) databases were conducted to evaluate if any documented wetlands were located on or near the site. The NWI and SCS databases do not identify wetlands or hydric soils respectively within the APE. This is because the site is identified as urban developed and non-natural conditions as a result of the historic filling of the Mission Bay. San Francisco has not yet completed FEMA flood maps of this area. Soil profiles were identified in the following report, LTR 2015, which verified that the site was developed on fill, placed over the Bay muds. The nearest open water to the project site is San Francisco Bay located approximately 702 ft. east of the project site.

San Francisco Bay is considered jurisdictional waters of the U.S. pursuant to Section 404 of the Clean Water Act (USACE, 1987, p. 2; 33 C.F.R. § 328.3). Mission Bay itself was an open tidal bay within the estuary, fully navigable and subject to use in international commerce. The bay was filled in a series of stages prior to the CWA (LTR 2015).

The site features are located approximately 702 feet from the nearest documented waters, tidal waters of the United States - San Francisco Bay, therefore adjacent to waters, meet the significant nexus tests; and are "other waters" as well, namely an open water pond feature and its associated wetlands is. The wetland features have been independently judged by two sets of wetland experts as having met wetland criteria for hydrology and vegetation (BSK and ESA), and soils (ESA). The site has been subject to significant recent disturbance which has apparently removed most of the vegetation associated with the seasonal wetlands. But these characteristics were evident despite being assessed during a drought season (USBR, 2014). Historic aerial photos from verify standing water on the site (Digital Globe, 2014). Therefore, all three the wetland hydrology indicators are satisfied (USACE, 2008).

The APE is within 1,000 feet of tidal waters (702 feet to the permanent water feature, and appears to provide the nexus functions: (i) Sediment trapping, (ii) Nutrient recycling, (iii) Pollutant trapping, transformation, filtering, and transport, (iv) Retention and attenuation of flood waters, (v) Runoff storage, (vii) Export of organic matter, (viii) Export of food resources, and (ix) Provision of life cycle dependent aquatic habitat (such as foraging, feeding, nesting, breeding, spawning, or use as a nursery area) for species (BSK 2015; ESA 2014; DSEIR 2015). It further contains characteristics of a wetland as defined by the USACE, and therefore, should be classified as waters and a wetland within the identified wetland boundary.

### 7. LIMITATIONS

The observations, assessment and recommendations submitted in this report are based upon the data obtained from existing reports prepared by others, limited field investigation, and limited access site

observations. The report does not reflect variations which may occur beyond the assessed area. The findings of the field observation may have a potential for negative impact(s) on the value or suitability of the site for some purposes. BSK cannot assume liability for any such negative impact(s). Permitting requirements or permit interpretations may change over time. The findings of this report are valid as of the present. However, changes in the conditions of the site can occur with the passage of time, whether caused by natural processes or the human-induced changes on this property or adjacent properties. In addition, changes in applicable or appropriate standards or practices may occur, whether they result from legislation, governmental policy, or the broadening of knowledge. BSK's services were performed in a manner consistent with the level of care and skill ordinarily exercised by other professionals practicing in the same locale and under similar circumstances at the time the work is performed.

BSK has prepared this report for the exclusive use of Soluri-Meserve. The report has been prepared in accordance with generally accepted practices which existed in northern California at the time the report was written. No other warranties either expressed or implied are made as to the professional advice provided under the terms of BSK's agreement with Soluri-Meserve.

#### Erik Ringberg – Ecological Services Group Manager

##### Professional Background:

Mr. Ringberg began his career as an environmental scientist in 1992. His academic background includes a B.Sc. in Microbiology from Colorado State University, a M.Sc. in Environmental Science from Lesley University in Cambridge, Massachusetts, and he is a Ph. D. candidate at the University of Montana, in Riparian and Wetland Ecology. He has directed organizations, managed departments, technical staff, contractors, and volunteers for the public and private sectors. He has coordinated development and restoration projects with state and federal oversight agencies, developed threatened and endangered species management plans. Mr. Ringberg directed and advised non-profit, tribal, and local government agencies on wildlife mitigation measures, special studies, habitat management and restoration for listed species.

Mr. Ringberg has completed numerous California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA) processes and associated field studies, including protocol studies for listed avian, terrestrial, and aquatic species and their associated habitats in California, Nevada, and Montana. He has delineated Streamside Management Zones, US Army Corps of Engineers - Wetlands and Ordinary High Water Marks and California "isolated" waters. Mr. Ringberg has also directed both large and small-scale wetland and river restorations.

##### Relevant Project Experience:

##### Field Studies and Observations

##### Wetland Delineations

21 linear miles of Putah Creek for USACE NWP-27 and for Regional General Permits; 17 linear miles of Cache Creek for the County of Yolo for a USACE Regional General Permit 58; 2,560 acres of wetland delineations in Tehama County; and, hundreds of acres for development projects in Fresno Sacramento, Solano, Stanislaus, and Yolo Counties.

##### Wetland Habitat Reconstruction Analysis

Reconstruction of pre-impact wetland and upland conditions using stratified random statistical analysis of NHP data, and site specific data from local informants, for the Yerington Nevada area.

##### Worker Environmental Awareness Protection Plans

Preparation and presentation of Worker Environmental Awareness Protection (WEAP) Plans for project which may have potential to impact wetlands, listed species and breeding birds in Solano and Yolo Counties.

##### Field Ecology

*Putah and Cache Creek Plans, Yolo County, CA, Washoe County, and Lyon County NV* - Technical Advisor on riparian and wetland habitat analysis, restoration (and SMARA-equivalent) planning for Yolo County Resource Management Planning

BSK Corp

## O-MBA20L7

### Erik Ringelberg – Ecological Services Group Manager

---

Area for Cache Creek, advisor for large-scale watershed restorations (and dam removal) on Putah Creek; and, restoration and management plans for the Pyramid Lake Paiute Reservation. Developed historic species lists for Cache Creek and Yerington region.

**Pyramid Lake Paiute Tribe, Big Valley, Robinson, and Upper Lake Rancherias, in Washoe County NV and Clear Lake County, CA** - Directed a multi-disciplinary lake and river research-management program for threatened and endangered species. Provided technical support for federal and state-listed species and those of tribal concern (Lahontan cutthroat trout, Cui-ui, Clearlake hitch, Sacramento perch, and tui chub), including managing 6 hatcheries, a water quality laboratory, and tagging programs.

**Missoula County Riparian Inventory and Classification Project, Missoula County, MT** - Co-funded, developed, and managed the Missoula County riparian inventory. Researched the integration of riparian and wetland vegetation, habitat, and stream classifications.

## Kevin Grove – Staff Scientist

### Professional Background:

Mr. Grove began his career as a Transportation Planning Intern with Yolo County Transportation District in 2013. During this internship, Mr. Grove managed the Thanksgiving Shuttle marketing program. He also assisted with significant route and schedule changes for YCTD's local transit agency, Yolobus.

Mr. Grove has assisted with site investigations including biological monitoring, data collection, soil sampling, remote camera operation and field mapping. Additionally, he has interpreted aerial photographs, prepared GIS Figures, conducted 1600 Permit Vegetation Inventory Surveys, Breeding Bird Surveys, Ordinary High Water Mark Surveys, and Wetland Delineation Surveys. He supports the preparation of California Environmental Quality Act documentation, including Environmental Impact Reports, Initial Studies and Mitigated Negative Declarations for proposed projects. His work includes conducting special studies, section writing reference development, and quality assurance.

### Example of Relevant Project Experience:

#### Field Work

##### **Putah Creek Restoration Projects, Yolo and Solano County, California**

Mr. Grove conducted 1600 Permit Vegetation Inventory Surveys, mapped various species of trees using GPS locations, tree diameters, and aerial photograph interpretations. Mr. Grove also conducted Ordinary High Water Mark and Wetland Delineation surveys using centimeter accuracy GPS equipment.

##### **Kilgore Property – Proposed Entertainment Center, EPA Brownfields Phase II ESA, City of Rancho Cordova**

Using GIS, Mr. Grove created all site maps and figures for the project area. He worked with Erik Ringelberg, Ecological Services Group Manager, to complete an ecological screening to determine the potential presence of endangered species on site. He also conducted inventory, documentation, and graphical representation of all soil samples from the project. Mr. Grove assisted with the writing of the Quality Assurance Project Plan (QAPP).

##### **Pleasants Dixon Main Drain/V-Drain Enlargement Project – Burrowing Owl Protocol Survey, Dixon, CA**

Mr. Grove assisted Erik Ringelberg, Ecological Services Group Manager, with a burrowing owl survey to determine the potential presence of burrowing owls on the project site.

##### **Pleasants Creek Bank Stabilization Project – Breeding Bird Survey, Vacaville, CA**

Mr. Grove assisted Mr. Ringelberg, with a breeding bird survey to determine the potential presence of breeding birds on the project site.

### Special Studies Modeling

#### Air Modeling and Reporting

- CalEEMod
- Caline4
- CT-EMFAC 5

##### **Grapevine Shopping Center Project, Kern County, California**

Mr. Grove performed air quality modeling to determine air emissions during construction and operation of the proposed project. Implemented mitigation measures to reduce emissions from the project.

##### **Proposed Newcastle Fire Station Phase I and CalEEMOD Air Modeling, Placer County, California**

Mr. Grove performed air quality modeling to determine air emissions during construction and operation of the proposed project.

#### Noise Modeling

- Federal Highway Administrations (FHWA) Traffic Noise Model TNM 2.5
- FHWA Roadway Construction Noise Model RCNM

##### **Grapevine Shopping Center Project, Kern County, California**

Mr. Grove conducted noise modeling to determine noise levels from the construction and operation of the proposed project. Implemented mitigation measures to reduce noise levels from the project.

#### Stormwater Pollution Prevention Plans (SWPPP)

Mr. Grove aided QSDs with the preparation and implementation of multiple SWPPP reports. He is trained for on-site water sampling for pH and turbidity, BMP inspection, and monitoring. He also has experience with the SMARTS online permitting process for Risk Levels 1, 2 and "exempt" projects.

#### Environmental Impact Report Preparation

##### **Grapevine Shopping Center Project, Kern County, California**

Mr. Grove performed noise and air quality modeling for preparation of an Environmental Impact Report for the construction of an approximately 45-acre shopping center. Developed mitigation measures to reduce air emissions and noise levels from the project.

#### Phase I and Phase II Environmental Site Assessments

##### **10<sup>th</sup> and R Street Phase I, Sacramento, CA**

In the Phase I work of the 10th and R Street project, Mr. Grove created site maps and figures using GIS. These maps identified potential hazardous materials, underground storage tanks, existing plumbing, and on-site observations.

##### **McClish Property Phase II, Yolo County, California**

In the Phase II work of the McClish Property Project, he created site maps and figures for the project area using GIS. These maps included monitoring well locations and ground water flow direction.

FILED  
In the Office of the Secretary of State  
of the State of California  
AUG 23 1993  
MARION JUNG, Secretary of State  
By *[Signature]* Deputy

EXECUTIVE DEPARTMENT  
STATE OF CALIFORNIA

EXECUTIVE ORDER W-59-93

WHEREAS, wetlands act as primary producers in the food chain, help retain floods, recharge and discharge groundwater, act as water quality filters, provide recreational and scenic values, and harbor a significant number of California's threatened and endangered plant and animal species; and

WHEREAS, in the nineteenth century and early decades of the twentieth century as much as ninety percent of California's historical wetlands base has been converted to other uses, with a consequent reduction in the functions and values wetlands provide; and

WHEREAS, wetlands in California continue to be converted to other uses and degraded by sedimentation, loss of associated upland habitat, and other factors; and

WHEREAS, past conservation efforts have resulted in the long-term protection of approximately two-thirds of California's remaining wetland acreage; and

WHEREAS, the administration of wetlands programs is often time consuming, duplicative, inconsistent, and therefore costly to landowners and public agencies; and

WHEREAS, it is the policy of the State of California to streamline regulatory permitting processes;

NOW, THEREFORE, I, PETE WILSON, Governor of the State of California, by virtue of the power and authority vested in me by the Constitution and statutes of the State of California, do hereby issue this order to become effective immediately:

I. It is hereby declared to be the policy of the State of California that all State government programs and policies that affect the wetlands of California be coordinated as described herein.

II. It is hereby declared to be the policy of the State of California that its Comprehensive Wetlands Policy rests on three primary objectives:

- 1) To ensure no overall net loss and long-term net gain in the quantity, quality, and permanence of wetlands acreage and values in California in a manner that fosters creativity, stewardship, and respect for private property.
- 2) To reduce procedural complexity in the administration of State and Federal wetlands conservation programs.
- 3) To encourage partnerships to make restoration, landowner incentive programs, and cooperative planning efforts the primary focus of wetlands conservation.

All agencies of the State shall conduct their activities, consistent with their existing authorities, in accordance with these three objectives.

PAGE TWO

- III. The California Wetlands Conservation Policy addresses wetlands inventory, planning, wetlands, regulation, landowner incentives, wetlands mitigation banking, and other wetlands conservation approaches (e.g., acquisition, restoration, management, and education). The goal of the California Wetlands Conservation Policy is to achieve a long term increase of wetlands acreage, functions and values in California. Steps taken to achieve this goal shall emphasize maintaining economic uses (e.g., agriculture) of restored and enhanced lands and be achieved through the voluntary participation of landowners. This goal is not meant to be achieved on a permit-by-permit basis. The Task Force or specific agencies as identified in the "California Wetlands Conservation Policy," will develop and implement the following:
- (a) a Statewide wetlands inventory and wetlands accounting system;
  - (b) identification and implementation of regional and Statewide wetlands restoration goals;
  - (c) State agency assistance and support for local and regional wetlands planning efforts;
  - (d) promotion of landowner incentive programs to preserve, restore, and enhance wetlands, including the provision of adequate funding from State and Federal sources;
  - (e) delegation of the permitting authority for the Federal Clean Water Act Section 404 program from the U.S. Army Corps of Engineers to the San Francisco Regional Water Quality Control Board and, for a limited set of activities, the San Francisco Bay Conservation and Development Commission as part of a longer term effort to explore feasibility of Statewide delegation, with adequate Federal funding, of the program;
  - (f) development of a consistent regulatory wetlands definition for State agencies that improves the overall efficiency of the Federal-State permitting process;
  - (g) development of a balanced Statewide policy concerning Army Corps of Engineers nationwide permits;
  - (h) development of consistent standards and guidelines concerning mitigation and monitoring of mitigation and restoration efforts;
  - (i) actions that promote efficiency of wetlands-related permitting processes of various State agencies, including but not limited to creation of consistent deadlines, establishment of concurrent permit review procedures, and sponsorship of pre-application consultations between permittees and permitting agencies;
  - (j) development of means to provide flexibility in the regulatory process for the accidental or unintentional creation of wetlands, and for allowing public agencies, water districts, and landowners to establish wetlands on their property consistent with the primary purpose of the property;
  - (k) development of Statewide wetland mitigation banking guidelines and the development of demonstration wetland mitigation banks in the Central Valley;
  - (l) enhanced coordination of State, Federal, and private acquisition, restoration, and incentive programs, including the establishment of a demonstration program in Southern California;
  - (m) ongoing management of wetlands which maintains or enhances wetlands values and recognizes the responsibility to minimize impacts to surrounding landowners;

FROM : CALIFORNIA STATE ARCHIVES PHONE NO. : 916 651 6604 JUL 11 21 2008 05:35PM P3/4

PAGE THREE

- (n) the development of internal policies within State agencies that encourage wetland conservation activities which are compatible with programmatic goals such as flood control, groundwater recharge, water management, water pollution control, recreation, and other purposes;
  - (o) such other matters as are deemed necessary to carry out the purposes of this Executive Order.
- IV. It is hereby declared to be the policy of the State of California that the California Wetlands Policy and Plan will initially emphasize Regional Strategies in the Central Valley, the San Francisco Bay Area, and in Southern California. They will be designed to test how wetlands programs can be implemented, refined, and combined in unique ways to achieve the goals and objectives of this California Wetlands Conservation Policy.
- V. An Interagency Task Force on Wetlands will be established by the Secretary of Resources and Secretary for Cal/EPA to provide coordination and information exchange among agencies, boards, commissions, and departments as necessary to ensure continued coordinated development and implementation of the California Wetlands Conservation Policy. The Task Force shall invite the participation as necessary of other boards and commissions, and local, Federal, and private agencies which have jurisdiction, expertise, and resources which may contribute to the continued development and implementation of the California Wetlands Conservation Policy. The Secretary of the Resources Agency and the Secretary for Cal/EPA shall serve as co-chairmen.

IN WITNESS WHEREOF I have hereunto set my hand and caused the Great Seal of the State of California to be affixed this 23rd day of August 1993.

*Pete Wilson*  
Governor of California

ATTEST:  
*Martha Jones*  
Secretary of State

**DATE:** January 25, 2001

**SUBJECT:** EFFECT OF *SWANCC V. UNITED STATES* ON THE 401 CERTIFICATION PROGRAM

This memorandum has been prepared to explain the effect of the recent US Supreme Court decision of *Solid Waste Association of Northern Cook Counties v. United States Corps of Engineers* (hereinafter "SWANCC"), which was issued on January 9<sup>th</sup>. The memo is intended to address the impact of the decision on the 401 program (33 U.S.C. § 1341), and to indicate alternative regulatory avenues available to the Regional Boards for waters that are no longer covered by section 404/401 jurisdiction.

**I. Facts of the SWANCC decision and holding**

SWANCC is a consortium of suburban Chicago cities and villages looking to develop a solid waste disposal site. It located a 533-acre parcel that was a gravel-mining pit until about 1960. The pit has reverted into a successional stage forest with seasonal and permanent ponds, but it was not a delineated wetland. SWANCC purchased the site and applied for a § 404 permit. In furtherance thereof, it sought certification from the state of Illinois.

The Clean Water Act (CWA) only regulates what it refers to as "navigable waters." The CWA defines navigable waters as "waters of the United States." In the past, the agencies responsible for implementing the Clean Water Act interpreted the term "waters of the United States" broadly. They determined that it reflected Congress' intention to regulate all waters that the Congress could constitutionally regulate under its commerce power. (See Art. I, Section 8 of the U.S. Constitution, generally known as the Commerce Clause.) Specifically, if the water had any possible connection to interstate commerce, it fell within the scope of the CWA. Since 1986 the Army Corps of Engineers' (COE) regulations reflected this determination. They stated that "waters of the United States" includes, among other things, intrastate waters:

**California Environmental Protection Agency**

- 2 -

January 25, 2001

- (a) That are or would be used as habitat by birds protected by migratory bird treaties; or
- (b) That are or would be used as habitat by other migratory birds that cross state lines; or
- (c) That are or would be used as habitat for endangered species; or
- (d) That are or would be used to irrigate crops sold in interstate commerce.

This has been dubbed “The Migratory Bird Rule.”

Although the SWANCC site was not a “wetland” according to the COE’s wetland delineation manual, the COE found that approximately 121 bird species dependent on aquatic environments were observed at the site, and thus found the site to be a water of the United States. Accordingly the COE asserted jurisdiction over the site. The state of Illinois granted 401 certification, but the COE denied the 404 permit on traditional grounds.<sup>1</sup>

SWANCC sued to challenge the COE’s jurisdiction over the site, claiming that the COE could not regulate non-navigable, isolated, intrastate waters based on the presence of migratory birds, and that Congress lacked authority under the Commerce Clause to grant the COE such jurisdiction in any event. Although the COE prevailed in the trial and appellate courts, the US Supreme Court reversed, and invalidated the Migratory Bird Rule. It held that the rule is not a fairly supported interpretation of the term “waters of the United States,” and the COE exceeded its jurisdiction by interpreting the CWA’s reach to include isolated, inland, non-navigable waters. The Court held or implied that the CWA might fairly extend to:

- “(a) [t]hose waters of the United States which are subject to the ebb and flow of the tide, and/or are presently, or have been in the past, or may be in the future susceptible for use for purposes of interstate or foreign commerce;
- “(b) waters that were or had been navigable in fact or which could reasonably be so made;
- “(c) non-navigable wetlands adjacent to open waters;
- “(d) wetlands [that are] ‘inseparably bound up with the waters of the United States; and
- “(e) water bodies [capable] of use by the public for purposes of transportation or commerce.”

<sup>1</sup> The COE found (1) that SWANCC had not established that the proposal was the least harmful practicable alternative; (2) that SWANCC’s failure to set aside funds for leak remediation was unacceptable risk to public drinking water supplies; and (3) that the impact to the waters was unmitigable because a landfill cannot be redeveloped into forested habitat.

California Environmental Protection Agency

## O-MBA20L7

State Board Members

- 3 -

January 25, 2001

The Supreme Court questioned the constitutionality of any amendment to the CWA, if Congress was so inclined, that would purport to assert federal jurisdiction over isolated, inland waters. In other words, if Congress tried to adopt the “migratory bird rule,” a majority of the Court indicated its belief that it would exceed the power granted to Congress under the U.S. Constitution.

### II. SWANCC’s effect upon the 401 certification program will not be wholly determined until the COE issues guidance implementing the decision.

California’s right and duty to evaluate certification requests under section 401 is pendant to (or dependent upon) a valid application for a section 404 permit from the COE, or another application for a federal license or permit. Thus if the Corps determines that the water body in question is not subject to regulation under the COE’s 404 program, for instance, no application for 401 certification will be required. Accordingly, the COE’s interpretation of the SWANCC decision will determine SWANCC’s impact upon a major portion of California’s 401 program. The COE has yet to issue guidance setting forth how the SWANCC decision will be implemented. Clearly, however, the Migratory Bird Rule will not determine the scope of the COE’s authority over isolated waters. Isolated non-navigable waters (including most non-tidal wetlands) appear to be outside the purview of section 404 of the Clean Water Act.

### III. The SWANCC decision does not affect the Porter-Cologne authorities to regulate discharges to isolated, non-navigable waters of the state.

If anything definitive can be said about the SWANCC decision, it is that the Supreme Court believes regulating inland waters, including isolated wetlands, vernal pools, etc., are the primary (and probably now the exclusive) province of the state. California has numerous authorities that require these waters to be protected. None of those state authorities are affected by the U.S. Supreme Court’s decision. Accordingly, the SWANCC decision has no impact upon the Regional Board’s authority to act under state law. Some major relevant provisions are set forth below.

Water Code section 13260 requires “any person discharging waste, or proposing to discharge waste, within any region that could affect the waters of the state to file a report of discharge (an application for waste discharge requirements).” (Water Code § 13260(a)(1) (emphasis added).) The term “waters of the state” is defined as “any surface water or groundwater, including saline waters, within the boundaries of the state.” (Water Code § 13050(e).) The U.S. Supreme Court’s ruling in SWANCC has no bearing on the Porter-Cologne definition. While all waters of the United States that are within the borders of California are also waters of the state, the converse is not true—waters of the United States is a subset of waters of the state. Thus, since Porter-Cologne was enacted California always had and retains authority to regulate discharges of waste into any waters of the state, regardless of whether the COE has concurrent jurisdiction under section 404. The fact that often Regional Boards opted to regulate discharges to, e.g.,

California Environmental Protection Agency

O-MBA20L7

State Board Members

- 4 -

January 25, 2001

vernal pools, through the 401 program in lieu of or in addition to issuing waste discharge requirements (or waivers thereof) does not preclude the regions from issuing WDRs (or waivers of WDRs) in the absence of a request for 401 certification.

Under state law, the duty to file a report of waste discharge is mandatory:

All of the following persons shall file with the appropriate regional board a report of the discharge. (Water Code § 13260(a).)

Furthermore, the Regional Board is required to issue or waive WDRs whenever it receives a report of discharge:

The regional board, after any necessary hearing, shall prescribe requirements as to the nature of any proposed discharge, existing discharge, or material change in an existing discharge... with relation to the conditions existing in the disposal area or receiving waters upon, or into which the discharge is made or proposed. The requirements shall implement any relevant water quality control plans that have been adopted, and shall take into consideration the beneficial uses to be protected, the water quality objectives reasonably required for that purpose [etc.] (Water Code § 13263(a).)

Notably, every person is precluded from initiating new discharges or making material changes to discharges prior to filing the report of waste discharge described in section 13260, and for 120 days thereafter unless they have received WDRs (or appropriate waivers). (Water Code § 13264(a).) Given the state's interest in protecting wetlands, it is incumbent upon staff to act within the 120 days. A fill thereafter may be lawful. If, however, it appears that the Regional Board is unable to meet and consider WDRs (or a waiver thereof) within the statutory time allotted, the Regional Board could issue a cleanup and abatement order under section 13304 against anyone who, through a discharge to waters of the state, has created or threatens to create a condition of pollution. "Pollution" is defined as an alteration of the quality of the waters of the state, which unreasonably affects its beneficial uses. (Water Code § 13050(l).) Wildlife is a beneficial use, and thus filling or threatening to fill wetlands would provide grounds to issue an appropriate order under 13304.

The California Environmental Quality Act (CEQA) also provides a requirement for the Regional Boards to exercise their authorities to require minimization and mitigation of impacts to waters of the state. Whenever a Regional Board is a responsible agency under CEQA, and the Lead Agency has prepared an EIR, the Regional Board must not only review the CEQA document, but it must reach its own conclusions on whether and how to approve the project involved. (14 CCR § 15096(a).) Moreover, the Regional Board must mitigate or avoid the direct or indirect environmental effects of the parts of the project it approves, and it is prohibited from approving a project if there is a feasible alternative or feasible mitigation measures that would

*California Environmental Protection Agency*

O-MBA20L7

State Board Members

- 5 -

January 25, 2001

lessen or avoid significant impacts. (14 CCR § 15096(g)(1) and (g)(2).) Furthermore, as a responsible agency the Regional Board must make specific findings relating to the feasibility of avoidance, minimization, or mitigation of the adverse effects. (14 CCR §§ 15096(h), 15091, 15093.) Feasible changes or alterations within the control of the Regional Board must be articulated in the WDRs.

Notably, since 1993 and continuing through the present, the official policy of the United States and the State of California respecting wetlands has and continues to be one of "no net loss." Accordingly, the charge to protect the state's wetlands has already been articulated. In areas where the COE determines it no longer has jurisdiction, it would be consistent with present federal and state policy for the Regional Boards to fill the gap. This may require contacting the applicable COE divisions for assistance in identifying pending 404 permit applications, or conducting outreach to the local development interests to remind them that, irrespective of the COE's authority or the 404 program, they still must comply with applicable state requirements for discharges.

**IV. Conclusion**

While the *SWANCC* decision will no doubt have repercussions for the state's 401 certification program, the reach of the decision will not be clear until the COE issues guidance indicating how it intends to implement the holding. The 404 program may be dramatically scaled back or the COE could read the decision narrowly, as merely invalidating the Migratory Bird Rule. Irrespective, the state retains its independent authority under Porter-Cologne and other statutes, to regulate discharges of waste to all waters of the state, including those waters that are no longer considered waters of the United States. The thrust of the *SWANCC* decision is that regulation of inland, isolated waters is and should be under the primary authority of the state rather than the federal government. Given the state and federal "no net loss" of wetlands policy, the Regional Board's should consider that regulating any discharges of waste to waters that may no longer be subject to COE jurisdiction is both authorized and justified.

If you have any questions about this memo, please contact Michael Levy, Staff Counsel at (916) 341-5193.

EXECUTIVE OFFICE

DATE: JUN 25 2004

SUBJECT: GUIDANCE FOR REGULATION OF DISCHARGES TO "ISOLATED" WATERS

### Background

As you know, Governor Schwarzenegger's *Action Plan for California's Environment* directs State agencies to fill any gaps in wetlands protection. The Supreme Court's 2001 decision in *Solid Waste Agency of Northern Cook County v. U. S. Army Corps of Engineers (SWANCC)* found that certain "isolated" wetlands and other waters are out of federal jurisdiction under the Clean Water Act, and it is the responsibility of the states to protect them. As a result of the decision, many projects carried out in "isolated waters" that previously would have required a Clean Water Act section 404 permit now no longer need one. From January 1, 2001 to December 31, 2003, the U. S. Army Corps of Engineers (USACE) disclaimed jurisdiction over 160 water bodies comprising 449 acres of waters of the State, including 251 acres of wetlands, 121 acres of riparian area, and 77 acres of other waters (these figures are under-reported because 24 percent of the jurisdictional disclaimers did not specify the sizes of the disclaimed water bodies). USACE continues to disclaim waters, pursuant to relevant federal guidance.

In response to *SWANCC*, the State Water Resources Control Board (SWRCB) has:

- issued a January 25, 2001 legal memorandum asserting the authority and responsibility of the SWRCB and Regional Water Quality Control Boards (RWQCBs) to regulate discharges to "isolated" waters,
- coordinated with USACE to ensure that the SWRCB and RWQCBs receive copies of all USACE jurisdictional disclaimer letters and developed a database of such disclaimers and related RWQCB orders,
- submitted March 13, 2003 comments on a federal proposal that would have redefined "Waters of the United States,"
- submitted to the legislature an April 2003 report titled *Regulatory Steps Needed to Protect and Conserve Wetlands Not Subject to the Clean Water Act*, and

California Environmental Protection Agency

O-MBA20L7

Regional Board  
Executive Officers

- 2 -

JUN 25 2004

- on May 4, 2004, adopted general waste discharge requirements for certain discharges to non-federal waters.

However, we have not yet developed a systematic, statewide approach for protecting "isolated" waters. The effects of *SWANCC* have fallen on the State at a time of shrinking agency budgets, and discharges to disclaimed waters have gone almost entirely unregulated by the RWQCBs; they are also often not subject to Department of Fish and Game (DFG) or other State regulation.

At their January 6, 2004 meeting, RWQCB Assistant Executive Officers suggested that the SWRCB provide direction for protecting "isolated" waters; and at the April 21, 2004 meeting of the Water Quality Certification Program Coordinating Committee (Corcom), RWQCB 401 Liaisons recommended the adoption of the following guidance. This document provides internal guidance only and has no regulatory effect. It is being forwarded electronically to RWQCB 401 staffs and will be posted on the SWRCB 401 Program's Intranet site (<http://dwqweb/wqcet/>).

### Guidance

Discharges subject to Clean Water Act section 404 receive a level of regulatory review and protection by the USACE and are often also subject to streambed alteration agreements issued by the DFG; whereas discharges to waters of the State subject to *SWANCC* receive no federal oversight and usually also fall out of DFG jurisdiction. Absent RWQCB attention, such discharges will generally go entirely unregulated. Therefore, to the extent that staffing constraints require the RWQCBs to regulate some dredge and fill discharges less closely than others and consistent with other RWQCB priorities, RWQCBs should consider setting a higher regulatory priority on discharges to "isolated" waters than to discharges of similar extent, severity, and permanence to federally-protected waters of similar value. Dredging, filling, or excavation of "isolated" waters constitutes a discharge of waste to waters of the State, and prospective dischargers are required to submit a report of waste discharge to the RWQCB and comply with other requirements of Porter-Cologne. Therefore, you should protect "isolated" waters in your Region by systematically instituting the following procedures:

1. Request a report of waste discharge from all recipients of USACE jurisdictional disclaimers, using the attached or a similar letter.
2. Pursuant to the requirements of the California Permit Streamlining Act, advise prospective dischargers within 30 days of receiving a report of waste discharge of whether their application is complete and, if not, what is needed to make it complete (assuming that you do not take regulatory action with 30 days).
3. Take appropriate regulatory action in response to receiving the report of waste discharge, using either the SWRCB's Water Quality Order No. 2004-0004-DWQ, *Statewide General Waste Discharge Requirements for Dredged or Fill Discharges to Waters Deemed by the U.S. Army Corps of Engineers to be Outside of Federal Jurisdiction* (General WDRs) or other individual or general WDRs or waivers. The General WDR can be downloaded from the SWRCB's website at "<http://www.swrcb.ca.gov/cwa401/index.html>". In issuing WDRs or waivers, you may refer to the same regulatory considerations which you generally apply to

California Environmental Protection Agency

O-MBA20L7

Regional Board  
Executive Officers

- 3 -

JUN 25 2004

issuance of Clean Water Act section 401 Water Quality Certifications (401 certification) and to those articulated in the General WDRs.

4. Copy SWRCB and USACE staffs on your requests for reports of waste discharge and on your regulatory orders. Addresses of appropriate parties are:

401 Program Manager  
State Water Resources Control Board  
1001 I Street  
Sacramento, CA 95814

U.S. Army Corps of Engineers  
(Appropriate District below):

Regulatory Branch  
Sacramento District  
1325 J Street  
Sacramento, CA 95814-2922

Regulatory Branch  
San Francisco District  
333 Market Street  
San Francisco, CA 94105

Regulatory Branch  
Los Angeles District  
911 Wilshire Boulevard, 11<sup>th</sup> Floor  
Los Angeles, CA 90017-3401

Use the USACE's file number, whenever available, on all correspondence. SWRCB staff will use the USACE file number (or your file number in its absence) to correlate USACE jurisdictional disclaimers, RWQCB requests for reports of waste discharge, applicants' reports of waste discharge, and RWQCB regulatory orders. Using this information, the SWRCB will assist your tracking of SWANCC-related discharges and will report on our effectiveness in filling the regulatory gap created by the current federal interpretation of SWANCC.

Thank you for your effective management of our very limited program resources in regulating dredge, fill, and excavation discharges to wetlands, riparian areas, headwater streams, and other waters. If you have any questions, please contact Stan Martinson, Chief of the Division of Water Quality, at 916-341-5458 or at [marts@swrcb.ca.gov](mailto:marts@swrcb.ca.gov). You may also contact Oscar Balaguer, Chief of the Wetlands and Certification Program, at 916-341-5485 or at [balao@swrcb.ca.gov](mailto:balao@swrcb.ca.gov).

*Regional Board Letterhead*

Dear \_\_\_\_\_

REQUEST FOR REPORT OF WASTE DISCHARGE

By copy of a U.S. Army Corps of Engineer (USACE) <date> jurisdictional disclaimer letter, we understand that you may be planning to dredge, fill, or excavate in waters which the USACE has determined to be outside of federal jurisdiction. Such activities may constitute a discharge of waste, which could affect the quality of waters of the State, as defined in California Water Code (CWC) section 13050. Pursuant to CWC section 13260, you are required to file with this Regional Water Quality Control Board (RWQCB) a Report of Waste Discharge (ROWD) describing the proposed discharge at least 140 days before it occurs (See CWC § 13264). This letter constitutes a formal request for such a ROWD. Pursuant to CWC section 13261, failure to respond to this request before discharging, or discharging without regulatory authorization, may result in substantial civil or criminal penalties.

If you do not plan to conduct any discharge to any "isolated" water as described above, please advise us so that we can close our file. If you are planning such a discharge, use one of the two forms listed below, as appropriate, to submit a ROWD. To expedite processing, please include a copy of this request letter with your response, and indicate the USACE's file number on all correspondence.

1. If the discharge will not be greater than 0.2 acre and 400 linear feet (for fill and excavation) or 50 cubic yards (for dredging), you may be eligible for the State Water Resource Control Board's *General Waste Discharge Requirements for Dredged or Fill Discharges to Waters Deemed by the U.S. Army Corps of Engineers to be Outside of Federal Jurisdiction* (GWDRs). You must submit a Notice of Intent (NOI) and a mitigation plan demonstrating that you have taken practicable steps to avoid and minimize impacts; that you will compensate for unavoidable permanent impacts to wetlands and headwater streams; and that you will comply with other specified conditions. Note that you will not be covered by the GWDRs unless the RWQCB sends you a written Notice of Enrollment; or unless the RWQCB does not issue you a Notice of Exclusion within 45 days of receiving your complete NOI. You can download a copy of the GWDRs and the NOI form at <http://www.swrcb.ca.gov/cwa401/index.html>. The form is also available in hardcopy from the RWQCB. Note that if your project is eligible under these GWDRs, your NOI need only be filed 45 days before the proposed discharge.
2. If your proposed discharge does not qualify for the GWDRs, you may need individual waste discharge requirements. To apply, please use the form normally used to apply for water quality certification. You can download that form at [www.rwqcb.org](http://www.rwqcb.org). Be sure to indicate that you are responding to this request for a ROWD. The form is also available in hardcopy from the RWQCB.

O-MBA20L7

Regional Board  
Executive Officers

- 2 -

As instructed in the NOI form, please include with your application any environmental documents, technical reports, plans, diagrams, maps, mitigation and monitoring proposals, and other documents which will help characterize the discharge. Please also submit the appropriate "To Non-Federal Waters" fee as determined from California Code of Regulations Title 23, section 2200 (a)(2). The fee schedule may be viewed and fees calculated at <http://www.swrcb.ca.gov/cwa401/docs/feccalculator.xls>.

Please send the application package to the address below. Please also send a duplicate copy of the application form/ROWD, but without any supplemental documents, to: SWANCC-ROWD, Wetlands and Certification Unit, Division of Water Quality, State Water Resources Control Board, 1001 I Street, 15<sup>th</sup> Floor, Sacramento, CA 95814.

If you have any questions, please contact <name> at <telephone> or <email>.

## O-MBA20L7

### STATE WATER RESOURCES CONTROL BOARD WATER QUALITY ORDER NO. 2004-0004-DWQ

#### STATEWIDE GENERAL WASTE DISCHARGE REQUIREMENTS FOR DREDGED OR FILL DISCHARGES TO WATERS DEEMED BY THE U.S. ARMY CORPS OF ENGINEERS TO BE OUTSIDE OF FEDERAL JURISDICTION (GENERAL WDRs)

#### I. FINDINGS

The State Water Resources Control Board (SWRCB) finds that:

##### Reasons for issuing these General WDRs

1. Section 13260(a) of the California Water Code (Water Code) requires that any person discharging waste or proposing to discharge waste within any region, other than to a community sewer system, which could affect the quality of the waters of the State<sup>1</sup>, file a report of waste discharge (ROWD). The discharge of dredged or fill material may constitute a discharge of waste that could affect the quality of waters of the State.
2. California has largely relied upon its authority under section 401 of the federal Clean Water Act (CWA) (33 U.S.C. § 1341) to regulate discharges of dredged or fill material to California waters. That section requires an applicant to obtain "water quality certification" from California that the project will comply with State water quality standards before certain federal licenses or permits may be issued. The permits subject to section 401 include permits for the discharge of dredged or fill materials (CWA section 404 permits) issued by the U.S. Army Corps of Engineers (ACOE).
3. Given the regulatory process employed under section 401, waste discharge requirements under the Porter-Cologne Water Quality Control Act were typically waived for projects that required certification. Regional Water Quality Control Board (RWQCB) waivers also applied to discharges outside of ACOE jurisdiction. However, these waivers expired as of January 1, 2003 pursuant to the requirements of SB 390. These General WDRs regulate some of the activities for which WDRs were previously waived.
4. The certification process under section 401 only applies to those waters that are subject to the reach of the CWA. The CWA applies to "navigable waters," which are defined in the CWA as "waters of the United States." The term "waters of the United States" is defined expansively in 33 Code of Federal Regulations (CFR), part 328. In 2001, the U.S. Supreme Court issued a decision in *Solid Waste Agency of Northern Cook County v. U.S. Army Corps of Engineers*, 531 U.S. 159 (2001) ("SWANCC"), which held that certain "isolated" waters are not subject to CWA jurisdiction merely because they are frequented by migratory birds that cross state lines. The full implications of SWANCC are yet to be determined in the federal courts, but as a result

<sup>1</sup> "Waters of the State" as defined in Water Code section 13050(e).

## O-MBA20L7

of the decision, many projects that previously would have required a section 404 permit now no longer need one. From January 1, 2001 to December 31, 2003, the ACOE disclaimed jurisdiction over 160 water bodies comprising 449 acres of waters of the state, including 251 acres of wetlands, 121 acres of riparian area, and 77 acres of other waters (these figures are under-reported because 24 percent of the jurisdictional disclaimers did not specify the sizes of the disclaimed waterbodies). The prospect of issuing waste discharge requirements for each of the now non-federal waters, especially in a time of budgetary contraction, is daunting. Many of the projects that were traditionally subject to certification requirements involved small discharges with few or no permanent impacts. It is the intent of these General WDRs to regulate a subset of the discharges that have been determined not to fall within federal jurisdiction, particularly those projects involving impacts to small acreage or linear feet and those involving a small volume of dredged material.

5. Wetlands, riparian areas, and headwaters are shallow waters of the state, which are by their nature affected most often and severely by filling and excavation. Regulatory attention to these water bodies is necessitated by the State "No Net Loss" Policy for wetlands (Executive Order W-59-93); the high habitat value of these waters; the basin-wide value of these waters for pollutant removal, floodwater retention, channel stability, and habitat connectivity; the high number of special-status species associated with these waters and their associated habitats; the high percentage of historic losses of these waters in California; the vulnerability of these waters to future impacts from projected population growth and land development; and the high level of public interest in these waters.
6. Water Code section 13263(a) requires that waste discharge requirements (WDRs) be prescribed as to the nature of any proposed discharge, existing discharge, or material change in an existing discharge. Such WDRs must implement any relevant water quality control plans, taking into consideration beneficial uses to be protected, the water quality objectives reasonably required for those purposes, other waste discharges, the need to prevent nuisance, and the provisions of section 13241 of the Water Code.
7. Water Code section 13263(i) authorizes the SWRCB to prescribe general WDRs for a category of discharges if the discharges are produced by the same or similar operations; the discharges involve the same or similar types of waste; the discharges require the same or similar treatment standards; and the discharges are more appropriately regulated under general discharge requirements than individual discharge requirements.
8. The discharges authorized by these General WDRs meet the criteria for general WDRs set forth in Water Code section 13263(i) because they are all produced by dredging or filling operations; they all involve the discharge of earth, rock, or similar solid materials; they are all limited in size per the terms of the WDRs; they all require similar mitigation techniques to avoid, minimize, and/or compensate for their adverse impacts; and they are all relatively small surface water bodies or water body segments that have been deemed by ACOE to be "isolated," do not meet the federal wetland criteria, or are above the "line of ordinary high water" limit of federal jurisdiction. They are appropriately regulated under General WDRs because of their similar nature, large numbers, and amenability to being regulated through the use of similar discharge restrictions, as specified in these General WDRs. Regulation of

## O-MBA20L7

such discharges by these General WDRs will allow the SWRCB and RWQCBs to direct limited staff time to larger, more complex, and potentially more damaging discharges to waters deemed to be outside of federal jurisdiction.

### Eligibility Criteria

9. These General WDRs are restricted to dredged or fill discharges of not more than two-tenths (0.2) of an acre and 400 linear feet for fill and excavation discharges, and of not more than 50 cubic yards for dredging discharges. Projects that may be covered under these General WDRs include land development, detention basins, disposal of dredged material, bank stabilization, revetment, channelization, and other similar projects. These size maximums help limit the potential environmental impact of the discharges and make them amenable to similar discharge restrictions, while permitting about half of the projects discharging to non-federal waters, as projected from historical data on discharge sizes. The size and volume restrictions are appropriate because larger projects involve a significantly greater risk to the environment and are more appropriately regulated by individual WDRs.

Absent a potential effect on the quality of waters of the state, no notification is required under these General WDRs.<sup>2</sup> The “quality of waters” refers to chemical, physical, biological, bacteriological, radiological, and other properties and characteristics of water which affects its use.<sup>3</sup> Because of the variability, complexity, and interactions of the factors affecting the quality of waters, it is not possible to provide advice on the kind, size, location, or duration of discharges that can affect water quality under all circumstances. Generally, discharges of dredged, fill, or excavated material to a wetland, or to the active channel or bed of a waterbody will require regulation. Discharges to a riparian area or to an area in proximity to a waterbody can affect the quality of the water if they directly or indirectly result in a discharge to the water (e.g., via stormwater flows, during flood events, or by generating pollutants or increased runoff); are associated with a change in the nature of vegetation that could affect water quality (e.g., by affecting pollutant removal, stream shading, or bank stability); or change the hydrologic or geomorphologic characteristics of the waterbody during some flow condition.

These General WDRs do not set a lower size limit below which a Notice of Intent is not required. Neither the Porter-Cologne Water Quality Control Act nor the federal CWA establish a lower size threshold for permitting. If a lower threshold were established in these General WDRs, discharges below that threshold would be subject to regulation under individual WDRs or an individual waiver of WDRs, thus defeating the purpose of these General WDRs. Moreover, size is not the sole factor dictating the value of a wetland or other water. Small, strategically placed waters, or segments of waters, can play important roles in supporting local habitat, habitat connectivity, pollutant removal, floodwater attenuation, and other beneficial uses. In addition, without a reporting requirement, there would be no way for the State to ensure that multiple small discharges will not have significant cumulative effects.

10. Discharges of fill can directly or indirectly destabilize the channel or bed of a receiving water by changing geomorphic parameters, including hydrologic characteristics, sediment characteristics, or stream grade. Such destabilization diminishes the ability of the water body

<sup>2</sup> Water Code section 13260

<sup>3</sup> Water Code section 13050(g)

## O-MBA20L7

to support designated beneficial uses. Quantification and mitigation of such impacts may require detailed project-specific analyses. Therefore, these General WDRs do not authorize discharges that could destabilize the channel or bed of a receiving water.

11. In urbanizing basins or other situations, a large number of relatively small projects potentially eligible for these General WDRs, in their aggregate, may adversely impair the ability of the water body to support beneficial uses. Quantification and mitigation of such impacts may require basin-wide analyses. Therefore, these General WDRs do not authorize discharges that, when considered in conjunction with other potential discharges, could cause a significant cumulative effect on water quality or beneficial uses.
12. To the extent they are determined to fall within federal jurisdiction, it is likely that the SWRCB and RWQCBs will continue to regulate dredged or fill discharges primarily through their authority under section 401 of the CWA. Therefore, these General WDRs do not apply to discharges to federal waters that are subject to sections 401 and 404 of the CWA. These General WDRs likewise do not apply to discharges regulated under a section 402 storm water permit.
13. Discharges which could have a significant impact on rare, candidate, threatened, or endangered species require detailed project-specific analysis and individual regulation. Such discharges are therefore not authorized by these General WDRs.
14. Although a discharge may be eligible for coverage under these General WDRs, the RWQCB may elect to regulate the discharge under other WDRs or waivers thereof.
15. Discharges that would be exempt pursuant to section 404(f) of the CWA are waived from these WDRs. This waiver shall not affect a RWQCB’s authority to issue individual WDRs or waivers for such discharges if it deems it appropriate.

### Mitigation Plan

16. SWRCB Resolution No. 68-16, “Statement Of Policy With Respect To Maintaining High Quality Of Waters In California” (“Antidegradation Policy”), states that discharges to existing high quality waters will be required to meet WDRs which will result in the best practicable treatment or control of the discharge necessary to assure that (a) a pollution or nuisance will not occur, and (b) the highest water quality consistent with maximum benefit to the people of the State will be maintained.
17. Executive Order W-59-93, dated August 23, 1993, establishes a California Wetlands Conservation Policy including an objective to ensure no overall net loss of and a long term net gain in the quantity, quality, and permanence of wetland acreage and value in California (“No Net Loss Policy”).
18. Filling wetlands, riparian areas, headwaters, and other waters causes partial or complete loss of the beneficial uses provided by those waters. To reconcile such losses with the “No Net

## O-MBA20L7

Loss” requirements of Executive Order W-59-93 and the “Antidegradation” requirements of SWRCB Resolution No. 68-16, these General WDRs require mitigation plans to ensure that impacts are mitigated through avoidance and minimization and that unavoidable loss of beneficial uses is offset with appropriate compensatory mitigation, including creation, restoration, or (in exceptional cases) preservation of other waters of the state. These mitigation requirements are consistent with those adopted by the U.S. Environmental Protection Agency and the ACOE for regulation of dredged or fill discharges to federal waters under CWA section 404.

19. To comply with the objective of the State “No Net Loss Policy” to ensure the quantity, quality, and permanence of wetland acreage and values in California, and with the “Antidegradation” requirements of SWRCB Resolution No. 68-16, these General WDRs require that compensatory mitigation areas for permanent impacts be subject to a deed restriction or other legal instrument that ensures preservation of the mitigation in perpetuity. These General WDRs do not generally require compensatory mitigation for temporary impacts, because the SWRCB does not anticipate that projects eligible under this order would ordinarily create temporary impacts of a size, severity, and/or duration that would have a significant adverse impact on beneficial uses. The decision in this order to generally require compensatory mitigation only for permanent impacts is not meant to be a precedent for any other SWRCB or RWQCB order.
20. Consistent and equitable application of these General WDRs is in the interest of environmental protection and the applicants. These General WDRs therefore provide guidance to SWRCB and RWQCB staffs regarding factors to evaluate in considering the eligibility of these General WDRs and in evaluating mitigation plans.

### Basin Plans

21. All WDRs must implement the RWQCB Water Quality Control Plan (Basin Plan) for the region affected by the discharge. These General WDRs require dischargers to comply with all applicable Basin Plan provisions, including maintaining the protection of beneficial uses and complying with any prohibitions and water quality objectives governing the discharge.

### Beneficial Uses

22. Beneficial uses are the most fundamental of the State’s water quality standards. RWQCBs designate appropriate beneficial uses for waters in their regions’ Basin Plans. The beneficial uses for the waters of the State include, but are not limited to, domestic supply, municipal supply, agricultural and industrial supply, power generation, recreation, aesthetic enjoyment, navigation, and preservation and enhancement of fish, wildlife, and other aquatic resources or preserves.

### Fees

23. Water Code section 13260(d)(1) requires that each person for whom WDRs have been prescribed pursuant to section 13263 shall submit an annual fee according to a reasonable fee

## O-MBA20L7

schedule established by the SWRCB. The schedule of fees for discharges of dredged or fill material is published at California Code of Regulations (CCR) 23 section 2200(a)(2). For activities covered by these General WDRs, the SWRCB anticipates that most of the discharges will be one-time and of short duration. Therefore, only a one-time fee usually will be charged.

### California Environmental Quality Act (CEQA)

24. CEQA requires a government agency to comply with certain procedures when it approves or proposes to carry out an activity. (Cal. Code Regs., tit. 14, § 15002(e))
25. Private actions are subject to CEQA if they involve governmental participation, financing, or approval. (Cal. Code Regs., tit. 14, § 15002(c))
26. A Mitigated Negative Declaration in compliance with CEQA has been adopted for these General WDRs.
27. Potential dischargers and all other known interested parties have been notified of the intent to adopt these General WDRs.
28. All comments pertaining to the proposed discharges have been heard and considered in a public meeting.

## II. ORDER

### A. ELIGIBILITY

IT IS HEREBY ORDERED that only discharges that meet the following criteria shall be enrolled under these General WDRs:

1. The discharge shall not be subject to section 404 of the CWA or section 10 of the federal Rivers and Harbors Act. These General WDRs likewise do not apply to discharges regulated under a section 402 storm water permit.
2. The discharge shall be dredged or fill materials.
3. The discharge shall meet the following size criteria:
  - a. Excavation<sup>4</sup> and fill activities must not excavate or fill an area greater than two-tenths (0.2) of an acre of waters of the state, and

<sup>4</sup> “Excavation refers to moving sediment or soil in shallow waters or under no-flow conditions where impacts to beneficial uses are best described by the area of discharge. It typically is done for purposes other than navigation. Examples include trenching for utility lines, other earthwork preliminary to construction, removing sediment to increase channel capacity, and aggregate mining in fresh water.” (Cal. Code Regs., tit. 23, § 2200(a)(2).)

O-MBA20L7

- b. Linear excavation and fill activities affecting drainage features and shorelines (e.g., bank stabilization, revetment, and channelization projects), must not excavate or fill more than 400 linear feet of waters of the state, measured parallel to the streambank or shoreline, and
  - c. Dredging<sup>5</sup> activities must dredge not more than 50 cubic yards within waters of the state.
  - d. These size criteria apply to discharges, which could either permanently or temporarily affect the quality of waters of the state<sup>6</sup>.
  - e. These size criteria apply to complete projects and shall not be used to authorize “piecemealing” of larger discharges. In regulating recurring discharges, e.g., routine maintenance of sedimentation basins, forebays, or similar waters, these criteria shall be applied for each discharge episode.
4. For purposes of defining the size criteria specified in this section, determining fees as required by section II.B.3, and evaluating mitigation proposals as required by section II.B.4 of these General WDRs, the lateral extent of waters of the state shall be determined by the most expansive of the following:
- a. The federal criteria current on the date of adoption of these General WDRs<sup>7</sup>,
  - b. Headwaters, defined as intermittent and ephemeral drainages.
5. The discharge shall not directly or indirectly destabilize a channel or bed of a receiving water. In determining whether a discharge meets this criterion, the RWQCB Executive Officer<sup>8</sup> will consider potential project-induced changes to:

<sup>5</sup> “Dredging” refers to removing sediment in deeper water to increase the depth. Impacts to beneficial uses are best described by the volume of the discharge. It typically occurs to facilitate navigation and for aggregate extraction in marine waters.

<sup>6</sup> Fill or dredged discharges can *permanently* affect the quality of waters of the state when the discharged material will be in place indefinitely and/or by its nature precludes a reasonable assurance that beneficial uses will be fully reestablished. Examples include filling of wetlands or other waters, streambank hardening, channelization, construction of bridge piers and abutments, and ongoing vegetation removal and channel maintenance. Fill or dredged discharges can *temporarily* affect the quality of waters of the state when the discharged material will be in place for a limited time and/or there is a reasonable assurance that beneficial uses will be fully reestablished once the discharge ceases. Examples include temporary fills, excavation for temporary access roads, and one-time vegetation removal or excavation of sediment. Mitigation measures or management practices may be needed to assure that impacts are “temporary” (e.g., reestablishment of natural grade, revegetation, reestablishment of soil permeability to allow vegetative growth, compaction of backfill to assure that utility trenches do not dewater wetlands).

<sup>7</sup> 33 CFR 328.3(b)-(e), 33 CFR 328.4, 40 CFR 230.41.

<sup>8</sup> For multi-region projects, the SWRCB Executive Director. The terms Executive Officer or Executive Director as used herein include any designees.

O-MBA20L7

- a. Quantity, velocity, timing, and direction of flow;
  - b. Sediment characteristics;
  - c. Stream grade; and
  - d. Other relevant project-induced changes.
6. The discharge shall not cause in combination with other discharges a significant cumulative effect on water quality or beneficial uses of the waters of the State including, but not limited to, wetlands and headwaters.
7. The discharge shall not adversely impact, either directly or through habitat modification, any plants or animals identified as candidate, sensitive, or special status species in local or regional plans, policies or regulations; or by the California Department of Fish and Game (DFG), the U.S. Fish and Wildlife Service (USFWS), or the National Marine Fisheries Service (NMFS). The project shall not, substantially reduce the habitat of fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, or reduce the number of or restrict the range of an endangered, rare or threatened species.
8. The discharge shall not significantly conflict with any adopted and approved USFWS Habitat Conservation Plan (HCP) or DFG Natural Community Conservation Plan (NCCP).
9. The discharge shall not adversely impact a significant historical or archeological resource, shall not directly or indirectly destroy a unique paleontological resource or site or unique geologic feature, shall not disturb any human remains, and shall not eliminate important examples of the major periods of California history or prehistory.
10. The discharge shall not cause conflict with existing zoning for agricultural use or a Williamson Act contract.
11. The discharge, as mitigated, shall not cause significant adverse environmental impacts.
12. Discharges that would be exempt pursuant to section 404(f) of the CWA are waived from these WDRs. This waiver shall not affect a RWQCB’s authority to issue individual WDRs or waivers for such discharges if it deems it appropriate.

**B. APPLICATION REQUIREMENTS**

IT IS FURTHER ORDERED that dischargers seeking enrollment under these General WDRs shall submit the following to the appropriate RWQCB Executive Officer or, in the case of multi-Region projects, to the SWRCB Water Quality Certification Program Manager at least 45 days prior to any discharge:

1. A Notice of Intent (NOI) to be enrolled under and to comply with these General WDRs.
2. Any CEQA documents that have been prepared for the project.

## O-MBA20L7

3. A fee pursuant to Title 23, section 2200 of the CCR.

### 4. A Mitigation Plan:

The Mitigation Plan shall demonstrate that the discharger will sequentially avoid, minimize, and compensate for the adverse impacts to the affected water bodies' beneficial uses (as defined in the applicable Basin Plan). The Mitigation Plan shall address the following:

- a. Avoidance: No discharge shall be permitted if there is a practicable alternative<sup>9</sup> to the proposed discharge, which would have less adverse impact to the aquatic ecosystem, as long as the alternative does not have other significant adverse environmental consequences.
- b. Minimization: Unavoidable temporary impacts shall be mitigated by restoring water bodies and vegetation to pre-discharge conditions as quickly as practicable and by taking other practicable measures to reduce the severity and duration of such impacts.
- c. Compensatory mitigation: Discharges resulting in unavoidable permanent impacts to wetlands or headwaters shall ensure "no net loss" of area (acreage), functions, and beneficial use values by providing appropriate compensatory mitigation including creation, restoration, or (in exceptional cases) preservation. The RWQCB Executive Officer/SWRCB Executive Director will consider, at a minimum, the following when reviewing the adequacy of compensatory mitigation:
  - (1) Onsite habitat value
  - (2) Habitat connectivity value
  - (3) Floodwater retention value
  - (4) Pollutant removal value
  - (5) Ratio of area of proposed compensation to proposed loss
  - (6) Proposed revegetation and irrigation plans and success criteria
  - (7) Availability of suitable soils, hydrology, and natural vegetation at the compensation site
  - (8) Monitoring and reporting provisions
  - (9) Contingency plan for failure to achieve success criteria
  - (10) Any other information requested by the RWQCB or SWRCB.

The Mitigation Plan shall demonstrate that all potentially adverse environmental impacts have been mitigated to a less than significant level. The thoroughness of the alternatives analysis and the extent of the proposed mitigation shall be commensurate with the purpose of the discharge, the value and sensitivity of the receiving water(s), and the extent, severity, and duration of the effect on the quality of waters.

<sup>9</sup> An alternative is practicable if it is available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes. If it is otherwise a practicable alternative, an area not presently owned by the applicant which could reasonably be obtained, utilized, expanded, or managed in order to fulfil the basic purpose of the proposed activity may be considered (this definition is the same as presented in federal regulations at section 230.10(a)(2) of Title 33 of the CFR).

## O-MBA20L7

5. Any other additional information requested by the SWRCB or RWQCB to evaluate the proposed dredged or fill discharge.

A discharge shall not be enrolled under these General WDRs unless the RWQCB Executive Officer or SWRCB Executive Director finds that the Mitigation Plan meets the requirements of this section and the discharge meets all other eligibility criteria. The RWQCB Executive Officer or SWRCB Executive Director shall independently determine eligibility, including the adequacy of the Mitigation Plan, but may consider findings and requirements included in other agencies' permits.

### C. DISCHARGE REQUIREMENTS

IT IS FURTHER ORDERED that the discharger shall comply with the following:

#### Prohibitions:

1. The discharge of material is prohibited until the discharger has received a Notice of Applicability (NOA) from the RWQCB Executive Officer or the SWRCB Executive Director or until 45 days after submission of a complete and accurate NOI.<sup>10</sup> If the RWQCB Executive Officer or the SWRCB Executive Director has not issued a Notice of Exclusion (NOE) within 45 days of receiving a complete and accurate NOI, the discharge may proceed.
2. No discharges are authorized under these General WDRs if the discharger has received a NOE from the RWQCB Executive Officer or the SWRCB Executive Director.
3. The discharge shall not cause pollution, contamination, or nuisance as defined in Water Code section 13050.
4. The discharge of material in a manner other than as described in the NOI, the Findings or conditions of these General WDRs, or in the RWQCB Executive Officer or SWRCB Executive Director-approved Mitigation Plan is prohibited.
5. The discharge of substances in concentrations toxic to human, plant, animal, or aquatic life or that produce detrimental physiological responses therein, is prohibited.
6. The discharge of waste classified as "hazardous" or "designated" as defined in Title 22, section 66261 of the CCR, or Water Code section 13173 is prohibited.

#### Special Provisions:

7. The discharger shall discharge in a manner that is consistent with the information provided in the NOI.

<sup>10</sup> The RWQCB Executive Officer or the SWRCB Executive Director, within 30 days from submittal of the NOI, may find a submittal to be incomplete or inaccurate.

## O-MBA20L7

8. The discharger shall comply with the eligibility criteria for these General WDRs.
9. The discharger shall implement the approved Mitigation Plan.
10. Requested amendments to the approved Mitigation Plan must be submitted in writing to the RWQCB Executive Officer and, for multi-region projects, to the SWRCB Water Quality Certification Program Manager. The discharger may not modify operations until the discharger has received written notification that the RWQCB Executive Officer or SWRCB Executive Director has approved the amendment. If the RWQCB Executive Officer or the SWRCB Executive Director does not disapprove the requested amendment within 45 days of receiving the written notification, the changes to the approved Mitigation Plan may be implemented as described in the requested amendment.
11. If mitigation measures do not meet their interim or ultimate success criteria, the discharger shall implement remedial measures that are acceptable to the RWQCB Executive Officer or SWRCB Executive Director.
12. All compensatory mitigation areas shall be subject to a conservation easement, deed restriction, or other legal instrument, which shall ensure preservation of the mitigation in perpetuity. Documentation of the easement, restriction, or other legal instrument shall be submitted to the RWQCB, or to the SWRCB for multi-region projects, before any discharge authorized by these General WDRs occurs.
13. The discharger, if requested by the RWQCB or SWRCB, shall provide certification that supervisory and other responsible operations personnel have received training regarding these General WDRs.
14. Fueling, lubrication, maintenance, operation, and storage of vehicles and equipment shall not result in a discharge or a threatened discharge to water bodies. At no time shall the discharger use vehicles or equipment that leak any substance that might impact water quality. Staging and storage areas for vehicles and equipment shall be located outside of water bodies.
15. Except in compliance with the terms of an NOA for this order, no construction material, spoils, debris, or other substances associated with this project, that may adversely impact water quality, shall be located in a manner which may result in a discharge or threatened discharge to water bodies.
16. Upon completion of the project, the discharger shall complete a Notice of Termination (NOT) requesting to be un-enrolled from these General WDRs.

### Standard Provisions:

17. A copy of these General WDRs shall be kept at the project site for reference by project personnel. Personnel shall be familiar with its contents.

## O-MBA20L7

18. The discharger shall take all reasonable steps to prevent any discharge in violation of these General WDRs.
19. The discharger shall report promptly to the RWQCB or SWRCB any proposed material change in the character, location, area, and/or volume of the discharge. The discharger shall obtain confirmation from the RWQCB or SWRCB that such proposed modifications do not disqualify the discharger from coverage under these General WDRs. Confirmation or new WDRs shall be obtained before any modifications are implemented. If the RWQCB Executive Officer or the SWRCB Executive Director does not disapprove the proposed change within 45 days of receiving a written report describing the proposed change, the discharge may proceed in accordance with the proposed modifications.
20. These General WDRs do not convey any property rights or exclusive privileges. The requirements prescribed herein do not authorize the commission of any act causing injury to persons or property, do not protect the discharger from liability under federal, State, or local laws, and do not create a vested right to continue to discharge waste.
21. These General WDRs do not relieve the discharger from the responsibility to obtain other necessary local, State, and federal permits, nor do these General WDRs prevent imposition of additional standards, requirements, or conditions by any other regulatory agency.
22. The discharger shall allow the RWQCB or SWRCB, or an authorized representative, upon the presentation of credentials and other documents, as may be required by law, to do the following:
  - a. Enter upon the premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of these General WDRs,
  - b. Have access to and copy, at reasonable times, any records that must be kept under the conditions of these General WDRs,
  - c. Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under these General WDRs, and
  - d. Sample, photograph, and monitor at reasonable times, for the purpose of assuring compliance with these General WDRs.
23. After notice and opportunity for a hearing, coverage of an individual discharge under these General WDRs may be terminated or modified for cause, including, but not limited to, the following:
  - a. Violation of any term or condition of these General WDRs.
  - b. Obtaining these General WDRs by misrepresentation or failure to disclose all relevant facts.

O-MBA20L7

- c. A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.
- 24. The filing of a request by the discharger for an order modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any condition of these General WDRs.
- 25. Where the discharger becomes aware that it failed to submit any relevant facts in an NOI or submitted incorrect information in an NOI to the RWQCB or SWRCB, it shall promptly submit such facts or information.
- 26. The discharger shall furnish, within a reasonable time, any information the RWQCB or SWRCB may request to determine whether cause exists for modifying, revoking and reissuing, or terminating the discharger coverage under these General WDRs. The discharger shall also furnish to the RWQCB or SWRCB, upon request, copies of records required to be kept by these General WDRs.
- 27. The Water Code provides that any person failing or refusing to furnish technical or monitoring program reports, as required under these General WDRs, or falsifying any information provided in the monitoring reports, is subject to civil liability for each day in which the violation occurs.
- 28. The discharger shall take all reasonable steps to minimize or correct any adverse impact on the environment resulting from noncompliance with these General WDRs, including such accelerated or additional monitoring as may be necessary to determine the nature and impact of the noncompliance.
- 29. All reports, notices, or other documents required by these General WDRs or requested by the RWQCB or SWRCB shall be signed by a person described below or by a duly authorized representative of that person.
  - a. For a corporation: by a responsible corporate officer such as (1) a president, secretary, treasurer, or vice president of the corporation in charge of a principal business function; (2) any other person who performs similar policy or decision-making functions for the corporation; or (3) the manager of one or more manufacturing, production, or operating facilities if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures.
  - b. For a partnership or sole proprietorship: by a general partner or the proprietor.
  - c. For a municipality, State, federal, or other public agency: by either a principal executive officer or ranking elected official.
- 30. Any person signing a document under Provision II.C.29 shall make the following certification, whether written or implied:

O-MBA20L7

- "I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."
- 31. The discharger shall report any discharge of waste that may endanger public health or the environment. Any information shall be provided orally to the RWQCB within 24 hours from the time the discharger becomes aware of the occurrence. A written report shall also be submitted to the RWQCB Executive Officer within five (5) consecutive days of the time the discharger becomes aware of the occurrence. The written report shall contain (a) a description of the noncompliance and its cause; (b) the period of the noncompliance event, including dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and (c) steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.
  - 32. The discharger shall report all instances of noncompliance not reported under Provision II.C.31 within seven (7) consecutive days of the time the discharger becomes aware of the occurrence. The report shall contain any applicable information listed in Provision II.C.31.
  - 33. The discharger shall comply with all of the conditions of these General WDRs. Any noncompliance with these General WDRs constitutes a violation of the Water Code and is grounds for an enforcement action.
  - 34. The discharger must comply with all applicable Basin Plan provisions, including maintaining the protection of beneficial uses and complying with any prohibitions and water quality objectives governing the discharge. In the event of a conflict between the provisions of these General WDRs and the applicable Basin Plan, the more stringent provisions prevails.

O-MBA20L7

**CERTIFICATION**

The undersigned, Clerk to the Board, does hereby certify that the foregoing is a full, true, and correct copy of an order duly and regularly adopted at a meeting of the SWRCB held on May 4, 2004.

### V. Discharge Information

Subject	Notes
Name(s) and type(s) of receiving waters:	Receiving water types are: river/streambed, lake/reservoir, ocean/estuary/bay, riparian area, wetland
Eligibility of receiving water. Provide evidence that the water affected by this discharge is deemed to be out side of federal jurisdiction:	U.S. Army Corps of Engineers jurisdictional disclaimer letter, or explanation why such a disclaimer is not needed
Identify all regulatory agencies having jurisdiction over this project. Attach copies of all federal and State license/permit applications or issued copies of licenses/permits from government agencies:	For example: Dept. of Fish and Game Streambed Alteration Agreement, Coastal Commission permit
Proposed project start date:	Expected date of completion:

## O-MBA20L7

Project description:	For example: Discharge of riprap; discharge of fill; excavation for a utility line			
Purpose of the entire activity:	For example: Stream-bank erosion control; flood management; residential development			
Characterization of discharges:	What types of constituents will be discharged? Is the sediment contaminated?			
<b>Fill and Excavation Discharges:</b> For each water body type listed below indicate in ACRES the area of the proposed discharge to waters of the state, and identify the impacts(s) as permanent and/or temporary. For linear discharges to drainage features and shorelines, e.g., bank stabilization, revetment, and channelization projects, ALSO specify the length of the proposed discharge to waters of the state IN FEET. <sup>1</sup>				
Water Body Type	Permanent Impact		Temporary Impact	
	Acres	Linear Feet	Acres	Linear Feet
Wetland				
Streambed				
Lake/Reservoir				
Ocean/Estuary/Bay				
Riparian				
<b>Dredging Discharges:</b> Volume (cubic yards) of dredged material to be discharged into waters of the United States.				

<sup>1</sup> For guidance in determining the extent of impacted waters, see General WDRs, section II.A.4

O-MBA20L7

VI. California Environmental Quality Act

Will an environmental impact report or a negative declaration be adopted for this project or has one been adopted?

☐ YES ☐ NO

If yes, what is the current status of the environmental impact report or negative declaration?

- ☐ Not yet issued for public review.  
☐ In public review.  
☐ Adopted.

Name of lead agency \_\_\_\_\_

If an environmental impact report or a negative declaration is in public review or has been adopted, enclose the document with this NOI.

Will the discharge occur in, or in immediate proximity to, an area covered by a U.S. Fish and Wildlife Service (USFWS) Habitat Conservation Plan (HCP) or a Department of Fish and Game Natural Community Conservation Plan (NCCP)?

☐ YES ☐ NO

Will the discharge occur in, or in immediate proximity to, any habitat of a plant or animal species that has been classified by the Department of Fish and Game, the U.S. Fish and Wildlife Service, or the National Marine Fisheries Service as candidate, sensitive, endangered, rare, or threatened?

☐ YES ☐ NO

Will the discharge occur in, or in immediate proximity to, a significant historical or archeological resource, a unique paleontological resource or site, a unique geologic feature, or any human remains?

☐ YES ☐ NO

Will the discharge occur in, or in immediate proximity to, land under existing zoning for agricultural use or under a Williamson Act contract?

☐ YES ☐ NO

Will the discharge, as mitigated, cause any other significant adverse environmental impact?

☐ YES ☐ NO

**If you answered "yes" to any of the previous five questions, provide a detailed explanation demonstrating why the discharge is eligible to be enrolled under the General WDRs.**

VII. **Additional Submittals.** In accordance with provisions of State Water Resources Control Board (SWRCB) Water Quality Order No. 2004-0004 DWQ, please submit the following with this NOI to the appropriate Regional Water Quality Control Board or, for multi-Region projects, to the SWRCB.

- a. A fee pursuant to California Code of Regulations, Title 23 Section 2200.
- b. A Mitigation Plan, as described in the General WDRs.

VIII. CERTIFICATION

O-MBA20L7

EXHIBIT R

O-MBA20L7

STATE WATER RESOURCES CONTROL BOARD  
RESOLUTION NO. 2008-0026

DEVELOPMENT OF A POLICY TO PROTECT WETLANDS AND RIPARIAN AREAS  
IN ORDER TO RESTORE AND MAINTAIN THE WATER QUALITY AND BENEFICIAL USES  
OF THE WATERS OF THE STATE

WHEREAS:

1. Over 85 percent of historic wetland and riparian acreage in California has been lost according to published research estimates. Remaining resources continue to be vulnerable to future impacts from projected population growth, land development, sea level rise, and climate change in California.
2. Although physically occupying only a small percentage of California watersheds, wetlands and riparian areas provide valuable water quality functions such as flood control, pollutant filtration, water supply and replenishment, recreation, and habitat for a wide variety of plants and animals. Wetlands and riparian areas act to promote the health and existence of other vital natural resources, and provide significant economic benefits to California.
3. The value of wetlands and riparian areas has been recognized in California through the enactment of the California Wetlands Conservation Policy that sets a goal to "ensure no overall net loss and achieve a long-term net gain in the quantity, quality, and permanence of wetlands acreage and values in California in a manner that fosters creativity, stewardship, and respect for private property" (Executive Order W-59-93).
4. The State has relied primarily on requirements of the Federal Water Pollution Control Act (33 U.S.C. § 1251 et seq.) (Clean Water Act) to protect wetlands and riparian areas for water quality goals.
5. Recent U.S. Supreme Court rulings (*Solid Waste Agency of Northern Cook County v. U.S. Army Corps of Engineers*, 2001 and *Rapanos v. United States*, 2006) have reduced the jurisdiction of the Clean Water Act over wetland and riparian areas by limiting the definition of "waters of the United States." These decisions necessitate the use of California's independent authorities under the Porter-Cologne Water Quality Control Act (Wat. Code, § 13000 et seq.) to protect these vital resources.
6. In 2003, the State Water Resources Control Board (State Water Board) issued a report to the Legislature titled, *Regulatory Steps Needed to Protect and Conserve Wetlands Not Subject to the Clean Water Act (Supplemental Report of the 2002 Budget Act Item 3940-001-0001)*. This report reviewed the critical role that wetlands and riparian areas have in protecting the beneficial uses of waters throughout the State. Consistent with the State Water Board and Regional Water Quality Control Boards' (Regional Water Boards) (collectively California Water Boards) 2001 Watershed Management Initiative, this report further recognizes that a watershed-level approach is needed to protect wetlands and riparian areas and their associated water quality functions.

O-MBA20L7

7. In 2004, State Water Board staff initiated a Workplan upon the California Environmental Protection Agency's request (*Workplan: Filling the Gaps in Wetland Protection*) to address the waters of the State that are no longer protected under the Clean Water Act. This *Workplan* specified the need to adopt a State wetland definition to "provide a standard metric to help determine compensatory mitigation requirements and compliance with [the] 'no net loss' policy [Executive Order W-59-93]." In addition, the *Workplan* included developing a statewide policy for wetland protection "at least as protective as the federal requirements." To immediately address part of "the gap," the State Water Board adopted general waste discharge requirements for minor discharges to non-federal waters ([Water Quality Order 2004-0004 May 4, 2004](#)).
8. California continues to lose "functional wetlands" at an increasing rate despite the efforts of the State's 401 Water Quality Certification Program. This fact is documented in a State Water Board research study contracted with UCLA titled *An Evaluation of Compensatory Mitigation Projects Permitted Under Clean Water Act Section 401 by The California State Water Resources Control Board, 1991-2002*. The current implementation of the 401 Water Quality Certification Program does not adequately protect functional wetlands. Unfortunately, compliance with regulatory requirements has not resulted in resource protection. Clearly, there is a need for a strong statewide policy that provides both guidance on the protection and restoration of wetlands, as well as assessing and measuring net change in wetland functions. . The purpose of the proposed Policy is to ensure no further net loss and ultimate long-term gain in the quantity and quality of "functional" wetlands and riparian areas within the State. Successful implementation of the proposed Policy will be assessed via measurable environmental outcomes.
9. In 2007, State Water Board staff completed public scoping meetings on wetland and riparian area policy alternatives and considered comments received in accordance with the California Environmental Quality Act.

THEREFORE BE IT RESOLVED THAT:

1. The State Water Board recognizes the beneficial services of wetlands and riparian areas for people and wildlife in protecting and improving water quality, providing fish and wildlife habitat including unique plant communities (i.e., wetland and riparian vegetation), storing floodwaters, maintaining surface water flows in dry periods, and other valuable functions. California has a rich ecological diversity, therefore, the State Water Board further recognizes that watershed focused planning is the most effective strategy for maintaining and enhancing these functions.
2. The State Water Board will take action to ensure the protection of the vital beneficial services provided by wetlands and riparian areas through the development of a statewide policy to protect wetlands and riparian areas (Policy) that is watershed-based.
3. The Development Team, as defined below, will examine the environmental issues, evaluate the relevant alternatives, and make recommendations regarding the Policy. To ensure a comprehensive scope, the staff is directed to consider additional alternatives and recommendations other than those outlined in the 2004 *Workplan*.
4. In recognition that successful Policy implementation will require a supporting level of internal program infrastructure, major policy areas should be addressed in a step-wise fashion and implemented in phases to allow for commensurate program development. The Policy shall

O-MBA20L7

- support efforts to collect wetland data to monitor progress towards statewide wetland protection and to evaluate the level of program resources needed, including staffing, to undertake the next phases.
5. (a) The State Water Board staff is directed to develop the Policy using a collaborative process that involves the Regional Water Boards and bring that Policy to the State Water Board for consideration. A California Water Board development team (Development Team) will be formed for the Policy. The Development Team will consider and utilize relevant plans, policies, and technical documents already adopted or being developed by the Regional Water Boards, including the Stream and Wetland Systems Protection Policy Basin Plan Amendment being prepared by Regions 1 and 2.
  - (b) The Development Team will coordinate with other State and federal agencies and interested stakeholders to ensure a high degree of public involvement and agency coordination throughout the Policy development process.
  - (c) A charter will be developed by the Development Team defining the Development Team's purpose, responsibilities, goals and objectives, operating procedures, and timelines. The charter will identify the relationship of the Development Team to the water boards, other public agencies, and stakeholders. In July 2008, the Development Team will report back to the State Water Board on the proposed charter, before adoption by the Development Team.
  - (d) The State Water Board will review the Development Team's progress in July 2008, and periodically thereafter to provide oversight guidance as needed.
  - (e) The Policy, as well as the work of the Development Team, will inform and shape proposed Regional Basin Plan amendments. At a minimum for the proposed Regional Basin Plan amendments, this would include a review following the completion of the peer review process, and also a review within the public comment period prior to adoption hearings by the Regional Water Boards.
  6. The Development Team will develop the Policy in three phases:  
Phase 1 – establish a Policy to protect wetlands from dredge and fill activities. The Development Team is directed to develop and bring forward for State Water Board consideration: (a) a wetland definition that would reliably define the diverse array of California wetlands based on the United States Army Corps of Engineers' wetland delineation methods to the extent feasible, (b) a wetland regulatory mechanism based on the 404 (b)(1) guidelines (40 C.F.R. parts 230-233) that includes a watershed focus, and (c) an assessment method for collecting wetland data to monitor progress toward wetland protection and to evaluate program development.  
Phase 2 – expand the scope of the Policy to protect wetlands from all other activities impacting water quality. The Development Team is directed to develop and bring forward for State Water Board consideration: (a) new beneficial use definitions, (b) water quality objectives, and (c) a program of implementation to achieve the water quality objectives, as necessary, to protect wetland-related functions.

**O-MBA20L7**

Phase 3 – extend the Policy's protection to riparian areas. The Development Team is directed to develop, and bring forward for State Water Board consideration: (a) new beneficial use definitions, (b) water quality objectives, and (c) a program of implementation to achieve the water quality objectives, as necessary, to protect riparian area-related functions.

7. The Development Team will begin Phase 1 immediately with a target completion date of mid-2009. Work on Phases 2 and 3 will proceed in parallel or in sequence as appropriate and will follow in subsequent years. Phase 1 work products will include:
  - a. An overarching policy statement establishing the intent of the California Water Boards to protect all waters of the State using a watershed approach in coordination with the Regional Water Boards; other local, State, and federal agencies; and local watershed and stakeholder groups and forums;
  - b. A wetland definition that would reliably define the diverse array of California wetlands based on the United States Army Corps of Engineers' wetland delineation methods to the extent feasible;
  - c. A framework for protecting water quality and beneficial uses that relies on sequential avoidance, minimization, and mitigation of impacts; and,
  - d. Guidance on tracking wetland condition and function to monitor wetland protection and other required data to evaluate necessary program development resources.
8. At all phases, the Policy is intended to complement and support Region-specific plans and policies to protect the functionality of wetlands and riparian areas and should recognize the Regional Water Boards' essential role in implementing and informing statewide policy.

**CERTIFICATION**

The undersigned Clerk to the Board does hereby certify that the foregoing is a full, true, and correct copy of a resolution duly and regularly adopted at a meeting of the State Water Resources Control Board held on April 15, 2008.

O-MBA20L7

2 November 2015

Mr. Tom Lippe, Esq.  
Law Offices of Thomas N. Lippe APC  
201 Mission Street, 12th Floor  
San Francisco, CA 94105

Project: Warriors Event Center in Mission Bay  
FHA # 648-02

Dear Mr. Lippe,

You requested that I review the analysis of this Project's noise impacts in the Responses to Comments on the Draft Subsequent EIR dated 5 June 2015, Chapters 12 & 13. This letter report summarizes my comments and responds to your specific questions.

**Does the DSEIR use a reliable methodology to determine the significance of Impact NO-1 and Impact NO-5?**

Impact NO-1 is "Construction of the proposed project would not cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project. (Less than Significant)." (DSEIR, pp. 5.3-20 to 5.3-23.)

Impact NO-5 is "Operation of the proposed project would cause a substantial permanent increase in ambient noise levels in the project vicinity. (Significant and Unavoidable with Mitigation)." (DSEIR, pp. 5.3-32 to 5.3-39.)

Frank Hubach Associates, Inc 4905 Central Ave, Ste 100

O-MBA20L7

Warriors Event Center in Mission Bay  
Noise Impact  
2 November 2015

In my opinion the DSEIR does not use a reliable methodology to determine whether Impact NO-1 or NO-5 is significant.

For Impact NO-1 and Impact NO-5, the DSEIR uses a threshold of significance of the "ambient plus increment" type. For Impact No-1, the "ambient plus increment" threshold of significance is whether the "the increase in noise levels over existing conditions would be less than 10 dBA." (DSEIR, p. 5.3-23.)

This type of threshold discounts the significance or severity of pre-existing noise levels and treats them as if they are irrelevant to whether the incremental change caused by the Project is "significant." Refer to additional detailed information in my 22 July 2015 report.

**12.2.1 Generator Relocation**

*"Because the generators would no longer be in a sub-grade location with the project refinements, the potential noise impacts of the routine generator maintenance operations at the at- or above-grade locations were assessed quantitatively, as described below." (pg 12-2)*

The generator relocation does not specifically address (in terms of decibels) the potential impact to pedestrians, bicyclists or motorists when in close proximity to the generators. Only the two large 150 kW generators are fitted with noise control treatments which will have some localized benefit. This is potentially significant impact.

**12.2.3 Transportation Improvements**

*"Similarly, the temporary impacts of construction noise would be limited to standard construction equipment such as a backhoe and jackhammer, which would not be expected to result in a significant construction noise impact, as these equipment types comply with the construction noise limits of the Sections 2907(a) and (b) of the Police Code, as discussed on page 5.3-14 of the SEIR and would occur in an area with elevated ambient background noise based on modeled baseline traffic volumes derived from the San Francisco County Transportation Authority travel demand model." (pg 12-11)*

This work along King Street has an unspecified noise impact that is in my opinion potentially significant.

[LC-NOI-1]

51  
[LC-NOI-2]

O-MBA20L7

Warriors Event Center in Mission Bay  
Noise Impact  
2 November 2015

#### 12.3.2 Other Construction Refinements

*"Refinements to the proposed construction techniques that were described in the Draft SEIR include: addition of on-site soil treatment, possible use of dewatering pump generators, and removal of rapid impact compaction equipment."* (pg 12-16)

The dewatering pump generators added do not specifically address (in terms of decibels) the potential impact to pedestrians, bicyclists or motorists when in close proximity to the generators. This is potentially significant impact.

*"The pug mill would be enclosed within a large canvas tent to control dust and noise generated by the plant."* (pg 12-17)

It is unlikely the tent will attenuate any pug mill noise. This is potentially significant impact.

#### 12.4 Muni UCSF/Mission Bay Station Variant

*"Assuming use of a backhoe, jack hammer and truck crane, construction activities for the demolition of the existing northbound platform would generate noise levels of 79.4 dBA, Leq at the nearest receptor (Hearst Tower), 75 feet away, which would result in a less than 10 dBA increase over existing ambient noise levels of 71.2 dBA, Leq."* (pg 12-28)

This is an 8.2 dB increase above ambient and in my opinion significant.

Using these "ambient plus increment" thresholds where existing noise levels are already too high, as shown in Tables 5.3-9 and 5.3-10 (DSEIR, pp. 5.3-34, 36), disregards the fact that the Project will make already severe conditions worse. In addition, using these "ambient plus increment" thresholds for operational noise results in an unsustainable gradual increase in ambient noise. It is a formula for ever-increasing noise levels because each new project establishes a new, higher, baseline; then when the next project is approved, the incremental change will be added to the new baseline.

Therefore, the operational impact assessment needs to be redone using valid, science-based thresholds that relate to actual human health and welfare effects of noise.

Subject: Re: Comments on Final SEIR re Warriors Arena Project

Dear Ms Bohee and Mr. Bollinger:

Attached hereto is Exhibit F (a report by Dan Smith) to my November 2, 2015, comment letter on the Final Environmental Impact Report (FSEIR) and Responses to Comments (RTC) for this Project delivered by email earlier this morning.

Also, please consider this email a comment on the process the OCII has chosen to follow for purposes of certifying the FSEIR.

The OCII's EIR preparation team includes 48 people, including 15 from several City departments and another 33 from six different consulting firms. (DSEIR, p. 9-1.) OCII's team spent 3 months preparing responses to comments and conducting new environmental analysis for changes to the Project, including a new Project Variant, ultimately publishing 2,624 pages of new analysis and data.

Yet the OCII gave the public only 11 days to review the FSEIR/RTC before meeting to certify it. Then, the October 23, 2015, notice of publication of the Response to Comments informed the public they would have no opportunity to comment on the FSEIR/RTC. But the OCII hearing agenda for November 3, 2015 published on October 29, 2015, reversed course and suggested that public comment on the FSEIR/RTC would be heard at the hearing.

As a result, the Mission Bay Alliance's legal team, with its consultants, has not had adequate time to review and comment on the FSEIR/RTC, depriving the Alliance of a fair trial on the Project approvals, including certification of the SEIR, per Code of Civil Procedure section 1094.5(b).

Moreover, the Mission Bay Alliance's legal team has submitted and will submit a large volume of new comments for consideration by the Commission. Since the members of the Commission cannot be expected to review this volume of new information before the close of today's hearing, the Alliance requests that Commission continue the hearing for at least three weeks to: (1) provide a fair trial on the Project approvals, (2) allow the Alliance to complete its review and comment on the FSEIR/RTC, and (3) allow the Commission to review the comments submitted for today's hearing.

Finally, I note that the vast majority of the volume of documents submitted for today's hearing consists of the documentary history of the City's violations of its NPDES permits (see Exhibit M). This submission reflects the fact that my July 24, 2015 comment letter regarding hydrology, water quality and biological impacts observed that the DSEIR's heavy reliance on City compliance with its NPDES permit to ensure the Project's combined stormwater and sewage impacts are less than significant is an unsupported assumption. My previous comment requested that the City support this assumption with evidence. The RTC fails to do so. Therefore, the Alliance gathered that evidence (contained in Exhibit M), and it shows the City has a continuous pattern of violating its NPDES permits.

Subject: Comments on the Final Subsequent EIR  
Warriors Event Center & Mixed Use Development

Dear Director Bohee and Mr. Bollinger:

The Mission Bay Alliance is concerned about many ongoing defects in the CEQA process for the proposed Warriors Event Center. These include violations of CEQA's procedural mandates, material inadequacies of the Subsequent EIR, and OCII's unsupported substantive findings. In the minimal 11-day time frame allotted for public review of the new and voluminous OCII CEQA documents, including the Final SEIR, technical reports, and proposed findings, my co-counsel and I have done our best to bring these issues to the attention of the Commission on behalf of the Alliance.

1  
[LC-ERP-1]

**1. The Final SEIR Must Be Certified by the Planning Commission**

Approval of a CEQA document must comply with local ordinances as well as with California environmental law. (*E.g., Citizens for the Restoration of L Street v. City of Fresno* (2014) 229 Cal.App.4th 340.) While OCII is a separate legal entity with discrete responsibilities under redevelopment law, it is under the legislative control of the Board of Supervisors per state statutes and local ordinances. For CEQA purposes, OCII's duties align with those of the City of San Francisco. The Planning Department was thus identified as a co-lead agency in the CEQA process for the 1998 Mission Bay South Redevelopment Plan.

2  
[LC-ERP-5]

CEQA is a process-driven statute that must be followed to the letter. The Event Center's Subsequent EIR reflects its preparation by the City Planning Department and the City will consider many of the Event Center's required approvals. If the current SEIR is certified, the Board of Supervisors will decide administrative appeals of its inadequacy as the elected decision-making body. The Planning Code requires initial consideration of the certification of the Final SEIR to be conducted by the San Francisco Planning Commission, and that must happen before its consideration by OCII. The current process violates CEQA.

O-MBA22B4

Warriors Event Center Final EIR and Approval  
November 3, 2015  
Page 2 of 4

**2. The Final SEIR Responses to Comments is Inadequate**

Every lead agency is required to provide a "good faith, reasoned analysis" in responses to comments on the EIR; "[c]onclusory statements unsupported by factual information will not suffice." (Guidelines, § 15088, subd.(b); see *Laurel Heights Improvement Association. v. Regents of the University of California* (1993) 6 Cal.4th 1112, p. 1124.) When a comment raises a significant environmental issue, the EIR must respond in detail, providing reasons why the comment was not accepted.

3  
[LC-ERP-1]

*Sutter Sensible Planning, Inc. v. Board of Supervisors* (1981) 122 Cal.App.3d 813 explains that detailed EIR responses "insure the integrity of the process of decision by precluding stubborn problems or serious criticism from being swept under the rug." (*Id.*, p. 820.) *Flanders Foundation v. City of Carmel-by-the Sea* (2012) 202 Cal.App.4th 603 ordered issuance of a writ when an EIR failed to respond to a comment proposing a reduced-size parcel for an environmentally damaging project. (*Id.*, pp. 616-617.)

**a. Land Use.** The Alliance submitted a letter from the undersigned counsel on November 2, 2015, reiterating in detail how the proposed Event Center's sports arena is not consistent with any of the principal or secondary uses allowed by the Mission Bay South Redevelopment Plan, including the secondary uses now being invoked by OCII for the first time in the Final SEIR. That letter is here incorporated by reference. The Draft SEIR did not address land use issues because the Initial Study and Notice of Preparation posited that all of the uses proposed by the Event Center were encompassed within the 'Nighttime Entertainment' secondary use that had been analyzed in the 1998 Mission Bay EIR.

4  
[LC-PP-1]

That EIR's refusal to analyze the project's land use inconsistencies has not been cured by the Responses to Comments, which now fails and/or inaccurately responds to the Alliance's DSEIR comments about secondary use categories, the Event Center's conflicts with Mission Bay South design criteria, including Vara Blocks, and impacts to community character. The inadequate Responses to Comments as to these land use inconsistencies constitutes a separate ground of legal error.

The SEIR should be revised and recirculated after amendment of the Mission Bay South Redevelopment Plan to provide for a consistent principal or secondary use.

**b. Alternatives.** The Alliance commented on the SEIR's inadequate analysis of the 'no project' alternative and failure to include a potentially-feasible off-site alternative. Following the SEIR comment period, the Alliance informed OCII that it had located a

5  
[LC-ALT-1]

# O-MBA22B4

Warriors Event Center Final EIR and Approval  
November 3, 2015  
Page 3 of 4

feasible off-site alternative that met project objectives and reduced impacts, and requested its consideration. This should still happen, and the site at Pier 80 should be considered in a revised and recirculated EIR.

In response, the Final SEIR offers rote statements like "CEQA does not require analysis of 'every imaginable alternative' but rather it gives agencies the flexibility to eliminate certain alternatives that either do not reduce environmental impacts or do not further the project's main objectives." The Alliance agrees, but the statement neither addresses nor cures this particular EIR's failure to analyze the 'no project' alternative or a potentially-feasible off-site location.

As to the 'no project' alternative, the Alliance finds the Responses to Comments again inadequate. Among other things, the responses both dismiss and acknowledge that the UCSF-owned Block 33 is eligible for a tower. That opportunity remains relevant to the discussion as it impacts the extent of reasonably foreseeable development at the Event Center project site if the project does not proceed. The EIR responses also continue to overestimate the traffic impacts of 'no project' by speculative assumptions as to the parking likely to be provided by developers for proposed retail uses.

The EIR's refusal to consider a potentially-feasible off-site alternative violates CEQA, which repeatedly confirms that consideration of alternatives is the key to reducing project impacts while accomplishing objectives. The SEIR responses to this issue treat CEQA like a game, tangentially acknowledging that the initial site at Piers 30-32 was too expensive and would require a public vote for a site so unpopular that the Warriors abandoned it, but then repeating over and over that the site is at least "potentially feasible for purposes of this SEIR." (Responses, 13.24-8.) In other words, the rejected site is not feasible in the real world, but can somehow be considered adequate to comply with CEQA under the substantial evidence standard of review. Not so, both as to the site and standard of review. The infeasibility of the site is reflected in the CEQA findings that dismiss it, citing its uncertain approval and significantly more severe impacts than the Mission Bay project.

**c. Cultural Resources.** In response to the Alliance's references to new information regarding archaeological impacts and inadequate studies, the SEIR provides a conclusory reference to new archaeological study in October 2015 that resolves concerns. As with the other new studies provided within the 11-day review period for the SEIR Responses to Comments, the public has not had sufficient opportunity to review the technical information. Further, the Responses to Comments is insufficient as an informational document because it fails to provide analysis regarding its conclusory

# O-MBA22B4

Warriors Event Center Final EIR and Approval  
November 3, 2015  
Page 4 of 4

dismissal of archaeological concerns based on the referenced new studies. There is thus insufficient basis for findings that archaeological impacts are infeasible.

## 3. The Proposed Findings on Alternatives are Inadequate

The SEIR does not analyze the alternate site proposed by the Alliance near Pier 80, nor circulate that analysis for public comment and so has no basis to make conclusory findings rejecting the alternative. The reasons provided in OCII's proposed findings are unsupported and inadequate. The site is three times as large as would be required for the Event Center project and need not utilize any of the City-owned property nor any particular configuration of the privately-owned lots should there be an unwilling seller. There is no evidence provided that the site could not be acquired within a reasonable time period.

Further, case law confirms that potential zoning adjustments are not grounds for infeasibility, as they are within the City's power. It is self-evident that the claimed limits to transportation services under current schedules are easily remedied, and the findings do not provide any studies to back up conclusory statements regarding traffic, air quality, hydrology, or water quality impacts. Again, since only a third of the site is needed to accommodate the event center, all of the impacts (if shown to have concern after sufficient technical review) can be avoided or mitigated. As stated above and in the Alliance letter proposing this site for consideration as an alternative, the EIR is inadequate for failing to consider an off-site alternative and must be revised and recirculated to do so before any findings of infeasibility can be made. The site near Pier 80 is suggested by the Alliance as potentially feasible and deserving of study.

Thank you for your attention.

Sincerely yours,  
  
Susan Brandt-Hawley

**SENT VIA EMAIL (MTABoard@sfmta.com)**

Tom Nolan, Chairman  
San Francisco Municipal Transportation Agency  
Board of Directors  
1 South Van Ness Avenue, 7th Floor  
San Francisco, CA 94103

**RE: Comments on November 3, 2015 Agenda Item No. 13 re: Warriors  
Event Center and Mixed-Use Development Project at Mission Bay  
Blocks 29-32**

Dear Chairman Nolan and Members of the Board:

This firm represents the Mission Bay Alliance (the "Alliance") with respect to the Warriors Event Center Project ("Project"). These comments address the Final Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("FSEIR") as well as the SFMTA's consideration and approval of the Project itself.

The Project's FSEIR is defective as an informational document with respect to the analysis and public disclosure of impacts and mitigation measures regarding transportation. Impermissibly buried within the "project description" are *de facto* mitigation measures for the Project's transportation impacts. These mitigation measures include both one-time capital improvements and ongoing expenditures as set forth in the Transportation Management Plan ("TMP") and Transit Service Plan ("TSP"). The City's strategy of conflating analysis of the Project's design features and mitigation measures violates CEQA. (See, e.g., *Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645.) The prejudice associated with the City's strategy, other than simply obscuring the City's massive public subsidy for the Project, is that the EIR "fail[s] to consider whether other possible mitigation measures would be more effective." (*Id.* at 657.)

The City also appears to rely on the incorporation of these plans into the project description in order to conceal from the public the City's failure to require full mitigation of the Project's impacts from the applicant. It is a bedrock principle of the California Environmental Quality Act (Pub. Resources Code, §§ 21000 et seq. ("CEQA"), 21002; see also CEQA Guidelines, § 15126.4) that development projects should mitigate their

1  
[LC-PD-1]

Tom Nolan  
SFMTA, Board of Directors  
November 3, 2015  
Page 2 of 4

O-MBA23S7

environmental impacts to the extent feasible. With respect to the Project's transportation impacts, however, the City deviates from this principle and instead adopts an odd, *ad hoc* "fair share" fee program to supposedly mitigate project-level impacts. (*Anderson First Coalition v. City of Anderson* (2005) 130 Cal.App.4th 1173 (*Anderson First*).) As a threshold matter, the SEIR never clearly discloses to the public that it essentially relies upon "fair share" payments from the Project in order to mitigate its project-level transportation impacts, which renders the SEIR defective as an informational document. Had the SEIR done so, it would have been apparent that the SEIR failed to disclose necessary information about this fair share program.

The payment of a "fair share" impact fees may constitute adequate mitigation if they "are part of a reasonable plan of actual mitigation that the relevant agency commits itself to implementing." (*Id.* at 1188-89.) The *Anderson First* decision identified the information that is required in an EIR to establish the adequacy of a "fair share" mitigation measure, which includes the following:

- (i) An identification of the required improvement;
- (ii) An estimate of the cost of the required improvement;
- (iii) Sufficient information to determine how much the project would pay towards the improvement; and
- (iv) The fees must be part of a reasonable, enforceable plan or program sufficiently tied to the actual mitigation of the impacts at issue.

(*Ibid.*)

The SEIR fails to provide this necessary information. While the SEIR mentions the TMP and TSP as addressing the Project's transportation impacts, the SEIR fails to identify the total costs of the improvements, the Project's allocated contribution, and the enforceable plan or program to contribute the Project's "fair share."

Although not included in the Project's CEQA documentation, some of this necessary information is contained in the Event Center Expenditure Plan, which the SFMTA is scheduled to review and approve on November 3, 2015 ("Expenditure Plan"). (See Enclosure 3 to Staff Report.) The Expenditure Plan reveals the legal deficiencies in the City's mitigation strategy for the Project's transportation impacts. Considering only one-time "capital uses" and "capital uses allocation to project," (i.e., excluding ongoing costs to mitigate the Project's transportation impacts), it reveals that the total cost of these improvements is \$64,663,474, and the Project's fair share allocation is \$61,898,909. Of the amount "allocated" to the Project, however, only \$27,390,335 will actually be paid by the project applicant, over the course of several years with the City fronting the funds for the improvements from the General Fund. Thus, the Project is contributing less than 50

1  
[LC-PD-1]  
cont.

O-MBA23S7

Tom Nolan  
SFMTA, Board of Directors  
November 3, 2015  
Page 3 of 4

percent of its allocated fair share contribution that is necessary to mitigate the Project's transportation impacts. To make matters worse, only \$19,434,536 is coming from an existing and enforceable impact fee program. The balance of the project applicant's contribution, approximately \$7,955,799, is the result of the City's planned redirection of General Fund revenues.

In other words, rather than simply require the project applicant to be responsible for the capital improvements needed to mitigate its project-level impacts, the City establishes a fair share fee program and then does not even require the applicant to pay the fair share fee – instead voluntarily giving up General Fund revenues that are intended to support other Citywide programs and services. By cloaking this deficient mitigation strategy as a design feature of the Project, the City never engages in a meaningful analysis of potentially feasible mitigation measures involving the project applicant actually mitigating these project-level impacts.

A similar deficiency applies to the Project's ongoing costs to mitigate its project-level transportation impacts. Total ongoing annual costs to mitigate the Project's transportation impacts are estimated at \$8,209,318 in FY18-18. Of this amount, \$2,773,110 in revenue is not paid from an enforceable impact fee program but rather redirected from the General Fund. What more, significant additional City revenues, which are not even generated by the Project but rather "allocated" to the Project from sources such as off-site parking and hotel tax, will be re-allocated to pay for the Project's ongoing mitigation for project-level transportation impacts. These reallocations of General Fund revenues cannot constitute an enforceable plan that is subject to future discretionary actions by the Board of Supervisors. Even the anticipated future adoption of the Mission Bay Transportation Improvement Fund ordinance is inadequate to ensure future reallocations of General Fund revenues because action by ordinance is cannot bind future Boards. (*McMahan v. City and County of San Francisco* (2005) 127 Cal.App.4th 1368.)

In short, the City fails without explanation to require the applicant to bear responsibility for fully mitigating its own project-level impacts. Instead, the City is setting up a flawed *de facto* fair share fee program to pay for this project-level mitigation, and redirecting revenues generated by the Project and elsewhere to cover the funding gap for these mitigation measures. This deficiency is nowhere disclosed to the public in the SEIR. The City may not rely on the preparation of various "plans" as a smokescreen to conceal from the public the Project's failure to mitigate its own project-level impacts and massive public subsidy needed to make up for that deficiency. The SEIR is misleading, and fails as an informational document with respect to mitigation for transportation impacts.

The City's action to mitigate the Project's transportation impacts is also an undisclosed public subsidy that triggers substantive and procedural mandates by the City

1  
[LC-PD-1]  
cont.

O-MBA23S7

Tom Nolan  
SFMTA, Board of Directors  
November 3, 2015  
Page 4 of 4

before committing to such subsidy. The attached report by Dr. Jon Haveman explains that the redirection of General Fund and other revenues to mitigate the Project's impacts represents a loss of revenue to the City (see Exhibit 1), which in turn constitutes a public subsidy under California law. More specifically, these subsidies include committing to direct General Fund revenues to pay for light rail cars, construction of transportation improvements, public safety and traffic officers, etc., "allocating" parking/hotel tax revenues from other properties to pay these expenses.

Because the TMP and TSP are built into the project description, the City's approval of the Project commits the City to the subsidy as set forth in these plans, which is further reinforced by the City's approval of the Expenditure Plan. California law requires that the City must provide public notice and a public hearing, as well as detailed information about the purpose, nature, extent and effect of such subsidy, prior to making such a commitment. The City has failed to comply with these substantive and procedural mandates prior to approving this public subsidy for the Project.

O-MBA23S7

## Executive Summary

In order for the Golden State Warriors (GSW) to move to San Francisco, the City must make significant infrastructure investments in transit and commit to providing over \$6 million in support each year that the new arena operates. Although estimates of the costs to the City and estimates of City revenues exist, a cash flow analysis of this project has not been produced. Nor has the project been subject to a comparison with plausible alternatives. With a project of this magnitude and with the significant external costs imposed on San Francisco, it is deserving of such an analysis.

This report provides both a cash flow analysis of the arena development and a comparison with a plausible alternative. It also provides a discussion of some of the assumed revenues associated with the project. In particular, the assumptions regarding hotel/motel tax revenues and parking taxes are optimistic. The reality could be millions of dollars less than expected.

Although the cash flow analysis suggests that the project will turn a surplus of revenue in the fourth year of arena operations, a comparison with an alternative development suggests that from a financial perspective the City could do much better. If a biotech facility were constructed in place of the arena, it is possible that City revenues over the course of 22 years (two years of construction and 20 years of operation) could be more than \$39.9 million higher in net present discounted value terms, or \$1.8 million per year over 22 years. This comparison is with a conservative investment. With a more aggressive development option, the net present discounted value of revenues could be as much as \$150 million higher, or nearly \$7 million per year.

It is worth noting that the effective subsidy provided by the City of San Francisco to provide transit infrastructure and traffic mediation amounts to roughly \$150 million over the same 22 years, again in present discounted value terms. Were this subsidy not necessary, the Warriors development project would have a revenue impact to the City comparable to that of the more aggressive development option. Unfortunately, the Warriors development project requires the extensive subsidy while a biotechnology center would not. The biotechnology center, whether using conservative or aggressive assumptions, provides greater net revenues to the City of San Francisco than does the development including the Arena, by between \$1.8 and \$7 million per year.

These figures can be thought of as the amount that San Franciscans are paying to bring the Warriors to town. It is the amount of revenues that the City would forgo with the GSW project, relative to a plausible alternative. This is not to say that the project is a bad idea, but merely to point out what is being given up in order to accommodate the Warriors' move.

## O-MBA23S7

### Key Findings

1. A cash flow analysis of the arena through the first twenty years of operation suggests net revenues for San Francisco of \$96 million. This is net of City expenses of approximately \$150 million during this time for transit and traffic mitigation.
2. This \$150 million of City spending in support of the Arena represents an implicit subsidy to the project. The City is funding transit infrastructure and the mitigation of traffic and transportation issues related to the functioning of the arena.
3. Although the Arena generates significant revenues for San Francisco, the City's costs will exceed its revenues from the development for at least the first three years of Arena operation, putting the taxpayers on the hook for the difference.
4. There are elements of the estimates of City revenues that are filled with uncertainty. In particular, the hotel/motel and parking revenues are highly speculative. This uncertainty may imply a broader burden for City taxpayers.
5. If hotel/motel revenues are overstated by half, which is possible, that would reduce City revenues by \$13.2 million in the first 20 years of Arena operation.
6. If an alternative development, one suited to biotechnology, were pursued, the City's net revenues would be nearly \$40 million higher and possibly as much as \$150 million higher over 22 years, or \$7 million per year.
7. An alternative development would have considerably larger economic impacts for the rest of the San Francisco Economy than would an arena, and would generate significantly more jobs, more than 2,000 on-site. Oracle Arena currently generates just 494 jobs.
8. An alternative development would generate as much as \$1 billion in direct economic activity on-site and perhaps as much as an additional \$1 billion in ancillary benefits to the broader San Francisco economy.
9. Forgoing the biotechnology development and pursuing the Arena reduces net revenues to the City of San Francisco by \$2 to \$7 million per year.

## O-MBA23S7

### 1: Introduction

In 2017, the Golden State Warriors are expected to begin playing in San Francisco. Although this is an exciting development for the City of San Francisco, the economics of the Warriors presence in the City are unclear. There are likely to be significant revenue benefits for the City, but welcoming the Warriors will also involve significant infrastructure investments and ongoing expenses for the City and County of San Francisco. The net effects of these revenues and costs have not been adequately addressed.<sup>1</sup>

It is not clear whether San Francisco is importing a lucrative asset or a financial burden; that is, it is not clear whether the revenues associated with the Warriors play in San Francisco exceed the considerable upfront investments that the City must make. It is also an open question as to what exactly the City might be giving up in order to host the Warriors. The 12-acre parcel on which the arena is to be built is a valuable piece of real estate. In 2010, Salesforce paid \$278 million for a 14-acre site that includes the property in question. The property, located as it is across the street from UCSF and near a variety of biotech companies, seems a likely candidate for a biotech friendly building.<sup>2</sup> Were this to happen, it would yield significant benefits for the City. Whether or not these financial benefits exceed those associated with the Warriors is the subject of this report.

The report proceeds to review the costs and benefits associated with the Warriors, as they have been made public. This is followed by an estimate of the likely benefits of a biotech development occupying the same space. The benefits of the GSW plan are then examined from a perspective of robustness, whether or not they are likely to come to pass.

This report provides a cash flow analysis of the GSW project and compares that analysis with an alternative development that includes a biotechnology-oriented commercial structure in place of the arena. The GSW project is cash flow positive, but not until at least the fourth year of operations. Relative to the alternative development, even after 20 years of operating, the GSW project falls short in terms of net government revenues by approximately \$39.9 million, or \$1.8 million per year over 22 years. Alternative developments, with more aggressive assumptions, though still plausible, suggest that City revenues could increase by as much as \$151.6 million after 22 years, or \$6.9 million per year, without the need for heavy subsidization on the part of the City in the early years. From a purely financial perspective, the GSW project is a significant drain on City revenues relative to what alternative developments might yield.<sup>3</sup>

<sup>1</sup>Accepting the team also results in a significant revenue hole for the City of Oakland in that most events that currently take place at Oracle Arena are projected to move to the new arena.

<sup>2</sup>Its neighbors would include UCSF, Celgene Corporation, National Multiple Sclerosis Society, venBio, Nurix, Clovis Oncology, FibroGen, and Illumina, among others.

<sup>3</sup>The methodology used in this report is comparable to the methods and assumptions used by EPS in producing its fiscal impact analysis of the GSW arena. The Appendix provides a set of tables that indicate where common assumptions are used.

## O-MBA23S7

### 2: Benefits and Costs of Hosting the Warriors

#### — Benefits/Revenues

As with any economic activity, there are certainly financial benefits for the City of San Francisco associated with hosting the Warriors. A report has been produced for the City of San Francisco that provides a fiscal analysis of the GSW project.<sup>4</sup> These benefits are derived from one-time revenues from the purchase of the land and arena construction and ongoing benefits associated with the events that the stadium hosts. The ongoing benefits also include revenues from commercial and retail activity built into the project, as well as parking revenues both on-site and off-site and off-site hotel and motel taxes. Table 1 provides a summary of an estimate of those benefits. Annually, stadium, retail, and office operations associated with the development are estimated to provide just over \$14.1 million in revenues to the City of San Francisco.

**Table 1. Summary of San Francisco Revenues from Ongoing Stadium Operations**  
(Thousands of 2014 dollars)

Annual Project-Generated Revenues	General Fund Revenues	Dedicated and Restricted Accounts	All Accounts
Revenues From on-Site Businesses	\$9,626 (84%)	\$1,883 (73%)	\$11,509 (82%)
Revenues From off-Site Hotels and Parking	\$1,887 (16%)	\$714 (27%)	\$2,601 (18%)
<b>Total Annual Project-Generated Revenues</b>	<b>\$11,513 (100%)</b>	<b>\$2,597 (100%)</b>	<b>\$14,110 (100%)</b>

Source: EPS and Keyser Marston Associates

Of these \$14.1 million in revenues, \$11.5 million are associated with the arena and on-site businesses. Although the majority of these revenues accrue to the general fund (\$9.6 million), nearly \$2 million goes directly to dedicated and restricted accounts. At the same time, nearly \$2.6 million are estimated to be from off-site sources, \$714 thousand of which are destined for dedicated and restricted accounts.

Table 2 provides estimates of detailed categories of revenues associated with ongoing economic activity once the development is completed. The largest categories of revenue include the stadium admission tax (\$4.3 million), gross receipts taxes (\$2.5 million) property taxes (\$2.5 million), including both general fund and MTA revenues), hotel/motel or transient occupancy taxes (\$1.7 million), and parking taxes (\$2.4 million). These five categories account for the vast majority of revenues associated with the development.

As mentioned, there will also be one-time revenues associated with the construction of the arena and the accompanying office and retail space (Table 3). These benefits amount to just over \$27.6 million, the vast majority of which is associated with the TIDF, or Transportation Impact Development

<sup>4</sup>Economic Planning Systems, *San Francisco Multi-Purpose Venue Project - Fiscal Impact Analysis: Revenues*, 9/25/15. (EPS)

Item	Difference
<b>City Fees</b> (per gross building sq. ft.)	
Child Care	\$662,000
Transit Impact Development Fee	\$17,436,000
<b>Other One-Time Revenues</b>	
Sales Taxes During Construction	\$2,355,000
Gross Receipts Tax During Construction	\$2,953,000
Property Transfer Tax from Initial Land Sale	\$4,200,000
<b>Total One-Time Revenues</b>	\$27,605,000

Source: EPS, 9/25/15, Table 2. Revised by Marin Economic Consulting to reflect changes in Table A-6 of the EPS report.

### — Costs

As with the benefits, there are also one-time and ongoing costs. The one-time costs are primarily those associated with enhancing transportation infrastructure and amount to \$55.3 million.<sup>6</sup> These costs include Transit Investments (the purchase of light rail vehicles), the installation of crossovers, the construction of a new center boarding platform, power augments to idling event trains, traffic/signals engineering investments, and a Mariposa Street restriping study.

These expenses are spread out over a four-year period, with the vast majority of expenses occurring in the 2016-17 MTA fiscal year. A major expenditure on light rail vehicles is slated to take place in the 2017-18 FY, when the Event Center begins operating. The costs to MTA are heavily loaded in the early years of the project, before ongoing revenues have begun. Estimated one-time revenues will be available during this time to cover expenses, but they will fall short of the total by approximately \$30.2 million.<sup>7</sup> This difference will be covered by contributions from San Francisco's General Fund, whether all at once or through the financing of these expenditures that are net of revenues.

Table 4 provides the details of the City's estimates of ongoing expenses related to the operation of the Event Center. As of early October, estimated annual net ongoing costs associated with operations at the Event Center amount to \$6.2 million.<sup>8</sup> The vast majority, \$5.1 million, are associated transit costs. It is worth noting that this estimate has decreased by \$0.4 million between May and

<sup>6</sup>One-time costs are from SFMTA, **Capital and Operating Cost Estimates for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32**, 10/6/2015. Estimates are in 2014 dollars.

<sup>7</sup>This figure is the difference between \$57.8 million, the total estimated capital uses estimate (not just that allocated to the project), and the total one-time revenues from Table 3.

<sup>8</sup>Ibid. The word "net" is included because the City has estimated revenues from fares and parking from riders going to events at the arena. These revenues amount to approximately \$1.8 million, split roughly evenly between the two sources.

## O-MBA23S7

October of this year. Other expenses are reported as they were presented in May, including nearly \$1 million in additional policing, and \$200 thousand in expenses incurred by DPW.

**Table 4. Ongoing Costs of the Arena (millions of 2014 dollars)**

### — Net Benefits

The project comes with considerable costs and benefits. Both upfront net costs and ongoing net revenues are considerable. It is our view that the original EPS report was incomplete in not considering the implications of the project over time. It failed to provide a comparison of overall costs and benefits associated with the GSW project. The reviewer, Keyser Marston Associates, appeared to agree with the EPS approach, saying that a "cash flow approach is appropriate to evaluate a multi-phase project, which does not apply to this project." We respectfully disagree. There are two stages to this project: first, the one-time infrastructure investments and revenue implications of construction and parcel purchase, and second, the ongoing costs and revenues. The project's benefits to the City come inherently in two stages. If both stages yielded a net benefit, the need for a cash flow approach would not be nearly as acute. As the first stage is significantly negative, the overall net benefits must be evaluated over time in order to properly evaluate the project.

This has not been publicly done. Here, we consider a 20-year period following the construction of the Event Center. Given that many of these revenues accrue many years in the future, it is necessary to discount them to today's dollars. The bottom line is the present discounted value of the net stream of revenues to the City of San Francisco.

Assumptions crucial to the present value discount calculation:

1. Discount Rate: 4.0%
2. Rate of inflation: 2.5% (2% for property taxes, as per Proposition 13)

Table 5 provides an estimate of the present discounted value of net revenues to the City of San Francisco, using estimates from the EPS report of September 25, 2015 and from documents from the City of San Francisco. Once the facility has been operating for 20 years, net revenues are ex-

## O-MBA23S7

pected to be on the order of \$95.7 million, or approximately \$4.3 million per year over a 22-year period including two years of construction and 20 years of operation. This estimate includes the upfront expenses incurred by the City as well as the ongoing expenses associated with event traffic mitigation.

**Table 5. Net Benefits of GSW Event Center Project over 22 years (Millions of Present Discounted 2014 dollars)**

	Benefits	Costs	Net Benefits
One-Time	\$27.6	\$55.3	-\$27.7
Ongoing	\$221.4	\$98.0	\$123.4
<b>Total</b>	<b>\$249.1</b>	<b>\$153.3</b>	<b>\$95.7</b>

Source: Calculations by Marin Economic Consulting.

The project pencils out as estimated. This calculus, however, begs two important questions:

1. This is a 12-acre plot of land in the middle of a biotechnology hub. Are there better uses for this land from a revenue perspective?
2. Estimating the costs associated with event management is a more certain endeavor than estimating the benefits. How certain is it that the benefits will materialize?

For a project of this magnitude, it is vitally important to evaluate the potential for plausible alternatives to provide more benefits than the project in question. It is also important to consider robustness tests for the revenues in question. Neither of these issues has been publicly addressed. This report will present plausible revenues associated with an alternative development, a space designed with biotech in mind, and will discuss weak points in the revenue estimates presented above.

### 3: On the Economics of Biotech as an Alternative

When evaluating the benefits of an economic endeavor, an exploration of alternatives is vital to understanding the full implications of an investment. Suppose that instead of building a 750,000-square-foot arena, the amount of commercial space on the property were doubled. In this section, we consider such an investment. In this exercise, we follow as closely as possible the assumptions contained in the EPS estimate of revenues associated with the GSW project.

Important assumptions associated with this analysis include:

1. Instead of a 750,000-square-foot arena, a commercial facility is constructed that provides 522,000 square feet of space. This constitutes an exact doubling of the commercial space in the GSW plan. This alternative development is otherwise comparable to the Warriors plan, including the original commercial, retail, and parking structures.

## O-MBA23S7

2. The space is designed with biotechnology in mind, which brings with it significant laboratory space. As such, it has a relatively high amount of space per worker associated with it: 250 square feet per employee.<sup>9</sup>
3. The transaction price for the land is unchanged at \$172.5 million.<sup>10</sup>
4. It is assumed that just two-thirds of the biotech revenues generated onsite are subject to gross receipts taxation in San Francisco.<sup>11</sup>
5. It is also assumed that a commercial facility would have ancillary benefits in terms of indirect and induced economic activity in San Francisco. Consistent with the EPS report, it is assumed that 90% of the ancillary output generated is subject to the Gross Receipts Tax.<sup>12</sup>

With the addition of these assumptions, an exercise analogous to that undertaken by EPS is performed for the new development. The new development includes the same retail revenues and costs, the same parking revenues, and essentially double the revenues associated with commercial development. Doubling the office space and maintaining other assets leads to an assessed value of at least \$605.5 million. This is considerably less than the project's assessed value with an arena.

Support for the notion that this construction is feasible comes not only from the 750,000-square-foot arena that the buildings will be replacing, but also from a similar planned development. UCSF was planning to build 500,000 square feet on four acres of blocks 33-34, right next to the site.<sup>13</sup> A new building of the size being considered is clearly feasible on the space currently to be occupied by the arena.

Table 5 presents a comparison of the one-time revenues and expenditures associated with the Event Center versus doubling the commercial space on the 12-acre property. While the Event Center brings with it a need for considerable infrastructure to accommodate the development, it is not clear that a doubling of the commercial space does. Accordingly, the Event Center brings with it a net upfront cost of \$37.5 million, relative to a commercial facility in place of the Center.

<sup>9</sup>This is an extremely conservative assumption. Some estimates suggest that a ratio of 150 to 11 is possible. This would considerably increase employment and hence output at the site, increasing the resulting income to both City residents and City coffers.

<sup>10</sup>The actual transaction price has been announced as \$150 million. San Francisco Times, **Warriors buy Mission Bay arena site from Salesforce**, 10/13/2015. In this analysis, the transaction price is kept at \$172.5 million to maintain comparability with the original EPS study. The change in sales price does have an effect on revenue estimates, but the effect is the same for both the Warriors plan and for the alternative, so it does not affect comparisons between the two.

<sup>11</sup>There are several avenues through which revenues may be exempt from gross receipts taxes in San Francisco. This analysis is extremely conservative in assuming that this is more likely the case for biotechnology firms (perhaps because of significant revenues accruing through pass-through companies) than for firms in other industries.

<sup>12</sup>Estimates of these benefits are derived from the 2013 San Francisco County model of IMPLAN. It should be noted that the EPS report does not provide estimates of the ancillary effects of the commercial aspect of the current project. This report similarly omits those benefits for the existing commercial development, but does include them for the commercial property that could be built in place of the stadium. These ancillary benefits are also reduced by one-half to provide a conservative estimate of the development's contribution to net revenues.

Immediate Net Revenue Impact	9,108	-28,410	37,518

Source: EPS Report (9/25/15) and calculations by Marin Economic Consulting.

Although capital expenditures related to the Event Center are significantly higher than the revenues brought in through the TIDF, such is not expected to be the case for additional commercial space. The TIDF was put in place with developments such as this alternative in mind. Therefore, the transit costs associated with the development are better approximated using the TIDF taxation formula. The TIDF collected from the hypothetical alternative development (including the commercial, retail and parking in the GSW project) will serve as our estimate of related transit costs, \$10,901.

In the analysis above, the sales price for the property on which the event center and accompanying commercial and retail structures will be built is the same as in the EPS report: \$172,546,000. Property transfer tax would result regardless of the purchaser and the end use, but conceivably at a higher price. Salesforce originally paid \$278 million dollars for 14 acres (including the space in question) in 2010. The current sales price is \$172.5 million for 12 acres (actual is \$150 million). The plot of land in question represents the majority of the plot originally purchased by Salesforce, and is the largest single contiguous piece. Property values have also increased substantially since the original purchase by Salesforce.<sup>14</sup> It seems likely then that the value of the land would have increased significantly over the last five years as San Francisco is currently starved for commercial real estate. In the end, the price that the Warriors have paid for the land is surprisingly low. It represents the bulk of a property that was valued at \$278 million in 2010 and market values have only increased in the intervening years. Therefore, the actual market value of the land may well be higher than the price the Warriors have been offered and have paid, with correspondingly higher transfer taxes resulting from some alternative development.

Source: EPS Report and calculations by Marin Economic Consulting.

In most categories, the annual revenues are greater for the Event Center than for a development with additional commercial space. The exception is in the Gross Receipts Taxes, where a biotech firm occupies the additional commercial space. Taken as a whole, annual revenues from a purely

<sup>15</sup> This alternative is chosen because it will allow the use of most of the EPS parameters and assumptions in producing annual revenues for the alternative project. See the Appendix for a comparison of calculations between this project and the EPS report.

## O-MBA23S7

commercial development are \$6.8 million less than for the project under consideration. Once the expenses related to the activities at the Event Center are taken into consideration, annual net revenues are nearly identical. However, expanding the commercial element of the development has considerable ancillary benefits. Most economic functions both make purchases from the broader economy and also compensate workers, who then in turn make purchases from the broader economy. The gross receipts taxes associated with output in the San Francisco economy that is related to activities in the additional commercial space are estimated to be \$754,000 per year.<sup>16</sup> Once these benefits have been considered, the commercial development results in \$162,000 more in revenues annually than would the arena (last line of Table 6). From a net revenue perspective, a commercial development dominates the Event Center.

As discussed above, merely calculating the one-time costs and an estimate of the ongoing revenue is insufficient. Were it sufficient, a commercial project focused on biotech would clearly dominate the current project. Table 7 provides an evaluation of the 22-year net benefits of an alternative development with space devoted to biotechnology comparable to the evaluation for the current project.

**Table 7. Net Benefits of Alternative Developments after 22 Years**  
(Millions of Present Discounted 2014 Dollars)

	Biotechnology		Net Benefits		
	Benefits	Costs	Biotech	GSW	Difference
One-Time	\$20.0	\$10.9	\$9.1	-\$27.7	\$36.8
Ongoing	\$126.5	\$0.0	\$126.5	\$123.4	\$3.1
<b>Total</b>	<b>\$146.5</b>	<b>\$10.9</b>	<b>\$135.6</b>	<b>\$95.7</b>	<b>\$39.9</b>

Source: Calculations by Marin Economic Consulting

According to these calculations, an alternative development would provide an extra \$39.9 million in revenues for the City of San Francisco (as in Table 7). Net present discounted revenues for the project with an Event Center are \$95.7 million, while a project with commercial space devoted to attracting biotechnology firms has a discounted value of net revenues expected to be \$135.6 million, a difference of \$39.9 million dollars, or an additional \$1.8 million each year on average over the 22 years.

From a cash flow perspective, there is a deep hole early on with the Event Center. The first three columns of Table 8 present annual present discounted flows of revenues into San Francisco City coffers. The final three columns provide a cash flow, or cumulative contribution to City coffers. Several things are immediately apparent from the table:

1. The Event Center puts an enormous hole in the City's budget in the first year (row 1, column 4).

<sup>16</sup>This is half of what is implied by IMPLAN in order to maintain the conservative nature of these estimates.

## O-MBA23S7

2. Substituting a commercial development is cash flow positive in the first year (row 3, column 5).
3. It will take four years of operation of the Event Center to dig the City out of the hole (column 6).
4. Although the gap in annual discounted net revenue closes over time, it remains significant even in year 20 (last row, column 4).
5. In year 20 of Event Center operations, there remains a surplus of revenue in the amount of \$39.9 million for the biotechnology development (last row, last column), which continues to grow in subsequent years.

A final issue that differentiates a biotechnology-centric development over an arena is one of economic impact. It is clear from the economics literature that sports stadiums and arenas provide little economic boost to the local economy. At the same time, it is clear that these facilities are responsible for generating some local economic activity. The failure to add to a region's economy is because they tend to displace other entertainment purchases from the broader economy rather than to stimulate new spending. An individual may go to a basketball game instead of to a play, opera, symphony, or rock concert. These facilities are therefore not additive to the economy.

Nonetheless, it has been estimated that economic activity associated with Oracle Arena accounts for \$44.9 million in economic activity and 494 jobs in Alameda County.<sup>17</sup> It seems likely that the impact of the new arena will be of a similar magnitude.

By comparison, a 522,000 square foot biotechnology facility, with a ratio of space to employee of 250 to 1 can accommodate more than 2,000 employees. That represents four times more employment for biotechnology than for the Arena. It is also consistent with an estimate of economic output on the order of \$1 billion, an order of magnitude higher than for the Arena. Accordingly, the biotechnology development can serve as a much more significant engine of economic growth for the region than can the new event center. Ancillary (indirect and induced) economic benefits for the City of San Francisco are estimated to similarly be in excess of \$1 billion. The gross receipts tax implications for the City of San Francisco are conservatively estimated to be \$754,000 per year.<sup>18</sup>

<sup>17</sup>Memo to Patrick Soluri, Attorney at Law, from Philip King, Ph.D., regarding Urban Decay Analysis of Proposed Relocation of Golden State Warriors from Oakland to San Francisco, page 9.

<sup>18</sup>These estimates are from the 2013 San Francisco County model of IMPLAN and have been scaled to 2014 dollars. The actual estimates of ancillary output generated were divided by two in order to keep the estimates conservative. The actual revenues could be significantly greater.

## O-MBA23S7

### 4: Questioning the Benefits and Costs of the GSW Project

There are few guarantees with economic endeavors. Assuming that the conditions that exist today will exist tomorrow, the day after that, or 20 years from now is of dubious merit. Conditions change. The level of success of a basketball team ebbs and flows (though hopefully not for the Warriors), the economy grows and shrinks, modes of transportation change, and the availability of hotel rooms may decline as demand grows but supply does not.

This certainly holds true for the construction of an arena. While it is quite likely that the Warriors will play at the arena for the foreseeable future and experience a high level of success for some time, it is not certain that the estimated revenues will materialize. As a case in point, the EPS study assumes a sales price for the land of \$172,546,000. It has just been announced that the sales price was \$150,000,000. That represents a reduction in sales price of 13%, with a corresponding reduc-

## O-MBA23S7

tion in revenues that are tied to the sales price: transfer taxes and ongoing property taxes. Although the long-term implications of a decline in ongoing property taxes is likely small, the transfer tax is reduced from \$4.2 million to \$3.65 million, a reduction in one-time revenues of \$549,000. Granted, this is just one percent of the one-time transit costs associated with the project, but it is more than half a million dollars no longer available for other city needs.

Two categories of revenue are particularly suspect: hotels and parking. With regard to hotels, it is not immediately clear that moving the venue from Oakland to San Francisco will necessarily lead to a significant increase in demand for hotel rooms in San Francisco. With regard to parking, the demand for parking ebbs and flows with the economy. It is also likely that demand for parking will decline significantly in the coming years. Estimates included in the EPS report are therefore likely biased upward and those revenues will not fully materialize.

### — Hotel/Motel Occupancy Tax

There are primarily two concerns related to forecasts of increased demand for hotel rooms in San Francisco resulting from the construction of the Event Center. First, San Francisco hotel occupancy rates for much of the year are very high, implying little excess capacity to be filled by basketball fans. During times of high demand for hotel rooms in San Francisco, many of those staying overnight for an event at the arena may choose to stay outside of the City. Alternatively, the demand resulting from arena events may well divert others to hotel rooms outside of the City. Second, it is also likely that many overnight visitors for the Warriors games currently stay in San Francisco, despite attending a game played in Oakland. Despite the change of venue to San Francisco, it is not clear that this shift will result in a significant net increase in demand for San Francisco hotel rooms.

The EPS estimates of revenues associated with the GSW project indicate an increase in hotel room occupancy. However, San Francisco is generally regarded as having a significant shortage of hotel rooms and to be operating near full capacity. Indeed, occupancy rates for San Francisco are high by any standard. San Francisco ranks third nationally in occupancy rates; New York is ranked #1.

The EPS report assumes that 10% of Event Center attendees are potential overnight visitors but that only half of them will constitute new demand for hotel rooms in San Francisco. This assumption represents an increase in demand for hotel rooms of approximately 50,000. However, it is likely that many current overnight visitors to Oracle Arena stay in San Francisco. It is entirely possible that a new arena will have a much smaller net impact on the demand for hotel rooms in San Francisco. This puts some \$1.7 million in expected additional revenues in question. If half of this demand does not materialize, or is displacement of other demand for hotel rooms in the City, this could reduce overall revenues by half, or by \$800,000 to \$900,000 in each year of operation, amounting to more than \$13 million in present discounted terms over 20 years of arena operation.

## O-MBA23S7

### — Parking

Going forward, the use of personal vehicles and hence the demand for parking, as well as transit services, is going to be subject to significant disruption. In particular, ride-sharing services continue to grow, especially in San Francisco. With the use of these vehicles, the demand for parking at an event site will likely decline. There is also growing evidence that autonomous vehicles will be available in the near future. Several automobile and tech companies have announced a target date of 2020 for making these cars, or cars with this capacity, available to the general public. The growth of ride-sharing and the development of autonomous vehicles will likely reduce the demand for parking, particularly the demand related to attending events. The advent of autonomous cars being used in car-sharing will significantly increase the rate at which parking demand declines. Current estimates are that the Event Center will result in the demand for parking spaces on the order of 422,000 per year. Some of this demand for parking is likely to evaporate over time.

There could also be a significant decline in the demand for public transportation resulting from increased car-sharing. This has several implications. First, planned investments in infrastructure designed to expand transit availability to serve events may be rendered to some extent obsolete as people move away from transit and toward the use of autonomous vehicles, whether shared or privately owned. This represents a move away from transit toward private vehicles. Despite the projected decline in parking demand, this represents increased need for traffic mitigation of some sort. There will likely be an increase in vehicular traffic to and from the Event Center that could have implications for the arena's neighbors.

With the advent of autonomous vehicles and greater use of ride-sharing services, it is possible that demand for parking could decline significantly over the coming years. If we assume that it declines at a rate of 1% each year, that would reduce revenues associated with parking by \$3.8 million over the 20-year time horizon. It will also reduce parking demand for a biotechnology development, but by less, just \$1.9 million over 20 years. Should parking demand decline more quickly (5%/year), revenues could decline by as much as \$15 million

### — Net Benefits

The point of this discussion is that estimated revenues are suspect, while estimated costs are much more likely accurate. Fixed investments, in particular, are known and not subject to market whims. However in this case, there are unknowns lurking in the cost estimates. It is likely that the revenue implications are biased high, resulting in uncertainty over their future stream with more downside risk than upside. It is already the case that actual one-time revenues have turned out to be less than anticipated (such as the transfer tax, which was lower by \$549,000) and that the City has revised its

## O-MBA23S7

estimates of one-time costs upward (by nearly \$16 million) and its estimates of ongoing expenses upward (by \$1.4 million in each year). Clearly, there is great uncertainty in almost all of these estimates.

### 5: Some Sensitivity Analysis

In each case, the revenue estimates relating to the GSW project and the revenue estimates relating to a biotechnology center are uncertain. It is therefore worthwhile to experiment with basic assumptions to better understand the implications for City revenues. Table 9 offers some evidence for the implications of particular assumptions. We provide four separate alternatives that relax in different ways the assumptions inherent in the baseline analysis. The top line of the table presents the baseline results of the analysis, the estimates of present discounted net revenues accruing to the City (corresponding to the last row in Table 7). In the case of the biotechnology development net present discounted revenues are \$135.6 million whereas they are just \$95.7 million for the GSW project, a difference of \$39.9 million.

**Table 9. Summary of Net Present Discounted Value Associated with Alternatives (22 Years, 2015-2036)  
Comparing the Multi-Purpose Venue with a Biotechnology Center (Millions)**

Item	Biotech	GSW	Difference	
			Over 22 Years	Per Year

- Add 200,000 sq ft to New Commercial Space (722,000 total)				

Source: Marin Economic Consulting

The first alternative scenario assumes that one-half of the demand for hotel rooms in San Francisco fails to materialize with the GSW project. This results in a reduction of approximately \$13.2 million

## O-MBA23S7

in net present discounted revenues. The revenues associated with the biotechnology development are unchanged because there are no transient occupancy tax revenues assumed to occur.

The second alternative assumes a greater density of employment in the new commercial facility, leaving the existing commercial plans constant. If there are 200 square feet per employee, rather than 250, revenues associated with the new facility increase by more than \$11.3 million relative to the baseline. This increase in revenue stems largely from an increase in the output produced by the building's occupants, resulting in increased gross receipts tax revenues. It also increases the occupants' interactions with the broader San Francisco economy, having a positive impact on ancillary benefits. Further reducing the space per employee will have correspondingly larger increases in revenues.

A third alternative assumes a larger facility is constructed, with 722,000 square feet of space rather than 522,000 square feet of space. This increases the number of employees working in the space by nearly 40%, holding the assumption that 250 square feet per employee is required. With greater space comes increased employment and increased output and increased demand for the output of the rest of the San Francisco economy. Accordingly, revenues are estimated to increase by nearly \$18.0 million with an expanded space. Under this scenario, the net discounted value of City revenues increases by \$58.7 million relative to the GSW project. Even larger spaces would have a correspondingly larger impact on City revenues.

Finally, an extreme alternative is offered. Alternative 4 allows for a 150 to 1 ratio of square feet to employees, assumes that all of the revenues accruing to the biotech occupants are subject to the GRT, reduces by one-half assumed hotel/motel TOT revenues associated with the Event Center, and involves a building with 722,000 square feet. Under this alternative, City revenues increase by \$111.7 million relative to the baseline, with biotechnology revenues exceeding GSW revenues by nearly \$151.6 million over 22 years and \$6.9 million per year.

These alternatives are not put forward to suggest that there is \$151.6 million being left on the table (though there may be), but rather to illustrate the range of differences that underlying assumptions can make. At the same time, even the extreme alternative is plausible.

### 6: Re-Evaluating the Net Benefits of Hosting the Warriors

There are two fundamental points made in this report:

1. Estimates of costs and revenues are highly speculative, and the evidence suggests that there is more downside risk to the GSW project than upside.
2. There is significant revenue that is forgone by the City in order to bring the Warriors to town.

## O-MBA23S7

Both of these points raise significant questions about the Warriors arena project from a financial perspective. First, how comfortable are taxpayers in their understanding of the implications of this development? Second, is this the right development?

The respective answers are "not very" and "quite possibly no." There is uncertainty in the information available and replacing the Event Center in the project with additional commercial space has the potential to increase City revenues significantly.

Another way of thinking about the differences in revenues between the GSW project and a biotechnology development is that these differences reflect the price the City is paying in order to bring the Warriors to town. There are certainly other more tangible costs, but these costs are also real.

The above analysis indicates that even with relatively conservative assumptions, in particular those surrounding employment in the new development and the size of the new development, a biotechnology center would increase City revenues significantly relative to the Event Center. Under the baseline scenario, the difference is \$39.9 million over 22 years. Under the most extreme, yet plausible, scenario presented, an additional \$151.6 million could be raised over the 22-year period. This analysis presents a range of increases of between \$1.8 and \$6.9 million per year. It should be noted that the extreme alternative does not include the possibility of a larger facility. Were it to do so, the forgone annual revenues would be significantly higher. This suggests that the City of San Francisco is likely paying more than \$1.8 million and possibly upwards of \$7 million per year in forgone revenues in each of the next 22 years to accommodate the Warriors.

Every economic development represents a choice. That choice is between the proposed development and plausible alternatives. The City has chosen to pursue a basketball team without exploring or disclosing the relative merits of the project compared with plausible alternatives. This report is not designed to condemn the choice, but rather to better inform the debate on the implications of this choice.

O-MBA23S7

**APPENDIX: Details of Annual Revenue Calculations for Biotech in Comparison with the Warriors Project**

This appendix provides tables illustrating key differences in the assumptions and results between the analysis presented in the EPS report of 9/25/15 and the biotechnology project discussed in the text. The tables very closely mirror those in the EPS report and reproduce assumptions and results from that report. Some tables are not applicable to the biotechnology project and are omitted. In particular, Tables A-9 through A-11 are omitted. It should also be noted that these tables have not been updated to reflect the actual purchase price paid by the Warriors. It does, however, include updates to the City's estimates of one-time and ongoing costs.

**Table A-1. San Francisco Revenue Summary (Thousands of 2014 dollars)  
Comparing the Multi-Purpose Venue with a Biotechnology Center**

President Rodney Fong and Members of the Planning Commission  
City and County of San Francisco  
1650 Mission Street, Suite 400  
San Francisco, CA 94103

**Re: Warriors Arena Project: Planning Codes section 321 and 305, General Plan Inconsistency and CEQA Findings.**

Dear Commission President Fong and Members of the Commission:

:

This office represents the Mission Bay Alliance (“Alliance”), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (“Warriors Arena Project” or “Project”). The Mission Bay Alliance objects to approval of this Project and certification of the Project SEIR.

**1. The Project is ineligible for any office space allocation under Planning Code section 321 and Motion 17709.**

**a. This Project does not comply with the Design for Development.**

Resolution 14702 and Motion 17709 require that any project in the Alexandria District must comply with the Mission Bay South Design for Development in order to be eligible for any office space allocation. (See Motion 17709, p. 9, Finding 9,<sup>1</sup> Finding 10<sup>2</sup>.)

<sup>1</sup>“This schedule of phased authorization will ensure that, in accord with Resolution 14702, adequate office space can be allocated to those projects within the Development District that are determined to be in compliance with the D for D requirements, while also complying with Section 321 of the Planning Code forbidding exceedance of the square footage available for allocation in any given annual cycle.”

<sup>2</sup>“Pursuant to Resolution 14702, the Commission is charged with determining whether a project seeking authorization conforms to applicable standards in the D for D Document, which supersedes the criteria set forth in Section 321 and other provisions of the Code except as provided in the MBS Plan. The projects previously approved were determined to have met the MBS Redevelopment Plan and the D for D Document standards and guidelines, and requirements for childcare, public art, and other provisions of the Plan Documents, and retain

## O-MBA24L9

Planning Commission  
City and County of San Francisco  
Re: Warriors Arena Project DSEIR  
November 5, 2015  
Page 2

This Project does not comply with the Design for Development, as evidenced by the many amendments that the Successor Agency made to the Design for Development to accommodate the Project. Therefore, it is ineligible for allocation of any office space under Planning Code section 321 and Motion 17709.

### b. This Project is inconsistent with the Redevelopment Plan.

A basic premise of the Planning Commission decisions in Resolution 14702 and Motion 17709, and a fundamental rationale for “superseding” section 321’s guidelines in favor of the Redevelopment Plan and Redevelopment Plan documents, were the Commission’s findings that the Redevelopment Plan met standards set in section 321, the San Francisco Master Plan, the priority policies in Planning Code section 101.1, and the requirements of redevelopment law. In short, in order to be eligible for the office space allocation available under motion 17709, the Project must be consistent with the Redevelopment Plan.

This Project is inconsistent with the Redevelopment Plan because, as demonstrated in the November 2, 2015, letter from Susan Brandt-Hawley, my co-counsel for the Alliance (attached as Exhibit 1), this Project is not an allowable secondary use under the Redevelopment Plan. However, in the alternative, as shown in my November 2, 2015, letter (attached as Exhibit 2), if the Project is an allowable secondary use under the Redevelopment Plan, then it requires a variance under section 305 of the Plan before Project approval.

### 2. The office space allocation requested for this Project exceeds the amount authorized for the Alexandria District.

In 1986, San Francisco voters passed Proposition M, a referendum limiting the amount of office space that can be approved each year. Codified as Section 321 of the San Francisco Planning Code, it provides that “[n]o office development may be approved during any approval period if the additional office space in that office development, when added to the additional office space in all other office developments . . . would exceed 950,000 square feet.” (San Francisco Planning Code § 321(a)(1).) Office space is defined to mean “construction . . . of any structure” that has the “effect of creating additional office space.”

The current Project plans call for the construction of two office towers on Mission Bay South Parcels 29 and 31, comprising 309,436 square feet and 267,486 square feet of office space, respectively, for

that design approval, along with all previously imposed conditions of approval. Future projects requesting authorization will be brought before the Commission for design review in accord with Resolution 14702, and upon determination by the Commission that such proposals are in conformity with the D for D and other applicable requirements, office space may be allocated for such new structures from the unassigned amount available in the Development District.”

## O-MBA24L9

Planning Commission  
City and County of San Francisco  
Re: Warriors Arena Project DSEIR  
November 5, 2015  
Page 3

a total of 576,922 square feet of office space. (Executive Summary, p. 2.)

In 2008, the Planning Commission adopted Motion No. 17709. Motion 17709 approved a cumulative total office space allocation for all projects within the Alexandria Development District of 1,350,000 gross square feet. (Motion 17709, p. 9, Finding 9.) Of that amount, 1,222,980 was allocated before the adoption of Motion 17709. (Motion 17709, p. 5, Finding 4, Table 1.) Therefore, at the time Motion 17709 was proposed, 227,020 gsf of unallocated office remained for allocation. (Motion 17709, p. 9, Finding 9, Table 4.)

According to Motion 17709, there were three pending projects at that time, at 600 Terry Francois, 650 Terry Francois, and 1450 Owens Street. Motion 17709 states that these projects represented 665,880 square feet of “potential office space.” (Motion 17709, p. 5, Finding 5, Table 2.) Motion 17709 also states an intent to authorize only 57% of “potential office space” for actual office space after 10/18/09, 53% of “potential office space” for actual office space after 10/18/10, and 50% of “potential office space” for actual office space after 10/18/11.

Motion 17709 does not state how much actual office space was approved for the three pending projects at 600 Terry Francois, 650 Terry Francois, and 1450 Owens Street. The Planning Department’s Office Development Annual Limitation Program record (attached as Exhibit 3) shows “0\*” in the “size” column for these projects. (Exhibit 3, p. 19.) Assuming the Planning Commission allocated office space to these projects at the 57% ratio, that amount is 379,552 gsf (665,880 x .5). **This amount exceeds the remaining office space available for allocation at that time (i.e., 227,020 gsf).**

According to Motion 17709, there were two additional areas where the applicant indicated an intent to develop “potential office space,” namely, MB South Blocks “29 and 31” and “33-34.” (Motion 17709, p. 5, Finding 6, Table 3.) Motion 17709 states that these possible future projects represented 915,700 square feet of “potential office space,” with Blocks “29 and 31” at 515,700 GSF. (Motion 17709, p. 5, Finding 6, Table 3.)

Assuming, again, that the Planning Commission allocated office space to these areas at the 50% ratio, that amount is 457,850 GSF (915,700 x .5), with 257,850 allocated to Blocks “29 and 31” at 257,850 gsf (515,700 x .5).

The Draft Motion proposed for adoption at today’s hearing states that “Blocks 29-32 are included in the Development District and have been allocated a total of 677,020 sf of office space pursuant to Motion No. 17709.” (Draft Motion, p. 3.) This is incorrect in at least four ways.

First, it is unclear and unstated how Planning staff derived the 677,020 gsf number.

Second, after approval of the office space allocation for the three pending projects at 600 Terry Francois, 650 Terry Francois, and 1450 Owens Street, there was no office space left in the

Planning Commission  
City and County of San Francisco  
Re: Warriors Arena Project DSEIR  
November 5, 2015  
Page 4

Alexandria District to allocate - as discussed above.

Third, even if one adds together the “potential office space” numbers for Blocks 29-32 in Motion 17709, the sum is 1,119,999 gsf, and 50% of that is only 560,000 gsf. The two office towers proposed for this Project require 576,922 gsf. (See Executive Summary, pp. 1-2: 309,436 gsf in the South tower and 267,486 gsf in the 16<sup>th</sup> Street tower). This number exceeds 560,000 gsf.

Fourth, when one adds the 25,000 gsf for office space in the arena building (see SEIR p. 3-17), the office space for this project totals 601,922 gsf (i.e., 576,922 plus 25,000), which also exceeds 560,000 gsf.

Fifth, to the extent there was any office space left for Motion 17709 to allocate after approval of the office space allocation for the three pending projects at 600 Terry Francois, 650 Terry Francois, and 1450 Owens Street, Motion 17709 allocated only 257,850 gsf to Blocks 29 and 31 (i.e., 50% of 515,700) pursuant to Finding 6, Table 3. **The 576,922 gsf of office space in the two office towers for this Project are located in Blocks 29 and 31; and the total of 576,922 gsf vastly exceeds the 257,850 gsf that may arguably be available.**

Because the office towers called for in the Project exceed the allowable office space cap, Section 321(a)(1) and Motion 17709 require the Planning Commission to deny approval of the Project and of the requested allocations of office space.

### 3. General Plan Inconsistency: BAAQMD.

San Francisco Master Plan Policy 4.1 states:

Support and comply with objectives, policies, and air quality standards of the Bay Area Air Quality Management District.

Regionwide monitoring of air quality and enforcement of air quality standards constitute the primary means of reducing harmful emissions. The conservation of San Francisco's air resource is dependent upon the continuation and strengthening of regional controls over air polluters. San Francisco should do all that is in its power to support the Bay Area Air Quality Management district in its following operations:

- Monitoring both stationary and mobile sources of air pollution within the region and enforcing District regulations for achieving air quality standards.
- Regulating new construction that may significantly impair ambient air quality.
- Maintaining alert, permit, and violations systems.
- Developing more effective controls and method of enforcement, as necessary

The attached letter from the Bay Area Air Quality Management District (Exhibit 4) and the City's response (Exhibit 5) show that this Project does not comply with this policy.

4  
[LC-PP-3]

## O-MBA24L9

Planning Commission  
City and County of San Francisco  
Re: Warriors Arena Project DSEIR  
November 5, 2015  
Page 5

The Alliance previously commented on the Draft SEIR (Comment AQ-7) that the per ton charge for emission offsets is too low to achieve complete offset of the Project's emissions. The City's response to comments on this point is cagey, but it does suggest what now turns out to be fact - that the BAAQMD agreed with the comment - because the response states:

SF Planning has been in communication with BAAQMD with regard to its suggestion that a higher fee may be warranted to offset project emissions to a less than significant level and found that BAAQMD could not establish that an increased rate beyond that of the Carl Moyer Program plus a five percent administrative fee could meet the “rough proportionality” standard required under CEQA.

(RTC, p. 13.13-67.) The RTC's rationale for contending that a higher offset fee would not meet the “rough proportionality” standard is that offset fees in other areas of the state are not higher than the offset fee proposed in the DSEIR. This is an error of law. The “rough proportionality” requirement requires a comparison of the cost of the mitigation to the degree of severity of the impact. The fees charged in other areas of the state are irrelevant to “rough proportionality.”

### 4. CEQA Findings: General

The Commission cannot make any CEQA findings required by CEQA section 21081 or CEQA Guidelines 15091, 15093, 15096(f), because the Project SEIR does not comply with CEQA and is not certifiable, for the reasons described in the Alliance's comments on the SEIR.

### 5. CEQA Findings: BAAQMD.

The Commission cannot find that “Impact AQ-4: Potential conflicts with BAAQMD's 2010 Clean Air Plan” is less than significant with mitigation because the City and Project Sponsor refuse to agree to BAAQMD's offset fees per Mitigation Measure M-AQ-2b. (See Exhibits 4 and 5.) There is also no evidence that the “Option 2” offset idea within Mitigation Measure M-AQ-2b is feasible. There are too many unanswered questions regarding Option 2, including lack of assured verification of offsets to ensure their effectiveness, and lack of assurance that offset sources are available in the quantity required. BAAQMD's offset program at least answers some, if not all, of these questions.

The Commission cannot find that all feasible mitigation measures that would substantially reduce “Impact AQ-1: Impacts of Criteria Air Pollutants from Construction” have been adopted as required by CEQA section 21081, because there is no evidence that paying the offset fees demanded by BAAQMD is infeasible. Also, as discussed above, there is no evidence that the “Option 2” offset idea within Mitigation Measure M-AQ-2b is feasible; therefore, it is not an adequate substitute for BAAQMD's offset program. This also applies to

- Impact AQ-2: Impacts of Criteria Air Pollutants from Project Operations”; Impact C-AQ-1: Project Contribution to Regional Air Quality Impacts;

5  
[LC-AQ-1]

6  
[LC-ERP-3]

7

O-MBA24L9

Planning Commission  
City and County of San Francisco  
Re: Warriors Arena Project DSEIR  
November 5, 2015  
Page 6

- Impact C-AQ-1: Project Contribution to Regional Air Quality Impacts.

**6. CEQA Findings: Pier 80 Alternate Site.**

The Commission cannot find that feasible alternatives that would substantially reduce the Project's significant impacts have been adopted. The SEIR does not analyze the alternate site proposed by the Alliance near Pier 80, and did not circulate that analysis for public comment. Neither OCII nor this Commission has the basis to make conclusory findings rejecting the alternative. Among the relevant facts not considered in the findings is that the site is three times as large as would be required for the Event Center project and need not utilize any of the City-owned property nor any particular configuration of the privately-owned lots should there be an unwilling seller. There is no evidence provided that the site could not be acquired within a reasonable time period.

Case law confirms that assuring a site's consistency with city plans and zoning is within the City's power. Similarly, the scheduling of transportation services to the site can be increased, and the findings provide no studies to back up conclusory statements regarding traffic, air quality, hydrology, or water quality impacts. Since only a third of the site is needed to accommodate the event center, all of the impacts (if shown to have concern after sufficient technical review) can be avoided or mitigated. As stated in the Alliance letter to OCII that proposes this site for consideration as an alternative, here incorporated by reference, the SEIR failed to consider a potentially-feasible off-site alternative and must be revised and recirculated to do so before findings of infeasibility may be considered or adopted. The site suggested by the Alliance is potentially feasible and deserving of study.

Thank you for your attention to this matter.

Very Truly Yours,

Thomas N. Lippe

Tiffany Bohee, OCII Executive Director  
c/o Brett Bollinger, San Francisco Planning Department  
via email [warriors@sfgov.org](mailto:warriors@sfgov.org)

Subject: Warriors Event Center & Mixed Use Development  
Inconsistency with Mission Bay South Redevelopment Plan  
'Secondary Use' Classification

Dear Director Bohee and Mr. Bollinger:

The Mission Bay Alliance (the Alliance) contends that the Warriors' Event Center is unlawfully inconsistent with every use allowed by the Mission Bay South Redevelopment Plan (the Plan). Although the Alliance raised this issue in comments on the Draft Subsequent EIR (DSEIR), both the Responses to Comments in the Final SEIR and OCII's findings of project consistency remain materially inadequate.

The Plan designates uses allowed at a 'Commercial Industrial/Retail' site. The Alliance notes that while OCII now concedes that a sports arena is not within the scope of allowed 'principal uses' in that zoning, OCII contends that an arena is consistent with 'secondary uses.' As this letter will explain, all such secondary uses are similarly and demonstrably insufficient to permit the Warriors' sports arena.

**Nighttime Entertainment.** The Initial Study concluded, in error, that the DSEIR did not need to address land use issues — at all. It asserted that the entire Event Center, including the sports arena use, somehow met the secondary 'Nighttime Entertainment' use analyzed in the 1998 Plan EIR. Secondary uses were then generally referenced in the DSEIR (*e.g.*, pp. 3-8, 3-51, 4-5, 5.2-115), but there was no discussion of which category of secondary use would be allocated to the Event Center, inferring acceptance of the Nighttime Entertainment category.

The Plan describes Nighttime Entertainment in terms of small-scale local uses like dance halls, bars, nightclubs, discotheques, nightclubs, private clubs, and

**EXHIBIT 1**

## O-MBA24L9

Warriors Event Center  
Secondary Use Inconsistency  
November 2, 2015  
Page 2 of 4

restaurants. (Plan, p. 50.) At the time of the 1998 EIR, several small neighborhood bars occasionally offered nighttime entertainment, consistent with the secondary use category. Such minor uses were compatible with the 3rd Street Corridor and the waterfront. Clearly, no mammoth regional entertainment venue was anticipated in Mission Bay South and no such use was considered in the 1998 Plan EIR.

And while professional basketball games are held at night, the Event Center also projects 31 annual events “related to conventions, conferences, civic events, corporate events and other gatherings,” with an estimated attendance of between 9,000 and 18,500 patrons. “[T]he majority of events are expected to occur during day time hours.” Such events are not ‘Nighttime Entertainment.’

The Director’s currently-proposed findings that the sports arena is ‘Nighttime Entertainment’ contemplated as a secondary use in the Plan are unsupported. The findings fail to match the scope and impacts of a professional sports venue with the analysis or description of uses in the Plan or in the 1998 EIR. The findings are fatally conclusory; that somehow a professional sports venue would be “similar” to a nightclub or bar use in the ‘Nighttime Entertainment’ category “because” it will serve alcohol, provide amplified live entertainment, and provide a venue for evening gatherings. The findings fail to address the core inconsistency of a regional sports arena with the intent of the adopted Plan and the Design for Development, which focus on commercial entertainment uses in Mission Bay North to complement the Giants’ ballpark.

OCII’s reliance on the negative; to wit, that the ‘Nighttime Entertainment’ secondary use has no specific size limitations, is not enough. The Plan provides for the continued development of Mission Bay South as a walkable urban community intended to facilitate world-class medical and biotechnology development. The Event Center project violates the Plan Area Map carefully designed in classic, walkable Vara Blocks. (Plan, Attachment 2, p. 40.) Neither the Plan nor the Design for Development contemplate any uses comparable in scope or impact to the Event Center as ‘Nighttime Entertainment.’

That being said, in fact in the Final SEIR and as reflected in the proposed Plan consistency findings, OCII now implicitly agrees with the Alliance that the ‘Nighttime Entertainment’ secondary use standing alone does not encompass a sports arena. Now, OCII additionally relies on the Plan’s alternate ‘secondary uses.’ No such uses are consistent with the Plan, as explained below.

## O-MBA24L9

Warriors Event Center  
Secondary Use Inconsistency  
November 2, 2015  
Page 3 of 4

**Recreation Building.** One of the Plan’s secondary use categories is for an undefined ‘Recreation building.’ (Plan, p. 15.) The Plan describes ‘Outdoor Recreation’ as “an area, not within a building, which is provided *for the recreational uses of patrons* of a commercial establishment.” (Plan, p. 50, italics added.)

OCII’s proposed findings as to the ‘Recreation building’ category stretch the regional sports arena use not only beyond what was contemplated by the Plan or studied in the 1998 EIR, but beyond logic. To state the obvious: there is a difference between ‘recreation’ and ‘entertainment.’ Both involve enjoyment and leisure, and may involve ancillary eating and drinking, and the Alliance has no quarrel with the Director’s reference to recreation as “something people do to relax or have fun; activities done for enjoyment.” (OCII Proposed Secondary Use Determination, p. 6.) But myriad dictionary definitions confirm and it cannot readily be denied that ‘recreation’ is commonly understood to involve one’s personal physical activities while ‘entertainment’ refers to events or performances designed to entertain others.

None of the Plan’s various references to ‘entertainment’ include athletic activities normally considered ‘recreation:’ Adult Entertainment [bookstore or theater], Amusement Enterprise [video games], Bar [drinking and theater], Theater [movies and performance]. (Plan, Attachment 5, pp. 44-51.) Consistently, the 1998 EIR’s discussion of ‘recreational’ land uses focused in turn on open space, bicycles, parks, and water-based activities. (Mission Bay EIR, Volume IIB, pp. V.M. 15-28.)

In context, the Plan’s reference to ‘Recreation building’ as a secondary use contemplates participatory recreational uses like the ‘recreation facilities’ referenced in the 1998 Plan EIR for the existing golf driving range and in-line hockey rink, with the expressed expectation that the size of recreational ‘facilities’ would decrease as redevelopment of the Plan area progressed. (OCII Proposed Secondary Use Determination, p. 6.)

Reliance on the secondary use of ‘Recreation building’ is unsupported.

**Public Structure or Use of a Nonindustrial Character.** As presented in the Plan, the category of “other secondary uses” labeled ‘Public structure or use of a nonindustrial character’ references *one* secondary use, not *two*. (Plan, p. 13.) The use is required to be public, and either a structure *or* a use.

O-MBA24L9

Warriors Event Center  
Secondary Use Inconsistency  
November 2, 2015  
Page 4 of 4

The interpretation urged by the Director is, again, strained beyond the plain words of the Plan. 'Public' is not defined in the Plan and so its common meaning is assumed. But as proposed in the consistency findings, OCII interprets a 'public' use as simply requiring that the public be somehow 'served.' That would encompass every kind of principal and secondary use listed in the Plan, from child care to animal care to hotel, *etc.*, and renders the category meaningless: *i.e.*, "Any use is ok."

Instead, a public structure or use is commonly understood to be under the control and management of a public agency for the benefit of its constituency — such as the University of California<sup>1</sup> or the City of San Francisco. The Plan provides a description of a range of anticipated public improvements in Attachment 4. This list includes both public buildings and public uses. None of the public improvements listed in Attachment 4 include anything like a private professional sports arena.

The Event Center is a private project and is not within the scope of the secondary use category for a public structure or use of a nonindustrial character.

**Director's Findings.** As explained, the sports arena uses that are the impetus for the Event Center project are not allowed by the Plan's allowed principal or secondary uses. An allowed use is prerequisite for a finding of Plan consistency. The Alliance will not belabor the myriad other inconsistencies with the Plan's objectives, design, incompatibility with UCSF, and creation of significant environmental impacts, as those have been described in the DSEIR comments and throughout the administrative record, but hereby objects to their insufficiencies and lack of supporting substantial evidence for the Plan consistency finding.

Consideration of the Event Center project must be preceded by amendment of the Plan to be consistent with the delineated principal and secondary uses and the adopted Plan Area Map of the Mission Bay South Redevelopment Plan.

Thank you.

Sincerely yours,

  
Susan Brandt-Hawley  
Attorney for Mission Bay Alliance

<sup>1</sup> See attached 2005 Resolution and Secondary Use finding regarding the "UCSF hospital" as a "public structure or use of a non-industrial character" for "a public body specifically created by the California Constitution."

O-MBA24L9

RESOLUTION NO. 176-2005

Adopted November 1, 2005

APPROVING A MEMORANDUM OF UNDERSTANDING WITH THE  
REGENTS OF THE UNIVERSITY OF CALIFORNIA, A CALIFORNIA  
PUBLIC CORPORATION, AND ACKNOWLEDGING THE EXECUTIVE  
DIRECTOR'S FINDINGS OF CONSISTENCY WITH THE MISSION BAY  
SOUTH REDEVELOPMENT PLAN, FOR THE EXPANSION OF UCSF  
FACILITIES IN THE MISSION BAY SOUTH REDEVELOPMENT  
PROJECT AREA; MISSION BAY SOUTH REDEVELOPMENT  
PROJECT AREA

BASIS FOR RESOLUTION

1. On September 17, 1998, by Resolution No. 193-98, the Redevelopment Agency of the City and County of San Francisco's (the "Agency") Commission (the "Agency Commission") conditionally approved the Mission Bay South Owner Participation Agreement (the "South OPA") and related documents between Catellus Development Corporation (the "Owner") and the Agency for development in the Mission Bay South Redevelopment Project Area (the "Project Area").
2. On November 2, 1998, the Board of Supervisors of the City and County of San Francisco (the "Board") by Ordinance No. 335-98 approved and adopted the Redevelopment Plan for the Mission Bay South Redevelopment Project Area (the "Plan"). The Board's adoption of the Plan satisfied the conditions to the effectiveness of Agency Resolution No. 193-98.
3. On November 16, 1998, the Agency entered into the South OPA with the Owner. The South OPA sets forth phasing principles that govern the development of property in the Project Area. Those principles include the Owner's obligations to deliver to the Agency affordable housing sites as market rate housing is built in the Project Area. They also include the Owner's commitments to construct public open space and other public infrastructure adjacent to – or otherwise triggered by – development on any of the private parcels governed by the South OPA.
4. Under the South OPA and the related Mission Bay South Tax Increment Allocation Pledge Agreement (the "Pledge Agreement"), dated as of November 16, 1998, between the Agency and the City and County of San Francisco (the "City"), approximately 20% of the total property tax increment (plus certain excess tax increment) generated by development in the Project Area is contractually dedicated to develop affordable housing units on parcels that the Owner will contribute to the Agency, to achieve the affordable housing program contemplated by the Plan.

O-MBA24L9

5. The South OPA requires the Owner to construct the public infrastructure directly related to each of the major phases in accordance with the incremental build-out of each project. Under the South OPA and the Pledge Agreement, the Agency is obligated to fund, repay or reimburse the Owner, subject to certain conditions, for the direct and indirect costs of constructing the infrastructure. The Agency has established a Community Facilities District ("CFD") for infrastructure in the Project Area. The Agency has also established a separate CFD to pay the costs of maintaining the public open space in the Project Area.
6. The South OPA provides that as a condition to any transfer of property in the Project Area, the Owner must obtain the agreement of the transferee to assume all of Owner's obligations under the South OPA with respect to the transferred parcels.
7. The Project Area includes an approximately 43-acre biomedical research and educational campus site (the "Campus Site") for the University of California, San Francisco ("UCSF"). UCSF has already invested about \$675 million on projects completed or underway on the Campus Site within the Plan Area and has plans to invest another \$225 million on projects in design.
8. The Regents of the University of California, a California public corporation ("The Regents") wishes to lease or acquire, and the Owner wishes to transfer Parcels 36, 37, 38 and 39 in the Project Area, comprising approximately 9.65 acres of land for the possible expansion of UCSF in Mission Bay (the "Expansion Parcels"). These parcels are not part of the 43 acres that the Plan originally designated as the Campus Site.
9. On November 30, 2004, The Regents released proposed amendments in draft form to its long range development plan, as LRDP Amendment #2. Those amendments contemplate an expansion of UCSF facilities onto the Expansion Parcels, including the possibility of developing by 2012 new integrated specialty Children's, Women's and Cancer hospitals containing about 210 beds, together with ambulatory and research facilities. In March 2005, The Regents approved LRDP Amendment #2 (the "Project") and certified a related final environmental impact report (the "LRDP #2 FEIR") which analyzed the environmental effects of the proposed UCSF development on the Expansion Parcels. Copies of the LRDP #2 FEIR are on file with the Agency Secretary.
10. The Owner and The Regents have entered into an Option Agreement and Grant of Option to Lease, dated as of January 1, 2005 (the "Option to Lease"), which provides that upon the satisfaction of certain conditions and the exercise by The Regents of its option (i) Catellus, as landlord, and The Regents, as tenant, will enter into a long-term ground lease of the Expansion Parcels (the "Lease") and (ii) the Owner and The Regents will at the same time enter into an Option Agreement and Grant of Option to Purchase (the

O-MBA24L9

- "Option to Purchase") under which The Regents will have an option to purchase the Expansion Parcels.
11. If The Regents exercises the Option to Lease within the option term, the Lease would allow for The Regents to develop up to 1,020,000 leasable square feet on the Expansion Parcels, provided that (a) any development of those parcels is the subject of further environmental review under the California Environmental Quality Act ("CEQA"), and (b) the Owner does not lose any of its entitled development potential for the balance of its land nor lose any of its other rights and privileges under the South OPA.
  12. Pursuant to Section 302 of the Plan, the development of the contemplated UCSF facilities on the Expansion Parcels is permitted as a subset of "Other Uses" as a secondary use. Such secondary uses are permitted provided that such use generally conforms with redevelopment objectives and planning and design controls established pursuant to the Plan and based on certain findings of consistency by the Agency's Executive Director (the "Consistency Findings"). The Executive Director has made the Consistency Findings, and such findings are hereby incorporated herein by this reference as if fully set forth.
  13. The City must make substantial improvements to San Francisco General Hospital ("SFGH") by 2013 and is evaluating a number of alternatives, including rebuilding on site and co-locating a new SFGH with new UCSF medical facilities in Mission Bay.
  14. As a State agency, The Regents is exempt under the State Constitution from local land use regulation and property taxes to the extent it uses property exclusively in furtherance of its educational mission.
  15. The Agency, City and The Regents negotiated a non-binding term sheet to guide the preparation of final transactional and related documents, such as a Disposition and Development Agreement ("DDA") for The Regents to acquire property for, and to construct and subsidize, affordable housing for low-income workers of UCSF, which DDA is being considered by the Agency Commission concurrently with this Resolution, pursuant to Resolution No. 160-2005, and provided terms for a Memorandum of Understanding regarding design standards and cooperation on the development of the Expansion Parcels (the "MOU"). The Agency Commission approved the non-binding term sheet on May 17, 2005 by Resolution No. 81-2005.
  16. The proposed MOU addresses, among other things: the potential loss of tax increment from the transfer of the Expansion Parcels to a tax-exempt entity; the obligations to build infrastructure associated with development on the Expansion Parcels; the potential assistance of UCSF in the planning of the co-location, if any, of SFGH with the new UCSF facilities; the standards for design review for construction on the Expansion Parcels; local hiring and

O-MBA24L9

equal opportunity for jobs associated with the development on the Expansion Parcels; and other matters designed to provide the Agency and City with significant public benefits.

17. Agency staff is recommending that the Agency Commission approve the MOU, and the associated Consistency Findings.
18. The Agency Commission has reviewed and considered the information contained in the LRDP #2 FEIR.
19. The Agency Commission hereby finds that the MOU is an action in furtherance of the implementation of the Project for purposes of compliance with CEQA.
20. By Resolution 175-2005, the Agency Commission adopted environmental findings related to the LRDP #2 FEIR, pursuant to CEQA and the CEQA Guidelines (the "Findings"). Such Findings are made pursuant to the Agency's role as the responsible agency under CEQA for the Project. The Findings are hereby incorporated herein by this reference as if fully set forth.

#### RESOLUTION

ACCORDINGLY, IT IS RESOLVED by the Redevelopment Agency of the City and County of San Francisco that the findings of consistency with the Mission Bay South Redevelopment Plan are approved and the Executive Director is authorized to execute the "Expansion of UCSF Facilities in Mission Bay South Redevelopment Project Area (Blocks 36-39) Memorandum of Understanding", substantially in the form lodged with the Agency General Counsel; Mission Bay South Redevelopment Project Area.

#### APPROVED AS TO FORM:

  
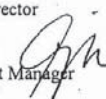

James B. Morales  
Agency General Counsel

O-MBA24L9

#### MEMORANDUM

126-03405-001  
October 12, 2005

To: Marcia Rosen  
Executive Director

From: Amy Neches   
Senior Project Manager

Re: Secondary Use Finding Recommendation for UCSF Hospital in Mission Bay South Redevelopment Area

Pursuant to a Term Sheet dated as of August 1, 2005 between the City, the Agency and The Regents of the University of California, which was endorsed by the Commission on May 17, 2005 (Resolution No. 81-2005), the Agency is considering agreements, including a Memorandum of Understanding ("MOU"), under which the University of California at San Francisco ("UCSF") may develop a hospital in the Mission Bay South Redevelopment Area ("Redevelopment Area").

The UCSF hospital would be located on Blocks 36-39 within the Commercial Industrial land use district of the Redevelopment Area, as described in the Mission Bay South Redevelopment Plan (the "Plan"). The UCSF hospital development may also include all or portions of Block X3 within the Commercial Industrial/Retail land use district. In both of these land use districts "public structure or use of a non-industrial character" is permitted as a subset of "Other Uses" as a secondary use.

The University of California, of which UCSF is a component, is a public body specifically created by the California Constitution. A hospital or medical center is described in §790.44 of the San Francisco Planning Code as a "public or private institutional use which provides medical facilities for inpatient care, medical offices, clinics, and laboratories." The proposed UCSF hospital development will include these components. The hospital will not include manufacturing, warehousing, or distribution of goods, and can reasonably be considered a "non-industrial use." This interpretation is supported by the San Francisco Planning Code, under which hospitals are permitted as a conditional use in all C districts and NC-3 districts.

Section 302 of the Plan provides as follows:

"Secondary uses shall be permitted in a particular land use district...provided that such use generally conforms with redevelopment objectives and planning and design controls established pursuant to this Plan and is determined by the Executive Director to make a positive contribution to the character of the Plan Area, based on

Marcia Rosen  
Page 2 of 3

O-MBA24L9  
October 12, 2005  
126-03405-001

a finding of consistency with the following criteria: the secondary use, at the size and intensity contemplated and at the proposed location, will provide a development that is necessary or desirable for, and compatible with, the neighborhood or the community."

Staff believes that the UCSF hospital is appropriate as a secondary use, based on the following:

- 1) The proposed hospital will be located on approximately 10 to 14 acres of land adjacent to the Mission Bay UCSF research campus that have been determined to be blighted and are affected by environmental contamination. UCSF plans close integration of its basic academic research activities with the teaching, research and patient care activities within the planned hospital. The plan for development of the UCSF hospital generally conforms to the Redevelopment Project Objectives as described in §103 of the Plan, particularly with objective A of eliminating blight and correcting environmental deficiencies, and objective B of retaining and promoting UCSF's research and academic activities within the City and County of San Francisco.
- 2) Under the MOU, the UCSF hospital development will generally conform to the planning and design controls established pursuant to the Plan, including the street layout, setbacks, and streetscape plan. To accommodate the needs of the hospital, the MOU will include specific adjustments to the existing height and bulk standards of the Commercial Industrial and Commercial Industrial/Retail land use zones of the Mission Bay South Design for Development. These changes will lower the maximum height of a hospital to 105 feet, compared to the existing 160 foot limit, but would allow for somewhat greater bulk in the mid-rise area. These changes have been studied and presented to the public at two well-noticed public meetings. In staff's opinion, the proposed adjustments represent reasonable variation from the existing standards, which will have little if any negative effect on the surrounding community in the context of overall Mission Bay development.
- 3) The hospital will contain no more development, as calculated under the Plan in leasable square feet, than would have been permitted under the principal uses permitted in these land use districts, and there will be no net increase in the overall size of development within the Redevelopment Area. The hospital will be developed on parcels that would otherwise likely have been developed with commercial office or life science/biotechnology uses. These uses would have been constructed in buildings of reasonably similar size and appearance as the proposed hospital use.
- 4) The proposed hospital will allow UCSF to continue to provide needed tertiary health care to the residents of San Francisco in a modern seismically safe hospital, and will assist UCSF in furthering its research and academic mission.

Marcia Rosen  
Page 3 of 3

O-MBA24L9  
October 12, 2005  
126-03405-001

Based on these factors, staff believes that it is appropriate to make the finding of consistency cited above, and recommends that the Executive Director permit the development of the UCSF hospital as a secondary use in Mission Bay, subject to the approval of the MOU by the Commission.

Approved on October 12, 2005:

**Re: Warriors Arena Project: Violation of Variance Requirement.**

Dear Ms Bohee and Mr. Bollinger:

This office represents the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project"). The Mission Bay Alliance objects to approval of this Project and certification of the Project SEIR.

I write today regarding the OCII's failure to require a variance or "variation" for this Project under section 305 of the Mission Bay South Redevelopment Plan ("Plan"). The November 2, 2015, letter from Susan Brandt-Hawley, my co-counsel for the Alliance, demonstrates this Project is not an allowable secondary use under the Plan. Thus, a variance is not available because, as shown by Brandt-Hawley, the Project "will change the land uses on this Plan." (Plan, § 305.) However, in the alternative, if the Project is an allowable secondary use under the Plan, then the OCII must process this Project application as a variance and make the findings required by Plan section 305 before Project approval.

Both California and San Francisco planning law provide a process for landowners to obtain a "variance" from the "uniformity" of zoning limits that, while appropriate for the zone district in general, would impose undue hardship due to unique characteristics of a specific parcel. Government Code section 65906 governs the grant of zoning variances by municipalities and prohibits local agencies from granting "special privileges" to individual landowners. Similarly, San

Re: Warriors Arena Project DSEIR: Violation of Variance Requirement  
November 2, 2015 [2 of 2]  
Page 2

Francisco Planning Code, section 305, subdivision (a), provides that a variance permit must be approved for any exception to the requirements of the Planning Code. Subdivision (c) thereof mirrors the requirements of state law, and requires a finding that "owing to such exceptional or extraordinary circumstances the literal enforcement of specified provisions of this Code would result in practical difficulty or unnecessary hardship ...."

Similarly, the Plan includes a variance provision that reflects the same substantive requirements as Government Code section 65906 and Planning Code section 305:

The Agency may modify the land use controls in this Plan where, owing to unusual and special conditions, enforcement would result in undue hardships or would constitute an unreasonable limitation beyond the intent and purposes of these provisions. Upon written request for variation from the Plan's land use provisions from the owner of the property, which states fully the grounds of the application and the facts pertaining thereto, and upon its own further investigation, the Agency may, in its sole discretion, grant such variation from the requirements and limitations of this Plan. The Agency shall find and determine that the variation results in substantial compliance with the intent and purpose of this Plan, provided that in no instance will any variation be granted that will change the land uses on this Plan.

(Plan, § 305.)

Because the Plan's variance provision imposes virtually identical requirements as Planning Code section 305, both apply. (Plan, §'s 101 ["Regardless of any future action by the City or the Agency, whether by ordinance, resolution, initiative or otherwise, the rules, regulations, and official policies applicable to and governing the overall design, construction, fees, use or other aspect of development of the Plan Area shall be (i) this Plan and the other applicable Plan Documents, (ii) to the extent not inconsistent therewith or not superseded by this Plan, the Existing City Regulations and (iii) any new or changed City Regulations permitted under this Plan"]; 304.9.C.(iv)).

Here, the Project creates at least sixteen inconsistencies with the Design for Development (D4D). The OCII now proposes to amend the D4D, the Owner's Participation Agreement (OPA), and other Plan documents to resolve these inconsistencies by, including but not limited to, raising maximum height limits from 90 to 135 feet, allowing a second 160+ foot tower, increasing bulk limits to accommodate the arena, and changing arena setbacks, street wall heights, view corridors, public rights of way, and parking standards. (See e.g., Draft SEIR, pp. 4-7 - 4-9, § 4.2.4; Proposed Resolution 2015, exhibit A; Memorandum to the OCII from Executive Director Tiffany Bohee for Items 5(a), 5(b), 5(c), 5(d) & 5(e) the November 3, 2015, CCII meeting agenda, pp. 4, 22.)

Even if the Project's land uses are allowable secondary uses, these amendments "modify the land use controls in this Plan" as provided in Plan section 305. But the Project Sponsor has made

no showing that due to “unusual and special conditions, enforcement would result in undue hardships or would constitute an unreasonable limitation beyond the intent and purposes of these provisions.” (Plan, § 305.)

“Variances are, in effect, constitutional safety valves to permit administrative adjustments when application of a general regulation would be confiscatory or produce unique injury.” (Curtin’s California Land Use and Planning Law, p. 55.) Variance requirements also implement the State Planning and Zoning Law’s requirement of “uniformity” of zoning rules within zoning districts. (See Gov. Code, § 65852 [“All such [zoning] regulations shall be uniform for each class or kind of building or use of land throughout each zone, but the regulation in one type of zone may differ from those in other types of zones.”] *Neighbors in Support of Appropriate Land Use v. Cnty. of Tuolumne* (2007) 157 Cal.App.4th 997, 1008 (*Neighbors*).) The State Planning and Zoning Law also requires vertical consistency between local agencies general plans, zoning ordinances, and land use permits. (Gov. Code, § 65860, subd. (c) [“County or city zoning ordinances shall be consistent with the general plan of the county or city...”]; see *DeVita v. Cnty. of Napa* (1995) 9 Cal.4th 763, 772 [“A general plan is a ‘constitution’ for future development [citation omitted] located at the top of ‘the hierarchy of local government law regulating land use’”].)

California courts have vigorously enforced the requirements for granting a variance, and have developed extensive jurisprudence to corral the many stratagems local agencies have used to avoid its requirements. (See e.g., *Topanga Association v. County of Los Angeles* (1974) 11 Cal.3d 506, 511-12 (*Topanga*); *Orinda Assn. v. Board of Supervisors* (1986) 182 Cal.App.3d 1145, 1166 (*Orinda Assn*) [“A zoning scheme, after all, is similar in some respects to a contract ... If the interest of these parties in preventing unjustified variance awards for neighboring land is not sufficiently protected, the consequence will be subversion of the critical reciprocity upon which zoning regulation rests...”].)

Variance findings must focus on a comparison of the subject property to other properties in the zone district with which the variance is intended to bring it into parity, and the benefits to the community or “public interest” associated with a zoning exception are irrelevant. (*Orinda Assn, supra*, at p. 1166.) By amending the Plan documents to accommodate this Project, the OCII would cast these requirements aside and grant a “special privilege” to this Project Sponsor.

In *Neighbors*, rather than adopt a rezone or grant a variance, the County created a special exception to the zoning ordinance for one landowner by including it in a development agreement adopted under the development agreement law. (*Neighbors, supra*, 157 Cal.App.4th at p. 1003.) In rejecting this stratagem, the Court in *Neighbors* noted that there are limits on the power to rezone: “The foundations of zoning would be undermined, however, if local governments could grant favored treatment to some owners on a purely ad hoc basis ... [R]ezoning, even of the smallest parcels, still necessarily respects the principle of uniformity.” (*Id.* at pp. 1009-10.)

Commission on Community Investment and Infrastructure  
Ms Tiffany Bohee  
Mr. Brett Bollinger  
Re: Warriors Arena Project DSEIR: Violation of Variance Requirement  
November 2, 2015 [2 of 2]  
Page 4

A similar result occurred in *Trancas Prop. Owners Assn. v. City of Malibu* (2006) 138 Cal.App.4th 172 (*Trancas*). In *Trancas*, the court held an exemption from a city’s zoning requirements accomplished by contract functionally resembled a variance, and held that “such departures from standard zoning by law require administrative proceedings, including public hearings ... followed by findings for which the instant [density] exemption might not qualify... Both the substantive qualifications and the procedural means for a variance discharge public interests. Circumvention of them by contract is impermissible.” (*Id.* at p. 182.)

In sum, the OCII’s proposed grant of zoning exceptions to this Project by way of amending the Plan documents rather than by variance violates the Plan, the variance requirements of the San Francisco Planning Code and state law, and the uniformity requirement of state law.

Thank you for your attention to this matter.

Very Truly Yours,

Thomas N. Lippe

## O-MBA24L9

### Office Development Annual Limitation ("Annual Limit") Program

The Office Development Annual Limit (Annual Limit) Program became effective in 1985 with the adoption of the Downtown Plan Amendments to the Planning Code (Sections 320-325) and was subsequently amended by Propositions M (1986) and C (1987). The Program defines and regulates the allocation of any office development project that exceeds 25,000 gross square feet (gsf) in area.

A total of 950,000 gsf of office development potential becomes available for allocation in each approval period, which begins on October 17th every year. Of the total new available space, 75,000 gsf is reserved for Small Allocation projects (projects with between 25,000 and 49,999 gsf of office space), and the remaining 875,000 gsf is available for Large Allocation projects (projects with at least 50,000 gsf of office space). Any available office space not allocated in a given year is carried over to subsequent years.

This document reflects the status of the Annual Limit Program, including current availability and summaries of previously approved and pending projects.

Information in this document was last updated on **September 1, 2015**. Inquiries should be directed to Corey Teague at (415) 575-9081 or corey.teague@sfgov.org.

#### Summary of Key Figures

	Current Availability	Pending Availability	Pipeline Availability
<b>Small Allocation Projects</b> (<50,000 gsf of office space)	<b>1,188,805 gsf</b> Current total square footage available for allocation.	<b>903,255 gsf</b> Currently available square footage less 285,550 gsf of pending* projects.	<b>776,280 gsf</b> Currently available square footage less 285,550 gsf of pending* projects and 126,975 gsf of pre-application** projects.
<b>Large Allocation Projects</b> (≥50,000 gsf of office space)	<b>1,429,763 gsf</b> Current total square footage available for allocation.	<b>-1,676,791 gsf</b> Currently available square footage less 3,108,554 gsf of pending* projects.	<b>-8,529,408 gsf</b> Currently available square footage less 3,108,554 gsf of pending* projects and 6,850,617 gsf of pre-application** projects.

\* A 'pending project' is one for which an office allocation application has been submitted but not yet acted upon.

\*\* A 'pre-application' project is one for which an environmental review application, preliminary project assessment application, or other similar application has been submitted but for which no office allocation application has yet been submitted.

### PENDING OFFICE PROJECTS\*

\*Projects that have submitted an application (B or OFA) pursuant to Planning Code Section 321 (Office Development Annual Limit) but on which no Commission action has yet occurred.

Small Office Cap					
Case No.	Address	Sq. Ft.	Status	Staff	Comments
2009.0065	3433 Third Street	49,229	B filed 1/27/09	Julian Banales	New 5-story office building for Carpenter's Union on vacant lot. May be cancelled due to inactivity (2/18/14).
2014.0567	2101 Mission Street	48,660	B filed on 4/17/14	Brittany Bendix	Legalize change of use from retail and warehouse to office. Planning Commission hearing scheduled for 9/3/15.
2012.1410	77-85 Federal Street	49,730	B filed on 6/5/14	Scott MacPherson	Demo two existing office buildings and construct a 5-story building with ground floor retail and office above.
2015-000509	1125 Mission Street	37,944	B filed on 1/15/15	Julian Banales	Change of use from auto repair.
2014.1315	135 Townsend Street	49,995	B filed on 3/11/15	Rich Sucre	Conversion of existing self storage building.
2013.1511	360 Spear Street (aka 100 Harrison St)	49,992	B filed on 4/3/15	Rich Sucre	Partial conversion of existing ISE.
<b>Subtotal</b>		<b>285,550</b>			

Large Office					
Case No.	Address	Sq. Ft.	Status	Staff	Comments
2012.0640	598 Brannan Street	700,456	B filed on 10/24/12	Elizabeth Puri	Demo of 2 industrial buildings; 2 new office buildings (Central SolMa Project).
2013.1545	645 Harrison Street	99,698	B filed on 7/18/13	Kimberly Durandet	LoD confirmed 14,520gsf as existing legal office space. Revised proposal to convert additional 99,698gsf, plus retain 33,758gsf of PDR on first and second floors.
2013.1593	2 Henry Adams	245,697	B filed on 2/6/14	Rich Sucre	Owner-initiated Article 10 Landmark designation and an Office Allocation. Eligible area limited by recent legislation.
2011.0409	925 Mission Street	803,300	B filed on 8/19/14	Kevin Guy	"SM" Project. Planning Commission informational hearing scheduled for 9/3/15.
2006.1523	50 First Street	1,050,000	B filed on 6/4/14	Kevin Guy	Demo and construction of a mixed-use building with two towers.
2014-002701	GSW Development	0	B filed on 12/12/14	David Winslow	Design approval only. Allocation already approved in Alexandria District.
2014.1063	633 Folsom Street	89,804	B filed on 12/23/14	Mark Luellen	Four story office addition to existing seven story building.
2014.0154	1800 Mission Street	119,599	OFA filed on 1/27/15	Rich Sucre	Conversion in the Armory.

# **PRE-APPLICATION OFFICE PROJECTS\***

\*Projects that have submitted for initial Department review (e.g. environmental review (EE) or Preliminary Project Assessment (PPA)), but have not submitted an application pursuant to Planning Code Section 321 (Office Development Annual Limit).

Small Office Cap					
Case No.	Address	Sq. Ft.	Status	Staff	Comments
2014.1616	1200 Van Ness Ave	27,000	PPA issued 1/14/15.	Mary Woods	Exact office square footage TBD.
2015-010219	462 Bryant Street	49,995	PPA filed on 8/12/15.		An existing single story office building and basement will remain, and five stories of new office space will be added (approximately 49,995 gsf of new office space).
2015-010374	598 Bryant Street	49,980	PPA filed on 8/12/15.	Kansai Uchida	Demo existing gas station and construct a 9-story mixed-use office building with underground parking.
<b>Subtotal</b>		<b>126,975</b>			

Large Office Cap					
Case No.	Address	Sq. Ft.	Status	Staff	Comments
2005.0759	725-735 Harrison	730,940	PPA letter issued 5/16/2013. Revised EE pending.	Debra Dwyer	"Harrison Gardens" (Central SoMa Project). Original proposal changed to office per 2/21/13 application amendment.
2014.0416	610-620 Brannan Street	561,065	EE filed 6/19/14	Elizabeth Puri	Demo and new 11-story mixed use bldg (Central SoMa Project).
2013.0478	559 6th Street	123,972	PPA issued on 6/17/13. PPA expired on 12/17/14.	Kimia Haddadan	Demolish 3 bldgs and construct a mixed-use project (Central SoMa Project)
2013.0970	Pier 70 (Forest City Only)	1,810,000	EE filed on 11/10/14.	Andrea Contreras	SF Port project
n/a	2525 16th Street	60,980	Legitimization request filed 11/30/12	Corey Teague	EN Legitimization
2014.0858	565-585 Bryant Street	188,280	PPA issued on 7/25/14	Jeremy Shaw	Demo four existing bldgs and construct an 11-story mixed-use bldg. 2nd PPA proposes only 46,990sf of office (Central SoMa Project).
2014.0405	330 Townsend Street	394,300	PPA issued on 5/15/14	Steve Wertheim	Demo existing bldg and construct a 21-story office bldg. 2nd PPA proposes only 212,300sf of office (Central SoMa Project).
2013.0208	SWL 337 ("Mission Rock")	1,300,000	EE filed on 6/4/13	Josh Switzky	Large mixed-use project on Port property.
2015-004256	630-698 Brannan St	1,512,260	PPA issued on 7/24/15. EE filed 7/24/15.	Lisa Chen	Flower Mart replacement project (Central SoMa Project). Two Previous PPAs. 2015-001903 analysed proposed 1,492,450gsf. 2013.0370 was under different ownership, only included Lot 5, and analysed 655,150gsf.

Subject: Response to Comments on the DSEIR for the Event Center & Mixed-Use Development at Mission Bay Blocks 29-32 (Project).

Dear Ms. Bohee:

The Bay Area Air Quality Management District (Air District) is willing to assist the City and County of San Francisco (City) by administering an off-site mitigation program to reduce this Project's significant air quality impacts to the extent feasible. As we have discussed extensively with City staff, the \$321,646 identified in M-AQ-2b is not sufficient to achieve the 17 tons per year of ozone precursor emission reductions needed for this Project. Due to the nature of air quality impacts that need to be mitigated, comparison of the Air District off-site mitigation program identified for this Project to other air district programs is inappropriate and incorrect.

The amount of funds required to reduce 4.4 tons of reactive organic gases (ROG) and 12.6 tons of oxides of nitrogen (NOx), including a 5 percent administration fee, is \$620,922. This amount is based on a study of the Air District's Vehicle Buy Back (VBB) program funds spent over the last 3 years and represents the average cost of reducing ROG and NOx during that three year period. Only through the VBB program can the Air District achieve the contemporaneous emission reductions and other conditions set forth in M-AQ-2b.

Air District staff continues to be willing to assist the City in implementing an off-site mitigation program. However, the Final Environmental Impact Report Response to Comments includes the following statement: "Acceptance of this fee by the BAAQMD shall serve as an acknowledgement and commitment by the BAAQMD to: (1) Implement an emissions reduction project(s) within one year of receipt of the mitigation fee to achieve the emission reduction objectives specified above [i.e. 17 tons of ozone precursors per year]". Given this language, unless the City amends M-AQ-2b to fund this feasible mitigation measure at the \$620,922 level previously discussed with City staff, the Air District will be unable to participate in offsetting this Project's air quality impacts.

DATE: November 2, 2015

TO: Tiffany Bohee, OCII Executive Director

FROM: Chris Kern, City Planning Department  
Sally Oerth, OCII Staff

SUBJECT: BAAQMD November 2, 2015 letter re Ozone Precursors Offset Mitigation Fee

The City Planning Department and the staff of the Office of Community Investment and Infrastructure (OCII) have reviewed the November 2, 2015 letter from the Bay Area Air Quality Management District regarding the Warriors Event Center and Mixed Use Development Subsequent Environmental Impact Report (SEIR). The letter states that the \$18,030 per weighted ton per year plus a 5% administrative fee mitigation fee identified in Mitigation Measure M-AQ-2b of the SEIR is insufficient to achieve the required reduction of 17.0 tons per year of ozone precursors. The letter proposes that the mitigation fee should be based on the BAAQMD's Vehicle Buy Back Program, at a cost of \$620,922 (or approximately \$36,525 per weighted ton per year) to achieve the required emissions reduction.

As discussed in the Draft SEIR (pages 5.4-41 through 5.4-42) and the Responses to Comments document (pages 13.13-65 through 13.13-69), the offset fee identified in Mitigation Measure M-AQ-2b is based on the California Air Resources Board (CARB) Carl Moyer program cost-effectiveness criteria. These criteria were developed by CARB to establish the upper limit for emissions offset projects eligible to receive funding through the Carl Moyer program.

Planning staff has been in communication with BAAQMD with regard to its suggestion that a higher fee may be warranted to offset project emissions to a less than significant level and found that BAAQMD could not establish that an increased rate beyond that of the Carl Moyer Program plus a five percent administrative fee could meet the "rough proportionality" standard required under CEQA. The Carl Moyer fee structure was reviewed and updated by CARB in March of 2015 and became fully implemented on July 1, 2015. The offset costs cited in Mitigation Measure M-AQ-2b Emission Offsets are consistent with those of the CARB and other operating California air districts. For example, in the Sacramento Metropolitan Air Quality Management District, the off-site construction mitigation fee rate is \$18,030 per ton of excess NOx emissions as of July 1, 2015 (plus an administrative fee of 5 percent) and is based on the cost effectiveness formula established in California's Carl Moyer Incentive Program. In the San Joaquin Valley Air Pollution Control District, the Indirect Source Review (ISR) program requires that an offsite reduction fee of \$9,350/ton plus a 4 percent administration fee be applied

for NOx emission reductions that cannot be achieved through onsite emission reduction measures. Furthermore, the offset costs in Mitigation Measure M-AQ-2b is consistent or even higher than comparable offset programs in the SFBAAB.<sup>1</sup>

The BAAQMD's November 2, 2015, letter does not establish that the CARB cost-effectiveness criteria are inappropriate for determining the offset costs under Mitigation Measure M-AQ-2b. Based on the information and analysis presented in the Draft SEIR, the Responses to Comments and supporting technical analyses, Planning Department and OCII staffs continue to believe that the offset fee established in Mitigation Measure M-AQ-2b is sufficient to achieve the required emissions offsets. In addition, as discussed in the Responses to Comments document, Mitigation Measure M-AQ-2b has been revised since publication of the Draft SEIR to allow the project sponsor to directly implement an emissions offset project as an alternative to entering into an agreement with the BAAQMD.

Therefore, for the reasons summarized above and discussed in greater detail in the SEIR and Responses to Comments, the November 2, 2015, letter from the BAAQMD does not alter the analysis or conclusions reached in the SEIR.

San Francisco, CA 94103

**Re: Warriors Arena Project Subdivision Map Application, Block 8722/001, 008  
(Project ID # 8593)**

Dear Bureau of Street-Use and Mapping:

This office represents the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project").

The Mission Bay Alliance requests notice of any public hearing, to be provided to my office, on this application.

The Mission Bay Alliance objects to approval of the Project's subdivision map application for the following reasons.

1. The Project SEIR does not comply with CEQA, as described in the Alliance's many comments on the SEIR submitted to the Successor Agency. 1  
[LC-ERP-1]
2. The Project does not comply with the Mission Bay South Redevelopment Plan as discussed in my November 5, 2015, letter to the Planning Commission attached as Exhibit 1. 2  
[LC-PP-1]
3. The Project does not comply with the San Francisco General Plan as discussed in my November 5, 2015, letter to the Planning Commission attached as Exhibit 1. 3  
[LC-PP-3]
4. The Project does not comply with Proposition M, as codified at Planning Code Section 320 et seq and Planning Commission Motion 17709, and is it is ineligible for allocation of any office space under Planning Code section 321 and Motion 17709, as discussed in my November 5, 2015, letter to the Planning Commission attached as Exhibit 1. 4  
[LC-PP-2]

November 5, 2015

President Rodney Fong and Members of the Planning Commission  
City and County of San Francisco  
1650 Mission Street, Suite 400  
San Francisco, CA 94103

**Re: Warriors Arena Project: Planning Codes section 321 and 305, General Plan  
Inconsistency and CEQA Findings.**

Dear Commission President Fong and Members of the Commission:  
:

This office represents the Mission Bay Alliance (“Alliance”), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (“Warriors Arena Project” or “Project”). The Mission Bay Alliance objects to approval of this Project and certification of the Project SEIR.

**1. The Project is ineligible for any office space allocation under Planning Code section 321 and Motion 17709.**

**a. This Project does not comply with the Design for Development.**

Resolution 14702 and Motion 17709 require that any project in the Alexandria District must comply with the Mission Bay South Design for Development in order to be eligible for any office space allocation. (See Motion 17709, p. 9, Finding 9,<sup>1</sup> Finding 10<sup>2</sup>.)

---

<sup>1</sup>“This schedule of phased authorization will ensure that, in accord with Resolution 14702, adequate office space can be allocated to those projects within the Development District that are determined to be in compliance with the D for D requirements, while also complying with Section 321 of the Planning Code forbidding exceedance of the square footage available for allocation in any given annual cycle.”

<sup>2</sup>“Pursuant to Resolution 14702, the Commission is charged with determining whether a project seeking authorization conforms to applicable standards in the D for D Document, which supersedes the criteria set forth in Section 321 and other provisions of the Code except as provided in the MBS Plan. The projects previously approved were determined to have met the MBS Redevelopment Plan and the D for D Document standards and guidelines, and requirements for childcare, public art, and other provisions of the Plan Documents, and retain

**EXHIBIT 1**

O-MBA25L10

Planning Commission  
City and County of San Francisco  
Re: Warriors Arena Project DSEIR  
November 5, 2015  
Page 2

This Project does not comply with the Design for Development, as evidenced by the many amendments that the Successor Agency made to the Design for Development to accommodate the Project. Therefore, it is ineligible for allocation of any office space under Planning Code section 321 and Motion 17709.

**b. This Project is inconsistent with the Redevelopment Plan.**

A basic premise of the Planning Commission decisions in Resolution 14702 and Motion 17709, and a fundamental rationale for “superseding” section 321’s guidelines in favor of the Redevelopment Plan and Redevelopment Plan documents, were the Commission’s findings that the Redevelopment Plan met standards set in section 321, the San Francisco Master Plan, the priority policies in Planning Code section 101.1, and the requirements of redevelopment law. In short, in order to be eligible for the office space allocation available under motion 17709, the Project must be consistent with the Redevelopment Plan.

This Project is inconsistent with the Redevelopment Plan because, as demonstrated in the November 2, 2015, letter from Susan Brandt-Hawley, my co-counsel for the Alliance (attached as Exhibit 1), this Project is not an allowable secondary use under the Redevelopment Plan. However, in the alternative, as shown in my November 2, 2015, letter (attached as Exhibit 2), if the Project is an allowable secondary use under the Redevelopment Plan, then it requires a variance under section 305 of the Plan before Project approval.

**2. The office space allocation requested for this Project exceeds the amount authorized for the Alexandria District.**

In 1986, San Francisco voters passed Proposition M, a referendum limiting the amount of office space that can be approved each year. Codified as Section 321 of the San Francisco Planning Code, it provides that “[n]o office development may be approved during any approval period if the additional office space in that office development, when added to the additional office space in all other office developments . . . would exceed 950,000 square feet.” (San Francisco Planning Code § 321(a)(1).) Office space is defined to mean “construction . . . of any structure” that has the “effect of creating additional office space.”

The current Project plans call for the construction of two office towers on Mission Bay South Parcels 29 and 31, comprising 309,436 square feet and 267,486 square feet of office space, respectively, for

---

that design approval, along with all previously imposed conditions of approval. Future projects requesting authorization will be brought before the Commission for design review in accord with Resolution 14702, and upon determination by the Commission that such proposals are in conformity with the D for D and other applicable requirements, office space may be allocated for such new structures from the unassigned amount available in the Development District.”

## O-MBA25L10

Planning Commission  
City and County of San Francisco  
Re: Warriors Arena Project DSEIR  
November 5, 2015  
Page 3

a total of 576,922 square feet of office space. (Executive Summary, p. 2.)

In 2008, the Planning Commission adopted Motion No. 17709. Motion 17709 approved a cumulative total office space allocation for all projects within the Alexandria Development District of 1,350,000 gross square feet. (Motion 17709, p. 9, Finding 9.) Of that amount, 1,222,980 was allocated before the adoption of Motion 17709. (Motion 17709, p. 5, Finding 4, Table 1.) Therefore, at the time Motion 17709 was proposed, 227,020 gsf of unallocated office remained for allocation. (Motion 17709, p. 9, Finding 9, Table 4.)

According to Motion 17709, there were three pending projects at that time, at 600 Terry Francois, 650 Terry Francois, and 1450 Owens Street. Motion 17709 states that these projects represented 665,880 square feet of “potential office space.” (Motion 17709, p. 5, Finding 5, Table 2.) Motion 17709 also states an intent to authorize only 57% of “potential office space” for actual office space after 10/18/09, 53% of “potential office space” for actual office space after 10/18/10, and 50% of “potential office space” for actual office space after 10/18/11.

Motion 17709 does not state how much actual office space was approved for the three pending projects at 600 Terry Francois, 650 Terry Francois, and 1450 Owens Street. The Planning Department’s Office Development Annual Limitation Program record (attached as Exhibit 3) shows “0\*” in the “size” column for these projects. (Exhibit 3, p. 19.) Assuming the Planning Commission allocated office space to these projects at the 57% ratio, that amount is 379,552 gsf (665,880 x .5). **This amount exceeds the remaining office space available for allocation at that time (i.e., 227,020 gsf).**

According to Motion 17709, there were two additional areas where the applicant indicated an intent to develop “potential office space,” namely, MB South Blocks “29 and 31” and “33-34.” (Motion 17709, p. 5, Finding 6, Table 3.) Motion 17709 states that these possible future projects represented 915,700 square feet of “potential office space,” with Blocks “29 and 31” at 515,700 GSF. (Motion 17709, p. 5, Finding 6, Table 3.)

Assuming, again, that the Planning Commission allocated office space to these areas at the 50% ratio, that amount is 457,850 GSF (915,700 x .5), with 257,850 allocated to Blocks “29 and 31” at 257,850 gsf (515,700 x .5).

The Draft Motion proposed for adoption at today’s hearing states that “Blocks 29-32 are included in the Development District and have been allocated a total of 677,020 sf of office space pursuant to Motion No. 17709.” (Draft Motion, p. 3.) This is incorrect in at least four ways.

First, it is unclear and unstated how Planning staff derived the 677,020 gsf number.

Second, after approval of the office space allocation for the three pending projects at 600 Terry Francois, 650 Terry Francois, and 1450 Owens Street, there was no office space left in the

## O-MBA25L10

Planning Commission  
City and County of San Francisco  
Re: Warriors Arena Project DSEIR  
November 5, 2015  
Page 4

Alexandria District to allocate - as discussed above.

Third, even if one adds together the “potential office space” numbers for Blocks 29-32 in Motion 17709, the sum is 1,119,999 gsf, and 50% of that is only 560,000 gsf. The two office towers proposed for this Project require 576,922 gsf. (See Executive Summary, pp. 1-2: 309,436 gsf in the South tower and 267,486 gsf in the 16<sup>th</sup> Street tower). This number exceeds 560,000 gsf.

Fourth, when one adds the 25,000 gsf for office space in the arena building (see SEIR p. 3-17), the office space for this project totals 601,922 gsf (i.e., 576,922 plus 25,000), which also exceeds 560,000 gsf.

Fifth, to the extent there was any office space left for Motion 17709 to allocate after approval of the office space allocation for the three pending projects at 600 Terry Francois, 650 Terry Francois, and 1450 Owens Street, Motion 17709 allocated only 257,850 gsf to Blocks 29 and 31 (i.e., 50% of 515,700) pursuant to Finding 6, Table 3. **The 576,922 gsf of office space in the two office towers for this Project are located in Blocks 29 and 31; and the total of 576,922 gsf vastly exceeds the 257,850 gsf that may arguably be available.**

Because the office towers called for in the Project exceed the allowable office space cap, Section 321(a)(1) and Motion 17709 require the Planning Commission to deny approval of the Project and of the requested allocations of office space.

### 3. General Plan Inconsistency: BAAQMD.

San Francisco Master Plan Policy 4.1 states:

Support and comply with objectives, policies, and air quality standards of the Bay Area Air Quality Management District.

Regionwide monitoring of air quality and enforcement of air quality standards constitute the primary means of reducing harmful emissions. The conservation of San Francisco's air resource is dependent upon the continuation and strengthening of regional controls over air polluters. San Francisco should do all that is in its power to support the Bay Area Air Quality Management district in its following operations:

- Monitoring both stationary and mobile sources of air pollution within the region and enforcing District regulations for achieving air quality standards.
- Regulating new construction that may significantly impair ambient air quality.
- Maintaining alert, permit, and violations systems.
- Developing more effective controls and method of enforcement, as necessary

The attached letter from the Bay Area Air Quality Management District (Exhibit 4) and the City’s response (Exhibit 5) show that this Project does not comply with this policy.

## O-MBA25L10

Planning Commission  
City and County of San Francisco  
Re: Warriors Arena Project DSEIR  
November 5, 2015  
Page 5

The Alliance previously commented on the Draft SEIR (Comment AQ-7) that the per ton charge for emission offsets is too low to achieve complete offset of the Project's emissions. The City's response to comments on this point is cagey, but it does suggest what now turns out to be fact - that the BAAQMD agreed with the comment - because the response states:

SF Planning has been in communication with BAAQMD with regard to its suggestion that a higher fee may be warranted to offset project emissions to a less than significant level and found that BAAQMD could not establish that an increased rate beyond that of the Carl Moyer Program plus a five percent administrative fee could meet the "rough proportionality" standard required under CEQA.

(RTC, p. 13.13-67.) The RTC's rationale for contending that a higher offset fee would not meet the "rough proportionality" standard is that offset fees in other areas of the state are not higher than the offset fee proposed in the DSEIR. This is an error of law. The "rough proportionality" requirement requires a comparison of the cost of the mitigation to the degree of severity of the impact. The fees charged in other areas of the state are irrelevant to "rough proportionality."

### 4. CEQA Findings: General

The Commission cannot make any CEQA findings required by CEQA section 21081 or CEQA Guidelines 15091, 15093, 15096(f), because the Project SEIR does not comply with CEQA and is not certifiable, for the reasons described in the Alliance's comments on the SEIR.

### 5. CEQA Findings: BAAQMD.

The Commission cannot find that "Impact AQ-4: Potential conflicts with BAAQMD's 2010 Clean Air Plan" is less than significant with mitigation because the City and Project Sponsor refuse to agree to BAAQMD's offset fees per Mitigation Measure M-AQ-2b. (See Exhibits 4 and 5.) There is also no evidence that the "Option 2" offset idea within Mitigation Measure M-AQ-2b is feasible. There are too many unanswered questions regarding Option 2, including lack of assured verification of offsets to ensure their effectiveness, and lack of assurance that offset sources are available in the quantity required. BAAQMD's offset program at least answers some, if not all, of these questions.

The Commission cannot find that all feasible mitigation measures that would substantially reduce "Impact AQ-1: Impacts of Criteria Air Pollutants from Construction" have been adopted as required by CEQA section 21081, because there is no evidence that paying the offset fees demanded by BAAQMD is infeasible. Also, as discussed above, there is no evidence that the "Option 2" offset idea within Mitigation Measure M-AQ-2b is feasible; therefore, it is not an adequate substitute for BAAQMD's offset program. This also applies to

- Impact AQ-2: Impacts of Criteria Air Pollutants from Project Operations"; Impact C-AQ-1: Project Contribution to Regional Air Quality Impacts;

## O-MBA25L10

Planning Commission  
City and County of San Francisco  
Re: Warriors Arena Project DSEIR  
November 5, 2015  
Page 6

- Impact C-AQ-1: Project Contribution to Regional Air Quality Impacts.

### 6. CEQA Findings: Pier 80 Alternate Site.

The Commission cannot find that feasible alternatives that would substantially reduce the Project's significant impacts have been adopted. The SEIR does not analyze the alternate site proposed by the Alliance near Pier 80, and did not circulate that analysis for public comment. Neither OCII nor this Commission has the basis to make conclusory findings rejecting the alternative. Among the relevant facts not considered in the findings is that the site is three times as large as would be required for the Event Center project and need not utilize any of the City-owned property nor any particular configuration of the privately-owned lots should there be an unwilling seller. There is no evidence provided that the site could not be acquired within a reasonable time period.

Case law confirms that assuring a site's consistency with city plans and zoning is within the City's power. Similarly, the scheduling of transportation services to the site can be increased, and the findings provide no studies to back up conclusory statements regarding traffic, air quality, hydrology, or water quality impacts. Since only a third of the site is needed to accommodate the event center, all of the impacts (if shown to have concern after sufficient technical review) can be avoided or mitigated. As stated in the Alliance letter to OCII that proposes this site for consideration as an alternative, here incorporated by reference, the SEIR failed to consider a potentially-feasible off-site alternative and must be revised and recirculated to do so before findings of infeasibility may be considered or adopted. The site suggested by the Alliance is potentially feasible and deserving of study.

Thank you for your attention to this matter.

Very Truly Yours,

Thomas N. Lippe

Tiffany Bohee, OCII Executive Director  
c/o Brett Bollinger, San Francisco Planning Department  
via email [warriors@sfgov.org](mailto:warriors@sfgov.org)

Subject: Warriors Event Center & Mixed Use Development  
Inconsistency with Mission Bay South Redevelopment Plan  
'Secondary Use' Classification

Dear Director Bohee and Mr. Bollinger:

The Mission Bay Alliance (the Alliance) contends that the Warriors' Event Center is unlawfully inconsistent with every use allowed by the Mission Bay South Redevelopment Plan (the Plan). Although the Alliance raised this issue in comments on the Draft Subsequent EIR (DSEIR), both the Responses to Comments in the Final SEIR and OCII's findings of project consistency remain materially inadequate.

The Plan designates uses allowed at a 'Commercial Industrial/Retail' site. The Alliance notes that while OCII now concedes that a sports arena is not within the scope of allowed 'principal uses' in that zoning, OCII contends that an arena is consistent with 'secondary uses.' As this letter will explain, all such secondary uses are similarly and demonstrably insufficient to permit the Warriors' sports arena.

**Nighttime Entertainment.** The Initial Study concluded, in error, that the DSEIR did not need to address land use issues — at all. It asserted that the entire Event Center, including the sports arena use, somehow met the secondary 'Nighttime Entertainment' use analyzed in the 1998 Plan EIR. Secondary uses were then generally referenced in the DSEIR (*e.g.*, pp. 3-8, 3-51, 4-5, 5.2-115), but there was no discussion of which category of secondary use would be allocated to the Event Center, inferring acceptance of the Nighttime Entertainment category.

The Plan describes Nighttime Entertainment in terms of small-scale local uses like dance halls, bars, nightclubs, discotheques, nightclubs, private clubs, and

EXHIBIT 1

O-MBA25L10

Warriors Event Center  
Secondary Use Inconsistency  
November 2, 2015  
Page 2 of 4

restaurants. (Plan, p. 50.) At the time of the 1998 EIR, several small neighborhood bars occasionally offered nighttime entertainment, consistent with the secondary use category. Such minor uses were compatible with the 3rd Street Corridor and the waterfront. Clearly, no mammoth regional entertainment venue was anticipated in Mission Bay South and no such use was considered in the 1998 Plan EIR.

And while professional basketball games are held at night, the Event Center also projects 31 annual events "related to conventions, conferences, civic events, corporate events and other gatherings," with an estimated attendance of between 9,000 and 18,500 patrons. "[T]he majority of events are expected to occur during day time hours." Such events are not 'Nighttime Entertainment.'

The Director's currently-proposed findings that the sports arena is 'Nighttime Entertainment' contemplated as a secondary use in the Plan are unsupported. The findings fail to match the scope and impacts of a professional sports venue with the analysis or description of uses in the Plan or in the 1998 EIR. The findings are fatally conclusory; that somehow a professional sports venue would be "similar" to a nightclub or bar use in the 'Nighttime Entertainment' category "because" it will serve alcohol, provide amplified live entertainment, and provide a venue for evening gatherings. The findings fail to address the core inconsistency of a regional sports arena with the intent of the adopted Plan and the Design for Development, which focus on commercial entertainment uses in Mission Bay North to complement the Giants' ballpark.

OCII's reliance on the negative; to wit, that the 'Nighttime Entertainment' secondary use has no specific size limitations, is not enough. The Plan provides for the continued development of Mission Bay South as a walkable urban community intended to facilitate world-class medical and biotechnology development. The Event Center project violates the Plan Area Map carefully designed in classic, walkable Vara Blocks. (Plan, Attachment 2, p. 40.) Neither the Plan nor the Design for Development contemplate any uses comparable in scope or impact to the Event Center as 'Nighttime Entertainment.'

That being said, in fact in the Final SEIR and as reflected in the proposed Plan consistency findings, OCII now implicitly agrees with the Alliance that the 'Nighttime Entertainment' secondary use standing alone does not encompass a sports arena. Now, OCII additionally relies on the Plan's alternate 'secondary uses.' No such uses are consistent with the Plan, as explained below.

O-MBA25L10

Warriors Event Center  
Secondary Use Inconsistency  
November 2, 2015  
Page 3 of 4

**Recreation Building.** One of the Plan's secondary use categories is for an undefined 'Recreation building.' (Plan, p. 15.) The Plan describes 'Outdoor Recreation' as "an area, not within a building, which is provided *for the recreational uses of patrons* of a commercial establishment." (Plan, p. 50, italics added.)

OCII's proposed findings as to the 'Recreation building' category stretch the regional sports arena use not only beyond what was contemplated by the Plan or studied in the 1998 EIR, but beyond logic. To state the obvious: there is a difference between 'recreation' and 'entertainment.' Both involve enjoyment and leisure, and may involve ancillary eating and drinking, and the Alliance has no quarrel with the Director's reference to recreation as "something people do to relax or have fun; activities done for enjoyment." (OCII Proposed Secondary Use Determination, p. 6.) But myriad dictionary definitions confirm and it cannot readily be denied that 'recreation' is commonly understood to involve one's personal physical activities while 'entertainment' refers to events or performances designed to entertain others.

None of the Plan's various references to 'entertainment' include athletic activities normally considered 'recreation:' Adult Entertainment [bookstore or theater], Amusement Enterprise [video games], Bar [drinking and theater], Theater [movies and performance]. (Plan, Attachment 5, pp. 44-51.) Consistently, the 1998 EIR's discussion of 'recreational' land uses focused in turn on open space, bicycles, parks, and water-based activities. (Mission Bay EIR, Volume IIB, pp. V.M. 15-28.)

In context, the Plan's reference to 'Recreation building' as a secondary use contemplates participatory recreational uses like the 'recreation facilities' referenced in the 1998 Plan EIR for the existing golf driving range and in-line hockey rink, with the expressed expectation that the size of recreational 'facilities' would decrease as redevelopment of the Plan area progressed. (OCII Proposed Secondary Use Determination, p. 6.)

Reliance on the secondary use of 'Recreation building' is unsupported.

**Public Structure or Use of a Nonindustrial Character.** As presented in the Plan, the category of "other secondary uses" labeled 'Public structure or use of a nonindustrial character' references *one* secondary use, not *two*. (Plan, p. 13.) The use is required to be public, and either a structure *or* a use.

O-MBA25L10

Warriors Event Center  
Secondary Use Inconsistency  
November 2, 2015  
Page 4 of 4

The interpretation urged by the Director is, again, strained beyond the plain words of the Plan. 'Public' is not defined in the Plan and so its common meaning is assumed. But as proposed in the consistency findings, OCII interprets a 'public' use as simply requiring that the public be somehow 'served.' That would encompass every kind of principal and secondary use listed in the Plan, from child care to animal care to hotel, *etc.*, and renders the category meaningless: *i.e.*, "Any use is ok."

Instead, a public structure or use is commonly understood to be under the control and management of a public agency for the benefit of its constituency — such as the University of California<sup>1</sup> or the City of San Francisco. The Plan provides a description of a range of anticipated public improvements in Attachment 4. This list includes both public buildings and public uses. None of the public improvements listed in Attachment 4 include anything like a private professional sports arena.

The Event Center is a private project and is not within the scope of the secondary use category for a public structure or use of a nonindustrial character.

**Director's Findings.** As explained, the sports arena uses that are the impetus for the Event Center project are not allowed by the Plan's allowed principal or secondary uses. An allowed use is prerequisite for a finding of Plan consistency. The Alliance will not belabor the myriad other inconsistencies with the Plan's objectives, design, incompatibility with UCSF, and creation of significant environmental impacts, as those have been described in the DSEIR comments and throughout the administrative record, but hereby objects to their insufficiencies and lack of supporting substantial evidence for the Plan consistency finding.

Consideration of the Event Center project must be preceded by amendment of the Plan to be consistent with the delineated principal and secondary uses and the adopted Plan Area Map of the Mission Bay South Redevelopment Plan.

Thank you.

Sincerely yours,

  
Susan Brandt-Hawley  
Attorney for Mission Bay Alliance

<sup>1</sup> See attached 2005 Resolution and Secondary Use finding regarding the "UCSF hospital" as a "public structure or use of a non-industrial character" for "a public body specifically created by the California Constitution."

O-MBA25L10

RESOLUTION NO. 176-2005

Adopted November 1, 2005

APPROVING A MEMORANDUM OF UNDERSTANDING WITH THE REGENTS OF THE UNIVERSITY OF CALIFORNIA, A CALIFORNIA PUBLIC CORPORATION, AND ACKNOWLEDGING THE EXECUTIVE DIRECTOR'S FINDINGS OF CONSISTENCY WITH THE MISSION BAY SOUTH REDEVELOPMENT PLAN, FOR THE EXPANSION OF UCSF FACILITIES IN THE MISSION BAY SOUTH REDEVELOPMENT PROJECT AREA; MISSION BAY SOUTH REDEVELOPMENT PROJECT AREA

BASIS FOR RESOLUTION

1. On September 17, 1998, by Resolution No. 193-98, the Redevelopment Agency of the City and County of San Francisco's (the "Agency") Commission (the "Agency Commission") conditionally approved the Mission Bay South Owner Participation Agreement (the "South OPA") and related documents between Catellus Development Corporation (the "Owner") and the Agency for development in the Mission Bay South Redevelopment Project Area (the "Project Area").
2. On November 2, 1998, the Board of Supervisors of the City and County of San Francisco (the "Board") by Ordinance No. 335-98 approved and adopted the Redevelopment Plan for the Mission Bay South Redevelopment Project Area (the "Plan"). The Board's adoption of the Plan satisfied the conditions to the effectiveness of Agency Resolution No. 193-98.
3. On November 16, 1998, the Agency entered into the South OPA with the Owner. The South OPA sets forth phasing principles that govern the development of property in the Project Area. Those principles include the Owner's obligations to deliver to the Agency affordable housing sites as market rate housing is built in the Project Area. They also include the Owner's commitments to construct public open space and other public infrastructure adjacent to – or otherwise triggered by – development on any of the private parcels governed by the South OPA.
4. Under the South OPA and the related Mission Bay South Tax Increment Allocation Pledge Agreement (the "Pledge Agreement"), dated as of November 16, 1998, between the Agency and the City and County of San Francisco (the "City"), approximately 20% of the total property tax increment (plus certain excess tax increment) generated by development in the Project Area is contractually dedicated to develop affordable housing units on parcels that the Owner will contribute to the Agency, to achieve the affordable housing program contemplated by the Plan.

O-MBA25L10

5. The South OPA requires the Owner to construct the public infrastructure directly related to each of the major phases in accordance with the incremental build-out of each project. Under the South OPA and the Pledge Agreement, the Agency is obligated to fund, repay or reimburse the Owner, subject to certain conditions, for the direct and indirect costs of constructing the infrastructure. The Agency has established a Community Facilities District ("CFD") for infrastructure in the Project Area. The Agency has also established a separate CFD to pay the costs of maintaining the public open space in the Project Area.
6. The South OPA provides that as a condition to any transfer of property in the Project Area, the Owner must obtain the agreement of the transferee to assume all of Owner's obligations under the South OPA with respect to the transferred parcels.
7. The Project Area includes an approximately 43-acre biomedical research and educational campus site (the "Campus Site") for the University of California, San Francisco ("UCSF"). UCSF has already invested about \$675 million on projects completed or underway on the Campus Site within the Plan Area and has plans to invest another \$225 million on projects in design.
8. The Regents of the University of California, a California public corporation ("The Regents") wishes to lease or acquire, and the Owner wishes to transfer Parcels 36, 37, 38 and 39 in the Project Area, comprising approximately 9.65 acres of land for the possible expansion of UCSF in Mission Bay (the "Expansion Parcels"). These parcels are not part of the 43 acres that the Plan originally designated as the Campus Site.
9. On November 30, 2004, The Regents released proposed amendments in draft form to its long range development plan, as LRDP Amendment #2. Those amendments contemplate an expansion of UCSF facilities onto the Expansion Parcels, including the possibility of developing by 2012 new integrated specialty Children's, Women's and Cancer hospitals containing about 210 beds, together with ambulatory and research facilities. In March 2005, The Regents approved LRDP Amendment #2 (the "Project") and certified a related final environmental impact report (the "LRDP #2 FEIR") which analyzed the environmental effects of the proposed UCSF development on the Expansion Parcels. Copies of the LRDP #2 FEIR are on file with the Agency Secretary.
10. The Owner and The Regents have entered into an Option Agreement and Grant of Option to Lease, dated as of January 1, 2005 (the "Option to Lease"), which provides that upon the satisfaction of certain conditions and the exercise by The Regents of its option (i) Catellus, as landlord, and The Regents, as tenant, will enter into a long-term ground lease of the Expansion Parcels (the "Lease") and (ii) the Owner and The Regents will at the same time enter into an Option Agreement and Grant of Option to Purchase (the

O-MBA25L10

"Option to Purchase") under which The Regents will have an option to purchase the Expansion Parcels.

11. If The Regents exercises the Option to Lease within the option term, the Lease would allow for The Regents to develop up to 1,020,000 leasable square feet on the Expansion Parcels, provided that (a) any development of those parcels is the subject of further environmental review under the California Environmental Quality Act ("CEQA"), and (b) the Owner does not lose any of its entitled development potential for the balance of its land nor lose any of its other rights and privileges under the South OPA.
12. Pursuant to Section 302 of the Plan, the development of the contemplated UCSF facilities on the Expansion Parcels is permitted as a subset of "Other Uses" as a secondary use. Such secondary uses are permitted provided that such use generally conforms with redevelopment objectives and planning and design controls established pursuant to the Plan and based on certain findings of consistency by the Agency's Executive Director (the "Consistency Findings"). The Executive Director has made the Consistency Findings, and such findings are hereby incorporated herein by this reference as if fully set forth.
13. The City must make substantial improvements to San Francisco General Hospital ("SFGH") by 2013 and is evaluating a number of alternatives, including rebuilding on site and co-locating a new SFGH with new UCSF medical facilities in Mission Bay.
14. As a State agency, The Regents is exempt under the State Constitution from local land use regulation and property taxes to the extent it uses property exclusively in furtherance of its educational mission.
15. The Agency, City and The Regents negotiated a non-binding term sheet to guide the preparation of final transactional and related documents, such as a Disposition and Development Agreement ("DDA") for The Regents to acquire property for, and to construct and subsidize, affordable housing for low-income workers of UCSF, which DDA is being considered by the Agency Commission concurrently with this Resolution, pursuant to Resolution No. 160-2005, and provided terms for a Memorandum of Understanding regarding design standards and cooperation on the development of the Expansion Parcels (the "MOU"). The Agency Commission approved the non-binding term sheet on May 17, 2005 by Resolution No. 81-2005.
16. The proposed MOU addresses, among other things: the potential loss of tax increment from the transfer of the Expansion Parcels to a tax-exempt entity; the obligations to build infrastructure associated with development on the Expansion Parcels; the potential assistance of UCSF in the planning of the co-location, if any, of SFGH with the new UCSF facilities; the standards for design review for construction on the Expansion Parcels; local hiring and

O-MBA25L10

equal opportunity for jobs associated with the development on the Expansion Parcels; and other matters designed to provide the Agency and City with significant public benefits.

17. Agency staff is recommending that the Agency Commission approve the MOU, and the associated Consistency Findings.
18. The Agency Commission has reviewed and considered the information contained in the LRDP #2 FEIR.
19. The Agency Commission hereby finds that the MOU is an action in furtherance of the implementation of the Project for purposes of compliance with CEQA.
20. By Resolution 175-2005, the Agency Commission adopted environmental findings related to the LRDP #2 FEIR, pursuant to CEQA and the CEQA Guidelines (the "Findings"). Such Findings are made pursuant to the Agency's role as the responsible agency under CEQA for the Project. The Findings are hereby incorporated herein by this reference as if fully set forth.

RESOLUTION

ACCORDINGLY, IT IS RESOLVED by the Redevelopment Agency of the City and County of San Francisco that the findings of consistency with the Mission Bay South Redevelopment Plan are approved and the Executive Director is authorized to execute the "Expansion of UCSF Facilities in Mission Bay South Redevelopment Project Area (Blocks 36-39) Memorandum of Understanding", substantially in the form lodged with the Agency General Counsel; Mission Bay South Redevelopment Project Area.

APPROVED AS TO FORM:

  
James B. Morales  
Agency General Counsel

MEMORANDUM

126-03405-001  
October 12, 2005

To: Marcia Rosen  
Executive Director

From: Amy Neches   
Senior Project Manager

Re: Secondary Use Finding Recommendation for UCSF Hospital in Mission Bay South Redevelopment Area

Pursuant to a Term Sheet dated as of August 1, 2005 between the City, the Agency and The Regents of the University of California, which was endorsed by the Commission on May 17, 2005 (Resolution No. 81-2005), the Agency is considering agreements, including a Memorandum of Understanding ("MOU"), under which the University of California at San Francisco ("UCSF") may develop a hospital in the Mission Bay South Redevelopment Area ("Redevelopment Area").

The UCSF hospital would be located on Blocks 36-39 within the Commercial Industrial land use district of the Redevelopment Area, as described in the Mission Bay South Redevelopment Plan (the "Plan"). The UCSF hospital development may also include all or portions of Block X3 within the Commercial Industrial/Retail land use district. In both of these land use districts "public structure or use of a non-industrial character" is permitted as a subset of "Other Uses" as a secondary use.

The University of California, of which UCSF is a component, is a public body specifically created by the California Constitution. A hospital or medical center is described in §790.44 of the San Francisco Planning Code as a "public or private institutional use which provides medical facilities for inpatient care, medical offices, clinics, and laboratories." The proposed UCSF hospital development will include these components. The hospital will not including manufacturing, warehousing, or distribution of goods, and can reasonably be considered a "non-industrial use." This interpretation is supported by the San Francisco Planning Code, under which hospitals are permitted as a conditional use in all C districts and NC-3 districts.

Section 302 of the Plan provides as follows:

"Secondary uses shall be permitted in a particular land use district...provided that such use generally conforms with redevelopment objectives and planning and design controls established pursuant to this Plan and is determined by the Executive Director to make a positive contribution to the character of the Plan Area, based on

Marcia Rosen  
Page 2 of 3

O-MBA25L10  
October 12, 2005  
126-03405-001

a finding of consistency with the following criteria: the secondary use, at the size and intensity contemplated and at the proposed location, will provide a development that is necessary or desirable for, and compatible with, the neighborhood or the community."

Staff believes that the UCSF hospital is appropriate as a secondary use, based on the following:

- 1) The proposed hospital will be located on approximately 10 to 14 acres of land adjacent to the Mission Bay UCSF research campus that have been determined to be blighted and are affected by environmental contamination. UCSF plans close integration of its basic academic research activities with the teaching, research and patient care activities within the planned hospital. The plan for development of the UCSF hospital generally conforms to the Redevelopment Project Objectives as described in §103 of the Plan, particularly with objective A of eliminating blight and correcting environmental deficiencies, and objective B of retaining and promoting UCSF's research and academic activities within the City and County of San Francisco.
- 2) Under the MOU, the UCSF hospital development will generally conform to the planning and design controls established pursuant to the Plan, including the street layout, setbacks, and streetscape plan. To accommodate the needs of the hospital, the MOU will include specific adjustments to the existing height and bulk standards of the Commercial Industrial and Commercial Industrial/Retail land use zones of the Mission Bay South Design for Development. These changes will lower the maximum height of a hospital to 105 feet, compared to the existing 160 foot limit, but would allow for somewhat greater bulk in the mid-rise area. These changes have been studied and presented to the public at two well-noticed public meetings. In staff's opinion, the proposed adjustments represent reasonable variation from the existing standards, which will have little if any negative effect on the surrounding community in the context of overall Mission Bay development.
- 3) The hospital will contain no more development, as calculated under the Plan in leasable square feet, than would have been permitted under the principal uses permitted in these land use districts, and there will be no net increase in the overall size of development within the Redevelopment Area. The hospital will be developed on parcels that would otherwise likely have been developed with commercial office or life science/biotechnology uses. These uses would have been constructed in buildings of reasonably similar size and appearance as the proposed hospital use.
- 4) The proposed hospital will allow UCSF to continue to provide needed tertiary health care to the residents of San Francisco in a modern seismically safe hospital, and will assist UCSF in furthering its research and academic mission.

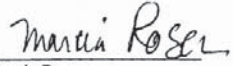

Marcia Rosen  
Page 3 of 3

O-MBA25L10  
October 12, 2005  
126-03405-001

Based on these factors, staff believes that it is appropriate to make the finding of consistency cited above, and recommends that the Executive Director permit the development of the UCSF hospital as a secondary use in Mission Bay, subject to the approval of the MOU by the Commission.

Approved on October 12, 2005:

  
Marcia Rosen  
Executive Director

**Re: Warriors Arena Project: Violation of Variance Requirement.**

Dear Ms Bohee and Mr. Bollinger:

This office represents the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project"). The Mission Bay Alliance objects to approval of this Project and certification of the Project SEIR.

I write today regarding the OCII's failure to require a variance or "variation" for this Project under section 305 of the Mission Bay South Redevelopment Plan ("Plan"). The November 2, 2015, letter from Susan Brandt-Hawley, my co-counsel for the Alliance, demonstrates this Project is not an allowable secondary use under the Plan. Thus, a variance is not available because, as shown by Brandt-Hawley, the Project "will change the land uses on this Plan." (Plan, § 305.) However, in the alternative, if the Project is an allowable secondary use under the Plan, then the OCII must process this Project application as a variance and make the findings required by Plan section 305 before Project approval.

Both California and San Francisco planning law provide a process for landowners to obtain a "variance" from the "uniformity" of zoning limits that, while appropriate for the zone district in general, would impose undue hardship due to unique characteristics of a specific parcel. Government Code section 65906 governs the grant of zoning variances by municipalities and prohibits local agencies from granting "special privileges" to individual landowners. Similarly, San

**EXHIBIT 2**

Commission on Community Investment and Infrastructure  
Ms Tiffany Bohee  
Mr. Brett Bollinger  
Re: Warriors Arena Project DSEIR: Violation of Variance Requirement  
November 2, 2015 [2 of 2]  
Page 2

Francisco Planning Code, section 305, subdivision (a), provides that a variance permit must be approved for any exception to the requirements of the Planning Code. Subdivision (c) thereof mirrors the requirements of state law, and requires a finding that “owing to such exceptional or extraordinary circumstances the literal enforcement of specified provisions of this Code would result in practical difficulty or unnecessary hardship ....”

Similarly, the Plan includes a variance provision that reflects the same substantive requirements as Government Code section 65906 and Planning Code section 305:

The Agency may modify the land use controls in this Plan where, owing to unusual and special conditions, enforcement would result in undue hardships or would constitute an unreasonable limitation beyond the intent and purposes of these provisions. Upon written request for variation from the Plan’s land use provisions from the owner of the property, which states fully the grounds of the application and the facts pertaining thereto, and upon its own further investigation, the Agency may, in its sole discretion, grant such variation from the requirements and limitations of this Plan. The Agency shall find and determine that the variation results in substantial compliance with the intent and purpose of this Plan, provided that in no instance will any variation be granted that will change the land uses on this Plan.

(Plan, § 305.)

Because the Plan’s variance provision imposes virtually identical requirements as Planning Code section 305, both apply. (Plan, §’s 101 [“Regardless of any future action by the City or the Agency, whether by ordinance, resolution, initiative or otherwise, the rules, regulations, and official policies applicable to and governing the overall design, construction, fees, use or other aspect of development of the Plan Area shall be (i) this Plan and the other applicable Plan Documents, (ii) to the extent not inconsistent therewith or not superseded by this Plan, the Existing City Regulations and (iii) any new or changed City Regulations permitted under this Plan”]; 304.9.C.(iv)).

Here, the Project creates at least sixteen inconsistencies with the Design for Development (D4D). The OCII now proposes to amend the D4D, the Owner’s Participation Agreement (OPA), and other Plan documents to resolve these inconsistencies by, including but not limited to, raising maximum height limits from 90 to 135 feet, allowing a second 160+ foot tower, increasing bulk limits to accommodate the arena, and changing arena setbacks, street wall heights, view corridors, public rights of way, and parking standards. (See e.g., Draft SEIR, pp. 4-7 - 4-9, § 4.2.4; Proposed Resolution 2015, exhibit A; Memorandum to the OCII from Executive Director Tiffany Bohee for Items 5(a), 5(b), 5(c), 5(d) & 5(e) the November 3, 2015, CCII meeting agenda, pp. 4, 22.)

Even if the Project’s land uses are allowable secondary uses, these amendments “modify the land use controls in this Plan” as provided in Plan section 305. But the Project Sponsor has made

O-MBA25L10

Commission on Community Investment and Infrastructure  
Ms Tiffany Bohee  
Mr. Brett Bollinger  
Re: Warriors Arena Project DSEIR: Violation of Variance Requirement  
November 2, 2015 [2 of 2]  
Page 3

no showing that due to “unusual and special conditions, enforcement would result in undue hardships or would constitute an unreasonable limitation beyond the intent and purposes of these provisions.” (Plan, § 305.)

“Variances are, in effect, constitutional safety valves to permit administrative adjustments when application of a general regulation would be confiscatory or produce unique injury.” (Curtin’s California Land Use and Planning Law, p. 55.) Variance requirements also implement the State Planning and Zoning Law’s requirement of “uniformity” of zoning rules within zoning districts. (See Gov. Code, § 65852 [“All such [zoning] regulations shall be uniform for each class or kind of building or use of land throughout each zone, but the regulation in one type of zone may differ from those in other types of zones;” *Neighbors in Support of Appropriate Land Use v. Cnty. of Tuolumne* (2007) 157 Cal.App.4th 997, 1008 (*Neighbors*).) The State Planning and Zoning Law also requires vertical consistency between local agencies general plans, zoning ordinances, and land use permits. (Gov. Code, § 65860, subd. (c) [“County or city zoning ordinances shall be consistent with the general plan of the county or city... .”]; see *DeVita v. Cnty. of Napa* (1995) 9 Cal.4th 763, 772 [“A general plan is a ‘constitution’ for future development [citation omitted] located at the top of ‘the hierarchy of local government law regulating land use’”].)

California courts have vigorously enforced the requirements for granting a variance, and have developed extensive jurisprudence to corral the many stratagems local agencies have used to avoid its requirements. (See e.g., *Topanga Association v. County of Los Angeles* (1974) 11 Cal.3d 506, 511-12 (*Topanga*); *Orinda Assn. v. Board of Supervisors* (1986) 182 Cal.App.3d 1145, 1166 (*Orinda Assn*) [“A zoning scheme, after all, is similar in some respects to a contract ... If the interest of these parties in preventing unjustified variance awards for neighboring land is not sufficiently protected, the consequence will be subversion of the critical reciprocity upon which zoning regulation rests...”].)

Variance findings must focus on a comparison of the subject property to other properties in the zone district with which the variance is intended to bring it into parity, and the benefits to the community or “public interest” associated with a zoning exception are irrelevant. (*Orinda Assn, supra*, at p. 1166.) By amending the Plan documents to accommodate this Project, the OCII would cast these requirements aside and grant a “special privilege” to this Project Sponsor.

In *Neighbors*, rather than adopt a rezone or grant a variance, the County created a special exception to the zoning ordinance for one landowner by including it in a development agreement adopted under the development agreement law. (*Neighbors, supra*, 157 Cal.App.4th at p. 1003.) In rejecting this stratagem, the Court in *Neighbors* noted that there are limits on the power to rezone: “‘The foundations of zoning would be undermined, however, if local governments could grant favored treatment to some owners on a purely ad hoc basis ... [R]ezoning, even of the smallest parcels, still necessarily respects the principle of uniformity.’” (*Id.* at pp. 1009-10.)

## O-MBA25L10

Commission on Community Investment and Infrastructure  
Ms Tiffany Bohee  
Mr. Brett Bollinger  
Re: Warriors Arena Project DSEIR: Violation of Variance Requirement  
November 2, 2015 [2 of 2]  
Page 4

A similar result occurred in *Trancas Prop. Owners Assn. v. City of Malibu* (2006) 138 Cal.App.4th 172 (*Trancas*). In *Trancas*, the court held an exemption from a city's zoning requirements accomplished by contract functionally resembled a variance, and held that "such departures from standard zoning by law require administrative proceedings, including public hearings ... followed by findings for which the instant [density] exemption might not qualify... Both the substantive qualifications and the procedural means for a variance discharge public interests. Circumvention of them by contract is impermissible." (Id. at p. 182.)

In sum, the OCII's proposed grant of zoning exceptions to this Project by way of amending the Plan documents rather than by variance violates the Plan, the variance requirements of the San Francisco Planning Code and state law, and the uniformity requirement of state law.

Thank you for your attention to this matter.

Very Truly Yours,

Thomas N. Lippe

## O-MBA25L10

### Office Development Annual Limitation ("Annual Limit") Program

The Office Development Annual Limit (Annual Limit) Program became effective in 1985 with the adoption of the Downtown Plan Amendments to the Planning Code (Sections 320-325) and was subsequently amended by Propositions M (1986) and C (1987). The Program defines and regulates the allocation of any office development project that exceeds 25,000 gross square feet (gsf) in area.

A total of 950,000 gsf of office development potential becomes available for allocation in each approval period, which begins on October 17th every year. Of the total new available space, 75,000 gsf is reserved for Small Allocation projects (projects with between 25,000 and 49,999 gsf of office space), and the remaining 875,000 gsf is available for Large Allocation projects (projects with at least 50,000 gsf of office space). Any available office space not allocated in a given year is carried over to subsequent years.

This document reflects the status of the Annual Limit Program, including current availability and summaries of previously approved and pending projects.

Information in this document was last updated on **September 1, 2015**. Inquiries should be directed to Corey Teague at (415) 575-9081 or corey.teague@sfgov.org.

### Summary of Key Figures

	Current Availability	1,188,805 gsf	Pending Availability	903,255 gsf	Pipeline Availability	776,280 gsf
<b>Small Allocation Projects</b> (<50,000 gsf of office space)	Current total square footage available for allocation.		Currently available square footage less 285,550 gsf of pending* projects.		Currently available square footage less 285,550 gsf of pending* projects and 126,975 gsf of pre-application** projects.	
<b>Large Allocation Projects</b> (≥50,000 gsf of office space)	Current total square footage available for allocation.	1,429,763 gsf	Pending Availability -1,678,791 gsf	Currently available square footage less 3,108,554 gsf of pending* projects.	Pipeline Availability -8,529,408 gsf	Currently available square footage less 3,108,554 gsf of pending* projects and 6,850,617 gsf of pre-application** projects.

\* A 'pending project' is one for which an office allocation application has been submitted but not yet acted upon.

\*\* A 'pre-application' project is one for which an environmental review application, preliminary project assessment application, or other similar application has been submitted but for which no office allocation application has yet been submitted.

PENDING OFFICE PROJECTS\*

\*Projects that have submitted an application (B or OFA) pursuant to Planning Code Section 321 (Office Development Annual Limit) but on which no Commission action has yet occurred.

Small Office Cap					
Case No.	Address	Sq. Ft.	Status	Staff	Comments
2009.0065	3433 Third Street	49,229	B filed 1/27/09	Julian Banales	New 5-story office building for Carpenter's Union on vacant lot. May be cancelled due to inactivity (2/18/14).
2014.0567	2101 Mission Street	48,660	B filed on 4/17/14	Brittany Bendix	Legalize change of use from retail and warehouse to office. Planning Commission hearing scheduled for 9/3/15.
2012.1410	77-85 Federal Street	49,730	B filed on 6/5/14	Scott MacPherson	Demo two existing office buildings and construct a 5-story building with ground floor retail and office above.
2015-000509	1125 Mission Street	37,944	B filed on 1/15/15	Julian Banales	Change of use from auto repair.
2014.1315	135 Townsend Street	49,995	B filed on 3/11/15	Rich Sucre	Conversion of existing self storage building.
2013.1511	360 Spear Street (aka 100 Harrison St)	49,992	B filed on 4/3/15	Rich Sucre	Partial conversion of existing ISE.
<b>Subtotal</b>		<b>285,550</b>			

Large Office					
Case No.	Address	Sq. Ft.	Status	Staff	Comments
2012.0640	598 Brannan Street	700,456	B filed on 10/24/12	Elizabeth Puri	Demo of 2 industrial buildings; 2 new office buildings (Central SoMa Project).
2013.1545	645 Harrison Street	99,698	B filed on 7/18/13	Kimberly Durandet	LoD confirmed 14,520gsf as existing legal office space. Revised proposal to convert additional 99,698gsf, plus retain 33,758gsf of PDR on first and second floors.
2013.1593	2 Henry Adams	245,697	B filed on 2/6/14	Rich Sucre	Owner-initiated Article 10 Landmark designation and an Office Allocation. Eligible area limited by recent legislation.
2011.0409	925 Mission Street	803,300	B filed on 8/19/14	Kevin Guy	"5M" Project. Planning Commission informational hearing scheduled for 9/3/15.
2006.1523	50 First Street	1,050,000	B filed on 6/4/14	Kevin Guy	Demo and construction of a mixed-use building with two towers.
2014-002701	GSW Development	0	B filed on 12/12/14	David Winslow	Design approval only. Allocation already approved in Alexandria District.
2014.1063	633 Folsom Street	89,804	B filed on 12/23/14	Mark Luellen	Four story office addition to existing seven story building.
2014.0154	1800 Mission Street	119,599	OFA filed on 1/27/15	Rich Sucre	Conversion in the Armory.
<b>Subtotal</b>		<b>3,108,554</b>			

2

PRE-APPLICATION OFFICE PROJECTS\*

\*Projects that have submitted for initial Department review (e.g. environmental review (EE) or Preliminary Project Assessment (PPA)), but have not submitted an application pursuant to Planning Code Section 321 (Office Development Annual Limit).

Small Office Cap					
Case No.	Address	Sq. Ft.	Status	Staff	Comments
2014.1616	1200 Van Ness Ave	27,000	PPA issued 1/14/15.	Mary Woods	Exact office square footage TBD.
2015-010219	462 Bryant Street	49,995	PPA filed on 8/12/15.		An existing single story office building and basement will remain, and five stories of new office space will be added (approximately 49,995 gsf of new office space).
2015-010374	598 Bryant Street	49,980	PPA filed on 8/12/15.	Kansai Uchida	Demo existing gas station and construct a 9-story mixed-use office building with underground parking.
<b>Subtotal</b>		<b>126,975</b>			

Large Office Cap					
Case No.	Address	Sq. Ft.	Status	Staff	Comments
2005.0759	725-735 Harrison	730,940	PPA letter issued 5/16/2013. Revised EE pending.	Debra Dwyer	"Harrison Gardens" (Central SoMa Project). Original proposal changed to office per 2/21/13 application amendment.
2014.0416	610-620 Brannan Street	561,065	EE filed 6/19/14	Elizabeth Puri	Demo and new 11-story mixed use bldg (Central SoMa Project).
2013.0478	559 6th Street	123,972	PPA issued on 6/17/13. PPA expired on 12/17/14.	Kimia Haddadan	Demolish 3 bldgs and construct a mixed-use project (Central SoMa Project).
2013.0970	Pier 70 (Forest City Only)	1,810,000	EE filed on 11/10/14	Andrea Contreras	SF Port project
n/a	2525 16th Street	60,980	Legitimization request filed 11/30/12	Corey Teague	EN Legitimization
2014.0858	565-585 Bryant Street	188,280	PPA issued on 7/25/14	Jeremy Shaw	Demo four existing bldgs and construct an 11-story mixed-use bldg. 2nd PPA proposes only 46,990gsf of office (Central SoMa Project).
2014.0405	330 Townsend Street	394,300	PPA issued on 5/15/14	Steve Wertheim	Demo existing bldg and construct a 21-story office bldg. 2nd PPA proposes only 212,300gsf of office (Central SoMa Project).
2013.0208	SWL 337 ("Mission Rock")	1,300,000	EE filed on 6/4/13	Josh Switzky	Large mixed-use project on Port property.
2015-004256	630-698 Brannan St	1,512,260	PPA issued on 7/24/15. EE filed 7/24/15.	Lisa Chen	Flower Mart replacement project (Central SoMa Project). Two Previous PPAs. 2015-001903 analysed proposed 1,492,450gsf. 2013.0370 was under different ownership, only included Lot 5, and analysed 655,150gsf.

3

2014-1208	1500 Mission Street	0	EE filed on 10/23/14	Chelsea Fordham	Demo and new construction of City office space, bldg with 462,800 sq ft of City office space.
2015-009704	505 Brannan Street	168,820	PPA filed on 7/27/15	Steve Wertheim	"Phase II" addition (165', 11 stories) of office space onto an approved 85' "Phase I" office building approved by the Planning Commission on 12/11/14. With this newly planned addition, total building height would now be 250' and contain a total of 306,266 sq ft.

Subject: Response to Comments on the DSEIR for the Event Center & Mixed-Use Development at Mission Bay Blocks 29-32 (Project).

Dear Ms. Bohee:

The Bay Area Air Quality Management District (Air District) is willing to assist the City and County of San Francisco (City) by administering an off-site mitigation program to reduce this Project's significant air quality impacts to the extent feasible. As we have discussed extensively with City staff, the \$321,646 identified in M-AQ-2b is not sufficient to achieve the 17 tons per year of ozone precursor emission reductions needed for this Project. Due to the nature of air quality impacts that need to be mitigated, comparison of the Air District off-site mitigation program identified for this Project to other air district programs is inappropriate and incorrect.

The amount of funds required to reduce 4.4 tons of reactive organic gases (ROG) and 12.6 tons of oxides of nitrogen (NOx), including a 5 percent administration fee, is \$620,922. This amount is based on a study of the Air District's Vehicle Buy Back (VBB) program funds spent over the last 3 years and represents the average cost of reducing ROG and NOx during that three-year period. Only through the VBB program can the Air District achieve the contemporaneous emission reductions and other conditions set forth in M-AQ-2b.

Air District staff continues to be willing to assist the City in implementing an off-site mitigation program. However, the Final Environmental Impact Report Response to Comments includes the following statement: "Acceptance of this fee by the BAAQMD shall serve as an acknowledgement and commitment by the BAAQMD to: (1) implement an emissions reduction project(s) within one year of receipt of the mitigation fee to achieve the emission reduction objectives specified above [i.e. 17 tons of ozone precursors per year]". Given this language, unless the City amends M-AQ-2b to fund this feasible mitigation measure at the \$620,922 level previously discussed with City staff, the Air District will be unable to participate in offsetting this Project's air quality impacts.

O-MBA25L10

DATE: November 2, 2015  
TO: Tiffany Bohee, OCII Executive Director  
FROM: Chris Kern, City Planning Department  
Sally Oerth, OCII Staff  
SUBJECT: BAAQMD November 2, 2015 letter re Ozone Precursors Offset Mitigation Fee

The City Planning Department and the staff of the Office of Community Investment and Infrastructure (OCII) have reviewed the November 2, 2015 letter from the Bay Area Air Quality Management District regarding the Warriors Event Center and Mixed Use Development Subsequent Environmental Impact Report (SEIR). The letter states that the \$18,030 per weighted ton per year plus a 5% administrative fee mitigation fee identified in Mitigation Measure M-AQ-2b of the SEIR is insufficient to achieve the required reduction of 17.0 tons per year of ozone precursors. The letter proposes that the mitigation fee should be based on the BAAQMD's Vehicle Buy Back Program, at a cost of \$620,922 (or approximately \$36,525 per weighted ton per year) to achieve the required emissions reduction.

As discussed in the Draft SEIR (pages 5.4-41 through 5.4-42) and the Responses to Comments document (pages 13.13-65 through 13.13-69), the offset fee identified in Mitigation Measure M-AQ-2b is based on the California Air Resources Board (CARB) Carl Moyer program cost-effectiveness criteria. These criteria were developed by CARB to establish the upper limit for emissions offset projects eligible to receive funding through the Carl Moyer program.

Planning staff has been in communication with BAAQMD with regard to its suggestion that a higher fee may be warranted to offset project emissions to a less than significant level and found that BAAQMD could not establish that an increased rate beyond that of the Carl Moyer Program plus a five percent administrative fee could meet the "rough proportionality" standard required under CEQA. The Carl Moyer fee structure was reviewed and updated by CARB in March of 2015 and became fully implemented on July 1, 2015. The offset costs cited in Mitigation Measure M-AQ-2b Emission Offsets are consistent with those of the CARB and other operating California air districts. For example, in the Sacramento Metropolitan Air Quality Management District, the off-site construction mitigation fee rate is \$18,030 per ton of excess NOx emissions as of July 1, 2015 (plus an administrative fee of 5 percent) and is based on the cost effectiveness formula established in California's Carl Moyer Incentive Program. In the San Joaquin Valley Air Pollution Control District, the Indirect Source Review (ISR) program requires that an offsite reduction fee of \$9,350/ton plus a 4 percent administration fee be applied

for NOx emission reductions that cannot be achieved through onsite emission reduction measures. Furthermore, the offset costs in Mitigation Measure M-AQ-2b is consistent or even higher than comparable offset programs in the SFBAAB.<sup>1</sup>

The BAAQMD's November 2, 2015, letter does not establish that the CARB cost-effectiveness criteria are inappropriate for determining the offset costs under Mitigation Measure M-AQ-2b. Based on the information and analysis presented in the Draft SEIR, the Responses to Comments and supporting technical analyses, Planning Department and OCII staffs continue to believe that the offset fee established in Mitigation Measure M-AQ-2b is sufficient to achieve the required emissions offsets. In addition, as discussed in the Responses to Comments document, Mitigation Measure M-AQ-2b has been revised since publication of the Draft SEIR to allow the project sponsor to directly implement an emissions offset project as an alternative to entering into an agreement with the BAAQMD.

Therefore, for the reasons summarized above and discussed in greater detail in the SEIR and Responses to Comments, the November 2, 2015, letter from the BAAQMD does not alter the analysis or conclusions reached in the SEIR.

**RE: Comments on November 9, 2015 Agenda Item Nos. 1-4 re: Warriors  
Event Center at Mission Bay, Mission Bay Transportation  
Improvement Fund and Related Actions**

Dear Budget and Finance Committee Members:

This firm represents the Mission Bay Alliance (the "Alliance") with respect to the Warriors Event Center Project ("Project"). These comments address the Final Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("SEIR") as well as the Budget and Finance Committee's consideration and approvals for the Project itself.

As explained in this firm's November 3, 2015, Letter to the San Francisco Municipal Transportation Agency ("MTA"), Board of Directors regarding their November 3, 2015, Agenda Item No. 13, the SEIR is defective as an informational document with respect to the analysis and public disclosure of impacts and mitigation measures regarding transportation under the California Environmental Quality Act (Pub. Resources Code, §§ 21000 et seq. ("CEQA")). Specifically, the SEIR does not describe the approval of the Mission Bay Transportation Improvement Fund ("MBTIF") as a mitigation measure. Yet the MBTIF is essential to the City's attempts to mitigate the Project's transportation-related impacts. The City's strategy of conflating analysis of the Project's design features and mitigation measures violates CEQA. (See, e.g., *Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645.) The prejudice associated with the City's strategy, in addition to obscuring the City's public subsidy for the Project, is that the EIR "fail[s] to consider whether other possible mitigation measures would be more effective." (*Id.* at 657.)

The City also appears to rely on the incorporation of the MBTIF into the Project description in order to conceal from the public the City's failure to require full mitigation of the Project's impacts from the applicant. A fundamental principle of CEQA is that

1  
[LC-PD-1]

O-MBA26S8

Budget and Finance Committee  
November 9, 2015  
Page 2 of 3

development projects should mitigate their impacts to the extent feasible. (See, e.g., Pub. Resources Code, § 21002; see also CEQA Guidelines, § 15126.4.) With respect to the Project's transportation impacts, the City deviates from this principle and instead adopts an odd, ad hoc "fair share" fee program to mitigate Project-level impacts. (*Anderson First Coalition v. City of Anderson* (2005) 130 Cal.App.4th 1173 (*Anderson First*)). As a threshold matter, the SEIR never discloses to the public that it essentially relies upon "fair share" payments from the Project in order to mitigate its Project-level transportation impacts, which renders the SEIR defective as an informational document. Had the SEIR described the Project's approach to mitigating transportation impacts, it would have been apparent that the SEIR failed to disclose necessary information about this fair share program.

The payment of "fair share" impact fees may constitute adequate mitigation if the payments "are part of a reasonable plan of actual mitigation that the relevant agency commits itself to implementing." (*Id.* at 1188-1189.) The *Anderson First* decision identified the information that is required in an EIR to establish the adequacy of a "fair share" mitigation measure, which includes the following:

- (i) An identification of the required improvement;
- (ii) An estimate of the cost of the required improvement;
- (iii) Sufficient information to determine how much the project would pay towards the improvement; and
- (iv) The fees must be part of a reasonable, enforceable plan or program sufficiently tied to the actual mitigation of the impacts at issue.

(*Ibid.*)

The SEIR fails to provide this necessary information, and never even mentions the MBTIF. While the SEIR does mention the Transportation Management Plan ("TMP") and Transit Service Plan ("TSP") as addressing the Project's transportation impacts, the SEIR fails to identify the total costs of the improvements, the Project's allocated contribution, and the enforceable plan or program to contribute the Project's "fair share." The new information contained within this Committee's agenda packet regarding the MBTIF and other related matters cannot substitute for full disclosure of the selected approach to mitigation of transportation related impacts in the SEIR.

In addition, the actions on November 6, 2015, by the MTA, and this Committee's planned actions today with respect to approval of the MBTIF and the grant of street and easement vacations are contrary to California public disclosure laws with respect to economic development subsidies. California law requires the City to provide public notice and a public hearing, as well as detailed information about the purpose, nature, extent and effect subsidies, prior to commitment. (Gov. Code, § 53083.) The Budget and

1

Page 3 of 3

Legislative Analyst's Memorandum ("BLA Memo"), along with the SFMTA Cost Estimate spreadsheet make clear that there is an estimated revenue shortfall of \$29,916,666, which will be financed through sale of SFMTA revenue bonds or other City financing source. (BLA Memo, pp. 7-8.) Payment of these Project mitigation costs by the City is an economic development subsidy, even if the loan is eventually repaid. (Gov. Code, §53083, subd. (g)(1).) Moreover, the summary vacation of streets and easements likely has value, yet no value is disclosed. Thus, the City must now comply with the substantive and procedural mandates of Government Code section 53083 prior to approving subsidies in the form of loans and other benefits included in the MBTIF and other related City actions and approvals, that provide transportation, infrastructure, public safety and other mitigation for Project impacts.

Bryant Tan, President  
and Members of the Entertainment Commission  
City and County of San Francisco  
1 Drive Carlton B. Goodlett Place  
San Francisco, CA 94102

**RE: Comments on November 10, 2015, Regular Agenda Item (a)  
Golden State Warriors Event Center  
Place of Entertainment Permit and CEQA Findings**

Dear President Tan and Commissioners:

This firm represents the Mission Bay Alliance (the “Alliance”) with respect to the Warriors Event Center Project (“Project”). These comments address the Final Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (“SEIR”) and the Entertainment Committee’s consideration of the Place of Entertainment Permit and CEQA Findings.

We have reviewed this Commission’s agenda and proposed Resolution provided to us today, but have been informed that there is neither an explanatory staff report nor analysis accompanying the Commission’s proposed actions.

Consideration of the Place of Entertainment Permit is premature and unlawful because the entertainment uses proposed by the Warriors sports arena are not a primary or secondary use allowed under the Mission Bay South Redevelopment Plan, as explained by my co-counsel Susan Brandt-Hawley on behalf of the Alliance in submissions to the OCII in July, October, and November 2015, and testimony before the OCII on November 3, 2015.

The Event Center Project SEIR does not comply with CEQA, as described in the Alliance’s many comments on the SEIR submitted to OCII. Over the last three months, the Alliance has reviewed and commented on material inadequacies in the expedited environmental review process. This Commission and the Board of Supervisors cannot fully consider and adequately mitigate the Event Center’s many significant impacts without the benefit of an EIR that complies with CEQA.

O-MBA27S9

Entertainment Commission  
City and County of San Francisco  
November 10, 2015  
Page 2 of 3

The CEQA findings adopted by the San Francisco Municipal Transportation Agency (“MTA”) and being considered by this Commission are premature and unsupported, as explained in the Alliance’s comments on the Draft Subsequent Environmental Impact Report (“DSEIR”), as well as letters submitted following the Final SEIR by this office and by Alliance co-counsel Thomas Lippe and Susan Brandt-Hawley.

As explained in this firm’s November 3, 2015, letter to the MTA, Board of Directors regarding their November 3, 2015, Agenda Item No. 13, incorporated by reference, the SEIR is defective and cannot be relied upon as an informational document with respect to the analysis and public disclosure of impacts and mitigation measures regarding transportation under the California Environmental Quality Act (Pub. Resources Code, §§ 21000 et seq. (“CEQA”). Specifically, the SEIR does not describe the approval of the Mission Bay Transportation Improvement Fund (“MBTIF”) as a mitigation measure. The MBTIF is essential to the City’s attempts to mitigate the Project’s transportation-related impacts and its omission from the SEIR precludes this Commission’s consideration of a Place of Entertainment Permit. The City’s strategy of conflating analysis of the Project’s design features and mitigation measures violates CEQA. (See, e.g., *Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645.)

The SEIR’s inadequate traffic analysis is explained in reports and letters submitted to the City and OCII throughout the administrative process for this project, as noted above, all of which are incorporated by reference. In particular, I respectfully direct the Commission’s attention to the attached letters and reports from my co-counsel Thomas Lippe and experts Smith Engineering & Management, and Larry Wymer & Associates, Traffic Engineering.

The Alliance requests that the Commission decline to make CEQA findings and decline to approve the Place of Entertainment Permit.

**Subject: Responses to Comment on Draft Subsequent Environmental Impact Report for Event Center and Mixed Use Development at Mission Bay Blocks 29-32. SCN:2014112045**

P15003

Dear Mr. Lippe:

This is a continuation of my November 2, 2015 review of the Responses to Comment ("the RTC") on the Draft Subsequent Environmental Impact Report (hereinafter "the DSEIR") on the above referenced Project in the City and County of San Francisco (hereinafter "the City"). As I was a commenter on the DSEIR in regard to matters involving transportation and circulation in a letter dated July 26, 2015 which was transmitted as Exhibit 1 to your comment letter of July 27, 2015, my current comments focus on the responses to my own comments and yours on that subject. In addition, several others including representatives of BARTD, Caltrans, Caltrain, UCSF and other have filed comments that parallel and reinforce our own. I address the responses to those comments as well.

My qualifications to perform this review were thoroughly documented in my letter of comment on the DSEIR dated July 26, 2015 and are incorporated herein by reference.

This continuation of my comments focuses on emergency response and considerations of emergency access to the UCSF hospitals adjacent to the Project site.

### Emergency Response and Hospital Access

Our comments of November 2, 2015 concluded with the very brief remarks on SEIR Response TR – 9 which concerned comments on emergency response and UCSF hospital access. These additional comments offer more detailed observations on that response.

#### Inadequacy of Analysis of Congestion and Delay at Critical Intersection of Sixteenth – Seventh and Mississippi Streets

Response TR-9 states that under existing-plus-Project conditions, the majority of the study intersection in the vicinity of the Project site and the UCSF Medical Center Phase One site are projected to operate at LOS E or better. The exception is the intersection of Seventh, Mississippi and Sixteenth Streets which would change from LOS E to dysfunctional LOS F. The problem with the response is twofold. First, this overburdened intersection is on the primary emergency access routes to the UCSF hospitals from the East Bay, Downtown San Francisco, SOMA and most of the central and northern parts of the City. Hence, the so called "exception" is actually a critical failure. Second, the SEIR's analysis of the intersection understates the level of congestion there because it fails to account for the portion of time when train movements at the adjacent at-grade crossing block movements on Sixteenth. In the 5 –to – 6 pm commute peak hour, according to current Caltrain schedules, between 10 and 12 trains preempt this crossing, and 9 to 10 in the 6 – to – 7 pm hour. This means that the Sixteenth Street leg of the intersection will be blocked for about 9 minutes or more in the 5 –to-6 pm peak and about 7.5 minutes or more in the 6 – to – 7 pm hour. In other words, movements to and from Sixteenth east of the subject intersections will be blocked between 12.5 and 15 percent of the time in these hours – and the effect of this blockage wasn't accounted for in the SEIR analysis.

#### Lack of Any Traffic Analysis of Intersections of Eighth – Harrison and Eighth – Bryant and Related I-80 Ramps That Are on Critical Access Routes to UCSF Hospitals

Another problem with the SEIR response regarding the Project's effects on emergency response and emergency access is that the SEIR failed to analyze the complex of the intersections of Eighth with Harrison and Eighth with Bryant and their related I-80 ramps at all. These heavily congested intersections are on the primary emergency access routes to the UCSF Mission Bay hospitals from the East Bay and from Downtown, most of the SOMA and northern San Francisco. The access route via these intersections on Eighth are particularly crucial whenever there is an overlapping Giants event that tends to preempt access via the Third/Fourth Street corridor.

Mr. Tom Lippe  
November 10, 2015  
Page 3

### SEIR's Underestimate of Numbers of Arena Event Attendees Traveling in 5-to-6 PM Evening Commute Peak Conceals the Extent of Impact on Emergency Services and Access to UCSF Hospitals

The SEIR, based on data on time of turnstile entry to the "paid" area of the Warriors current venue, Oracle Arena and at the Barclay Center in Brooklyn (home count of the Nets), that only about 5 percent of weekday arena event attendees traveling to an event starting at 7:30 pm would be traveling on the transportation system between 5 and 6 pm (the pm commute peak hour). Our comments of July 26, 2015 and November 2, 2015 presented cogent reasons why those turnstile based assumptions grossly understate the number of attendees to a 7:30 pm start basketball game would be traveling on the transportation system in the 5-to-6 pm peak commute hour. Those reasons include:

- The offset between getting off the transit system or out of a car in a parking spot and the time of actual passage through the ticket turnstiles, even for people who go straight in after arrival,
- The offset between arena turnstile passage time and the actual duration of travel time on the transportation system that would put people on the system during the peak hour.
- The offset between turnstile passage time and actual arrival time in the arena area for those who go into nearby restaurants and bars to eat a meal or have a drink before entering the arena or those who just hang around outside to meet up with friends traveling independently, especially perhaps to exchange a ticket.

The SEIR has ignored these considerations and persisted in assuming that only a tiny fraction of arena attendees would be traveling in the 5-to-6 pm evening commute peak hour.

In our prior comments, we have pointed out that national TV broadcasts of weeknight Warrior games which typically start at 6 pm, (and possibly national broadcasts of other arena events) would also cause a very high portion of event attendees to be traveling in the 5-to-6 pm commute peak hour and requested that this be analyzed as a separate case in the SEIR. The SEIR persists in refusing to consider this scenario.

Both of these considerations – the attendees who travel to the Project area long before passing through the arena turnstiles and the attendees coming to a national TV game start – would intensify emergency service and hospital access problems in the 5-to-6 pm commute peak hour well beyond anything analyzed in the SEIR and most importantly, compound the critical emergency service and UCSF hospital access problem issues related to the Sixteenth – Seventh – Mississippi – Caltrain

7  
[LC-TR-13]  
cont.

## O-MBA27S9

Mr. Tom Lippe  
November 10, 2015  
Page 4

rail crossing complex as well as the Eighth – Harrison / Eighth – Bryant / I-80 ramps complex as described above.

### The SEIR Refuses To Quantify Impacts on Emergency Vehicle Travel

Another commenter requested that the SEIR estimate emergency vehicle travel times with and without an event for the proposed Project. SEIR Response TR-9 refuses to do so. It claims that because the infrastructure supporting UCSF hospital facilities is currently incomplete, such a projection is it feasible. We note, however, that the SEIR has not hesitated to estimate LOS and delay times on the incomplete is roadway network for ordinary predictions of Project traffic impacts (for instance, at Owens and Sixteenth without Owens yet connected through to Mariposa). This inconsistency is an unacceptable evasion. If the SEIR is unable to estimate emergency response time, then the entire analysis of effects on all emergency services is without foundation, uselessly conclusory and inadequate.

### Public Relations Response To Emergency Access Impacts Irrelevant

SEIR Response TR-9 continues, stating that strategies to provide attendees with suggested driving routes to and from the 950 parking spaces within the Project site would alleviate interference of that traffic with emergency vehicle traffic. However, most of the on-site spaces would be held by VIP season ticket holders. These drivers will determine quickly various routes that work to their own advantage to minimize their own travel time, rather than following suggested routes to fine-tune recommended event access/egress routes that avoid primary emergency vehicle routes. The notion that pre-event and post-event recommended driving routes all could be revised based on monitoring is nonsense because knowledgeable regular attendees will follow their own notion of what works best for them, not public relations advisories.

### Effects of Event Coordinator and PCO Management Doubtful

The next section of SEIR Response TR-9 indicates that at the times when northbound lanes of third closed in between Sixteenth and South Streets (mostly during post-event times), PCO's would be available to open the emergency barricades to allow northbound emergency vehicle traffic through. While the PCOs may get the emergency barricades out of the way, whether they can safely clear swarming pedestrians from the "closed" street section is an open question.

The response indicates that the Event Transportation Coordinator would inform emergency service dispatchers of the dates and times when there would be temporary closure of Third Street following an event so that emergency vehicles could be advised to take routes other than Third Street. However this is not very

7  
[LC-TR-13]  
cont.

## O-MBA27S9

Mr. Tom Lippe  
November 10, 2015  
Page 5

useful if the location of the emergency dictates that emergency services really need to travel on Third Street.

This response also observes that drivers must comply with California vehicle code article 21806 requiring the drivers to clear a way to for authorized emergency vehicles, drive to the right road curb, stop, and remain stopped until the emergency vehicle has passed. This is a nonsensical evasion of the key issue which is that when traffic is queued in gridlock, it becomes very difficult and potentially dangerous for drivers to clear the way for emergency vehicles.

For smaller events where there are fewer PCOs, the response claims that PCOs would be stationed at key locations monitoring traffic conditions and could be reassigned to respond to conflicts between event center traffic and UCSF hospital access. It is questionable that PCOs could relocate quickly enough to be of effective assistance in an emergency access matter at another location.

### Effective Facilitation of Privately Driven Vehicles in Emergencies Doubtful

The next section of the ResponseTR-9 claims that persons accessing UCSF medical Center emergency room and Urgent Care Center using private vehicles rather than authorized emergency vehicles would be able to use the transit-only lanes provided for the 22 Fillmore transit priority on 16th Street. This begs the questions of how anxious non-professional drivers, probably making their first emergency trip of this nature, would know the bus lanes are there, that they're eligible to use them, or how they will safely get around the lumbering, overloaded buses using the lanes and how they would be distinguished from casual bus lane violators.

### Failure to Address Access to Hospitals for Doctors, Other Caregivers and Support Staff

UCSF's comments on the DSEIR included the observation that adverse traffic impacts on the hospitals is not limited to emergency vehicles. Doctors, other caregivers and support staff must have reasonably unobstructed access to and from the facilities at all times. Nowhere does the SEIR address this issue.

### **Conclusion**

Because of all of the foregoing, the SEIR's conclusions regarding the Project's impacts on emergency access are unsupported and unsupportable. A more realistic appraisal of the Project's impacts on emergency service and hospital access is required as is a more realistic set of mitigation measures.

**Subject: Responses to Comment on Draft Subsequent Environmental Impact Report for Event Center and Mixed Use Development at Mission Bay Blocks 29-32. SCN:2014112045**

P15003

Dear Mr. Lippe:

This is a continuation of my November 2, 2015 review of the Responses to Comment ("the RTC") on the Draft Subsequent Environmental Impact Report (hereinafter "the DSEIR") on the above referenced Project in the City and County of San Francisco (hereinafter "the City"). As I was a commenter on the DSEIR in regard to matters involving transportation and circulation in a letter dated July 26, 2015 which was transmitted as Exhibit 1 to your comment letter of July 27, 2015, my current comments focus on the responses to my own comments and yours on that subject. In addition, several others including representatives of BARTD, Caltrans, Caltrain, UCSF and other have filed comments that parallel and reinforce our own. I address the responses to those comments as well.

My qualifications to perform this review were thoroughly documented in my letter of comment on the DSEIR dated July 26, 2015 and are incorporated herein by reference.

This continuation of my comments focuses on use of certain sites owned by the Port of San Francisco for parking in support of the Warriors Arena Project.

TRAFFIC • TRANSPORTATION • MANAGEMENT  
5311 Lowry Road, Union City, CA 94587 tel: 510.489.9477 fax: 510.489.9478

O-MBA27S9

Mr. Tom Lippe  
November 10, 2015  
Page 2

The revised parking analysis, SEIR Appendix TR-X, identifies additional parking areas to the south of the Project site that are not addressed in the DSEIR. We note that the nearer site, described as 'the Nineteenth Street site' in Appendix TR-X, is located within the Port of San Francisco's Port Waterfront Land Use Plan Southern Waterfront Subarea and designated as part of the Pier 70 Waterfront Opportunity Area. The site is within the Union Iron Works Historic District (listed on the National Register of Historic Places. Building 40 within the site has been determined to be a contributing resource to the Historic District although the Port has determined that its removal would not affect the historic significance of the District. The Port currently plans to construct a 250 space parking lot on the site. SEIR Appendix TR-X assumes the Port will have done so and that the parking lot will be operational prior to completion of the proposed Project and that it will be made available for use of Project arena event attendees. However, given the complications of the Historic designation, compatibility with the Pier 70 Plans and with the Port's own purposes in developing this parking for support of Pier 70 and the Historic District, the assumptions that this parking will be developed in advance of completion of the proposed Project and will be made available to support the Project's arena event parking over the long term are extremely optimistic and inconsistent with the good faith effort to disclose impact required by CEQA.

The other parking site identified in Appendix TR-X is located on the Southern Waterfront with its nearest corner 1.2 miles south of the nearest corner of the Project site. Portions of the site are located within the San Francisco Bay Conservation and Development Commission's (BCDC) shoreline band jurisdiction. The site is currently used for off-site storage of trailers supporting Moscone Center. The site could support development of an up to 800 space parking lot. Because of the distance from the proposed Project site, it would require shuttle bus service connections. Because considerations such as BCDC approval, development of a suitable place for relocating the off-site trailer parking that supports Moscone Center and whether parking this far from the proposed Project site and located in a remote industrial wasteland would be attractive to patrons have not been addressed, the suitability of this parking area remains speculative. Hence, Response TR-9's assumptions regarding dispersal of parking locations itself remains speculative.

### Conclusion

Because of the speculative nature of these parking proposals with respect to service of events at the proposed arena, they cannot be considered clear elements that support the project or disperse its traffic.

**RE: Comments on November 9, 2015 Agenda Item Nos. 1-4 re: Warriors  
Event Center at Mission Bay, Mission Bay Transportation  
Improvement Fund and Related Actions**

Dear Budget and Finance Committee Members:

This firm represents the Mission Bay Alliance (the “Alliance”) with respect to the Warriors Event Center Project (“Project”). These comments address the Final Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (“SEIR”) as well as the Budget and Finance Committee’s consideration and approvals for the Project itself.

As explained in this firm’s November 3, 2015, Letter to the San Francisco Municipal Transportation Agency (“MTA”), Board of Directors regarding their November 3, 2015, Agenda Item No. 13, the SEIR is defective as an informational document with respect to the analysis and public disclosure of impacts and mitigation measures regarding transportation under the California Environmental Quality Act (Pub. Resources Code, §§ 21000 et seq. (“CEQA”). Specifically, the SEIR does not describe the approval of the Mission Bay Transportation Improvement Fund (“MBTIF”) as a mitigation measure. Yet the MBTIF is essential to the City’s attempts to mitigate the Project’s transportation-related impacts. The City’s strategy of conflating analysis of the Project’s design features and mitigation measures violates CEQA. (See, e.g., *Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645.) The prejudice associated with the City’s strategy, in addition to obscuring the City’s public subsidy for the Project, is that the EIR “fail[s] to consider whether other possible mitigation measures would be more effective.” (*Id.* at 657.)

The City also appears to rely on the incorporation of the MBTIF into the Project description in order to conceal from the public the City’s failure to require full mitigation of the Project’s impacts from the applicant. A fundamental principle of CEQA is that

O-MBA27S9

Budget and Finance Committee  
November 9, 2015  
Page 2 of 3

development projects should mitigate their impacts to the extent feasible. (See, e.g., Pub. Resources Code, § 21002; see also CEQA Guidelines, § 15126.4.) With respect to the Project’s transportation impacts, the City deviates from this principle and instead adopts an odd, ad hoc “fair share” fee program to mitigate Project-level impacts. (*Anderson First Coalition v. City of Anderson* (2005) 130 Cal.App.4th 1173 (*Anderson First*).) As a threshold matter, the SEIR never discloses to the public that it essentially relies upon “fair share” payments from the Project in order to mitigate its Project-level transportation impacts, which renders the SEIR defective as an informational document. Had the SEIR described the Project’s approach to mitigating transportation impacts, it would have been apparent that the SEIR failed to disclose necessary information about this fair share program.

The payment of “fair share” impact fees may constitute adequate mitigation if the payments “are part of a reasonable plan of actual mitigation that the relevant agency commits itself to implementing.” (*Id.* at 1188-1189.) The *Anderson First* decision identified the information that is required in an EIR to establish the adequacy of a “fair share” mitigation measure, which includes the following:

- (i) An identification of the required improvement;
- (ii) An estimate of the cost of the required improvement;
- (iii) Sufficient information to determine how much the project would pay towards the improvement; and
- (iv) The fees must be part of a reasonable, enforceable plan or program sufficiently tied to the actual mitigation of the impacts at issue.

(*Ibid.*)

The SEIR fails to provide this necessary information, and never even mentions the MBTIF. While the SEIR does mention the Transportation Management Plan (“TMP”) and Transit Service Plan (“TSP”) as addressing the Project’s transportation impacts, the SEIR fails to identify the total costs of the improvements, the Project’s allocated contribution, and the enforceable plan or program to contribute the Project’s “fair share.” The new information contained within this Committee’s agenda packet regarding the MBTIF and other related matters cannot substitute for full disclosure of the selected approach to mitigation of transportation related impacts in the SEIR.

In addition, the actions on November 6, 2015, by the MTA, and this Committee’s planned actions today with respect to approval of the MBTIF and the grant of street and easement vacations are contrary to California public disclosure laws with respect to economic development subsidies. California law requires the City to provide public notice and a public hearing, as well as detailed information about the purpose, nature, extent and effect subsidies, prior to commitment. (Gov. Code, § 53083.) The Budget and

O-MBA27S9

Budget and Finance Committee  
November 9, 2015  
Page 3 of 3

Legislative Analyst's Memorandum ("BLA Memo"), along with the SFMTA Cost Estimate spreadsheet make clear that there is an estimated revenue shortfall of \$29,916,666, which will be financed through sale of SFMTA revenue bonds or other City financing source. (BLA Memo, pp. 7-8.) Payment of these Project mitigation costs by the City is an economic development subsidy, even if the loan is eventually repaid. (Gov. Code, §53083, subd. (g)(1).) Moreover, the summary vacation of streets and easements likely has value, yet no value is disclosed. Thus, the City must now comply with the substantive and procedural mandates of Government Code section 53083 prior to approving subsidies in the form of loans and other benefits included in the MBTIF and other related City actions and approvals, that provide transportation, infrastructure, public safety and other mitigation for Project impacts.

**RE: Responses to RTC - Responses to Comments on the Draft Subsequent Environmental Impact Report-  
Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (SCN:2014112045)**

Mr. Lippe,

This letter summarizes my responses to the Response to Comments published on October 23, 2015. These are the professional opinions of Larry Wymer, licensed California Traffic Engineer (#1955).

**OPINION 1 - The DSEIR's Transportation and Circulation analysis does not adequately analyze the entirety of the study area impacted by the development**

**OPINION 2 - The DSEIR's Transportation and Circulation analysis does not analyze impacted study intersections and ramps in the SoMa and North Mission Bay areas, most notably those between Market Street and King Street**

I maintain the opinion that the study area should be expanded beyond those assumed within the SEIR to the SoMa area to incorporate relevant travel patterns which would exist for both the proposed project and the "the previous proposed arena site as described within the memorandum report titled "Travel and Parking Demand Estimates for the Proposed Event Center and Mixed Use Development at Piers 30-32 and Seawall Lot 330" which was dated August 9, 2013.

The RTC states that my comment:

*"...noted that because some of the basketball game attendees would be arriving from the San Francisco downtown and Financial District areas, they would be required to pass through SoMa to arrive at the project site, so that additional intersections in the SoMa area would have to be evaluated. Mode of travel and place of origin surveys of baseball game attendees conducted by the SF Giants, as well as available parking occupancy surveys, suggest that many of those game attendees that drove to work at their jobs in the Financial District and SoMa areas, tend to walk, ride transit, or take a taxi to AT&T Park, leaving their cars at their commuter parking locations in order to avoid the evening commute congestion that*

*typically occurs near I-80 and AT&T Park and having to re-park their cars at game-day rates. It is likely*

*that a similar condition would occur with the proposed project, with many of those working in downtown*

O-MBA27S9

*riding Muni or special event shuttles, and taking taxis or TNC vehicles2, such as Uber or Lyft to the event center, rather than driving and having to park again with limited space availability."*

The SEIR itself, as noted within Table 1 of my original comment letter (provided below) identified several corridors to/from the SoMa neighborhood with substantial trip percentages up to 32% of project traffic.

**Table 1**  
**Project Vehicle Trip Patterns to Major Parking Facilities**  
**North Mission Bay & South SoMa**

Figure	Page	Figure Title	Trip Assignment Along Roadway			
			Seventh St s/o Townsend St	Fourth St s/o Townsend St	King St e/o Third St	from WB I-80 to Fifth St
5.2-14A	5.2-95	Project Vehicle Trip Patterns to Major Parking Facilities - Inbound Weekday PM Peak Hour - No Event and Convention Event	18% / 22%	7% / 7%	5% / 11%	8% / 7%
5.2-14B	5.2-96	Project Vehicle Trip Patterns to Major Parking Facilities - Outbound Weekday PM Peak Hour - No Event and Convention Event	19% / 19%	7% / 12%	5% / 5%	8% / 8%
5.2-14C	5.2-97	Project Vehicle Trip Patterns to Major Parking Facilities - Inbound Saturday Evening Peak Hour - No Event	20%	8%	5%	9%
5.2-14D	5.2-98	Project Vehicle Trip Patterns to Major Parking Facilities - Outbound Saturday Evening Peak Hour - No Event	20%	8%	5%	7%
5.2-14E	5.2-99	Project Vehicle Trip Patterns to Major Parking Facilities - Inbound Weekday and Saturday Peak Hours - Basketball Game Without a SF Giants Evening Game	31% / 32%	13% / 13%	9% / 11%	29% / 30%
5.2-14F	5.2-100	Project Vehicle Trip Patterns to Major Parking Facilities - Outbound Weekday Late Evening Peak Hour - Basketball Game Without a SF Giants Evening Game	31%	13%	11%	20%

Source: "Event Center and Mixed Use Development at Mission Bay Blocks 29-32" DSEIR (June 5, 2015)

It is not reasonable to discount the trips clearly represented by these trip pattern percentages established within the SEIR as irrelevant or unworthy of analysis because they may not be entirely comprised of trips within personal vehicles of those traveling through the SoMa area from the financial district. Even if attendees utilize alternate transportation such as taxis, Uber or Lyft, they will still be new trips added to the roadways which will potentially significantly impact intersections north of the area studied.

The RTC also states:

*"The previously proposed center at Piers 30-32 was located at the intersection of The Embarcadero and*

*Bryant Street, with very different access patterns compared to the proposed project."*

While true, generally the same level of traffic will be generated by both alternatives, and trips originating from the financial district would still be required to travel through the SoMa area. While admittedly traveling along some different arterials through the SoMa district, the previous analysis considered intersections within SoMa whereas the SEIR does not.

Please feel free to give me a call if you have any questions.

O-MBA27S9

Sincerely,

Larry Wymer & Associates Traffic Engineering

**Subject: Responses to Comment on Draft Subsequent Environmental Impact Report for Event Center and Mixed Use Development at Mission Bay Blocks 29-32. SCN:2014112045**

P15003

Dear Mr. Lippe:

Per your request, I have reviewed the Responses to Comment ("the RTC") on the Draft Subsequent Environmental Impact Report (hereinafter "the DSEIR") on the above referenced Project in the City and County of San Francisco (hereinafter "the City"). As I was a commenter on the DSEIR in regard to matters involving transportation and circulation in a letter dated July 26, 2015 which was transmitted as Exhibit 1 to your comment letter of July 27, 2015, my current comments focus on the responses to my own comments, those of yourself and affiliated consultant Larry Wymer. In addition, several others including representatives of BARTD, Caltrans, Caltrain, UCSF and other have filed comments that parallel and reinforce our own. I address the responses to those comments as well.

My qualifications to perform this review were thoroughly documented in my letter of comment on the DSEIR dated July 26, 2015 and are incorporated herein by reference.

My current comments follow. They are organized in the order the City chose to respond to my and others, not in order of comments or order of importance.

### Section 13.11.3, Response TR-2a

This section, in part, replies to our comments now labeled by the City as O-MBA10L4-15 and O-MBA10L4-17.

TRAFFIC • TRANSPORTATION • MANAGEMENT  
5311 Lowry Road, Union City, CA 94587 tel: 510.489.9477 fax: 510.489.9478

O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 2

### Re MBA10L4-15:

MBA10L4-15 points out that while the DSEIR evaluated the Project's transportation *with* implementation of a Special Events Transit Service Plan in the context of *six* different event scenarios, it only evaluates the Project's transportation impacts *without* the a Special Events Transit Service Plan in the context of *only one* event scenario (without Giants game but with Basketball game). It requests the analysis *without* the a Special Events Transit Service Plan in the context of for *all six* of the event scenarios that were evaluated assuming the Special Events Transit Service Plan was in place.

There are several problems with the City's reply to this comment.

- The reply claims that the scenario of an overlapping evening game at AT&T Park with a Basketball event at the proposed Project without the Special Event Transit Services Plan taking place is a "worst-of-the-worst scenarios" that could only happen about 9 times a year, and then only if Muni were unable to deliver those services. However, with the Project located just a block from the emergency entrances to the UCSF hospitals, "worst-of-the-worst scenarios" are germane considerations for potential impacts on patient access to emergency facilities and the ordinary or special access/egress of emergency service providers.
- Despite the City's assertion that funding of Muni's Special Event Transit Services Plan is guaranteed, this funding is dependent on allocation of General Funds and discretionary transportation funds to this purpose, with such future allocations not guaranteed.
- The response also points to Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring as providing measures that could be implemented in the event Muni's Special Event Transit Services Plan is not implemented. However, many of the potential action measures in M-TR-18 are vague and conditional, and strict monitoring and enforcement is unlikely if the City through Muni has failed to deliver its promised Special Event Transit Services Plan.
- The response, although admitting no quantitative analysis of an overlapping Giants event at AT&T Park with an evening Basketball event at the Project and without implementation of the Muni Special Event Transit Services Plan was prepared, claims that the DSEIR essentially covers this situation for intersections and freeway ramps by having quantitatively analyzed the scenario of an evening Basketball Event with no Giants Event and no Special Event Transit Services Plan (Impacts TR-18 and TR-19) by virtue of having stated that these impacts would be additive to impacts in the "existing conditions without evening Giants event scenario" (Impacts TR-2 and TR-3) or to Impacts TR-11 and TR-12 (existing conditions with a Giants Event at AT&T Park). The problem with this is that the simple statement that the impacts are additive provides the public with no measure of the severity of the combined impacts.

TRAFFIC • TRANSPORTATION • MANAGEMENT  
5311 Lowry Road, Union City, CA 94587 tel: 510.489.9477 fax: 510.489.9478

O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 3

- The response also notes that Impact TR-20 presents Muni transit impacts for the weekday evening Basketball scenario without an overlapping Giants game or implementation of the Muni Special Event Transit Services Plan and adds text stating as follows: "Impacts to the T Third and 22 Filmore would be in addition to the significant impacts identified for the proposed project with implementation of the Muni Special Event Transit Services Plan in Impact TR-13 for conditions with an overlapping SF Giants evening game." It then concludes, "The revision does not change the analysis or conclusions presented in the SEIR." The problem with this part of the response, like that related to the impacts on intersections and freeway ramps is that the simple statement that the impacts are additive fails to inform the public of the extent of the change in severity of the impacts.
- With regard to failure to consider cumulative scenarios that lack implementation of the Muni Special Event Transit Services Plan, this failure is not remedied by addition of text to the SEIR that specify that cumulative analysis for the Basketball game scenarios include assumption of implementation of the Muni Special Event Transit Services Plan. Since the SETSP is not guaranteed funding in perpetuity and there is no assurance that Muni vehicles and personnel resources will be able to be devoted to this special service in lieu of serving regular transit needs, this change in language does not relieve the deficiency of the SEIR's failure to consider the cumulative scenario in absence of the Muni Special Event Transit Services Plan.

As a consequence of these flaws, Response TR-2a related to MBA10L4-15 is inadequate.

Re MBA10L4-17

Comment O-MBA10L4-17 is part of a stream of comment demonstrating why the DSEIR is inadequate for having unreasonably understated the amount of weekday evening arena event access travel would occur during the evening commute peak hour (see our comment now labeled O-MBA10L4-16 for related discussion). Responding to this apart from the related issues in O-MBA10L4-16 evades the compelling nature of the joint comments that the DSEIR has understated the numbers of weekday evening basketball event attendees actually traveling on the transportation system in the evening commute peak hour (5 to 6 PM).

As to the direct substance of the comment and response, the DSEIR's decision to base the analysis of weekday evening games on a presumed starting time of 7:30 was predicated on experience over 3 seasons when the Warriors were a poor to marginal team and games starting earlier in the evening (at about 6 pm) averaged only 2.5 games per season. The comment documented that based on the 2014/2015 season performance, the combined total of weeknight regular season and playoff games starting at 6 pm (the normal start time for nationally televised weeknight games played on the West Coast) could easily be 16 games per season

O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 4

over the next several years or beyond. The inadequacies of the SEIR reply are as follows:

- The reply notes that the 2 to 3 preseason and up to 16 postseason games - number variable - (and in actuality, though not admitted in the response, a number of regular season games as well) could have a 6pm weekday start time. It also admits that such games would worsen traffic in the weekday peak commute period from conditions reported in the SEIR (failing to admit also adversely impacting transit and also failing to quantify the increase in severity of impacts on weekday pm commute peak. It claims that these start times are driven by such factors as TV deals, other team's travel schedules and outcomes of postseason series that are beyond the abilities of the Warriors to control - although it is nonsense for the response to imply that those considerations make the Project's significant impacts in the circumstances of these earlier-start events any less significant.
- The response claims that the quality of the team will vary from year to year and claims that this will make the situation of large numbers of national telecasts that might start at 6 pm inconsistent over the time horizon considered in the SEIR. This is a speculation not consistent with precedent. Once a team has achieved an iconic status and national following (as the Warriors have done in the recent season with winning the league championship and the most valuable player award and with the shiny new venue comprised by the Project reinforcing that iconic status), the number of nationally televised weeknight games (6 pm starts) is likely to increase over the next several seasons, and to reoccur despite hiccups in individual seasons (witness the pervasive national attraction to the Lakers and Celtics despite several bad seasons, or, in another sport, Notre Dame football). Moreover, the project arena may be used for other major weekday capacity events such as the NCAA basketball tournament quarter- and semi-finals that would have start times dictated by national TV (that is, 6 pm). Hence, the response's conclusion that "it is unlikely that this scenario [a large number of nationally televised weekday games starting at 6 pm] *would occur on a regular basis during the time horizon addressed by the SEIR*" is non-factual, speculative and inconsistent with the good faith effort to disclose impact that CEQA demands.
- Finally, the response claims that "consistent with common practice in the transportation planning profession, the SEIR includes an analysis of the highest demand with the most frequent conditions for evening events ...". We agree that the 7:30 start time is probably the most frequent weekday evening start time likely to occur. But the SEIR is in error and misleading in proclaiming that it is consistent with common practice in the transportation planning profession to only study the high-demand situation that occurs most frequently. In fact, when a high demand scenario that is not the most frequently occurring but is one that occurs frequently enough to be significantly impactful, it is the common practice in the transportation planning

O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 5

profession to study that frequent-enough circumstance as a separate scenario on a CEQA or other analysis. A good example of this is normal transportation planning practice with respect to major regional shopping centers. Studies are performed for an average weekday, and because shopping centers have their highest travel peaks on Saturday, for an average Saturday; these are the most frequently occurring peak conditions. But because shopping center travel has its highest peaks in the Thanksgiving to day-after-New Year holiday season and because the peaks in that approximately 38 day season occur frequently enough to be significantly impactful on their own and pose impacts of different severity than on the average weekday and average Saturday, normal transportation planning practice is to evaluate holiday shopping season weekday and Saturday impacts as separate scenarios. Another example is in the Napa Valley. There, it is the practice to evaluate a project's transportation impacts for the average weekday and average Saturday (which are the most frequently occurring impact situations) and to also evaluate impacts in the "crush" (harvest) season as a separate case as well because those impacts, occurring over a four to six week period are frequent enough and of such severity in comparison to annual averages to warrant consideration as a separate impact case.

- This matter cannot be dismissed as a disagreement among experts. A compelling argument that the SEIR should have evaluated a case scenario for weeknight capacity Basketball games starting at 6 pm is the fact that the SEIR did evaluate a scenario where there are an overlapping capacity Basketball event at the proposed Project and a Giants game at AT&T Park on a weekday evening. The SEIR claims that that type of overlapping event is likely to occur only about 9 times per year. It is obvious that, if a nine times per year occurrence rate is sufficient to require the SEIR to evaluate the Project in the context of that overlapping scenario, then the SEIR should also evaluate the weeknight 6 pm Basketball start scenario which is likely to occur more than 9 times per year in many years of operation.
- The fact that two hospital emergency entrances and the entries for emergency caregivers are located within a block of the Project site make the need for the SEIR to specifically evaluate impacts and mitigation in the 6 pm weekday event start scenario all the more compelling.

Hence, considering all of the above, the SEIR should have evaluated weekday Basketball events starting at 6 pm and is inadequate for not having done so.

**Section 13.11.3, Response TR-2b**

This section purports to respond to our comments now labeled by the City as O-MBA10L4-2, O-MBA10L4-20, O-MBA10L4-39A and those of Caltrans (A-Caltrans-5) and others. These comments concern the SEIR's lack of analysis at intersections

O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 6

and freeway ramps that are on obvious approach and/or departure routes to/from and that are obviously or potentially capacity-challenged already.

The response begins by reciting the 6 freeway ramps and their related surface street intersections where analysis was conducted, a point not at issue in the comment. The key point of the comment is the locations the SEIR failed to analyze, not the places it did so. The reply continues, adding that the depth and approach is similar to other studies of completed and ongoing major project studies in San Francisco, and noting that the 1998 Mission Bay FSEIR did not address freeway ramp operations and queuing at all. However, what other studies did or didn't do is immaterial. What is material is what this SEIR should have studied but failed to do, and the response attempts to evade this.

The response continues for two paragraphs describing the configurations and conditions at the I 280 Mariposa off-ramp - one of the locations the SEIR did study. This section, not related to the issue of the ramps and ramp intersections that the SEIR should have but failed to study, concludes by observing that the LOS F conditions on the off ramp in the evening peak hour would be cured by Mitigation Measure M-TR-11c involving stationing a PCO at the ramp terminus intersection and waving traffic turning right to Mariposa eastbound through the traffic signal at the end of the off-ramp. But that conclusion is completely speculative. This commenter was a long term Giants season ticket holder at AT&T Park and this particular off ramp was on my normal route to the Park. The problem there is not that the signal causes queues to back up the ramp and onto the freeway mainline. It is that once a driver reaches the end of the ramp and has a green light, there is often no place to turn to on Mariposa because eastbound traffic is queued all the way back from Third Street. So placing a PCO there will be largely useless.

The response then discusses the I-80 westbound off-ramp to Fifth Street, and concludes that mitigation measure M-TR-2b, vague measures of unquantifiable effect to encourage travel by non-automotive modes would reduce the Project's impacts at this location. Again, this discussion of a location the SEIR did study is irrelevant to the issue that the SEIR should have but failed to study other locations - unless the implicit message is that, had it done so and discovered impacts, it would have just proposed vague, unquantifiable and ineffectual mitigations and declared the impacts mitigated.

Finally, after four lengthy paragraphs of largely irrelevant matter, the reply turns to the subject of the intersections and ramps that should have been studied and were not. The response notes that under CEQA Guidelines § 15130, defining the location or locations for study "*is within the lead agency's reasonable discretion*" and fundamentally claims that in defining what intersections and ramps were analyzed in this SEIR the City has exercised reasonable discretion. However, this assertion is undermined by content in the comments demonstrating that by prior and ongoing

O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 7

studies in the general area and by common observation, the City knew or should have known that certain intersections and ramps in the SOMA and Mission Bay area that are on logical access and egress routes to the Project site are capacity challenged and are likely to be adversely impacted by the Project, yet it did not study them in the SEIR. Hence, rather than exercising "*reasonable discretion*" as required by CEQA Guidelines, the City, in failing to study these locations, abused its discretion and failed to undertake the good faith effort to disclose impact demanded by CEQA.

That the City has failed to exercise reasonable discretion in this matter is reinforced by two considerations.

- Two UCSF hospitals are located a block from the Project site. Many of the intersections and ramps on logical access/egress routes to/from the Project that, at the City's discretion, the SEIR failed to analyze are on the advised emergency access routes from various points in the City and region to the hospitals and are posted on the UCSF web site. In excluding these intersections and ramps, the City clearly ignored public safety impacts of that decision.
- The State of California Department of Transportation (Caltrans) has commented on the DSEIR as follows. "Project-related queuing impacts on nearby State facilities should be analyzed" (see comment now labeled in SEIR A-Caltrans-5). Caltrans clearly believes the DSEIR has not assessed impacts on a sufficient number of freeway mainline, ramps and ramp intersections that are likely to be impacted by the Project. Caltrans opinion is due the same deference in this matter as that of the City.

The City's response continues, attempting to explain why individual or groups of intersections and ramps were excluded from study in the DSEIR. For example, the response cites 9 intersections along the Embarcadero and 15 along or east of Fourth Street that we claimed should have been studied. It claims that because the Project is shifted to its current location farther south-west from the originally proposed location on Piers 30-32, the primary routes to and from the Project site from Downtown, SOMA, the northern parts of the City and from the North Bay and the I-80 ramps would be shifted farther west, away from these intersections. But this is not true. Except for the relatively few instances in which there is a concurrent evening Giants game at AT&T park, the routes along the Embarcadero and along and east of Fourth Street remain the most effective and imageable routes to the currently proposed Project site and the parking facilities that serve it from much of the Downtown, SOMA, northern parts of the City, the North Bay and the I-80 ramps to and from the East Bay. Those paths are only likely to be altered on evenings with a concurrent Giants game. And if a massive shift of traffic further west was assumed in the City's thinking as it scoped the current SEIR and excluded the intersections along the Embarcadero and on and east of Fourth on that assumption, why didn't it add more intersections in the Eighth Street corridor (including but not

O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 8

limited to the ramps and intersections at Eighth and Harrison, Eighth and Bryant) and other intersections in the Van Ness, Franklin, Gough, Octavia corridors for example? The City has no good answer.

The response also claims that traffic passing through the Embarcadero intersections and the intersections along and east of Fourth would be less significant because a survey of baseball attendees at AT&T park *suggested* that many attendees who worked Downtown or in SOMA and drove to work left their cars at their commute parking locations and walked, used transit or took cabs to and from the ballpark. This type of data is of course irrelevant because those considerations should have already been taken into account in the SEIR's assumptions about mode split to the park from those districts. Moreover, this type behavior is likely to become increasingly uncommon as surface parking in those districts disappears and is replaced by parking garages that tend to close earlier than parkers could travel back to them at the conclusion of ballpark or arena events.

The response also cites new study of a single intersection, that of Eighth and Bryant as exemplar of why additional study intersections are not justified. This intersection is an anomalously complex intersection, and the effects of its complexities on traffic operations are difficult to replicate in theoretical delay/level of service calculations. Part of the complexity is that Eighth Street, which is one-way southbound north of Brannan becomes two-way south of Brannan. The complexity is compounded because columns that support I-80 as it crosses above Eighth between Bryant and Brannan are located in the center of Eighth Street and force southbound drivers that want to turn left at Brannan or go through or right there to pick the correct lane before departing the heavily congested intersection of Eighth and Bryant. Moreover, from this point of choice, drivers' views of what choices they must make before moving along Eighth toward Brannan are obscured by the columns and I-80 structure. In general, calculations of LOS at one location are poor predictors of delay/LOS conditions somewhere else. Moreover, in this case, the unique geometrics of the subject intersection and their unusual effects on driver behavior make the outcome of theoretical delay/LOS calculations anomalous rather than exemplar of anything elsewhere.

The City's response is clearly grasping straws to avoid analyzing the full array of intersections and ramps that, in a good faith effort to disclose impact, the SEIR should have evaluated. The City's response to the subject comment set is inadequate, and in continuing to evade analysis of potentially adversely affected freeway segments, intersections and ramps, the SEIR is defective and unsuited for certification.

## O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 9

### Section 13.11.3, Response TR-2c

Response TR-2c replies to our comments O-MBA10L4-21 and -22, and those of others that the DSEIR understates transit and traffic impacts because it is based on outdated traffic and transit data unrepresentative of existing conditions at the time of filing the Notice of Preparation (NOP) for the SEIR.

The initial point in the response in Response TR-2c is to deny that the baseline data relied upon in the DSEIR was stale, and to claim that the City and its consultants took steps to assure that they relied upon data as up-to-date as feasible. This assertion is factually untrue.

Here we briefly review the facts of the situation, first with regard to transit data.

- The NOP for the Project was circulated on November 19, 2014.
- The data document relied on in the DSEIR transit impact analysis for Muni operations in the City states that this data was collected in the fall of 2010 and at some time in 2011.
- The data relied upon for services in the regional transit corridors serving the City was drawn from a SFMTA TEP project published in October 2012. Obviously, the regional transit corridor data published in that study reflects observations some time before October, 2012.
- Since those times of data collection, there have been a large number of development projects completed and occupied in the C-3, SOMA and Mission Bay and yet others were approved and under construction. In addition, the recovering economy has added considerable numbers of riders to the local and regional transit systems.

Clearly the transit data relied upon in the DSEIR was stale at the time the analysis was performed and this should have been obvious to the City and its consultants. Moreover, contrary to the claim in Response TR-2c that the City and its consultants took steps to assure that they relied upon data as up-to-date as feasible, new information released as part of Response TR-2c makes obvious that this is not the case.

- Several weeks before the DSEIR was circulated, the City issued updated summarizations of Muni patronage data and regional transit service data.
- Several weeks before the DSEIR was circulated, the City had BART patronage data that was very current – actually through April, 2015.

Yet the City did not update the transit analysis in light of this data before circulating the DSEIR or even acknowledge the existence of newer data in any way in that document. This is improper.

Response TR-26 does not present in full the new transit data set, the San Francisco Planning Department Memorandum *Transit Data for Transportation Impact Studies* dated May 15, 2015. Instead it presents a composite table compiled from the

TRAFFIC • TRANSPORTATION • MANAGEMENT  
5311 Lowry Road, Union City, CA 94587 tel: 510.489.9477 fax: 510.489.9478

## O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 10

information in the cited memorandum (Table 5.2-43) sourced to Advant Consulting/Fehr & Peers/LCW Consulting and dated 2015. This composite table omits key data from the actual May 15, 2015 San Francisco Planning Department Memorandum (a copy of which is appended hereto as Exhibit 1) that indicate the data reflected therein were collected in 2013 for Muni operations and in 2012 for regional transit operations. This raises two key issues:

- Although the revised analysis presented in Response TR-2c is based on newer data, that data is also stale.
- In omitting, in the summary table published in Response TR-2c, the notations indicating the dates on which the newer data was collected, the response either deliberately or inadvertently misleads the public to believe the analysis in the response is based on current 2015 data, which it is not.

Although Response TR-2c mentions having BART's April, 2015 ridership data and claims to have relied on it, there is no evidence in the response of how and where the SEIR made use of it in any way. Although the City has placed the raw BART of April ridership data, ascribed to a May 1, 2015 submission by Val Menotti, Bart Chief Planning & Development Officer, on the SEIR web site, the transmittal narrative is not presented nor is its translation into the regional screenline format relied on in the SEIR. We hereby demand that the conversion of the subject BART ridership data release be provided to the Mission Bay Alliance and its consultants in the format of the regional screenline analysis of the SEIR and that the period of comment be extended beyond the date of its provision to allow adequate time for review and comment on its implications. We also note that BART's own letter of comment on the DSEIR (now Comment A-BART) in its second paragraph of comment (a paragraph the SEIR ignores rather than enumerating for response (see SEIR page COM-19) notes as follows: *"Given strong job expansion in San Francisco, BART has experienced unprecedented ridership growth (~25% over the last four years) which creates a number of peak period capacity challenges."* This statement clearly demonstrates that any reliance on regional transit data as old as 2012 (which the SEIR continues to rely on) is an inaccurate portrayal of the background conditions on which the Project imposes impacts. Response TR-2c claims to have used the April, 2015 BART data

Response TR-2c presents a reassessment of impacts on the 22 – Fillmore and the T-Third lines based on the purportedly 'new' baseline data set and finds that deficiencies on these lines are not Project impacts because the Project's contribution to ridership does not exceed 5 percent of total ridership at the maximum load points. However, this finding of lacking a ridership contribution in excess of 5 percent at the maximum load point comes about only because of the failure to consider the scenario of weekday Basketball event starts at 6 pm and the SEIR's illogical refusal to consider that there is an offset between the time attendees pass through the arena turnstiles and the time those attendees are traveling on and impacting the transportation system (see our comments O-MBA10L4-17, O-MBA10L4-7, O-

## O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 11

MBA10L4-16 and our comments herein with respect to Response to Comments TR-2a and TR-2d. Had either or both the 6 pm game start scenario and the proper offset between arena turnstile passage time and time traveling on the transportation system been considered, there would be much more Project travel on the subject lines during the pm peak commute hour (5-6 pm) than is considered in the SEIR and significant impacts on these lines would be disclosed.

Response TR-2c claims that use of the updated transit data does not result in any changes to impact determination for Muni transit presented in Impact TR-4. This conclusion is incorrect and misleading because the analysis was not performed on *adequately updated* (still stale) transit ridership data and because it was performed without considering reasonable Project contributions to evening commute peak hour transit ridership (because of failure to consider a 6 pm game start scenario and failure to consider the offset between time riding transit and time passing through arena turnstiles for the 7:30 game start scenario).

Response TR-2c also opines that, since ridership figures for the 22 Fillmore and T Third routes were obtained from SFMTA and reflect City's plans for changing the 22-Fillmore and completing the Central Subway by year 2020, the SEIR analysis for these lines accounts for development that occurred and is probable to occur through 2020. However, we note that the planning studies for those transit service changes on those lines were performed several years ago and the SEIR presents no clear evidence whether or not the SFMTA projections for those transit projects reasonably reflects the development boom that has occurred in the C-3, SOMA and Mission Bay in the intervening years and whether or not job infill in existing development due to a revitalized economy was reflected.

A final section of Response TR-2c attempts legalistic evasion of the issue of stale existing conditions data. This section starts by stating: "*Overall the transit impact analysis presents a reasonable representation of transit conditions based on available data for the Muni and regional transit providers and additional analysis is not required. Nor have commenters identified any flaws in the analysis that built upon the transit impact analysis.*" This statement is contrary to fact. Four year old data collected at a time when the job and development economy was just starting to begin recovering from a period of stagnation and decline is clearly not representative of conditions after four subsequent years of aggressive development and job boom. And for our part, in our comment letter of July 26, 2015 comprises 27 pages identifying flaws in the analysis that are compounded by the flawed and outdated transit data base assumed as "existing" conditions in the DSEIR. The response goes on to state: "*Although a somewhat different, and yet technically plausible, approach might have been possible, the City's approach is abundantly supported by substantial evidence and represents a reasonable exercise of technical judgment. In general, a lead agency's determination regarding how 'existing physical conditions without the project' could 'most reasonable be measured' is 'quintessentially a*

## O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 12

*discretionary determination*". This statement misrepresents the issue in order to bend the framing of it to fit legal case precedents which are then cited in the response. However, this is absolutely not a technical disagreement about how to go about collecting or reasonably measuring existing transit conditions data. The issue is that the old transit data the City had on hand is simply not representative of the transit conditions that existed in late November, 2014 when the NOP was circulated.

With regard to the issue of stale traffic data (Comment O-MBAL4-21), Response TR-2c reiterates that the DSEIR adjusted the original counts to account for the opening of the UCSF Medical Center Phase 1 and the Public Safety Building that were nearing completion after the traffic counts were taken. This adjustment for those buildings was acknowledged in our comment O-MBAL4-21 and is not a matter of question. Response TR-2c goes on to state that subsequent traffic counts taken at three intersections in April 2015 confirm that the adjustments to the earlier traffic counts reasonably reflect the added traffic associated with the newly opened facilities cited above. This point is also not challenged in our comment, at least with respect to the three particular intersections counted. However, Response TR-2c then concludes: "*Because the adjusted volumes used in the analysis were similar to or higher than those collected in the field in April 2015, it can reasonably be inferred* [emphasis added] *that the traffic volumes used in the existing and existing plus project analyses also adequately reflect any changes that may be associated with newly completed projects further afield (e.g., in SoMa).*" The idea that this conclusion can reasonably be inferred is utter nonsense. The DSEIR made no attempt to quantify what projects in northern Mission Bay, SOMA and the C-3 were completed after 2013 or nearing completion by early 2015, how much traffic they would generate and where most of that traffic would go and what study intersections it would affect. The intersections that were counted in April 2015 (Third with Sixteenth, Fourth with Sixteenth and Fourth with Mariposa) are indeed "*far afield*", being well to the southeast from new developments in northern Mission Bay, the SOMA and C-3 and are unlikely to be affected much by developments in those areas<sup>1</sup>. But other intersections in the Project's scope of study are much closer to those development areas and are likely to be considerably more affected by traffic generated by the uncounted developments there as well as increased traffic to/from those areas due to job growth within existing uses due to the improved economy. The April 2015 counts do nothing more than show the SEIR traffic adjustments for UCSF Medical Center Phase 1 and for the Public Safety Building came reasonably close to getting it right for those particular facilities and those particular intersections. They carry no inference for other new development and for other study intersections farther afield.

<sup>1</sup> This is because traffic from northern Mission Bay, the SOMA and C-3 would likely take other routes journeying to and from the southeast that would not pass through the 3 intersections counted in April 2015.

## O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 13

Because of these considerations, Response TR-2c is inadequate and the comment that the SEIR traffic baseline is stale remains unrefuted.

### Section 13.11.3, Response TR-2d

Response TR-2d concerns our comments now O-MBA10L4-7, O-MBA10L4-7, Caltrans (A-Caltrans-1) and others.

Our comments concern the fact that the DSEIR relies on turnstile data<sup>2</sup> on time of arrival at the Golden State Warriors current venue site (Oracle Arena) and other basketball venues to estimate how many attendees traveling to a game with a 7:30 PM start time would be traveling on the area transportation system in the 4 to 6 PM peak commute period versus in the 6 to 8 PM early evening peak shoulder period without considering the reasonable offsets between the time attendees enter the "paid" areas of the arena and the time when they were actually traveling on the transportation system.

Response TR-2d begins by stating as follows: *"For reasons explained below, the City disagrees with those comments and stands by its analysis, which reflects a number of evidence-backed, conservative assumptions. While some of the points raised in the comments seem intuitively believable, actual data from comparable situations show that the comments have exaggerated the likely numbers of people would arrive [sic] before 6 pm for a 7:30 pm event."*

Let us parse this introductory section of the response before moving to the further details.

Re: *"points raised in the comments seem intuitively believable"*,

- It is undeniable fact that attendees occupy capacity on the transportation for a period of time that depends on the length of their journey and mode and that the period they occupy capacity on the transportation system occurs before the time they pass through the arena turnstiles.
- It is undeniable fact that even for attendees who go directly through the turnstiles into the paid section of the arena at the end of their trip to the site, there is a time offset between the time when they stop occupying capacity on the transportation system - when they debark onto the T Third platform, or the 22 Fillmore stop or find a parking place nearby or perhaps even start walking from BART, Caltrain or the other Muni-Metro lines - and the time they pass through the turnstiles.
- It is fact that some attendees wait outside the venue, perhaps to meet up with companions traveling separately (possibly to hand them their tickets, just soak in the atmosphere of the crowd arriving or for other reasons). So the

<sup>2</sup> The time attendees actually enter the "paid" areas of the arena.

## O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 14

time these attendees occupy capacity on the transportation system is even more offset than those who enter the arena directly.

- It is fact that some choose to have drinks or meals at restaurants and bars outside the venue before entering the arena and that the offset between when these attendees occupy capacity on the transportation system and the time they pass through the arena turnstiles is even greater yet.

These considerations are not just *"intuitively believable"*; they are undeniable fact and the SEIR's analysis has failed to take them into account.

Re: *"the comments have exaggerated the likely numbers of people would arrive [sic] before 6 pm for a 7:30 pm event."*

The fact that time of arena event attendees' time on the transportation system is offset from the time they pass through the arena turnstiles for the reasons stated above is not a newly-discovered concept or theory; it is a fact the City and its consultants knew or should have known. It is the City's responsibility to have reasonably considered the offset factors in the SEIR and, based on that, reasonably estimated the number of arena attendees who would be impacting the transportation system during the evening commute peak hour in the case of a weekday evening arena event starting at 7:30 pm. We have made a reasoned effort to estimate how many attendee's travel to such an evening event would be offset into the evening commute peak hour. The City and its consultants have made absolutely no attempt to consider the offset factors in estimating impacts of travelers to a 7:30 pm arena event start on the transportation system in the evening commute peak hour. Hence, the City is in no position to opine that our reasonable estimate based on those offset factors is *"exaggerated"* since it didn't try to make such an estimate at all.

Re: *"the City disagrees with those comments and stands by its analysis..."*

This is an attempt to transform what is a matter of fact into a disagreement among experts in the hope that courts will grant deference to the City's opinion in the matter. However, since this is a clear matter of fact, the response is inadequate and the City has refused to make the good faith effort to disclose impact that CEQA demands.

Here we consider of details of Response TR-2d.

Response TR-2d in the last paragraph of Volume 4, page 13.11-41 states:

"As shown in the table on SEIR p. TR-37 of Volume 3 of the SEIR, multiple basketball

venues from various sources were evaluated to derive the arrival patterns at the

## O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 15

proposed project arena. Of these, two locations (Oracle Arena in Oakland and Barclays Center in Brooklyn) separately reported arrivals occurring more than one and a half hour prior to the start of a basketball game. The remaining facilities reported all arrivals occurring more than one hour before the start of a game, most likely because those occurring more than one and a half hour prior to the game represent a small fraction of the total attendance. The average percentage of arrivals occurring between 5:00 and 6:00 p.m. for those instances where arrivals occurring more than one and a half hour prior to the start of a basketball game (i.e., between 5:00 and 6:00 p.m. for a typical game starting at 7:30 p.m.) is less than 2.5 percent. Thus, to account for potential daily variability in arrival patterns, as well as the additional time it may take for attendees to enter to the event center after their arrival at the site or nearby vicinity, the SEIR conservatively assumed that more than twice as many attendees as the average (i.e., 5 percent) would arrive between 5:00 and 6:00 p.m."

This section of the response is misleading in several respects. Although Volume 3, page TR 37 presents 7 data sets obtained for 6 NBA basketball venues, examination reveals all of the data is turnstile entry data and only 3 of the data sets for 2 venues provided useful data measuring turnstile arrival times earlier more than 1.5 hours before game start time (which would definitely put travel by those attendees into the 5 to 6 pm evening commute peak period). One of those is for the Warriors at their current venue, Oracle Arena, and shows only 1 % of attendees arriving more than 1.5 hours before game start time. The other two are for the first two years of operations of the Barclays Center in Brooklyn which respectively showed 2.0 and 4.1 percent of attendees arriving more than 1.5 hours before the start of an evening basketball game.

Let us put this data in perspective. The Oakland-Alameda Coliseum complex on which the Oracle Arena sits has a total of almost 10,000 parking spaces, more than enough spaces to accommodate the entire Arena capacity attendance if attendees arrived at two persons per car occupancy. This facility is noted for tailgating before basketball games as well as before other events. In addition, persons arriving at the complex by BART can readily be observed joining friends who drove and parked at their tailgates. Because of this, the observed 1 percent of attendees turnstile count for Oracle is probably under-representative of the numbers of attendees who actually arrive on the premises more than 1.5 hours before game start by a factor of 25- to 30-fold or so.<sup>3</sup>

The other data sets from Brooklyn show turnstile counts at the Barclays Center more than 1.5 hours before game start at 2 percent in the initial year and 4.1 percent in the second year of operation. These percentages likely reflect in part attendees unfamiliar with a new venue and adapting their pregame behavior as they become more knowledgeable. But neither of the two years turnstile data provides any

<sup>3</sup> We note that it would not have been difficult or costly for the City, its consultants or the Project sponsor to have taken aerial photos of parking at the complex 1.5 hours before game start and again some time after game start, counted the cars in each, and used the relative numbers as a reasonable surrogate measure of what percentage of attendees arrive 1.5 hours before event start.

## O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 16

indication of how many of the attendees actually arrived in the vicinity of the Barclays Center more than 1.5 hours before event start (hence actually traveling on the transportation system in the pm commute peak period).

The SEIR takes these three data sets, averages them, finds them to be less than 2.5 percent of total attendees, doubles that to 5 percent and assumes that becomes a "*conservative*" estimate covering all the considerations why attendees might have arrived in the Project area 1.5 hours or more before event start (hence been traveling on the transportation system in the pm peak commute hour.). The problem with this is, there is nothing that connects the turnstile percentage of attendees entering the arena more than 1.5 hours before event start to the percentage who arrive near the venue site 1.5 hours before or indicates that double that turnstile count is a "*conservative*" estimate of that latter item. The claimed "*evidence backed, conservative assumptions*" the City claims to have made in this matter has no direct quantified or quantifiable relationship to the "*evidence*" the SEIR cites. The City, its consultants or the Project sponsor could easily have easily and inexpensively measured attendee arrivals to the Warriors current venue environs (the Oakland Alameda Coliseum property) via motor vehicle and BART, but they failed to do so. By 'deeming this unnecessary' as it does on page 13.11-42, Response TR-2d expresses preference for the SEIR's own unsubstantiated guess as to how many attendees of a 7:30 pm start basketball event are actually traveling on the transportation in the pre-6 pm evening commute peak hour rather than having reliably measured data. And that guess is highly favorable to the Project since the low number of travelers in it minimize the chance of Project impacts on the transportation system being disclosed for the pm commute peak hour. The response is inadequate and inconsistent with the good faith effort to disclose impact that CEQA demands.

### Section 13.11.3, Response TR-2f

Response TR-2f replies to our comments O-MBA10L4-3, O-MBA10L4-4, O-MBA10L4-23, O-MBA10L4-24, and O-MBA10L4-27. The first and fourth of these comments relate to the SEIR's failure to define the severity of the Project's traffic impacts. The second and third of these comments relate to failure to evaluate impacts at intersections under PCO control and the fifth relates to the SEIR's failure to account for the effects of train passage in the analysis of the intersection of Sixteenth, Seventh and Mississippi. Both of these latter matters also ultimately go to the issue of failure to define severity of impacts.

With regard to the failure to address changes in severity to impacts at locations already operating under conditions qualifying as impacted, the first three paragraphs of the response are padding, reciting definitions of LOS that are not in dispute in the comments. The next three paragraphs of the response on page are legalistic arguments about whether CEQA requires disclosure of distinctions in severity to

## O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 17

impacts where conditions are already in a state considered impacted. Without engaging in the argument of legal matters, we can state that from an engineering perspective, distinctions in severity of impacts represented by changes in delay in the LOS/delay computations are highly significant. If the computations at a ramp or intersection already at LOS F show changes of a couple seconds of delay or so, this is hardly perceptible to drivers and is not indicative of meaningful change in severity of impact. But if the computations show changes of, for example, a half-minute or a minute or more, this is indicative of a dramatic change in severity that is highly perceptible and involves potential for queue blockages of additional lanes or upstream locations. Since the calculation procedures are capable of generating these estimates of delay and distinction of severity, this information should not be suppressed and ignored – doing so appears to be inconsistent with the good faith effort to disclose impact that CEQA demands.

The response goes on for four more paragraphs discussing the evolution of LOS computation techniques, the City's practices in use of them, and the technical meaningfulness of them. The single point in these paragraphs worthy of consideration can be summarized as follows: Calculation procedures to determine delay have been validated for instances where the subject location is below or slightly above capacity; in circumstances where capacity is greatly exceeded the validation is less strong and therefore the delay predictions are less reliable. We acknowledge this. But it is still clear if, say, an intersection or ramp is a couple seconds over the LOS F threshold in the existing condition and addition of project traffic computes to add a half minute or minute or more of delay, those are significant changes in severity. This is regardless of the fact, because of the lower reliability of the delay calculation in the LOS F zone, that if the traffic were actually added in the field and the changes in delay were measured, the results might be 27 seconds added instead of a half-minute or 55 seconds added instead of a minute.

Response TR-2f continues for another page-and-a-half of irrelevant speculation that in the future, consideration of LOS/delay may be excluded from CEQA consideration. For the present, LOS is a CEQA consideration, the City has relied on it and that portion of the response can safely be dismissed.

Response TR-2f continues, replying to the issues in O-MBA10L4-4, O-MBA10L4-23, concerning failure to evaluate LOA/delay impacts at intersections under PCO control. This comment concerns specific tables in DSEIR Volume 1 that are explicitly identified in the comments, Tables 5.2-47 and 5.2-48, respectively located on pages 5.2-172 and 5.2-174. These tables have no entries for LOS or delay at certain intersections, with the normal space for delay and LOS entries in those tables filled with the notation "PCO Controlled". The response points to completely different tables, Tables 5.2-34, 5.2-35 and 5.2-36 as having delay and LOS entries for those intersection locations. This response evades the following questions:

- What is LOS and delay at the times these intersections are PCO controlled?

## O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 18

- Does the SEIR conclude that PCO control mitigates significant impacts at these locations or do they remain significantly and unavoidably impacted?  
The response is inadequate.

The final portion of Response TR-2f concerns the apparent lack considering the effect of Caltrain train movements on delay and LOS at the intersection of Seventh, Sixteenth and Mississippi. The response confirms that the SEIR analysis did not attempt to analyze the effect of Caltrain train movements on the LOS/delay compiled for the intersection of Seventh-Sixteenth and Mississippi. It points out that the SEIR analysis shows that with the reductions in general traffic lanes associated with the 22 Fillmore Transit Priority project, together with Project traffic, with or without overlapping Giants games, this location would be at LOS F. It then claims that, because the computation of delay is less reliable when LOS F conditions are already evident, there would be no point to attempting to further quantify the situation with respect to the effects on the subject intersection by Caltrain movements on the immediately adjacent grade crossing of Sixteenth. This absurd response ignores and attempts to evade the key point of the comment which is that had Caltrain movements been considered, there is a good prospect the analysis might have shown that traffic on Sixteenth would queue to an extent that might obstruct the intersections of Sixteenth with Owens, Sixteenth with Fourth, and even Sixteenth with Third. Since these locations are on a critical emergency and regular access route to the UCSF hospitals it is imperative that such an analysis be done (a good case for micro-simulation) and the SEIR is critically deficient for having failed to perform it.

### Section 13.11.3, Response TR-2g

This response replies to our comments O-MBA10L4-3-13a and O-MBA10L4-18 which concerns the criteria the City uses to define impacts on transit.

To our comment that the ordinary transit impact criterion, ridership in excess of 85 percent of screenline capacity based on scheduled service, or by scheduled line service where an individual line evaluation is ordered, is unreasonable and unrealistic. Our reasoning is based on the fact that Muni rarely, if ever actually delivers the effective capacity of full scheduled service due to missed runs, bunching and skip-stopping and other issues related to lack of schedule reliability or on-time performance. The response describes how passengers are counted, but this clearly does not include those left standing at bus stops and LRT platforms. It also claims that the procedure takes into account the schedule reliability and on-time performance issues, but demonstrates no clear way that this is true. It also fails to address the issue that, when only a screenline analysis is performed, this assumes the excess capacity on one line is available to serve the excess ridership on another, while in reality, most people's travel patterns are well served by only a single line.

## O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 19

The response then moves to a key issue, that the City has relaxed the normal threshold of impact from 85 percent to 100 percent of capacity for this particular Project. One of our criticisms is that relaxation of the normal threshold of significant impact for one favored project is inconsistent with the good faith effort to disclose impact that CEQA demands. The response's reply to this is that San Francisco already did the same for the 34<sup>th</sup> America's Cup competition event and New York City does it all the time for large special events. But the America's Cup competition is/was fundamentally different from the proposed Project in that it involved large-attendance spectator event competition occurring over just a few days in a single year; the Project involves events on over 200 days per year repeated over many, many years. Moreover, the fact that nobody noticed that the City changed the rules for that specific event does not make it right then and does not justify making a special change of the impact criteria for this Project or for any project. As regards to what New York City does for transit impact criterion with respect to large special events there, that is irrelevant to San Francisco.

A key issue identified in the comments is that while event-attendees may tolerate 100 percent-of-capacity crush loads (a justification the DSEIR used for the relaxed impact criterion), the problem is that this imposes a special misery on the people who are normal users of the affected lines at the times. Response TR-2g fails to address this relevant point. Furthermore, the issue of who the regular riders who are adversely impacted when special event attendees overcrowd and slow the operation of the affected transit lines has Social Justice implications. We explore this topic, which the SEIR fails to address, below.

Other commenters provide evidence that the community south of the Project site served by the T Third line is a disadvantaged community that is adversely impacted by the effects of transit services to the Project that create social justice issues unaddressed in the SEIR. Here we discuss transit operations considerations that lend support to the assertion that the SEIR has failed to address social justice issues.

- Regular users of the T Third will suffer unpleasant overcrowding due to event-goers in the pre-event and post-event periods, having to deal with scarcity of seating and uncomfortable sharing of standing space with boisterous pre-event goers and over-exuberant or angrily depressed (and often liquor-fueled) departing event goers.
- The City's decision to reduce the threshold of significant impact from the normal 85 percent of capacity to 100 percent of capacity exacerbates the overcrowding impacts on the regular user community.
- Special T Third shuttle services to the Project site that turn back near the intersection of Sixteenth and Third occupy time slots that could be filled by runs that serve the community to the south in this corridor.

## O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 20

- Heavy boardings and alightings associated with event arrival and departure travel increase station dwell times, slowing service to normal users south of the Project site. Delays associated with shuttle operation turn-backs do the same. Also, turn-backs tend to create big gaps in service south of the Project site, as is reportedly already evidenced as the result of Giants games.
- Reconstruction of the T Third station platform near the intersection of Third with Sixteenth to accommodate Project crowds, a reconstruction that will require over a year, will inevitably delay T Third services to the disadvantaged community to the south over the duration of the construction period. At times this may even require substitution of inferior bus services.

All of these constitute transit operational reasons why the SEIR should have included a Social Justice Impact section that has not been provided.

### Section 13.11.3, Response TR-2h

This response replies to our comments O-MBA5-6, O-MBA10L4-9, O-MBA10L4-10, O-MBA10L4-11, O-MBA10L4-12, O-MBA10L4-26 and O-MBA10L4-36 and those of others. The points of these comments are summarized as follows:

- The cumulative analysis, pegged to Year 2040, 25 years from now, is purely speculative.
- While a speculative look at conditions 25 years hence is not objectionable, overlooking a cumulative scenario 10 years hence misses the most active concerns of the current residents of San Francisco and the region, hence the SEIR is defective as an information document.
- Absent inclusion of a shorter time-frame cumulative analysis, the long-term cumulative analysis deludes the public as to the nearer-term cumulative consequences of the Project.
- Given the rapid pace of development approvals including frequent planning and zoning variances, a 25 year forward cumulative analysis based on General Plan development quantifications is irrelevant.
- The transportation planning forecast tool used to prepare the travel forecasts for the 2040 cumulative analysis has a greater validation error (by a factor of 2) than the threshold of Project cumulative impact.
- The City is actively planning massive changes to the transportation network that would substantially alter (seemingly to the Project's detriment and to make it more impactful) transportation conditions in the immediate Project vicinity and that are as reasonably foreseeable as the plan development totals relied on in the 2040 analysis. The SEIR has failed to assess these transportation network changes.
- The SEIR uses an improper baseline for assessing cumulative transportation impacts. It assesses the Project's impacts relative to 2040 conditions that are assumed to exist without the Project. Per CEQA, it should evaluate the Project's impacts, in combination with those of other present and

## O-MBA27S9

Mr. Tom Lippe  
November 2, 2015  
Page 21

reasonably foreseeable future projects on the existing environment. The essential difference is that what the SEIR has done is to compare a projection to a projection. CEQA requires comparison of a joint projection to a known (the existing condition). These are different things.

Response TR-2h begins with a laborious 4-page description of the City's ordinary practices in cumulative analysis and of the SF-CHAMP transportation model. The discussion fails to address any of the issues in the comments and, in particular, the SF-CHAMP model's calibration error being double the threshold of impacts that it is being relied upon to disclose.

Response TR-2h continues in an attempt to justify the distant year cumulative analysis as follows:

The 2040 cumulative horizon year is preferable to shorter period because the 25 - year horizon year more accurately accounts for land use changes and their associated transportation network changes, as well as other planned transportation improvements. Future growth occurs according to the vagaries of variable economic conditions, development trends, changing sponsor development priorities, and legal actions that delay or curtail proposed development, and therefore, short - term land use growth patterns cannot be accurately predicted in five - year increments. In particular, redevelopment projects such as those included in the 2040 growth forecasts (e.g., Mission Bay Plan, Candlestick Point - Hunters Point Shipyard Plan, redevelopment of Pier 70 and Seawall Lot 337), often take longer than anticipated to be completed. For example, the Mission Bay Plan was anticipated to be substantially built - out by 2015, which is the cumulative analysis year for transportation conditions in the Mission Bay FSEIR; however, construction of development is still underway and the UCSF Mission Bay campus is anticipated to be completed by 2019. Nearby, the Candlestick Point - Hunters Point Shipyard Phase II Development Plan identified completion of about 3,100 residential units by 2017; however, only about 240 of the 3,100 residential units are anticipated to be completed by the end of 2015. Construction of development part of the Pier 70 project is anticipated to continue through 2030. Thus, because larger multi - year development proposals would be built over a number of years, a future cumulative analysis year considers completion of buildout of these projects. Therefore, the cumulative impact analysis presented on SEIR pp. 5.2 - 208 - 5.2 - 232 (i.e., Impact C - TR - 1 though Impact C - TR - 10) adequately reflects the proposed project's impacts in combination with other past, present, and reasonably foreseeable future projects, and a different or additional cumulative analysis year is not warranted.

This response begs the question: If all this is true, why didn't the City use a 50, 60 or 100 year period for the cumulative analysis. The response, although seemingly filled with factual information, is nonsense relative to the issues.

Also, nothing in the response addresses the final bulleted point above or its elaboration in the original comments. CEQA requires evaluation of the

TRAFFIC • TRANSPORTATION • MANAGEMENT

Page 22

cumulative condition, including the Project in combination with other foreseeable in comparison to the existing environment, not a comparison of two hypothetical future conditions.

### Section 13.11.6 – Response TR-5

This response relates to comments by BART (Comments A-BART-1, -4, -5, -7, -8, and -9) and ourselves (O-MBA10L4-19) supplying a station-level analysis of impacts on BART that was critically missing in the DSEIR. This station-level analysis provides completely new information, including Table 13.11-2, and conclusions that were previously missing. Consequently, the information should be available for review for the full 45 day review period in Recirculated Draft status under CEQA.

### Section 13.11.6 – Response TR-8

This response replies to our comment O-MBA10L4-28 concerning truck loading. The response indicates that new (un-numbered and untitled) figures showing truck turning templates for each loading are presented with the response. It is not evident if and where the said figures are actually provided. Hence, the response is inadequate.

### Section 13.11.6 – Response TR-9

This reply responds to our comment and those of others regarding access impacts to emergency vehicles attempting to reach UCSF hospitals located in the immediate vicinity of the Project. The response consists of a repetition and elaboration of the description of the ineffectual measures that prompted the comment rather than proposing clear mitigation to resolve the issues. We note that the critical traffic LOS deficiency at the intersection of Seventh, Sixteenth and Mississippi, which is on advertised emergency routes to the UCSF hospitals is unmitigated and that the SEIR analysis at this location has failed to consider the effects of train crossings of Sixteenth Street, which could cause traffic on Sixteenth to queue into the intersections of Sixteenth with Owens and Sixteenth with Fourth, which are intersections crucial to hospital access, both emergency and normal. The response is inadequate.

### Section 13.11.6 – Response TR-10

This response, which concerns construction impacts, is merely a reprise of the inadequate information and findings in the DSEIR that prompted our and several other comments. Of particular concern is the failure to address construction impacts associated with the reconstruction of the LRT station by the Project site on Third

Street, a reconstruction which poses impacts for ordinary traffic on Third Street, emergency vehicle traffic on Third Street and for operations of the T Third Muni LRT line itself, which may impose social justice transportation impacts on the disadvantaged communities located further south in the T Third LRT corridor. These social justice impacts in specific have not been addressed.

#### Conclusion

Due to all of the foregoing and other issues not yet addressed in these comments, the SEIR transportation and circulation section is inadequate and unsuited for certification.

Sincerely,

Smith Engineering & Management  
A California Corporation

Daniel T. Smith Jr., P.E.

Re: **Transportation Impacts** - Comments on Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (Warriors Arena Project); San Francisco Planning Department Case No. 2014.1441E; State Clearinghouse No. 2014112045

Dear Ms Bohee and Mr. Bollinger:

This office represents the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project"). The Mission Bay Alliance objects to approval of this Project and certification of this EIR for the reasons stated in this letter.

This letter incorporates by reference, as comments on the DSEIR, all of the comments on the DSEIR contained in the July 23, 2015, letter report authored by traffic engineer Dan Smith (attached as Exhibit 1), and the July 21, 2015, letter report authored by traffic engineer Larry Wymer (attached as Exhibit 2).

#### I. THE DSEIR IS NOT SUFFICIENT AS AN INFORMATIONAL DOCUMENT WITH RESPECT TO TRANSPORTATION IMPACTS.

##### A. The DSEIR Fails to Assess the Project Traffic Impacts on the Entire Affected Environment.

The DSEIR studies Project-induced increases in congestion and delay, for both incremental and cumulative impacts, at twenty-two (22) intersections and six (6) freeway ramps, as shown in Table 1.

O-MBA27S9

Tiffany Bohee  
c/o Brett Bollinger  
Re: Mission bay Alliance comments on the Warriors Arena Project DSEIR: **Transportation Impacts**  
July 27, 2015  
Page 2

Table 1

Incremental Impact Assessment (With Implementation of the Special Events Transit Service Plan)	Incremental Impact Assessment (Without Implementation of the Special Events Transit Service Plan)	Cumulative Impact Assessment
Intersections at DSEIR, p. 5.2-18, Table 5.2-34 p. 5.2-121, Table 5.2-35 p. 5.2-123, Table 5.2-36 p. 5.2-172, Table 5.2-47 p. 5.2-174, Table 5.2-48	Intersections at DSEIR, p. 5.2-192, Table 5.2-53 p. 5.2-193, Table 5.2-54	Intersections at DSEIR, p. 5.2-214, Table 5.2-59 p. 5.2-217, Table 5.2-60.
Freeway ramps at DSEIR, p. 5.2-133, Table 5.2-37 p. 5.2-133, Table 5.2-38 p. 5.2-134, Table 5.2-39 p. 5.2-181, Table 5.2-49 p. 5.2-181, Table 5.2-50	Freeway ramps at DSEIR, p. 5.2-198, Table 5.2-55 p. 5.2-198, Table 5.2-66	Freeway ramps at DSEIR, p. 5.2-221, Table 5.2-61 p. 5.2-221, Table 5.2-62

Remarkably, the DSEIR fails to disclose the criteria the City used to select these intersections and freeway ramps. More importantly, the DSEIR fails to disclose the criteria the City used to *exclude* other intersections and freeway ramps. The omission of this fundamentally important information renders the DSEIR so legally inadequate as an informational document that it frustrates CEQA's goal of providing the public with a meaningful opportunity to comment on the DSEIR.

Also, as shown in the attached report from traffic engineers Larry Wymer and Dan Smith, the DSEIR omitted from its area of study numerous intersections and freeway ramps that will also suffer potentially substantial increases in traffic congestion and delay. The omission of these intersections and freeway ramps from the DSEIR's analysis of the Project's effect on traffic also renders the DSEIR so legally inadequate as an informational document that it frustrates CEQA's goal of providing the public with a meaningful opportunity to comment on the DSEIR.

How did this happen? The DSEIR simply states: "The traffic impact assessment for the proposed project was conducted for 23 study intersections and six freeway ramp locations in the vicinity of the project site" (DSEIR, p. 5.2-72),<sup>1</sup> with no further explanation. The same is true for

<sup>1</sup>The DSEIR actually studies 22 intersections, not 23, in the tables listed in footnote 1.

O-MBA27S9

Tiffany Bohee  
c/o Brett Bollinger  
Re: Mission bay Alliance comments on the Warriors Arena Project DSEIR: **Transportation Impacts**  
July 27, 2015  
Page 3

the six freeway ramps. (DSEIR, p. 5.2-74.)

The DSEIR does inform the reader that:

The impacts of the proposed project on the surrounding transportation network were analyzed using the Transportation Impact Analysis Guidelines issued by the Planning Department in 2002 (SF Guidelines 2002), which provides direction for analyzing transportation conditions and in identifying the transportation impacts of a proposed project.

(DSEIR, p. 5.2-69.) These Guidelines provide:

2. Project Setting

The setting information shall be presented immediately following the Project Description as a discrete chapter or report section. The goal is to provide a brief but complete description of existing transportation infrastructure and conditions in the vicinity of the project. Normally, the described vicinity is a radius between two blocks and 0.25 mile, however, a larger area may be determined in the scoping process. *The specific perimeters of the study area, for both setting and project impact analysis, are to be confirmed as part of the approval for the scope of work.*

(Transportation Impact Analysis Guidelines (October 2002), pp.6-7 (italics added).) Based on this text, the reader would expect to find the criteria and rationale for delimiting "the specific perimeters of the study area" in the Scope of Work which the City approved pursuant to these Guidelines as a prerequisite to preparation of the DSEIR. Unfortunately, this expectation is disappointed, because the City-approved Scope of Work is also silent on the topic. (DSEIR, Appendix TR, pp. TR-8 to TR 14.)

Consequently, the City must revise the DSEIR to include an analysis of the Project's congestion and delay impacts on the excluded intersections and freeway ramps and then recirculate the Revised DSEIR for at least 45 days for public review and comment.

**B. The DSEIR Fails to Disclose the Severity of the Project's Impacts on Intersections and Freeway Ramps which the Project Will Cause to Deteriorate to Level of Service (LOS) F.**

As explained by Dan Smith in his attached report, the DSEIR fails to disclose the severity of the Project's congestion and delay impacts on intersections and freeway ramps which the Project will cause to deteriorate to Level of Service (LOS) F.

The DSEIR discloses the Project will cause significant congestion and delay impacts at

## O-MBA27S9

Tiffany Bohee  
c/o Brett Bollinger

Re: Mission bay Alliance comments on the Warriors Arena Project DSEIR: **Transportation**

### **Impacts**

July 27, 2015

Page 4

numerous intersections and freeway ramps in the “study area,” where Project-induced increases in congestion and delay will cause deterioration in Level of Service (LOS) to LOS E or F. (See intersections and freeway ramps listed in footnote 1.) For the intersections and freeway ramps in the “study area” where Project-induced increases in congestion and delay will cause deterioration to LOS E, the DSEIR provides a measurement of the degree of severity of the significant impact (i.e., average delay for intersections or average density for freeway ramps).

However, for the intersections and freeway ramps in the study area where Project-induced increases in congestion and delay will cause deterioration to LOS F, the DSEIR fails to provide a full measurement of the degree of severity of the significant impact. Instead, for intersections pushed to LOS F, instead of presenting a measure of average delay, the DSEIR provides a “greater than” measurement of “80 seconds per vehicle.” (See 5.2-74 and Tables cited above.) For freeway ramps pushed to LOS F, instead of providing the average density, the DSEIR provides no measurement of “existing plus project” density. Instead, the severity of the Project’s impacts at intersections and freeway ramps pushed to LOS F has no upper limit, and remains undisclosed, other than to note that “demand exceeds capacity.” (See 5.2-75, Table 5.2-19 and Tables cited above.)

Thus, the DSEIR fails to comply with CEQA because, beyond making the binary determination that the Project’s impacts on these intersections and freeway ramps are significant, the DSEIR fails to disclose the severity of these significant impacts. (See *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831 [“The conclusion that one of the unavoidable adverse impacts of the project will be the ‘increased demand upon water available from the Santiago County Water District’ is only stating the obvious. What is needed is some information about how adverse the adverse impact will be”].) Consequently, the City must revise the DSEIR to include this missing information, then recirculate the Revised DSEIR for at least 45 days for public review and comment.

### **C. The DSEIR Fails to Identify the Significance and Severity of the Project’s Impacts on Intersections Where the Project Will Use Parking Control Officers.**

In its impact assessment tables for “Intersection Level of Service - Existing plus Project Conditions - With a SF Giants Evening Game – Weekday PM and Saturday Evening Peak Hour” (DSEIR, p. 5.2-172, Table 5.2-47) and “Intersection Level of Service - Existing plus Project Conditions - With a SF Giants Evening Game – Weekday Evening and Late Evening Peak Hour” p. 5.2-174, Table 5.2-48), the DSEIR measures the significance of impacts by the use of Level of Service (LOS) and delay measurements.

But for two intersections, King and Third streets, and King and Fourth streets, the DSEIR provides no LOS or delay measurements, and therefore, no information on whether the Project’s congestion and delay impacts on these intersections are significant, and if so, the severity of these significant impacts.

## O-MBA27S9

Tiffany Bohee  
c/o Brett Bollinger

Re: Mission bay Alliance comments on the Warriors Arena Project DSEIR: **Transportation**

### **Impacts**

July 27, 2015

Page 5

Instead, the DSEIR indicates that the Project calls for posting Parking Control Officers (PCOs) at these intersections at the times indicated. But the adoption of a mitigation measure cannot substitute for disclosing whether the Project’s impacts on these intersections are significant or their severity.<sup>2</sup>

### **D. The DSEIR’s Analysis of the Project’s Construction-Related Traffic Congestion and Delay Impacts Is Legally Flawed.**

The DSEIR’s analysis of the Project’s construction related traffic congestion and delay impacts is legally flawed because it is based on invalid criteria, it fails to lawfully assess the Project’s cumulative construction period impacts, and it improperly defers the development of mitigation measures to reduce the Project’s construction-related traffic impacts to less than significant.

The DSEIR states “Construction related impacts generally would not be considered significant due to their temporary and limited duration.” (DSEIR, p. 5.2-46.) This statement is placed in the section describing the DSEIR’s thresholds of significance. Therefore, it appears this conclusion reflects a policy decision rather than a fact-based assessment.

In the impacts analysis section, the DSEIR states: “Construction related impacts generally would not be considered significant due to their temporary and limited duration.” (DSEIR p 5.2-111). Elsewhere the DSEIR quantifies the construction period’s “temporary and limited duration” as 26 months. (DSEIR, p. 5.2-112.) However, the notion that the DSEIR can determine the Project’s construction related traffic impacts to be “less than significant” based primarily on their temporary duration is legally and logically flawed because from a cumulative standpoint, the Project’s construction impacts are part of an essentially permanent, not temporary, condition of ongoing construction in this part of San Francisco.

Indeed, the DSEIR’s discussion of the Project’s cumulative construction period impacts recognizes there are numerous other construction projects planned in Mission Bay and that the construction related traffic impacts of these projects will combine with this Project’s construction related impacts. (DSEIR, p. 5.2-210 (Impact C-TR-1.)

However, the DSEIR’s discussion of the Project’s cumulative construction period impacts

---

<sup>2</sup>CEQA does not permit an agency to simply adopt mitigation measures in lieu of fully assessing a project’s potentially significant environmental impacts because mere acknowledgment that an impact would be significant is inadequate; the EIR must include a detailed analysis of “how adverse” the impact would be. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 655-56’ *Galante Vineyards v. Monterey Peninsula Water Management Dist.* (1997) 60 Cal.App.4th 1109, 1123; *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831.)

## O-MBA27S9

Tiffany Bohee  
c/o Brett Bollinger  
Re: Mission bay Alliance comments on the Warriors Arena Project DSEIR: **Transportation Impacts**  
July 27, 2015  
Page 6

is flawed because it is constrained by several artificial limits.

First, as discussed in section I.A above, the impact assessment is limited to impacts and intersections and freeway ramps within the artificially restricted geographic “study area.”

Second, the impact assessment considers only construction projects within the Mission Bay neighborhood without regard to whether other “past, present, or reasonably foreseeable future projects” may be “closely related” because their impacts may combine with the Project’s impacts.

Third, the DSEIR’s analysis of cumulative traffic impacts for *construction* of the project only references a handful of foreseeable projects located very close to the Project, and the DSEIR’s discussion of these projects is solely in terms of whether their construction periods overlap with construction of this Project, as if the operational impacts of other “past, present, and reasonably foreseeable future projects” are not “closely related.” (See DSEIR, p. 5.2-10 and 11.)<sup>3</sup> This is incorrect because “closely related” simply means the other projects’ impacts may combine with the Project’s impacts.

Table 3 in the attached report by Larry Wymer shows that it is possible to include a broader range of projects - across both time and area - in the assessment of the Project’s cumulative construction period traffic impacts, and that when this is done, there are many Projects that will be under construction or operational in the period before, during, and after construction of the Project whose effects will combine with those of the Warriors Arena construction. Therefore, the Project’s construction impacts are part of an essentially permanent, not temporary, condition of ongoing construction in this part of San Francisco and the DSEIR errs by basing its determination of significance on the “limited duration” of the construction period. (DSEIR, p. 5.2-212.)

The second basis for the DSEIR’s less-than-significant determination is the DSEIR’s statement that “construction activities would be ... required to be conducted in accordance with City

---

<sup>3</sup>These projects are:

- 1.13 million gsf of UCSF LRDP projects under construction at the Mission Bay Campus, including, the UCSF East Campus project on Blocks 33/34,
- Construction of Bayfront Park,
- realignment of Terry A. Francois Boulevard,
- construction of a neighborhood park on the north side of Mariposa Street east of Owens Street,
- the Exchange project on Mission Bay Block 40,
- the Family House project on Mission Bay Block 7 East,
- the Residential and Hotel project on Mission Bay Block 1,
- the 360 Berry Street project on Mission Bay Block N4/P3, and
- Caltrain’s Peninsula Corridor Electrification Project.

## O-MBA27S9

Tiffany Bohee  
c/o Brett Bollinger  
Re: Mission bay Alliance comments on the Warriors Arena Project DSEIR: **Transportation Impacts**  
July 27, 2015  
Page 7

requirements.” (DSEIR, p. 5.2-212.) This vague assurance is meaningless because the DSEIR does not specify what these “City requirements” are, does not specify a performance standard that these City requirements would either impose or achieve, and presents no evidence that these unspecified “City requirements” are likely to avoid significant cumulative construction related traffic effects. (See *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 95 (CBE); *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359; 1394 (Gentry).

The third and final basis for the DSEIR’s less-than-significant determination is “Improvement Measure I-TR-1: Construction Management Plan and Public Updates.” The DSEIR suggests this Plan would help avoid significant cumulative construction related traffic effects. (DSEIR, p. 5.2-212.) But it is improper for the DSEIR to rely on Improvement Measure I-TR-1 to help reduce impacts to less than significant because it is not identified as a mitigation measure necessary to substantially reduce significant Project impacts; therefore, it is not enforceable. (CEQA Guideline 15126.4(a)(4).)

Finally, the DSEIR fails to quantify the Projects’ construction period impacts, presumably based on its qualitative conclusion that unspecified “City requirements” and “Improvement Measure I-TR-1” will avoid significant impacts. This puts the cart before the horse.<sup>4</sup>

### E. The DSEIR’s Analysis of the Project’s Operational Traffic and Transit Congestion and Delay Impacts Is Legally Flawed.

#### 1. The DSEIR understates traffic and transit volumes in the PM peak period of 4:00 to 6:00 PM by using “time of arrival” at the Arena as a proxy measurement for “time of travel.”

In modeling traffic and transit impacts, the DSEIR assumes only 5% of basketball game attendees will be traveling in the “study area” in the PM peak period of 4:00 to 6:00 p.m. Table 5.2-21 states that 5% of arrivals are expected before 6:00 p.m. for 7:30 p.m. weekday basketball games; another 11% will arrive between 6:00 and 6:30 p.m. (DSEIR, p. 5.2-83.) This data is based on turnstile counts of people entering the arena.

As explained by Dan Smith in his attached report, this proxy measurement does not provide reliable data as to when game or event attendees are actually traveling through affected intersections or freeway ramps or using affected transit routes:

These considerations are so obvious to any transportation professional knowledgeable about sports stadium transportation issues that the analysis presented

---

<sup>4</sup>See footnote 2 above.

O-MBA27S9

Tiffany Bohee  
c/o Brett Bollinger  
Re: Mission bay Alliance comments on the Warriors Arena Project DSEIR: **Transportation Impacts**  
July 27, 2015  
Page 8

in the DSEIR cannot be said to constitute the good faith effort to disclose impact that the California Environmental Quality Act demands. Since the entire analysis of transportation impacts flows from the estimate of trip generation and time-of-travel analysis, the entire transportation impact component of the DSEIR must be redone to accurately reflect the time that event attendees are actually traveling on the transportation system instead of the time they enter the event venue.

(Exhibit 1, p. 3.)

In his analysis, Mr. Smith found:

it seems highly probable that as much as one-third or more of the trips that the DSEIR considers to take place in the 6 to 7 PM period and the 7 to 8 PM period would actually be on the transportation system in the more critical 5 to 6 PM commute peak hour. That would put 7,466 event-related travelers on the transportation system in the 5 PM to 6 PM period instead of the 1,866 assumed in the DSEIR, a difference that would likely result in transportation impacts not disclosed in the DSEIR and/or intensification of impacts and mitigation needs of those that were disclosed.

(Exhibit 1, p. 3.)

Even just applying common sense to the DSEIR's data indicates that many or most of the 11% that the DSEIR says arrive at the turnstile between 6:00 and 6:30 p.m. would be traveling to the event in the PM peak period of 4:00 to 6:00 pm. This minimal adjustment alone changes the assumption on which the modeling is based from 5% to 16% traveling in the "study area" in the PM peak period of 4:00 to 6:00 pm. As shown by Mr. Smith, this minimal adjustment more than doubles the Project's contribution of traffic to affected intersections, and would change the DSEIR's determination from less-than-significant to significant at some intersections. (Exhibit 1, p. 4.)

This issue was flagged in public scoping comments on the DSEIR. (DSEIR, p. 2-15.) Yet, somehow, the DSEIR did not adjust its reliance on turnstile data to develop a reliable metric to use instead. Instead, the DSEIR offers a series of weak or irrelevant rationales for its methodology, including:

because basketball games typically start at 7:30 p.m. a higher percentage of inbound event attendees would travel to the event center during the 6:00 to 8:00 p.m. period than during the 4:00 to 6:00 p.m. commute peak period.

(DSEIR p. 5.2-71); and

O-MBA27S9

Tiffany Bohee  
c/o Brett Bollinger  
Re: Mission bay Alliance comments on the Warriors Arena Project DSEIR: **Transportation Impacts**  
July 27, 2015  
Page 9

the SF Guidelines do not include travel demand characteristics for the specialized uses (e.g., sports events, conventions, and other events) that would take place at the proposed event center. Similarly, standard trip generation resources, such as the Institute of Transportation Engineer's Trip Generation Manual, do not include sufficiently detailed trip generation data for such specialized uses. Therefore, the travel demand for the event center component of the proposed project was based on the estimated attendance, as well as information on current travel characteristics of Golden State Warriors basketball attendees at the Oracle arena in Oakland.

(DSEIR, p. 5.2-81); and

The data are based on information provided by the Golden State Warriors for their current facility, which was then adjusted to provide for earlier arrival patterns based on comparable information collected at similar NBA facilities to account for the increased availability of retail and restaurant uses at the proposed project site compared to Oracle Arena in Oakland. A summary of this data is provided in the travel demand technical memorandum included in Appendix TR.

(DSEIR, p. 5.2-82.)<sup>5</sup>

---

<sup>5</sup> In the "Travel Demand Methodology and Results" section of Chapter 5.2, the DSEIR states:

The Basketball Game scenario reflects the travel demand of the office, retail and restaurant uses, plus an evening basketball game. The transportation impact analysis of the Basketball Game scenario was conducted for four analysis hours (weekday p.m., weekday evening, weekday late evening, and Saturday evening), for conditions without and with an overlapping SF Giants evening game at AT&T Park.

Table 5.2-21 presents the expected temporal distribution of arrival and departure patterns for basketball game attendees of the proposed project. The data are based on information provided by the Golden State Warriors for their current facility, which was then adjusted to provide for earlier arrival patterns based on comparable information collected at similar NBA facilities to account for the increased availability of retail and restaurant uses at the proposed project site compared to Oracle Arena in Oakland. A summary of this data is provided in the travel demand technical memorandum included in Appendix TR. Based on this information, it was assumed that approximately 5 percent of arrivals to a basketball game would occur during the p.m. peak hour (5:00 to 6:00 p.m.), and up to 66 percent of arrivals would occur during the evening peak hour (7:00 to 8:00 p.m.). Similarly, up to 70 percent of the departures would occur during the late evening peak hour (9:00 to 10:00 p.m.).

O-MBA27S9

Tiffany Bohee  
c/o Brett Bollinger  
Re: Mission bay Alliance comments on the Warriors Arena Project DSEIR: **Transportation Impacts**  
July 27, 2015  
Page 10

A discussion and summary of the data from other venues than Oracle is provided in DSEIR, Appendix TR, at pp. TR-21 to TR-25 and TR-37 [Appendix A, p. A-9]. The table at page TR-37 provides time of arrival data from, in addition to Oracle, six purportedly “comparable” venues, namely: Icon Venue Group, Houston, Phoenix, Sacramento, Brooklyn (2013-2014), and Brooklyn (2014-2015). An interesting fact about this table is that the data for 4:00 to 6:00 p.m. arrivals at four of these six venues (i.e., Icon Venue Group, Houston, Phoenix, Sacramento) is “included in” the data for later time periods. So, in fact, the only purportedly comparable venue for which the DSEIR presents supporting data is Brooklyn (2013-2014 and 2014-2015). The venue with the largest proportion of arrivals in the 4:00 to 6:00 p.m. period is Brooklyn (2014-2015), with 4.1%.

In short, the City and the Warriors failed to develop reliable accurate, reliable data on the key variable in the entire transportation analysis, i.e., the number of people traveling to events in the peak PM time period when traffic and transit crowding are at their worst. A lead agency “must use its best efforts to find out and disclose all that it reasonably can.” (CEQA Guideline, § 15144.)

The above quoted rationales do not excuse this failure. The scoping comments flagging this issue were submitted to the City between November 19, 2014, and December 19, 2014, during the middle of the basketball season. (DSEIR, p. 2-8 and 2-9, 2-15.) The Warriors played fifty-seven (57) games between December 19, 2014, through the close of the regular season on April 15, 2015.<sup>6</sup> There are thirty (30) teams in the NBA.<sup>7</sup> That means there were approximately eight-hundred and fifty five (i.e.,  $15 \times 57 = 855$ ) regular season games played in the 2014-2015 regular season after December 19, 2014. In the playoffs following the regular season, sixteen teams played a total of seventy-nine games after April 15, 2015.<sup>8</sup>

Therefore, both the Warriors and the City had ample opportunity to conduct market research by interviews and exit polling of a sample of the hundreds of thousands of fans attending these games to discover how far in advance of arriving at the turnstile they traveled through the traffic and transit impacted area surrounding the venue. The City’s and Warriors’ decision to pass up this opportunity after being informed of the issue does not satisfy their duty to use best efforts to find out

---

Event staff for basketball games would be expected to arrive between 4:30 and 5:00 p.m. and would be on post prior to the gate opening time; event staff would leave between 11:00 and 11:30 p.m.

(DSEIR, p. 5.2-82.)

Re: Mission bay Alliance comments on the Warriors Arena Project DSEIR: **Transportation Impacts**  
July 27, 2015  
Page 11

and disclose all they reasonably can.

Indeed, the City was fully aware of the need to gather information more relevant to fans “time of travel” than turnstile counts and made some efforts to do so. But it failed to disclose that there are alternative metrics for “time of travel” or the results of its efforts in this regard. For example, an email exchange dated January 12, 2015, between the City’s EIR consultant (ESA) and City Planning officials includes data on arrivals before 6:00 p.m. at the Arco Arena parking lot for a 7:00 p.m. Sacramento Kings game and arrivals before 6:00 p.m. in buildings for other NBA venues. Thus, the City was aware of other measurements (e.g., parking lot entry rather than turnstile counts) that could more accurately predict peak PM period travel to games.

Also, the arrival numbers cited in this email exchange show 14% arriving at the Arco Arena parking lot before 6 p.m. for one 7 p.m. game and 9% arriving before 6 p.m. in buildings for other NBA venues. These numbers indicate the DSEIR’s assumption that 5% of fans will be traveling through the study area before 6 p.m. for 7:30 p.m. games is vastly understated. Yet the DSEIR fails to reference these numbers.

The DSEIR must be revised to provide accurate peak period traffic data and analysis

**2. The DSEIR’s Analysis of the Project’s Cumulative Impacts Does Not Comply With CEQA.**

**a. The 5% threshold of significance for impacts at intersections and freeway ramps operating at LOS E or F violates CEQA.**

For intersections operating at LOS E or F, the DSEIR uses a threshold of significance of “a contribution of 5 percent or more to the traffic volumes at the critical movements operating at LOS E or LOS F” (DSEIR, p. 5.2-73-74.) For freeway ramps operating at LOS E or F, the DSEIR uses a threshold of significance of “a contribution of 5 percent or more to the traffic volumes on the ramp.” (DSEIR, p. 5.2-74.)<sup>9</sup>

No rationale for the 5% threshold is provided. Indeed, blind reliance on this number ignores the law governing the assessment of cumulative impacts, which requires a fact based assessment that takes into account the severity of preexisting impacts. A one-size-fits-all “ratio” violates CEQA. (See *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120 (“*Communities*”); *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d

---

<sup>9</sup>“The project may result in significant adverse impacts at intersections that operate at LOS E or LOS F under existing conditions depending upon the magnitude of the project’s contribution to the worsening of the average delay per vehicle.” (DSEIR, p. 5.2-45.)

O-MBA27S9

Tiffany Bohee  
c/o Brett Bollinger  
Re: Mission bay Alliance comments on the Warriors Arena Project DSEIR: **Transportation Impacts**  
July 27, 2015  
Page 12

692, 720-21 (*Kings County*). *Communities* and *Kings County* teach that the significance of a cumulative impact depends on the environmental setting in which it occurs, especially the severity of existing environmental harm, and that focusing on the magnitude (i.e., “ratio”) of the Project’s incremental contribution to severe preexisting harm is inconsistent with the definition of cumulative impacts under CEQA.<sup>10</sup>

**b. The year 2040 baseline for assessing the significance of the Project’s cumulative impacts violates CEQA.**

The DSEIR assesses the Project’s incremental traffic and transit impacts and its cumulative traffic and transit impacts pegged to the year 2040, which is 25 years in the future.<sup>11</sup> While the Alliance supports such long range forecasting in general, as used in this DSEIR the year 2040 baseline for assessing the significance of the Project’s cumulative impacts is misleading, for two reasons.

First, this approach overlooks the Project’s cumulative traffic and transit impacts pegged to its first 1 to 10 years of operations. This time period is of immediate interest to the citizens of San Francisco because the traffic mess predicted by the DSEIR will be upon them then. And who among them know whether they will even be in the City by the year 2040. Thus, while including a year 2040 baseline is not in itself objectionable, the omission of a baseline 5 to 10 years in the future

<sup>10</sup>(*Communities*, 103 Cal.App.4th at p. 120 [“[T]he relevant question”... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether “any additional amount” of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project’s contribution to cumulative impacts as significant. [footnote omitted]”]; *Kings County*, 221 Cal.App.3d at pp. 720-21 [“They contend in assessing significance the EIR focuses upon the ratio between the project’s impacts and the overall problem, contrary to the intent of CEQA.... We find the analysis used in the EIR and urged by GWF avoids analyzing the severity of the problem and allows the approval of projects which, when taken in isolation, appear insignificant, but when viewed together, appear startling. Under GWF’s ‘ratio’ theory, the greater the overall problem, the less significance a project has in a cumulative impacts analysis. We conclude the standard for a cumulative impacts analysis is defined by the use of the term ‘collectively significant’ in Guidelines section 15355 and the analysis must assess the collective or combined effect of energy development”].)

<sup>11</sup>“Future 2040 cumulative traffic volumes were estimated based on cumulative development and growth identified by the San Francisco County Transportation Authority SF-CHAMP travel demand model, using model output that represents Existing conditions and model output for 2040 cumulative conditions.” (DSEIR, p. 5.2-110.)

O-MBA27S9

Tiffany Bohee  
c/o Brett Bollinger  
Re: Mission bay Alliance comments on the Warriors Arena Project DSEIR: **Transportation Impacts**  
July 27, 2015  
Page 13

renders the DSEIR informationally defective.

Second, by using a baseline projected to the year 2040, the DSEIR inflates the denominator in the 5% “ratio” it uses to determine the significance of Project cumulative impacts at LOS E and F intersections, thereby masking actual significant effects. (See Exhibit 2 (D. Smith), p. 25.)

**c. The DSEIR’s use of a “projection” based approach to the Project’s cumulative impacts is misleading.**

The DSEIR states that:

Future 2040 cumulative traffic volumes were estimated based on cumulative development and growth identified by the San Francisco County Transportation Authority SF-CHAMP travel demand model, using model output that represents Existing conditions and model output for 2040 cumulative conditions. .... The 2040 cumulative traffic volumes take into account cumulative development projects in the project vicinity, such as the build-out of the Mission Bay Area, completion of the UCSF Research Campus and the UCSF Medical Center, the Mission Rock Project at Seawall Lot 337, Pier 70, etc., as well as the additional vehicle trips generated by the proposed project.

(DSEIR, p. 5.2-110.)<sup>12</sup>

The DSEIR presents no evidence supporting the DSEIR’s assumption that the year 2040 projection is reliable for predicting future traffic and transit demand, other than the vague assertion that the “SF-CHAMP travel demand model, using model output that represents Existing conditions and model output for 2040 cumulative conditions ... has been validated to represent future

<sup>12</sup>In the section titled “Approach to Cumulative Impact Analysis” (DSEIR 5.1-6, § 5.1.5), the DSEIR asserts that the CEQA Guidelines provide “two approaches to a cumulative impact analysis ... (a) the analysis can be based on a list of past, present, and probable future projects producing related or cumulative impacts; or (b) a summary of projections contained in a general plan or related planning document can be used to determine cumulative impacts. The projections model includes individual projects and applies a quantitative growth factor to account for other growth that may occur in the area.” (DSEIR, p. 5.1-7.) The DSEIR asserts that “The analyses in this SEIR employ both the list-based approach and a projections-based approach, depending on which approach best suits the individual resource topic being analyzed ... the Transportation and Circulation analysis relies on a citywide growth projection model that also encompasses many individual projects anticipated in and surrounding the project site vicinity, which is the typical methodology the San Francisco Planning Department applies to analysis of transportation impacts.” (DSEIR, p. 5.1-7.)

O-MBA27S9

Tiffany Bohee  
c/o Brett Bollinger  
Re: Mission bay Alliance comments on the Warriors Arena Project DSEIR: **Transportation Impacts**  
July 27, 2015  
Page 14

transportation conditions in San Francisco.” (DSEIR, p. 5.2-110.) But, as explained by Mr Smith, the SF-CHAMP model’s margin of error is greater than the 5% threshold used to determine the significance of Project cumulative impacts at LOS E and F intersections. (See Exhibit 2 (D. Smith), p. 25.) Therefore, SF-CHAMP is the wrong tool for the task.

Further, given the sheer number of developments in this area of the City (see table 3 of Mr. Wymer’s report) and the bottleneck pace of their approval and implementation, the projection approach is misleading, not informative. Therefore, the DSEIR’s cumulative impact assessment must use a list based approach to forecast reasonably foreseeable travel demand, and do so in a meaningful time frame.

**F. The DSEIR’s Methodology for Analyzing Project Impacts on the Transit System Is Legally Flawed.**

The DSEIR summarizes its methodology for analyzing Project Impacts on the transit system, as follows:

The impact of additional transit ridership generated by the proposed project on local and regional transit providers was assessed by comparing the projected ridership to the available transit capacity at the maximum load point. Transit “capacity utilization” refers to transit riders as a percentage of the capacity of the transit line, or group of lines combined and analyzed as screenlines across which transit lines travel. The transit analyses were conducted for the peak direction of travel for each of the analysis time periods.

(DSEIR, p. 5.2-75.)

This methodology contains two flaws. First, it suffers from the same unwarranted and unsupported assumptions about basketball fans’ time of travel to the arena for games described above. Second, the DSEIR’s use of transit screenline and route capacities is also misleading and unsupported.

**1. The DSEIR’s use of transit screenline and route capacities is misleading and unsupported.**

For its Project specific (or incremental) transit impact analysis, the DSEIR uses the following thresholds of significance:

The proposed project was determined to have a significant transit impact if project-generated transit trips would cause downtown or regional screenlines, and, where applicable, directly affected routes, operating at less than its capacity

O-MBA27S9

Tiffany Bohee  
c/o Brett Bollinger  
Re: Mission bay Alliance comments on the Warriors Arena Project DSEIR: **Transportation Impacts**  
July 27, 2015  
Page 15

utilization standard under existing conditions, to operate at more than capacity utilization standard. For Muni, the capacity utilization standard is 85 percent for conditions without an event at the project site, and 100 percent for conditions with an event at the project site. For regional operators, the capacity utilization standard is 100 percent for conditions without and with an event at the project site.

(DSEIR, p. 5.2-76, 77.)

For its cumulative transit impact analysis, the DSEIR uses the following thresholds of significance:

Under 2040 cumulative conditions, the proposed project was determined to have a significant cumulative impact if its implementation would cause the capacity utilization at the Muni and regional screenlines and/or corridors within the screenlines to exceed the capacity utilization standard noted above for conditions without and with an event at the project site, or if its implementation would contribute considerably to a screenline or corridor projected to operate at greater than the capacity utilization standard under 2040 cumulative plus project conditions (i.e., a contribution of 5 percent or more to the transit ridership on the screenline or route). In addition, if it was determined that the proposed project would have a significant project-specific transit impact under existing plus project conditions, then the impact would also be considered a significant cumulative impact under 2040 cumulative conditions.

(DSEIR, p. 5.2-76, 77.)

For both Project specific (incremental) and cumulative impacts, the DSEIR uses “capacity utilization standards” as baselines against which to measure the Project’s impacts. Capacity utilization standards are specific percentages of the theoretical maximum capacity of a transit screenline or transit line.

For Project specific (or incremental) thresholds of significance for Muni, the DSEIR uses two different capacity utilization standards against which to measure the Project’s impacts. For conditions without an event at the Project site, the capacity utilization standard is 85 percent of maximum theoretical capacity of the transit screenline or line. For conditions with an event at the Project site, the capacity utilization standard is 100 percent of maximum theoretical capacity.

If the question to be answered by the transit impact analysis is whether the Project will inflict significant suffering on people riding Muni, why does the DSEIR use two different baselines for its impact assessment. If exceeding 85% inflicts suffering without an event, then exceeding 85% will inflict suffering with an event.

## O-MBA27S9

Tiffany Bohee  
c/o Brett Bollinger  
Re: Mission bay Alliance comments on the Warriors Arena Project DSEIR: **Transportation Impacts**  
July 27, 2015  
Page 16

The DSEIR does not examine this use of inconsistent baselines. However, the June 21, 2013, Planning Department Memorandum “Transit Data for Transportation Impact Studies” (at Appendix-TR, p. TR-624) states:

The SFMTA Board has adopted an “85 percent” capacity utilization standard for transit vehicle loads. In other words, transit lines should operate at or below 85 percent capacity utilization. The SFMTA Board has determined that this threshold more accurately reflects actual operations and the likelihood of “pass-ups” (i.e., vehicles not stopping to pick up more passengers). The Planning Department, in preparing and reviewing transportation impact studies, has similarly utilized the 85 percent capacity utilization as a threshold of significance for determining peak period transit demand impacts to the SFMTA lines.

(DSEIR, Appendix-TR, p. TR-624.) Thus, the 85 percent capacity utilization threshold apparently has nothing to do with the suffering of Muni’s passengers; it simply reflects the reality of Muni’s operations. And even if 85% of capacity is the break point at which Muni drivers tend to refuse to pick up more passengers due to overcrowding, then using 100% of capacity as a threshold of significance is entirely unsupportable.

For its cumulative impact analysis, the DSEIR uses the same baselines and thresholds of significance discussed above plus one more if the Project “would contribute considerably to a screenline or corridor projected to operate at greater than the capacity utilization standard under 2040 cumulative plus project conditions (i.e., a contribution of 5 percent or more to the transit ridership on the screenline or route).”

The 5% threshold for determining a Project’s contribution to be “considerable” is stated at Appendix-TR, p. TR-625. No rationale for this number is provided. A Project contributing 1% more capacity utilization to a screenline that usually operates at 84%, resulting in a total capacity utilization of 85%, may not contribute considerably to a significant impacts, while a Project contributing 1% more capacity utilization to a screenline that usually operates at 94%, resulting in a total capacity utilization of 95%, may well contribute considerably to a significant impact. A one-size-fits-all “ratio” violates CEQA. (See *Communities, supra*; *Kings County, supra*.)

### G. The DSEIR Unlawfully Defers the Development of Mitigation Measures.

The DSEIR sketches out a number of concepts for mitigating the Project’s significant transportation effects where it defers the development of specific mitigation measure until a future date. The DSEIR’s deferral all of the mitigation measures listed below in this section does not meet CEQA requirements to identify specific mitigation measures in the Draft EIR so the public may meaningfully review and comment on them. These measures violate CEQA’s requirements for deferred mitigation because the DSEIR does not specify binding performance standards by which

## O-MBA27S9

Tiffany Bohee  
c/o Brett Bollinger  
Re: Mission bay Alliance comments on the Warriors Arena Project DSEIR: **Transportation Impacts**  
July 27, 2015  
Page 17

the measures’ success can be judged, there is no evidence it is impracticable to develop and include the specific measures in the DSEIR, there is no evidence the measures will be effective, there is no evidence the measures are feasible, there is no evidence the measures will be implemented because the Project Sponsor may deem them infeasible, and the measures are not enforceable. (See *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 95 (CBE); *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359; 1394 (Gentry).)

The listed measures are qualified by language such as “if feasible” or “could include” (e.g., Measure M-TR-2b). Such qualifications render the measures illusory, unenforceable, and ineffective for purposes of the DSEIR’s claim of substantial reductions in impact or reductions in impact to less-than-significant levels. (See *Federation of Hillside & Canyon Associations v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1260-1262; *Lincoln Place Tenants Association v. City of Los Angeles* (2005) 130 Cal.App.4th 1491, 1508 [“mitigating conditions are not mere expressions of hope...”].)

Even the listed measures that include performance standards (e.g., Measure M-TR-18) do not require they be achieved. For example, Measure M-TR-18 only requires that the Project Sponsor “work to achieve” the performance standards. CEQA requires that deferred mitigation measures include binding performance standards.

- Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts. (DSEIR, p. 1-15.)
- Mission Bay FSEIR Mitigation Measure E.47: Transportation System Management Plan. (DSEIR, p. 1-17.)
- Mitigation Measure M-TR-5a: Additional Caltrain Service. (DSEIR, p. 1-18.)
- Mitigation Measure M-TR-5b: Additional North Bay Ferry and/or Bus Service. (DSEIR, p. 1-19.)
- Mitigation Measure M-TR-9a: Crane Safety Plan for Project Construction. (DSEIR, p. 1-20.)
- Mitigation Measure M-TR-9d: Event Center Exterior Lighting Plan. (DSEIR, p. 1-21.)
- Mitigation Measure M-TR-11b: Participation in the Ballpark/Mission Bay Transportation Coordinating Committee. (DSEIR, p. 1-22.)
- Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events. (DSEIR, p. 1-23.)
- Mitigation Measure M-TR-13: Additional Muni Transit Service during Overlapping Events.

## O-MBA27S9

Tiffany Bohee  
c/o Brett Bollinger  
Re: Mission bay Alliance comments on the Warriors Arena Project DSEIR: **Transportation Impacts**  
July 27, 2015  
Page 18

(DSEIR, p. 1-24.)

- Mitigation Measure M-TR-14: Additional BART Service to the East Bay during Overlapping Events. (DSEIR, p. 1-24.)
- Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring. (DSEIR, p. 1-25.)

### H. The DSEIR's Discussion of Transportation Impacts Is Incomplete.

The DSEIR analyzes transportation impacts in two broad scenarios: with and without implementation of the Special Events Transit Service Plan.

In the scenario "With Implementation of the Special Events Transit Service Plan" the DSEIR analyzes two narrower scenarios: with and without a Giants game. In each Giants game scenario, the DSEIR analyzes three narrower scenarios: no event, convention event, and basketball game. The result is six scenarios applied to ten different transportation resources, as shown in Table 2.

Table 2

With Implementation of the Special Events Transit Service Plan					
Without Giants game			With Giants game		
No event	Convention event	Basketball game	No event	Convention event	Basketball game
TR-1 Construction - Traffic	LS		TR-1 Construction - Traffic	LS	
TR-2 Traffic - Intersections	SUM		TR-11 Traffic - Intersections	SUM	
TR-3 Traffic - Freeway Ramps	SUM		TR-12 Traffic - Freeway Ramps	SUM	
TR-4 Transit - Muni	LS		TR-13 Transit - Muni	LSM	
TR-5 Transit - Regional - Caltrain	SUM		TR-14 Transit - Regional - All	SUM	
TR-6 Pedestrian	LSM		TR-15 Pedestrian	LSM	
TR-7 Bicycle	LS		TR-16 Bicycle	LS	
TR-8 Loading	LS		TR-17 Emergency Vehicle Access	LS	
TR-9a Construction Helipad	LSM				
TR-9b Const. Lights Helipad	LS				
TR-9c Operation Helipad	LS				
TR-9b Operation Lights Helipad	LSM				
TR-10 Emergency Vehicle Access	LS				

In the scenario "Without Implementation of the Special Events Transit Service Plan"

## O-MBA27S9

Tiffany Bohee  
c/o Brett Bollinger  
Re: Mission bay Alliance comments on the Warriors Arena Project DSEIR: **Transportation Impacts**  
July 27, 2015  
Page 19

the DSEIR analyzes only one narrower scenario: without a Giants game and with a basketball game. The result is one scenario applied to ten different transportation resources, but the omission of the other five scenarios, as shown in Table 3.

Table 3

Without Implementation of the Special Events Transit Service Plan	
Without Giants game	
Basketball Game	
TR-1 Construction - Traffic	LS
TR-18 Traffic - Intersections	SUM
TR-19 Traffic - Freeway Ramps	SUM
TR-20 Transit - Muni	SUM
TR-21 Transit - Regional	SUM
TR-22 Pedestrian	LSM
TR-23 Bicycle	LS
TR-24 Loading	LS
TR-25 Emergency Vehicle Access	LS

Since the scenario "Without Implementation of the Special Events Transit Service Plan" is likely enough to justify including it in the DSEIR, the DSEIR should include the other five omitted scenarios.

In addition, the DSEIR's cumulative impact analysis does not even inform the reader if it is performed for the "with" or "without" scenario for "Implementation of the Special Events Transit Service Plan." The cumulative impact analysis should include both scenarios, and should inform the reader which is which.

Thank you for your attention to this matter.

Very Truly Yours,

Thomas N. Lippe

Budget and Finance Committee  
San Francisco Board of Supervisors  
c/o Ms. Angela Calvillo  
Clerk of the Board of Supervisors  
1 Dr. Carlton B. Goodlett Place  
San Francisco, CA 94102-4689

Re: November 9, 2015 Budget and Finance Committee, Warriors Arena Project CEQA Findings, Resolution 150994

Dear Committee Members:

This office represents the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project"). The Mission Bay Alliance objects to approval of the Project for the following reasons.

1. The Project SEIR does not comply with CEQA, as described in the Alliance's many comments on the SEIR submitted to the Successor Agency. Over the last three months, the Mission Bay Alliance has reviewed and commented on material inadequacies in the Project's expedited environmental review process. This Committee and the Board of Supervisors cannot fully consider and adequately mitigate the Project's many significant impacts without the benefit of an EIR that complies with CEQA.

1  
[LC-ERP-1]

The CEQA findings adopted by the OCII and the SFMTA are, therefore, premature and unsupported, as explained in the Alliance's comments on the Draft Subsequent Environmental Impact Report ("DSEIR"), as well as letters submitted following the Final SEIR.

Re: Warriors Arena Project Subdivision Map (Project ID # 8593)  
November 6, 2015  
Page 5

BAAQMD's 2010 Clean Air Plan" is less than significant with mitigation because the City and Project Sponsor refuse to agree to BAAQMD's offset fees per Mitigation Measure M-AQ-2b. (See Exhibits 4 and 5.) There is also no evidence that the "Option 2" offset idea within Mitigation Measure M-AQ-2b is feasible. There are too many unanswered questions regarding Option 2, including lack of assured verification of offsets to ensure their effectiveness, and lack of assurance that offset sources are available in the quantity required. BAAQMD's offset program at least answers some, if not all, of these questions.

The Commission cannot find that all feasible mitigation measures that would substantially reduce "Impact AQ-1: Impacts of Criteria Air Pollutants from Construction" have been adopted as required by CEQA section 21081, because there is no evidence that paying the offset fees demanded by BAAQMD is infeasible. Also, as discussed above, there is no evidence that the "Option 2" offset idea within Mitigation Measure M-AQ-2b is feasible; therefore, it is not an adequate substitute for BAAQMD's offset program. This also applies to:

- Impact AQ-2: Impacts of Criteria Air Pollutants from Project Operations; and
- Impact C-AQ-1: Project Contribution to Regional Air Quality Impacts.

6. The Commission cannot find that feasible alternatives that would substantially reduce the Project's significant impacts have been adopted. The SEIR does not analyze the alternate site proposed by the Alliance near Pier 80, and did not circulate that analysis for public comment. Neither OCII nor this Commission has the basis to make conclusory findings rejecting the alternative. Among the relevant facts not considered in the findings is that the site is three times as large as would be required for the Event Center project and need not utilize any of the City-owned property nor any particular configuration of the privately-owned lots should there be an unwilling seller. There is no evidence provided that the site could not be acquired within a reasonable time period.

Case law confirms that assuring a site's consistency with city plans and zoning is within the City's power. Similarly, the scheduling of transportation services to the site can be increased, and the findings provide no studies to back up conclusory statements regarding traffic, air quality, hydrology, or water quality impacts. Since only a third of the site is needed to accommodate the event center, all of the impacts (if shown to have concern after sufficient technical review) can be avoided or mitigated. As stated in the Alliance letter to OCII that proposes this site for consideration as an alternative, here incorporated by reference, the SEIR failed to consider a potentially-feasible off-site alternative and must be revised and recirculated to do so before findings of infeasibility may be considered or adopted. The site suggested by the Alliance is potentially feasible and deserving of study.

President Rodney Fong and Members of the Planning Commission  
City and County of San Francisco  
1650 Mission Street, Suite 400  
San Francisco, CA 94103

**Re: Warriors Arena Project: Planning Codes section 321 and 305, General Plan  
Inconsistency and CEQA Findings.**

Dear Commission President Fong and Members of the Commission:

This office represents the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project"). The Mission Bay Alliance objects to approval of this Project and certification of the Project SEIR.

**1. The Project is ineligible for any office space allocation under Planning Code section 321 and Motion 17709.**

**a. This Project does not comply with the Design for Development.**

Resolution 14702 and Motion 17709 require that any project in the Alexandria District must comply with the Mission Bay South Design for Development in order to be eligible for any office space allocation. (See Motion 17709, p. 9, Finding 9,<sup>1</sup> Finding 10<sup>2</sup>.)

<sup>1</sup>"This schedule of phased authorization will ensure that, in accord with Resolution 14702, adequate office space can be allocated to those projects within the Development District that are determined to be in compliance with the D for D requirements, while also complying with Section 321 of the Planning Code forbidding exceedance of the square footage available for allocation in any given annual cycle."

<sup>2</sup>"Pursuant to Resolution 14702, the Commission is charged with determining whether a project seeking authorization conforms to applicable standards in the D for D Document, which supersedes the criteria set forth in Section 321 and other provisions of the Code except as provided in the MBS Plan. The projects previously approved were determined to have met the MBS Redevelopment Plan and the D for D Document standards and guidelines, and requirements for childcare, public art, and other provisions of the Plan Documents, and retain

**EXHIBIT 1**

Re: Warriors Arena Project DSEIR  
November 5, 2015  
Page 2

This Project does not comply with the Design for Development, as evidenced by the many amendments that the Successor Agency made to the Design for Development to accommodate the Project. Therefore, it is ineligible for allocation of any office space under Planning Code section 321 and Motion 17709.

**b. This Project is inconsistent with the Redevelopment Plan.**

A basic premise of the Planning Commission decisions in Resolution 14702 and Motion 17709, and a fundamental rationale for “superseding” section 321’s guidelines in favor of the Redevelopment Plan and Redevelopment Plan documents, were the Commission’s findings that the Redevelopment Plan met standards set in section 321, the San Francisco Master Plan, the priority policies in Planning Code section 101.1, and the requirements of redevelopment law. In short, in order to be eligible for the office space allocation available under motion 17709, the Project must be consistent with the Redevelopment Plan.

This Project is inconsistent with the Redevelopment Plan because, as demonstrated in the November 2, 2015, letter from Susan Brandt-Hawley, my co-counsel for the Alliance (attached as Exhibit 1), this Project is not an allowable secondary use under the Redevelopment Plan. However, in the alternative, as shown in my November 2, 2015, letter (attached as Exhibit 2), if the Project is an allowable secondary use under the Redevelopment Plan, then it requires a variance under section 305 of the Plan before Project approval.

**2. The office space allocation requested for this Project exceeds the amount authorized for the Alexandria District.**

In 1986, San Francisco voters passed Proposition M, a referendum limiting the amount of office space that can be approved each year. Codified as Section 321 of the San Francisco Planning Code, it provides that “[n]o office development may be approved during any approval period if the additional office space in that office development, when added to the additional office space in all other office developments . . . would exceed 950,000 square feet.” (San Francisco Planning Code § 321(a)(1).) Office space is defined to mean “construction . . . of any structure” that has the “effect of creating additional office space.”

The current Project plans call for the construction of two office towers on Mission Bay South Parcels 29 and 31, comprising 309,436 square feet and 267,486 square feet of office space, respectively, for

that design approval, along with all previously imposed conditions of approval. Future projects requesting authorization will be brought before the Commission for design review in accord with Resolution 14702, and upon determination by the Commission that such proposals are in conformity with the D for D and other applicable requirements, office space may be allocated for such new structures from the unassigned amount available in the Development District.”

O-MBA28L11

Planning Commission  
City and County of San Francisco  
Re: Warriors Arena Project DSEIR  
November 5, 2015  
Page 3

a total of 576,922 square feet of office space. (Executive Summary, p. 2.)

In 2008, the Planning Commission adopted Motion No. 17709. Motion 17709 approved a cumulative total office space allocation for all projects within the Alexandria Development District of 1,350,000 gross square feet. (Motion 17709, p. 9, Finding 9.) Of that amount, 1,222,980 was allocated before the adoption of Motion 17709. (Motion 17709, p. 5, Finding 4, Table 1.) Therefore, at the time Motion 17709 was proposed, 227,020 gsf of unallocated office remained for allocation. (Motion 17709, p. 9, Finding 9, Table 4.)

According to Motion 17709, there were three pending projects at that time, at 600 Terry Francois, 650 Terry Francois, and 1450 Owens Street. Motion 17709 states that these projects represented 665,880 square feet of “potential office space.” (Motion 17709, p. 5, Finding 5, Table 2.) Motion 17709 also states an intent to authorize only 57% of “potential office space” for actual office space after 10/18/09, 53% of “potential office space” for actual office space after 10/18/10, and 50% of “potential office space” for actual office space after 10/18/11.

Motion 17709 does not state how much actual office space was approved for the three pending projects at 600 Terry Francois, 650 Terry Francois, and 1450 Owens Street. The Planning Department’s Office Development Annual Limitation Program record (attached as Exhibit 3) shows “0\*” in the “size” column for these projects. (Exhibit 3, p. 19.) Assuming the Planning Commission allocated office space to these projects at the 57% ratio, that amount is 379,552 gsf (665,880 x .5). **This amount exceeds the remaining office space available for allocation at that time (i.e., 227,020 gsf).**

According to Motion 17709, there were two additional areas where the applicant indicated an intent to develop “potential office space,” namely, MB South Blocks “29 and 31” and “33-34.” (Motion 17709, p. 5, Finding 6, Table 3.) Motion 17709 states that these possible future projects represented 915,700 square feet of “potential office space,” with Blocks “29 and 31” at 515,700 GSF. (Motion 17709, p. 5, Finding 6, Table 3.)

Assuming, again, that the Planning Commission allocated office space to these areas at the 50% ratio, that amount is 457,850 GSF (915,700 x .5), with 257,850 allocated to Blocks “29 and 31” at 257,850 gsf (515,700 x .5).

The Draft Motion proposed for adoption at today’s hearing states that “Blocks 29-32 are included in the Development District and have been allocated a total of 677,020 sf of office space pursuant to Motion No. 17709.” (Draft Motion, p. 3.) This is incorrect in at least four ways.

First, it is unclear and unstated how Planning staff derived the 677,020 gsf number.

Second, after approval of the office space allocation for the three pending projects at 600 Terry Francois, 650 Terry Francois, and 1450 Owens Street, there was no office space left in the

O-MBA28L11

Planning Commission  
City and County of San Francisco  
Re: Warriors Arena Project DSEIR  
November 5, 2015  
Page 4

Alexandria District to allocate - as discussed above.

Third, even if one adds together the "potential office space" numbers for Blocks 29-32 in Motion 17709, the sum is 1,119,999 gsf, and 50% of that is only 560,000 gsf. The two office towers proposed for this Project require 576,922 gsf. (See Executive Summary, pp. 1-2: 309,436 gsf in the South tower and 267,486 gsf in the 16<sup>th</sup> Street tower). This number exceeds 560,000 gsf.

Fourth, when one adds the 25,000 gsf for office space in the arena building (see SEIR p. 3-17), the office space for this project totals 601,922 gsf (i.e., 576,922 plus 25,000), which also exceeds 560,000 gsf.

Fifth, to the extent there was any office space left for Motion 17709 to allocate after approval of the office space allocation for the three pending projects at 600 Terry Francois, 650 Terry Francois, and 1450 Owens Street, Motion 17709 allocated only 257,850 gsf to Blocks 29 and 31 (i.e., 50% of 515,700) pursuant to Finding 6, Table 3. **The 576,922 gsf of office space in the two office towers for this Project are located in Blocks 29 and 31; and the total of 576,922 gsf vastly exceeds the 257,850 gsf that may arguably be available.**

Because the office towers called for in the Project exceed the allowable office space cap, Section 321(a)(1) and Motion 17709 require the Planning Commission to deny approval of the Project and of the requested allocations of office space.

**3. General Plan Inconsistency: BAAQMD.**

San Francisco Master Plan Policy 4.1 states:

Support and comply with objectives, policies, and air quality standards of the Bay Area Air Quality Management District.

Regionwide monitoring of air quality and enforcement of air quality standards constitute the primary means of reducing harmful emissions. The conservation of San Francisco's air resource is dependent upon the continuation and strengthening of regional controls over air polluters. San Francisco should do all that is in its power to support the Bay Area Air Quality Management district in its following operations:

- Monitoring both stationary and mobile sources of air pollution within the region and enforcing District regulations for achieving air quality standards.
- Regulating new construction that may significantly impair ambient air quality.
- Maintaining alert, permit, and violations systems.
- Developing more effective controls and method of enforcement, as necessary

The attached letter from the Bay Area Air Quality Management District (Exhibit 4) and the City's response (Exhibit 5) show that this Project does not comply with this policy.

O-MBA28L11

Planning Commission  
City and County of San Francisco  
Re: Warriors Arena Project DSEIR  
November 5, 2015  
Page 5

The Alliance previously commented on the Draft SEIR (Comment AQ-7) that the per ton charge for emission offsets is too low to achieve complete offset of the Project's emissions. The City's response to comments on this point is cagey, but it does suggest what now turns out to be fact - that the BAAQMD agreed with the comment - because the response states:

SF Planning has been in communication with BAAQMD with regard to its suggestion that a higher fee may be warranted to offset project emissions to a less than significant level and found that BAAQMD could not establish that an increased rate beyond that of the Carl Moyer Program plus a five percent administrative fee could meet the "rough proportionality" standard required under CEQA.

(RTC, p. 13.13-67.) The RTC's rationale for contending that a higher offset fee would not meet the "rough proportionality" standard is that offset fees in other areas of the state are not higher than the offset fee proposed in the DSEIR. This is an error of law. The "rough proportionality" requirement requires a comparison of the cost of the mitigation to the degree of severity of the impact. The fees charged in other areas of the state are irrelevant to "rough proportionality."

**4. CEQA Findings: General**

The Commission cannot make any CEQA findings required by CEQA section 21081 or CEQA Guidelines 15091, 15093, 15096(f), because the Project SEIR does not comply with CEQA and is not certifiable, for the reasons described in the Alliance's comments on the SEIR.

**5. CEQA Findings: BAAQMD.**

The Commission cannot find that "Impact AQ-4: Potential conflicts with BAAQMD's 2010 Clean Air Plan" is less than significant with mitigation because the City and Project Sponsor refuse to agree to BAAQMD's offset fees per Mitigation Measure M-AQ-2b. (See Exhibits 4 and 5.) There is also no evidence that the "Option 2" offset idea within Mitigation Measure M-AQ-2b is feasible. There are too many unanswered questions regarding Option 2, including lack of assured verification of offsets to ensure their effectiveness, and lack of assurance that offset sources are available in the quantity required. BAAQMD's offset program at least answers some, if not all, of these questions.

The Commission cannot find that all feasible mitigation measures that would substantially reduce "Impact AQ-1: Impacts of Criteria Air Pollutants from Construction" have been adopted as required by CEQA section 21081, because there is no evidence that paying the offset fees demanded by BAAQMD is infeasible. Also, as discussed above, there is no evidence that the "Option 2" offset idea within Mitigation Measure M-AQ-2b is feasible; therefore, it is not an adequate substitute for BAAQMD's offset program. This also applies to

- Impact AQ-2: Impacts of Criteria Air Pollutants from Project Operations; Impact C-AQ-1: Project Contribution to Regional Air Quality Impacts;

Planning Commission  
City and County of San Francisco  
Re: Warriors Arena Project DSEIR  
November 5, 2015  
Page 6

- Impact C-AQ-1: Project Contribution to Regional Air Quality Impacts.

**6. CEQA Findings: Pier 80 Alternate Site.**

The Commission cannot find that feasible alternatives that would substantially reduce the Project's significant impacts have been adopted. The SEIR does not analyze the alternate site proposed by the Alliance near Pier 80, and did not circulate that analysis for public comment. Neither OCII nor this Commission has the basis to make conclusory findings rejecting the alternative. Among the relevant facts not considered in the findings is that the site is three times as large as would be required for the Event Center project and need not utilize any of the City-owned property nor any particular configuration of the privately-owned lots should there be an unwilling seller. There is no evidence provided that the site could not be acquired within a reasonable time period.

Case law confirms that assuring a site's consistency with city plans and zoning is within the City's power. Similarly, the scheduling of transportation services to the site can be increased, and the findings provide no studies to back up conclusory statements regarding traffic, air quality, hydrology, or water quality impacts. Since only a third of the site is needed to accommodate the event center, all of the impacts (if shown to have concern after sufficient technical review) can be avoided or mitigated. As stated in the Alliance letter to OCII that proposes this site for consideration as an alternative, here incorporated by reference, the SEIR failed to consider a potentially-feasible off-site alternative and must be revised and recirculated to do so before findings of infeasibility may be considered or adopted. The site suggested by the Alliance is potentially feasible and deserving of study.

Thank you for your attention to this matter.

Very Truly Yours,

Thomas N. Lippe

Tiffany Bohee, OCII Executive Director  
c/o Brett Bollinger, San Francisco Planning Department  
via email [warriors@sfgov.org](mailto:warriors@sfgov.org)

Subject: Warriors Event Center & Mixed Use Development  
Inconsistency with Mission Bay South Redevelopment Plan  
'Secondary Use' Classification

Dear Director Bohee and Mr. Bollinger:

The Mission Bay Alliance (the Alliance) contends that the Warriors' Event Center is unlawfully inconsistent with every use allowed by the Mission Bay South Redevelopment Plan (the Plan). Although the Alliance raised this issue in comments on the Draft Subsequent EIR (DSEIR), both the Responses to Comments in the Final SEIR and OCII's findings of project consistency remain materially inadequate.

The Plan designates uses allowed at a 'Commercial Industrial/Retail' site. The Alliance notes that while OCII now concedes that a sports arena is not within the scope of allowed 'principal uses' in that zoning, OCII contends that an arena is consistent with 'secondary uses.' As this letter will explain, all such secondary uses are similarly and demonstrably insufficient to permit the Warriors' sports arena.

**Nighttime Entertainment.** The Initial Study concluded, in error, that the DSEIR did not need to address land use issues — at all. It asserted that the entire Event Center, including the sports arena use, somehow met the secondary 'Nighttime Entertainment' use analyzed in the 1998 Plan EIR. Secondary uses were then generally referenced in the DSEIR (e.g., pp. 3-8, 3-51, 4-5, 5.2-115), but there was no discussion of which category of secondary use would be allocated to the Event Center, inferring acceptance of the Nighttime Entertainment category.

The Plan describes Nighttime Entertainment in terms of small-scale local uses like dance halls, bars, nightclubs, discotheques, nightclubs, private clubs, and

**EXHIBIT 1**

O-MBA28L11

Warriors Event Center  
Secondary Use Inconsistency  
November 2, 2015  
Page 2 of 4

restaurants. (Plan, p. 50.) At the time of the 1998 EIR, several small neighborhood bars occasionally offered nighttime entertainment, consistent with the secondary use category. Such minor uses were compatible with the 3rd Street Corridor and the waterfront. Clearly, no mammoth regional entertainment venue was anticipated in Mission Bay South and no such use was considered in the 1998 Plan EIR.

And while professional basketball games are held at night, the Event Center also projects 31 annual events "related to conventions, conferences, civic events, corporate events and other gatherings," with an estimated attendance of between 9,000 and 18,500 patrons. "[T]he majority of events are expected to occur during day time hours." Such events are not 'Nighttime Entertainment.'

The Director's currently-proposed findings that the sports arena is 'Nighttime Entertainment' contemplated as a secondary use in the Plan are unsupported. The findings fail to match the scope and impacts of a professional sports venue with the analysis or description of uses in the Plan or in the 1998 EIR. The findings are fatally conclusory; that somehow a professional sports venue would be "similar" to a nightclub or bar use in the 'Nighttime Entertainment' category "because" it will serve alcohol, provide amplified live entertainment, and provide a venue for evening gatherings. The findings fail to address the core inconsistency of a regional sports arena with the intent of the adopted Plan and the Design for Development, which focus on commercial entertainment uses in Mission Bay North to complement the Giants' ballpark.

OCII's reliance on the negative; to wit, that the 'Nighttime Entertainment' secondary use has no specific size limitations, is not enough. The Plan provides for the continued development of Mission Bay South as a walkable urban community intended to facilitate world-class medical and biotechnology development. The Event Center project violates the Plan Area Map carefully designed in classic, walkable Vara Blocks. (Plan, Attachment 2, p. 40.) Neither the Plan nor the Design for Development contemplate any uses comparable in scope or impact to the Event Center as 'Nighttime Entertainment.'

That being said, in fact in the Final SEIR and as reflected in the proposed Plan consistency findings, OCII now implicitly agrees with the Alliance that the 'Nighttime Entertainment' secondary use standing alone does not encompass a sports arena. Now, OCII additionally relies on the Plan's alternate 'secondary uses.' No such uses are consistent with the Plan, as explained below.

O-MBA28L11

Warriors Event Center  
Secondary Use Inconsistency  
November 2, 2015  
Page 3 of 4

**Recreation Building.** One of the Plan's secondary use categories is for an undefined 'Recreation building.' (Plan, p. 15.) The Plan describes 'Outdoor Recreation' as "an area, not within a building, which is provided *for the recreational uses of patrons* of a commercial establishment." (Plan, p. 50, italics added.)

OCII's proposed findings as to the 'Recreation building' category stretch the regional sports arena use not only beyond what was contemplated by the Plan or studied in the 1998 EIR, but beyond logic. To state the obvious: there is a difference between 'recreation' and 'entertainment.' Both involve enjoyment and leisure, and may involve ancillary eating and drinking, and the Alliance has no quarrel with the Director's reference to recreation as "something people do to relax or have fun; activities done for enjoyment." (OCII Proposed Secondary Use Determination, p. 6.) But myriad dictionary definitions confirm and it cannot readily be denied that 'recreation' is commonly understood to involve one's personal physical activities while 'entertainment' refers to events or performances designed to entertain others.

None of the Plan's various references to 'entertainment' include athletic activities normally considered 'recreation:' Adult Entertainment [bookstore or theater], Amusement Enterprise [video games], Bar [drinking and theater], Theater [movies and performance]. (Plan, Attachment 5, pp. 44-51.) Consistently, the 1998 EIR's discussion of 'recreational' land uses focused in turn on open space, bicycles, parks, and water-based activities. (Mission Bay EIR, Volume IIB, pp. V.M. 15-28.)

In context, the Plan's reference to 'Recreation building' as a secondary use contemplates participatory recreational uses like the 'recreation facilities' referenced in the 1998 Plan EIR for the existing golf driving range and in-line hockey rink, with the expressed expectation that the size of recreational 'facilities' would decrease as redevelopment of the Plan area progressed. (OCII Proposed Secondary Use Determination, p. 6.)

Reliance on the secondary use of 'Recreation building' is unsupported.

**Public Structure or Use of a Nonindustrial Character.** As presented in the Plan, the category of "other secondary uses" labeled 'Public structure or use of a nonindustrial character' references *one* secondary use, not *two*. (Plan, p. 13.) The use is required to be public, and either a structure *or* a use.

O-MBA28L11

Warriors Event Center  
Secondary Use Inconsistency  
November 2, 2015  
Page 4 of 4

The interpretation urged by the Director is, again, strained beyond the plain words of the Plan. 'Public' is not defined in the Plan and so its common meaning is assumed. But as proposed in the consistency findings, OCII interprets a 'public' use as simply requiring that the public be somehow 'served.' That would encompass every kind of principal and secondary use listed in the Plan, from child care to animal care to hotel, *etc.*, and renders the category meaningless: *i.e.*, "Any use is ok."

Instead, a public structure or use is commonly understood to be under the control and management of a public agency for the benefit of its constituency — such as the University of California<sup>1</sup> or the City of San Francisco. The Plan provides a description of a range of anticipated public improvements in Attachment 4. This list includes both public buildings and public uses. None of the public improvements listed in Attachment 4 include anything like a private professional sports arena.

The Event Center is a private project and is not within the scope of the secondary use category for a public structure or use of a nonindustrial character.

**Director's Findings.** As explained, the sports arena uses that are the impetus for the Event Center project are not allowed by the Plan's allowed principal or secondary uses. An allowed use is prerequisite for a finding of Plan consistency. The Alliance will not belabor the myriad other inconsistencies with the Plan's objectives, design, incompatibility with UCSF, and creation of significant environmental impacts, as those have been described in the DSEIR comments and throughout the administrative record, but hereby objects to their insufficiencies and lack of supporting substantial evidence for the Plan consistency finding.

Consideration of the Event Center project must be preceded by amendment of the Plan to be consistent with the delineated principal and secondary uses and the adopted Plan Area Map of the Mission Bay South Redevelopment Plan.

Thank you.

Sincerely yours,

  
Susan Brandt-Hawley  
Attorney for Mission Bay Alliance

O-MBA28L11

RESOLUTION NO. 176-2005

Adopted November 1, 2005

APPROVING A MEMORANDUM OF UNDERSTANDING WITH THE  
REGENTS OF THE UNIVERSITY OF CALIFORNIA, A CALIFORNIA  
PUBLIC CORPORATION, AND ACKNOWLEDGING THE EXECUTIVE  
DIRECTOR'S FINDINGS OF CONSISTENCY WITH THE MISSION BAY  
SOUTH REDEVELOPMENT PLAN, FOR THE EXPANSION OF UCSF  
FACILITIES IN THE MISSION BAY SOUTH REDEVELOPMENT  
PROJECT AREA; MISSION BAY SOUTH REDEVELOPMENT  
PROJECT AREA

BASIS FOR RESOLUTION

1. On September 17, 1998, by Resolution No. 193-98, the Redevelopment Agency of the City and County of San Francisco's (the "Agency") Commission (the "Agency Commission") conditionally approved the Mission Bay South Owner Participation Agreement (the "South OPA") and related documents between Catellus Development Corporation (the "Owner") and the Agency for development in the Mission Bay South Redevelopment Project Area (the "Project Area").
2. On November 2, 1998, the Board of Supervisors of the City and County of San Francisco (the "Board") by Ordinance No. 335-98 approved and adopted the Redevelopment Plan for the Mission Bay South Redevelopment Project Area (the "Plan"). The Board's adoption of the Plan satisfied the conditions to the effectiveness of Agency Resolution No. 193-98.
3. On November 16, 1998, the Agency entered into the South OPA with the Owner. The South OPA sets forth phasing principles that govern the development of property in the Project Area. Those principles include the Owner's obligations to deliver to the Agency affordable housing sites as market rate housing is built in the Project Area. They also include the Owner's commitments to construct public open space and other public infrastructure adjacent to -- or otherwise triggered by -- development on any of the private parcels governed by the South OPA.
4. Under the South OPA and the related Mission Bay South Tax Increment Allocation Pledge Agreement (the "Pledge Agreement"), dated as of November 16, 1998, between the Agency and the City and County of San Francisco (the "City"), approximately 20% of the total property tax increment (plus certain excess tax increment) generated by development in the Project Area is contractually dedicated to develop affordable housing units on parcels that the Owner will contribute to the Agency, to achieve the affordable housing program contemplated by the Plan.

O-MBA28L11

5. The South OPA requires the Owner to construct the public infrastructure directly related to each of the major phases in accordance with the incremental build-out of each project. Under the South OPA and the Pledge Agreement, the Agency is obligated to fund, repay or reimburse the Owner, subject to certain conditions, for the direct and indirect costs of constructing the infrastructure. The Agency has established a Community Facilities District ("CFD") for infrastructure in the Project Area. The Agency has also established a separate CFD to pay the costs of maintaining the public open space in the Project Area.
6. The South OPA provides that as a condition to any transfer of property in the Project Area, the Owner must obtain the agreement of the transferee to assume all of Owner's obligations under the South OPA with respect to the transferred parcels.
7. The Project Area includes an approximately 43-acre biomedical research and educational campus site (the "Campus Site") for the University of California, San Francisco ("UCSF"). UCSF has already invested about \$675 million on projects completed or underway on the Campus Site within the Plan Area and has plans to invest another \$225 million on projects in design.
8. The Regents of the University of California, a California public corporation ("The Regents") wishes to lease or acquire, and the Owner wishes to transfer Parcels 36, 37, 38 and 39 in the Project Area, comprising approximately 9.65 acres of land for the possible expansion of UCSF in Mission Bay (the "Expansion Parcels"). These parcels are not part of the 43 acres that the Plan originally designated as the Campus Site.
9. On November 30, 2004, The Regents released proposed amendments in draft form to its long range development plan, as LRDP Amendment #2. Those amendments contemplate an expansion of UCSF facilities onto the Expansion Parcels, including the possibility of developing by 2012 new integrated specialty Children's, Women's and Cancer hospitals containing about 210 beds, together with ambulatory and research facilities. In March 2005, The Regents approved LRDP Amendment #2 (the "Project") and certified a related final environmental impact report (the "LRDP #2 FEIR") which analyzed the environmental effects of the proposed UCSF development on the Expansion Parcels. Copies of the LRDP #2 FEIR are on file with the Agency Secretary.
10. The Owner and The Regents have entered into an Option Agreement and Grant of Option to Lease, dated as of January 1, 2005 (the "Option to Lease"), which provides that upon the satisfaction of certain conditions and the exercise by The Regents of its option (i) Catellus, as landlord, and The Regents, as tenant, will enter into a long-term ground lease of the Expansion Parcels (the "Lease") and (ii) the Owner and The Regents will at the same time enter into an Option Agreement and Grant of Option to Purchase (the

O-MBA28L11

- "Option to Purchase") under which The Regents will have an option to purchase the Expansion Parcels.
11. If The Regents exercises the Option to Lease within the option term, the Lease would allow for The Regents to develop up to 1,020,000 leasable square feet on the Expansion Parcels, provided that (a) any development of those parcels is the subject of further environmental review under the California Environmental Quality Act ("CEQA"), and (b) the Owner does not lose any of its entitled development potential for the balance of its land nor lose any of its other rights and privileges under the South OPA.
  12. Pursuant to Section 302 of the Plan, the development of the contemplated UCSF facilities on the Expansion Parcels is permitted as a subset of "Other Uses" as a secondary use. Such secondary uses are permitted provided that such use generally conforms with redevelopment objectives and planning and design controls established pursuant to the Plan and based on certain findings of consistency by the Agency's Executive Director (the "Consistency Findings"). The Executive Director has made the Consistency Findings, and such findings are hereby incorporated herein by this reference as if fully set forth.
  13. The City must make substantial improvements to San Francisco General Hospital ("SFGH") by 2013 and is evaluating a number of alternatives, including rebuilding on site and co-locating a new SFGH with new UCSF medical facilities in Mission Bay.
  14. As a State agency, The Regents is exempt under the State Constitution from local land use regulation and property taxes to the extent it uses property exclusively in furtherance of its educational mission.
  15. The Agency, City and The Regents negotiated a non-binding term sheet to guide the preparation of final transactional and related documents, such as a Disposition and Development Agreement ("DDA") for The Regents to acquire property for, and to construct and subsidize, affordable housing for low-income workers of UCSF, which DDA is being considered by the Agency Commission concurrently with this Resolution, pursuant to Resolution No. 160-2005, and provided terms for a Memorandum of Understanding regarding design standards and cooperation on the development of the Expansion Parcels (the "MOU"). The Agency Commission approved the non-binding term sheet on May 17, 2005 by Resolution No. 81-2005.
  16. The proposed MOU addresses, among other things: the potential loss of tax increment from the transfer of the Expansion Parcels to a tax-exempt entity; the obligations to build infrastructure associated with development on the Expansion Parcels; the potential assistance of UCSF in the planning of the co-location, if any, of SFGH with the new UCSF facilities; the standards for design review for construction on the Expansion Parcels; local hiring and

O-MBA28L11

equal opportunity for jobs associated with the development on the Expansion Parcels; and other matters designed to provide the Agency and City with significant public benefits.

17. Agency staff is recommending that the Agency Commission approve the MOU, and the associated Consistency Findings.
18. The Agency Commission has reviewed and considered the information contained in the LRDP #2 FEIR.
19. The Agency Commission hereby finds that the MOU is an action in furtherance of the implementation of the Project for purposes of compliance with CEQA.
20. By Resolution 175-2005, the Agency Commission adopted environmental findings related to the LRDP #2 FEIR, pursuant to CEQA and the CEQA Guidelines (the "Findings"). Such Findings are made pursuant to the Agency's role as the responsible agency under CEQA for the Project. The Findings are hereby incorporated herein by this reference as if fully set forth.

#### RESOLUTION

ACCORDINGLY, IT IS RESOLVED by the Redevelopment Agency of the City and County of San Francisco that the findings of consistency with the Mission Bay South Redevelopment Plan are approved and the Executive Director is authorized to execute the "Expansion of UCSF Facilities in Mission Bay South Redevelopment Project Area (Blocks 36-39) Memorandum of Understanding", substantially in the form lodged with the Agency General Counsel; Mission Bay South Redevelopment Project Area.

#### APPROVED AS TO FORM:

#### MEMORANDUM

126-03405-001  
October 12, 2005

To: Marcia Rosen  
Executive Director

From: Amy Neches   
Senior Project Manager

Re: Secondary Use Finding Recommendation for UCSF Hospital in Mission Bay South Redevelopment Area

Pursuant to a Term Sheet dated as of August 1, 2005 between the City, the Agency and The Regents of the University of California, which was endorsed by the Commission on May 17, 2005 (Resolution No. 81-2005), the Agency is considering agreements, including a Memorandum of Understanding ("MOU"), under which the University of California at San Francisco ("UCSF") may develop a hospital in the Mission Bay South Redevelopment Area ("Redevelopment Area").

The UCSF hospital would be located on Blocks 36-39 within the Commercial Industrial land use district of the Redevelopment Area, as described in the Mission Bay South Redevelopment Plan (the "Plan"). The UCSF hospital development may also include all or portions of Block X3 within the Commercial Industrial/Retail land use district. In both of these land use districts "public structure or use of a non-industrial character" is permitted as a subset of "Other Uses" as a secondary use.

The University of California, of which UCSF is a component, is a public body specifically created by the California Constitution. A hospital or medical center is described in §790.44 of the San Francisco Planning Code as a "public or private institutional use which provides medical facilities for inpatient care, medical offices, clinics, and laboratories." The proposed UCSF hospital development will include these components. The hospital will not including manufacturing, warehousing, or distribution of goods, and can reasonably be considered a "non-industrial use." This interpretation is supported by the San Francisco Planning Code, under which hospitals are permitted as a conditional use in all C districts and NC-3 districts.

Section 302 of the Plan provides as follows:

"Secondary uses shall be permitted in a particular land use district...provided that such use generally conforms with redevelopment objectives and planning and design controls established pursuant to this Plan and is determined by the Executive Director to make a positive contribution to the character of the Plan Area, based on

Marcia Rosen  
Page 2 of 3

October 12, 2005  
O-MBA28L11  
126-03405-001

a finding of consistency with the following criteria: the secondary use, at the size and intensity contemplated and at the proposed location, will provide a development that is necessary or desirable for, and compatible with, the neighborhood or the community."

Staff believes that the UCSF hospital is appropriate as a secondary use, based on the following:

- 1) The proposed hospital will be located on approximately 10 to 14 acres of land adjacent to the Mission Bay UCSF research campus that have been determined to be blighted and are affected by environmental contamination. UCSF plans close integration of its basic academic research activities with the teaching, research and patient care activities within the planned hospital. The plan for development of the UCSF hospital generally conforms to the Redevelopment Project Objectives as described in §103 of the Plan, particularly with objective A of eliminating blight and correcting environmental deficiencies, and objective B of retaining and promoting UCSF's research and academic activities within the City and County of San Francisco.
- 2) Under the MOU, the UCSF hospital development will generally conform to the planning and design controls established pursuant to the Plan, including the street layout, setbacks, and streetscape plan. To accommodate the needs of the hospital, the MOU will include specific adjustments to the existing height and bulk standards of the Commercial Industrial and Commercial Industrial/Retail land use zones of the Mission Bay South Design for Development. These changes will lower the maximum height of a hospital to 105 feet, compared to the existing 160 foot limit, but would allow for somewhat greater bulk in the mid-rise area. These changes have been studied and presented to the public at two well-noticed public meetings. In staff's opinion, the proposed adjustments represent reasonable variation from the existing standards, which will have little if any negative effect on the surrounding community in the context of overall Mission Bay development.
- 3) The hospital will contain no more development, as calculated under the Plan in leasable square feet, than would have been permitted under the principal uses permitted in these land use districts, and there will be no net increase in the overall size of development within the Redevelopment Area. The hospital will be developed on parcels that would otherwise likely have been developed with commercial office or life science/biotechnology uses. These uses would have been constructed in buildings of reasonably similar size and appearance as the proposed hospital use.
- 4) The proposed hospital will allow UCSF to continue to provide needed tertiary health care to the residents of San Francisco in a modern seismically safe hospital, and will assist UCSF in furthering its research and academic mission.

Marcia Rosen  
Page 3 of 3

October 12, 2005  
O-MBA28L11  
126-03405-001

Based on these factors, staff believes that it is appropriate to make the finding of consistency cited above, and recommends that the Executive Director permit the development of the UCSF hospital as a secondary use in Mission Bay, subject to the approval of the MOU by the Commission.

Approved on October 12, 2005:

  
Marcia Rosen  
Executive Director

**Re: Warriors Arena Project: Violation of Variance Requirement.**

Dear Ms Bohee and Mr. Bollinger:

This office represents the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project"). The Mission Bay Alliance objects to approval of this Project and certification of the Project SEIR.

I write today regarding the OCII's failure to require a variance or "variation" for this Project under section 305 of the Mission Bay South Redevelopment Plan ("Plan"). The November 2, 2015, letter from Susan Brandt-Hawley, my co-counsel for the Alliance, demonstrates this Project is not an allowable secondary use under the Plan. Thus, a variance is not available because, as shown by Brandt-Hawley, the Project "will change the land uses on this Plan." (Plan, § 305.) However, in the alternative, if the Project is an allowable secondary use under the Plan, then the OCII must process this Project application as a variance and make the findings required by Plan section 305 before Project approval.

Both California and San Francisco planning law provide a process for landowners to obtain a "variance" from the "uniformity" of zoning limits that, while appropriate for the zone district in general, would impose undue hardship due to unique characteristics of a specific parcel. Government Code section 65906 governs the grant of zoning variances by municipalities and prohibits local agencies from granting "special privileges" to individual landowners. Similarly, San

Commission on Community Investment and Infrastructure  
Ms Tiffany Bohee  
Mr. Brett Bollinger  
Re: Warriors Arena Project DSEIR: Violation of Variance Requirement  
November 2, 2015 [2 of 2]  
Page 2

Francisco Planning Code, section 305, subdivision (a), provides that a variance permit must be approved for any exception to the requirements of the Planning Code. Subdivision (c) thereof mirrors the requirements of state law, and requires a finding that "owing to such exceptional or extraordinary circumstances the literal enforcement of specified provisions of this Code would result in practical difficulty or unnecessary hardship ...."

Similarly, the Plan includes a variance provision that reflects the same substantive requirements as Government Code section 65906 and Planning Code section 305:

The Agency may modify the land use controls in this Plan where, owing to unusual and special conditions, enforcement would result in undue hardships or would constitute an unreasonable limitation beyond the intent and purposes of these provisions. Upon written request for variation from the Plan's land use provisions from the owner of the property, which states fully the grounds of the application and the facts pertaining thereto, and upon its own further investigation, the Agency may, in its sole discretion, grant such variation from the requirements and limitations of this Plan. The Agency shall find and determine that the variation results in substantial compliance with the intent and purpose of this Plan, provided that in no instance will any variation be granted that will change the land uses on this Plan.

(Plan, § 305.)

Because the Plan's variance provision imposes virtually identical requirements as Planning Code section 305, both apply. (Plan, §'s 101 ["Regardless of any future action by the City or the Agency, whether by ordinance, resolution, initiative or otherwise, the rules, regulations, and official policies applicable to and governing the overall design, construction, fees, use or other aspect of development of the Plan Area shall be (i) this Plan and the other applicable Plan Documents, (ii) to the extent not inconsistent therewith or not superseded by this Plan, the Existing City Regulations and (iii) any new or changed City Regulations permitted under this Plan"]; 304.9.C.(iv)).

Here, the Project creates at least sixteen inconsistencies with the Design for Development (D4D). The OCII now proposes to amend the D4D, the Owner's Participation Agreement (OPA), and other Plan documents to resolve these inconsistencies by, including but not limited to, raising maximum height limits from 90 to 135 feet, allowing a second 160+ foot tower, increasing bulk limits to accommodate the arena, and changing arena setbacks, street wall heights, view corridors, public rights of way, and parking standards. (See e.g., Draft SEIR, pp. 4-7 - 4-9, § 4.2.4; Proposed Resolution 2015, exhibit A; Memorandum to the OCII from Executive Director Tiffany Bohee for Items 5(a), 5(b), 5(c), 5(d) & 5(e) the November 3, 2015, CCII meeting agenda, pp. 4, 22.)

Even if the Project's land uses are allowable secondary uses, these amendments "modify the land use controls in this Plan" as provided in Plan section 305. But the Project Sponsor has made

O-MBA28L11

Commission on Community Investment and Infrastructure  
Ms Tiffany Bohce  
Mr. Brett Bollinger  
Re: Warriors Arena Project DSEIR: Violation of Variance Requirement  
November 2, 2015 [2 of 2]  
Page 3

no showing that due to "unusual and special conditions, enforcement would result in undue hardships or would constitute an unreasonable limitation beyond the intent and purposes of these provisions." (Plan, § 305.)

"Variances are, in effect, constitutional safety valves to permit administrative adjustments when application of a general regulation would be confiscatory or produce unique injury." (Curtin's California Land Use and Planning Law, p. 55.) Variance requirements also implement the State Planning and Zoning Law's requirement of "uniformity" of zoning rules within zoning districts. (See Gov. Code, § 65852 ["All such [zoning] regulations shall be uniform for each class or kind of building or use of land throughout each zone, but the regulation in one type of zone may differ from those in other types of zones;" *Neighbors in Support of Appropriate Land Use v. Cnty. of Tuolumne* (2007) 157 Cal.App.4th 997, 1008 (*Neighbors*).) The State Planning and Zoning Law also requires vertical consistency between local agencies general plans, zoning ordinances, and land use permits. (Gov. Code, § 65860, subd. (c) ["County or city zoning ordinances shall be consistent with the general plan of the county or city..."]; see *DeVita v. Cnty. of Napa* (1995) 9 Cal.4th 763, 772 ["A general plan is a 'constitution' for future development [citation omitted] located at the top of 'the hierarchy of local government law regulating land use'"].)

California courts have vigorously enforced the requirements for granting a variance, and have developed extensive jurisprudence to corral the many stratagems local agencies have used to avoid its requirements. (See e.g., *Topanga Association v. County of Los Angeles* (1974) 11 Cal.3d 506, 511-12 (*Topanga*); *Orinda Assn. v. Board of Supervisors* (1986) 182 Cal.App.3d 1145, 1166 (*Orinda Assn*) ["A zoning scheme, after all, is similar in some respects to a contract ... If the interest of these parties in preventing unjustified variance awards for neighboring land is not sufficiently protected, the consequence will be subversion of the critical reciprocity upon which zoning regulation rests..."].)

Variance findings must focus on a comparison of the subject property to other properties in the zone district with which the variance is intended to bring it into parity, and the benefits to the community or "public interest" associated with a zoning exception are irrelevant. (*Orinda Assn. supra*, at p. 1166.) By amending the Plan documents to accommodate this Project, the OCII would cast these requirements aside and grant a "special privilege" to this Project Sponsor.

In *Neighbors*, rather than adopt a rezone or grant a variance, the County created a special exception to the zoning ordinance for one landowner by including it in a development agreement adopted under the development agreement law. (*Neighbors, supra*, 157 Cal.App.4th at p. 1003.) In rejecting this stratagem, the Court in *Neighbors* noted that there are limits on the power to rezone: "The foundations of zoning would be undermined, however, if local governments could grant favored treatment to some owners on a purely ad hoc basis ... [R]ezoning, even of the smallest parcels, still necessarily respects the principle of uniformity." (*Id.* at pp. 1009-10.)

O-MBA28L11

Commission on Community Investment and Infrastructure  
Ms Tiffany Bohce  
Mr. Brett Bollinger  
Re: Warriors Arena Project DSEIR: Violation of Variance Requirement  
November 2, 2015 [2 of 2]  
Page 4

A similar result occurred in *Trancas Prop. Owners Assn. v. City of Malibu* (2006) 138 Cal.App.4th 172 (*Trancas*). In *Trancas*, the court held an exemption from a city's zoning requirements accomplished by contract functionally resembled a variance, and held that "such departures from standard zoning by law require administrative proceedings, including public hearings ... followed by findings for which the instant [density] exemption might not qualify... Both the substantive qualifications and the procedural means for a variance discharge public interests. Circumvention of them by contract is impermissible." (*Id.* at p. 182.)

In sum, the OCII's proposed grant of zoning exceptions to this Project by way of amending the Plan documents rather than by variance violates the Plan, the variance requirements of the San Francisco Planning Code and state law, and the uniformity requirement of state law.

Thank you for your attention to this matter.

Very Truly Yours,

Thomas N. Lippe

O-MBA28L11

Office Development Annual Limitation ("Annual Limit") Program

The Office Development Annual Limit (Annual Limit) Program became effective in 1985 with the adoption of the Downtown Plan Amendments to the Planning Code (Sections 320-325) and was subsequently amended by Propositions M (1986) and C (1987). The Program defines and regulates the allocation of any office development project that exceeds 25,000 gross square feet (gsf) in area.

A total of 950,000 gsf of office development potential becomes available for allocation in each approval period, which begins on October 17th every year. Of the total new available space, 75,000 gsf is reserved for Small Allocation projects (projects with between 25,000 and 49,999 gsf of office space), and the remaining 875,000 gsf is available for Large Allocation projects (projects with at least 50,000 gsf of office space). Any available office space not allocated in a given year is carried over to subsequent years.

This document reflects the status of the Annual Limit Program, including current availability and summaries of previously approved and pending projects.

Information in this document was last updated on September 1, 2015. Inquiries should be directed to Corey Teague at (415) 575-9081 or corey.teague@sfgov.org.

Summary of Key Figures

	Current Availability	Pending Availability	Pipeline Availability
<b>Small Allocation Projects</b> (<50,000 gsf of office space)	1,188,805 gsf Current total square footage available for allocation.	993,255 gsf Currently available square footage less 285,550 gsf of pending* projects.	776,280 gsf Currently available square footage less 285,550 gsf of pending* projects and 126,975 gsf of pre-application** projects.
<b>Large Allocation Projects</b> (≥50,000 gsf of office space)	1,429,763 gsf Current total square footage available for allocation.	1,678,791 gsf Currently available square footage less 3,108,554 gsf of pending* projects.	8,529,408 gsf Currently available square footage less 3,108,554 gsf of pending* projects and 6,850,617 gsf of pre-application** projects.

\* A 'pending project' is one for which an office allocation application has been submitted but not yet acted upon.

\*\* A 'pre-application' project is one for which an environmental review application, preliminary project assessment application, or other similar application has been submitted but for which no office allocation application has yet been submitted.

Subject: Response to Comments on the DSEIR for the Event Center & Mixed-Use Development at Mission Bay Blocks 29-32 (Project).

Dear Ms. Bohee:

The Bay Area Air Quality Management District (Air District) is willing to assist the City and County of San Francisco (City) by administering an off-site mitigation program to reduce this Project's significant air quality impacts to the extent feasible. As we have discussed extensively with City staff, the \$321,646 identified in M-AQ-2b is not sufficient to achieve the 17 tons per year of ozone precursor emission reductions needed for this Project. Due to the nature of air quality impacts that need to be mitigated, comparison of the Air District off-site mitigation program identified for this Project to other air district programs is inappropriate and incorrect.

The amount of funds required to reduce 4.4 tons of reactive organic gases (ROG) and 12.6 tons of oxides of nitrogen (NOx), including a 5 percent administration fee, is \$620,922. This amount is based on a study of the Air District's Vehicle Buy Back (VBB) program funds spent over the last 3 years and represents the average cost of reducing ROG and NOx during that three year period. Only through the VBB program can the Air District achieve the contemporaneous emission reductions and other conditions set forth in M-AQ-2b.

Air District staff continues to be willing to assist the City in implementing an off-site mitigation program. However, the Final Environmental Impact Report Response to Comments includes the following statement: "Acceptance of this fee by the BAAQMD shall serve as an acknowledgement and commitment by the BAAQMD to: (1) implement an emissions reduction project(s) within one year of receipt of the mitigation fee to achieve the emission reduction objectives specified above [i.e. 17 tons of ozone precursors per year]". Given this language, unless the City amends M-AQ-2b to fund this feasible mitigation measure at the \$620,922 level previously discussed with City staff, the Air District will be unable to participate in offsetting this Project's air quality impacts.

DATE: November 2, 2015

TO: Tiffany Bohee, OCII Executive Director

FROM: Chris Kern, City Planning Department  
Sally Oerth, OCII Staff

SUBJECT: BAAQMD November 2, 2015 letter re Ozone Precursors Offset Mitigation Fee

The City Planning Department and the staff of the Office of Community Investment and Infrastructure (OCII) have reviewed the November 2, 2015 letter from the Bay Area Air Quality Management District regarding the Warriors Event Center and Mixed Use Development Subsequent Environmental Impact Report (SEIR). The letter states that the \$18,030 per weighted ton per year plus a 5% administrative fee mitigation fee identified in Mitigation Measure M-AQ-2b of the SEIR is insufficient to achieve the required reduction of 17.0 tons per year of ozone precursors. The letter proposes that the mitigation fee should be based on the BAAQMD's Vehicle Buy Back Program, at a cost of \$620,922 (or approximately \$36,525 per weighted ton per year) to achieve the required emissions reduction.

As discussed in the Draft SEIR (pages 5.4-41 through 5.4-42) and the Responses to Comments document (pages 13.13-65 through 13.13-69), the offset fee identified in Mitigation Measure M-AQ-2b is based on the California Air Resources Board (CARB) Carl Moyer program cost-effectiveness criteria. These criteria were developed by CARB to establish the upper limit for emissions offset projects eligible to receive funding through the Carl Moyer program.

Planning staff has been in communication with BAAQMD with regard to its suggestion that a higher fee may be warranted to offset project emissions to a less than significant level and found that BAAQMD could not establish that an increased rate beyond that of the Carl Moyer Program plus a five percent administrative fee could meet the "rough proportionality" standard required under CEQA. The Carl Moyer fee structure was reviewed and updated by CARB in March of 2015 and became fully implemented on July 1, 2015. The offset costs cited in Mitigation Measure M-AQ-2b Emission Offsets are consistent with those of the CARB and other operating California air districts. For example, in the Sacramento Metropolitan Air Quality Management District, the off-site construction mitigation fee rate is \$18,030 per ton of excess NOx emissions as of July 1, 2015 (plus an administrative fee of 5 percent) and is based on the cost effectiveness formula established in California's Carl Moyer Incentive Program. In the San Joaquin Valley Air Pollution Control District, the Indirect Source Review (ISR) program requires that an offsite reduction fee of \$9,350/ton plus a 4 percent administration fee be applied

for NOx emission reductions that cannot be achieved through onsite emission reduction measures. Furthermore, the offset costs in Mitigation Measure M-AQ-2b is consistent or even higher than comparable offset programs in the SFBAAB.<sup>1</sup>

The BAAQMD's November 2, 2015, letter does not establish that the CARB cost-effectiveness criteria are inappropriate for determining the offset costs under Mitigation Measure M-AQ-2b. Based on the information and analysis presented in the Draft SEIR, the Responses to Comments and supporting technical analyses, Planning Department and OCII staffs continue to believe that the offset fee established in Mitigation Measure M-AQ-2b is sufficient to achieve the required emissions offsets. In addition, as discussed in the Responses to Comments document, Mitigation Measure M-AQ-2b has been revised since publication of the Draft SEIR to allow the project sponsor to directly implement an emissions offset project as an alternative to entering into an agreement with the BAAQMD.

Therefore, for the reasons summarized above and discussed in greater detail in the SEIR and Responses to Comments, the November 2, 2015, letter from the BAAQMD does not alter the analysis or conclusions reached in the SEIR.

SMITH ENGINEERING & MANAGEMENT

November 13, 2015

Mr. Tom Lippe  
Law Offices of Thomas N. Lippe, APC  
201 Mission Street, 12<sup>th</sup> Floor  
San Francisco, CA 94105

**Subject: Subsequent Environmental Impact Report for Event Center and  
Mixed Use Development at Mission Bay Blocks 29-32.  
SCN:2014112045**

P15003

Dear Mr. Lippe:

This is an addendum to my November 2, 2015 comments of the Responses to Comment ("the RTC") on the Subsequent Environmental Impact Report (hereinafter "the SEIR") on the above referenced Project in the City and County of San Francisco (hereinafter "the City"). This addendum focuses on additions to the Project that were not addressed in the DSEIR

My qualifications to perform this review were thoroughly documented in my letter of comment on the DSEIR dated July 26, 2015 and are incorporated herein by reference.

**Central Subway / T Third Electrical Power Distribution System Expansion**

The Central Subway / T Third electrical power distribution system expansion is included in the proposed Project to provide additional traction power for expanded frequencies of LRT service associated with new special event operations. This traction power expansion feature would provide two new circuits from the existing King Street substation for the inbound and outbound circuits of the Central Subway / T Third. Providing duct banks for the new electrical connection for King Substation and the Central Subway line would involve trenching in the eastbound and westbound travel lanes of King Street between Second and Fourth Streets. This trenching would take place over a 6-month

O-MBA29L12

Mr. Tom Lippe  
November 13, 2015  
Page 2

period and would require lane closures while trenching and duct installation is actively taking place. Although the power distribution system expansion had previously been identified by SFMTA as a desirable long-term action, it is now incorporated in the subject Event Center and Mixed Use Development Project.

As noted in the third paragraph of SEIR Volume 4, page 12-11, the trenching work and duct installation on King Street associated with the electrical power distribution system expansion was not analyzed in the DSEIR.

Under CEQA, if the project changes after publication of the Draft EIR, and these changes create a new significant impact not identified in the Draft EIR, or a substantial increase in severity of a significant impact that was identified in the Draft EIR, the lead agency must recirculate the draft EIR for public comment. (CEQA section 21092.1.). Although the FEIR makes the conclusory statement that this would not result in new or more severe impacts than previously disclosed, there is no analysis to support this conclusion, which defies logic that this always busy boulevard would be unimpacted by lane closures over a period of six months.

Sincerely,

Smith Engineering & Management

Subject: T'eedUP: GSW Arena a disaster for environmental justice and transit equity; ignores BART/Oakland Airport Connector precedents

Dear Public Servants,

Please accept my attached submission with regard to the Subsequent Environmental Impact Statement concerning GSW Arena LLC's proposal to build an 18,000 seat arena, two office buildings, retail and open space in the Mission Bay redevelopment area.

After seeing the despicable comments by Planning Commissioner Michael Antonini last week, I was compelled to examine through critical race theory why the statement fails to comply with state and federal law and advisory opinions to address the profound environmental justice issues from the cumulative effects of decades of pollution centered on southeast San Francisco. The precedent for compliance was established firmly in the case of BART's Oakland Airport Connector.

Antonini wrote, as reported:

\*Tech and Airbnb have saved San Francisco.

"Their effect has bought many new residents to San Francisco and helped to provide vitality to many of our neighborhoods that were heretofore economically depressed, unsafe, dirty areas of San Francisco to which few would travel to shop, dine and -much less-live... The population of the neighborhoods have changed dramatically. "

\*Airbnb is better than... brothels?

"It's better to have short term renters sharing homes with owners, even in RH1 and RH2 neighborhoods, than to have multiple families living in a single family home or for such homes to be used for illegal criminal activities, often pretending to be message [sic] establishments."

For a decade, I engaged with the Excelsior and Bayview Hunters Point communities during the highly successful Branch Library Improvement Program as a board member of the Friends of the San Francisco Public Library, testifying before the Library Commission for the \$1 million to build the Bayview Linda Brooks Burton Branch Library instead of just a remodeling. I found those people in the forgotten parts of the City to be hard-working,

## I-Templeton

determined to raise their families and hopeful that they would share in the blessings that San Francisco has to offer. I also spent a lot of nights coming from evening meetings, particularly on Third Street, waiting for the T-Line in the cold, dark of night for as much as an hour.

Now that we have the Bayview Linda Brooks Burton Branch Library open for public programs as a magnet for the neighborhood, it troubles me that potential visitors would not be able to attend because their access would be blocked by the substantial and unmitigated impacts from placing such a gargantuan arena at the choke point of the \$2.2 billion investment of federal, state and local bond and property tax funds to build the T-Line, purportedly to finally link southeast to the rest of the City.

Unfortunately, Mr. Antonini's words are reflected in this EIR, because it assumes that the families of southeast San Francisco are much less valuable than the well-heeled luxury box purchasers who would enrich the owners of the Arena. Sports teams have morphed into a shell for real estate speculation. However, the desire to make windfall profits collides with the mandates of California's pioneering law in environmental justice, continually affirmed by the legislature since 1999 and most recently in advisory opinions by Atty. Gen. Kamala Harris.

It flies in the face of sustainable planning policy to move a large venue from a site which has access from an airport, Amtrak, BART, ACTransit and hundreds of acres of parking to rely on a single stop on the T-Line, which has failed to meet its promised service goals for the past eight years. The only conceivable reason is Antonini's assertion that certain types of people are more desirable. In the past year, two NBA franchises have changed hands because owners made similar admissions.

When the USF Dons had the opportunity in 1951 to play in the Cotton Bowl, only if they left their black players behind, the university and the players turned their back on the bowl, leading to their being labeled "the greatest college football team of all time." It is now time for our City officials to assert the primacy of justice over profit and reject this Arena.

### T'eedUP: Technical Fouls Make GSW Arena Bad for Environmental Justice Nov. 1, 2015

#### EXECUTIVE SUMMARY

A critical race theory analysis of the proposed Golden State Warriors Event Center in Mission Bay indicates that the Subsequent Environmental Impact Report falls short of the standards on the California Environmental Protection Act and the Executive Order 12898 because:

1. It does not address the cumulative effects of a Superfund site, proximity to a highway with more than 200,000 vehicles per day, two power plants and an open air waste water treatment plant and decades of governmental disinvestment on the largest concentration of affordable family housing in the nation's most expensive city for housing.
2. It breaks promises made to African-Americans throughout the city and Bayview-Hunters Point specifically about the T-Line being the artery to enhance access to the city's economy.
3. It values wealth and race in land use decision-making to the financial, health and civic detriment of African-American, Latino and Chinese citizens.
4. It does not supply the stated objective of the General Plan to provide middle class jobs to a community which has 43 percent of the city median income.
5. Technically, it makes assertions that fly in the face of reality about transit. Narrative testimony from young people throughout the city describe a segregated transit system in which race and income determine how quickly one moves across the city.
  - a. This project would block for more than 200 days per year the primary artery from Bayview-Hunters Point during peak hours.
  - b. MUNI has a history of missing construction deadlines. The T-Line was 18 months late. The Central Subway was planned to open in 2009.
  - c. This project would endanger children forced to use the Muni system to attend public schools and foster truancy or inability to participate in afterschool events.
  - d. Utilization of the 22-Fillmore would impact African-American and Latino transit riders.
6. The Subsequent Environmental Impact Statement fails to include any consideration of Environmental Justice nor does it include an Equity Analysis.
7. Expert opinion indicates that it would be easier for most San Franciscans and other citizens throughout the Bay Area to reach the current location (a 15 minute BART trip) than to reach the new facility.
8. The Event Center will raise housing prices, increase real estate speculation, short-term leasing activity and displace minority home owners already having faced the most severe predatory lending activity in the country.
9. A much more effective use of the land would be the development of research and development geared to addressing health disparities, particularly in honor of the late Dr. B. Nathaniel Burbridge.

## I-Templeton

### T'eedUP

#### Profound Environmental Justice Issues with the Golden State Warriors Event Center EIR

- The T-Line currently is on time less than half of its scheduled runs; compared to the predecessor 15 bus line, it carries 20 percent more passengers, but operates 60 percent slower.
- GSW Event Center worsens the race and poverty related stress factors for the highest concentration of affordable housing in the City.
- The City and County of San Francisco has denied southeast San Francisco needed investment for 60 years, according to a 2004 civil grand jury report.
- The Draft Subsequent EIR contradicts the General Plan and the 1998 EIR for the Third Street Light Rail by ignoring the negative impact on Bayview-Hunters Point.
- The 30-Stockton line serving Chinatown is a proxy for the expected demand along the Central Subway. It also fails to achieve on-time operation half of the time. The proposed arena is right at the choking point where the current T-Line and additional Central Subway riders would intersect.
- A critical race theory analysis of the proposal indicates a long history of sports owners using African-American communities to gain public benefits but giving little in return in the Bay Area
- Open air waste treatment in Bayview Hunters Point would lift the smells from 18,000 event center patrons using the toilet into the homes of Bayview-Hunters Point residents, undoing gains in air pollution from closure of power plants.

## Technical Fouls Make Proposed Warriors Arena Bad for Environmental Justice

By John William Templeton\*

### DEFINING ENVIRONMENTAL JUSTICE

Attorney General Kamala D. Harris defines environmental justice as "...the fair treatment of people of all races, cultures and incomes with respect to the development, adoption, implementation and enforcement of environmental laws, regulations and policies," in an advisory for local and regional governments.<sup>1</sup>

The U.S. Department of Transportation requires that its grantees:

"avoid, minimize or mitigate disproportionately high and adverse human health and environmental effects, including social and economic effects, on minority populations and low-income populations;

"ensure the full and fair participation by all potentially affected communities in the transportation decision-making process;

"prevent the denial of, reduction in or significant delay in the receipt of benefits by minority and low-income populations.."<sup>2</sup>

**\*Templeton is co-founder of National Black Business Month and architect of Our10Plan, the African-American economic fairness plan. Given a lifetime achievement award in February 2015 by the S.F. Public Utilities Commission Celebrating Black Achievement program, he served six years on the board of the Friends of the San Francisco Public Library and was active in the Excelsior and Bayview branch campaigns. Author of context statements on African-American history in San Francisco and San Jose, he is creator of the California African-American Freedom Trail. He has presented on environmental justice to Region 9 of the Environmental Protection Agency, the National Park Service, California Historical Resources Commission and U.S. Army Corps of Engineers, Sacramento district. Conservator of the 20,000 image Clarence Gatson Collection and the Wesley Johnson Collection, he convenes the annual Preserving California Black Heritage conference.**

In a 2012 regional videoconference<sup>3</sup> to Region 9 of the Environmental Protection Agency, this writer described southeastern San Francisco as a bellwether for the practice of environmental justice. Community members began addressing a variety of health and environmental factors in the 1940s, soon after World War II, and became famous in 1968 for sitting in at the office of the Secretary of the new Department of Housing and Urban Development until it received \$50 million as one for the first two Model Cities initiatives.<sup>4</sup>

## I-Templeton

### CRITICAL RACE THEORY AND ENVIRONMENTAL JUSTICE

Critical race theory emerged as a scholarly field from the recognition that embedded practices in society lead to disparate outcomes. Foster<sup>5</sup> wrote:

"Consider the problem of environmental racism, understood as the disproportionate distribution of environmentally harmful substances (such as lead) and land uses (such as hazardous waste facilities) in communities of color. As with most adverse racially disparate outcomes across a spectrum of social contexts and goods, there is no clear perpetrator or encompassing theory of causation that explains these outcomes. Indeed, as I have argued, these outcomes are best understood as yet another manifestation of the racism and discrimination that exists throughout our social structure-in housing discrimination, political disenfranchisement, and lack of access to health care and other social amenities."

Decisions for public infrastructure, in this analysis, can have long-lasting generational impacts such as the decision by the New Deal-era Federal Housing Agency to insist on racial covenants as a condition for federal mortgage insurance<sup>6</sup>. It took a 1946 Supreme Court decision to overturn the rule, but the effects for residential segregation have endured for more than 70 years.<sup>7</sup>

When the Bay Area attracted major league sports franchises in the 1950s and 1960s, it located all the facilities in African-American neighborhoods of San Francisco or Oakland.<sup>8</sup> Through the 1990s, all the major league teams played in Bayview Hunters Point or East Oakland, with combined football/baseball stadiums and basketball arenas attracting more than 150 events per year.

In the same year that Willie Mays arrived from New York with the San Francisco Giants, Roy Clay Sr. arrived in the Bay Area as a computer programmer on the most advanced such device in the world, at the Lawrence Radiation Lab in Livermore.<sup>9</sup> His contributions to programming

9

## I-Templeton

and technology led to his naming as a Silicon Valley Engineering Hall of Fame member in 2002.

Also in 1957, the Santa Clara County Board of Supervisors, in a racially-motivated decision, chose not to join the Bay Area Rapid Transit District (BART), choosing instead to spend its transportation resources on highway construction.<sup>10</sup>

That decision would increase pollution to the north along US. 101 and I-280, built through the same neighborhoods as Candlestick Park and make lucrative defense contractor jobs relatively inaccessible to thousands of African-Americans who had worked in defense industries in the East Bay and southeastern San Francisco since World War II.

In 2015, the ramifications which those decisions set in motion have created a community severely impacted by a variety of air and ground pollutants without the employment base to maintain middle class communities.

A critical race theory analysis of environmental justice must address the long-standing inequities that go beyond the project in question. Although the project sponsors are ignorant of these inequities and may claim no role in causing them, they are the beneficiaries of these decisions and should be held accountable for not worsening already dire circumstances.

The question San Francisco decision-makers should ask is *"Why take the risk of increasing pollution to the most severely impacted community in the city and worsening transit access in order to move a sports arena away from another low-income, minority community?"*

In another decision of regional, long-lasting importance, the City and County of San Francisco now encourages, if not requires, its homeless or poverty-stricken African-American residents to use housing choice vouchers outside the city as far away as Fresno and Bakersfield, moving them even further away from opportunity.<sup>11</sup>

The consequences of its land use decisions must also take the same regional approach. A critical race theory approach is called upon to examine why the Subsequent Environmental Impact Report ("EIR") completely ignored the Bayview-Hunters Point General Plan, the Environmental Impact Report for the Third Street Light Rail and a long history of environmental racism towards the residents of southeastern San Francisco.

For example, the Subsequent EIR acknowledges:

"significant and unavoidable impacts in the areas of transportation and circulation (traffic impacts at multiple intersections and freeway ramps, and transit demand on regional transit providers exceeding capacity), noise (substantial permanent

## I-Templeton

increase in roadway noise and crowd noise affecting sensitive receptors); air quality (construction and operational emissions or ozone precursors exceeding thresholds) wind, (substantial increase in wind hazard hours at off site public areas and utilities (construction of new or upgrader wastewater facilities and determination by the San Francisco Public Utilities Commission that it currently has inadequate capacity to serve the project's wastewater demand."

For the City and County of San Francisco to accept such outcomes is an act of environmental racism comparable to the restrictive covenants of the New Deal federal housing agency and the Santa Clara County supervisors who rejected BART (only to welcome it in 2015 at a much higher cost).

Ironically, the Santa Clara County employers who turned their back on workers from the East Bay and San Francisco have now gained approval to have their private shuttle buses stop at public transit stops, blocking the regular MUNI lines for a minimal fee without seeking any remediation for the impact on the 60 percent of MUNI riders who are minorities.

For the second time in 50 years, a county government is using transit infrastructure to promote employment segregation. As Goldman writes:

"Lower-income people should not bear the brunt of the negative externalities of economic development. "<sup>12</sup>

The disparity in the response to the concerns of the affluent and powerful neighbors of Mission Bay speaks volumes in contrast to the complete avoidance of the environmental injustice to be heaped on the long-suffering residents of Bayview-Hunters Point.

See these comments by Planning Commissioner Michael Antonini:<sup>13</sup>

*\*Tech and Airbnb have saved San Francisco.*

*"Their effect has bought many new residents to San Francisco and helped to provide vitality to many of our neighborhoods that were heretofore economically depressed, unsafe, dirty areas of San Francisco to which few would travel to shop, dine and - much less-live... The population of the neighborhoods have changed dramatically. "*

## I-Templeton

Critical race theory highlights the importance of narratives to balance numerical processes which focus on the minutiae of individual projects without understanding how they affect people in the real world.

Talking to people in their own environment produces insights not available from outside “experts” with no cultural competency and different from what can be gathered through the typical public hearing format, with time limits on comments.

A process which says that notice was given in the legally proscribed way without any specific outreach into a community which has 43 percent of the median income of the city in general does not take into account financial and transportation pressures which can preclude participation in meetings, and the community’s lack of resources to analyze massive amounts of data.

San Francisco’s activists were legendary as relatively uneducated persons to take the time to study land use documents during the 1940s through the 1990s as the likes of Geraldine Johnson, Dr. Hannibal Williams and Mary Helen Rogers became more expert than the city officials they tormented.

A generation of health practitioners and scholars such as Dr. Arthur Coleman, a joint J.D./M.D. and Dr. Carlton B. Goodlett, an M.D. and Ph.D. and dentists like Drs. Dan Collins and Zuretti Goosby also gave the community the capability to speak authoritatively to the powerful.

Just recently, residents near Candlestick stopped the plan to implode the stadium to prevent dust pollution.<sup>14</sup>

Fortunately, the activists group POWER has created an excellent narrative summary of the impact of race, poverty and transportation in San Francisco. Alicia Garza, the catalyst behind the Black Lives Matter movement, was co-director of POWER.

The new generation of activists also includes the web site Color of Change, founded by Van Jones.

With such visible activists and the history of public involvement, it is quite inconceivable that an Environmental Impact Statement affecting Bayview-Hunters Point and secondarily, the Mission, Chinatown and the Western Addition would omit the issue of environmental justice.

However, the Candlestick implosion idea was handled in the same backdoor fashion until the community found out about it.

Additionally, this writer has conducted more than 400 oral history interviews of African-Americans in San Francisco since 2003 and catalogued the artifact collections of Dr. Carlton B. Goodlett, former publisher of the San Francisco Sun Reporter; Clarence Gatson, photo editor of the Sun Reporter and Wesley Johnson Sr., and Dr. Wesley Johnson III, owners of nightclubs and pharmacies from the 1940s through the 1970s.

For the past nine years, the community has been encouraged to tell their stories through the Preserving California Black Heritage conference each September. The 2015 conference led to

<sup>14</sup> NBC Bay Area “Developers Don’t Live Here: Bayview Resident says” Jan. 5, 2015

cont.

## I-Templeton

coverage by CNN, KGO and KPIX along with a Datebook article in the San Francisco Chronicle by uncovering an abandoned Sargent Johnson carving in the Western Addition neighborhood.

While raising funds for the Excelsior and Bayview branch library campaigns over the past ten years, this writer has had extensive experience catching public transit in the southeast part of the city after late night meetings. It has been apparent that there was a segregated transit system at work in the city, with different reliability standards based on the racial makeup of the neighborhood.

Reading about the proposed transit improvements offered to the basketball team caused him to explore the hypothesis in more detail.

Since 80 acres of Bayview were dedicated to slaughterhouses in the late 1880s, the community has borne the brunt of the city’s progress, without sharing in it.

The customized treatment of the Event Arena is comparable to the difference between the city’s two waste water treatment plants. The one in southeast San Francisco has been open air for 50 years, with smells apparent for miles and homes just feet away, contributing in no small way to profound health disparities and abridged mental health. The one at the Great Highway is completely contained with no smells.

Antonini’s slip of the email, like the video of Donald Sterling and the memo from the Atlanta Hawks owner, are just glimpses into the mindset behind the policy decisions at work for professional athletics.

Critical race theory is designed to ferret out those ramifications without such clear-cut instances. It doesn’t take a police shooting to determine whether “Black Lives Matter.” The choices that governments and businesses make are even clearer indicators.

1  
[LC-GEN-2]  
cont.

## I-Templeton

### CRITICAL RACE THEORY AND SPORTS

It is not an accident that the most visible breakthroughs to end segregation in American society in the early and middle 20<sup>th</sup> century first came in sports. The Olympic victories of Jesse Owens and Joe Louis in the 1936 Berlin Olympics and the successful entry of Jack Roosevelt Robinson as the first black player in major league baseball were pivotal, according to UC-Santa Cruz sociologist Anthony Pratkanis.<sup>15</sup>

San Francisco was pivotal to the integration of sports because of breakthroughs dating back to the 1890s. In the field of horse racing, Alonzo Clayton won the California Derby at Ingleside Race Track and later won the Kentucky Derby.<sup>16</sup> Rube Foster brought the Chicago American Giants beginning in 1908 to play in the Pacific Winter League, the first integrated professional baseball league, a decade before he started the Negro National League in 1929.<sup>17</sup>

The University of San Francisco's first black athlete, Earl Booker, won the intercollegiate boxing championship in 1934. By 1951, Ollie Matson and Burl Toler led the team to an undefeated record and a Cotton Bowl berth<sup>18</sup>. Their teammates turned down the bid when informed that the black players could not compete, leading to a reputation as the "greatest college football team in history" with four future NFL Hall of Famers.

William Felton Russell and K.C. Jones, both graduates of McClymonds High School in Oakland, led USF basketball to consecutive NCAA championships along with an Olympic gold medal performance in 1956. Russell and Jones would continue their championship run for ten seasons in the National Basketball Association as part of the most successful franchise ever, helping to enhance the popularity of the sport and attract television viewers.

Major league sports, particularly football and basketball, have an important responsibility to protect the historic character of the neighborhoods which sacrificed years of pollution, disruption and slow growth to help those leagues achieve their current financial success through the help of public assets, in the long view of the critical race theory perspective.

The relevant question to answer is whether there is a corresponding benefit to the people of southeast San Francisco, who have already hosted the Warriors for almost a decade at the Cow Palace in the 1970s and hosted the Giants and 49ers for 50 years at Candlestick.

<sup>15</sup> Pratkanis, Anthony and Turner, Marlene "The Year Cool Papa Bell Lost the Battling Title: Branch Rickey and the First Affirmative Action Program," Chap. 22 in *Our Roots Run Deep: the Black Experience in California, Vol. 2, 1900-1950* (ed.) Templeton, John William (ASPIRE SAN FRANCISCO)

<sup>17</sup> Ibid. p.

<sup>18</sup> Ibid. p.

1  
[LC-GEN-2]  
cont.

## I-Templeton

No evidence is offered to suggest that the arena would have any benefit to this community, such temporary event jobs have been available for decades. Any such jobs would be simply transferred from the East Bay into San Francisco with no net gain in opportunity.

Would Bayview-Hunters Point residents get to enjoy the facility as fans? POWER indicates that the most likely result is that San Francisco Police Department would step up enforcement of fare violations to actually discourage its residents from mingling with event center riders<sup>19</sup>. They note the shooting of a young man on the T-Line platform by two officers seeking to cite him for fare evasion

It is also noteworthy that two NBA owners lost their teams in the last year, in Los Angeles and Atlanta, for suggesting that their games attracted too many African-Americans (even if they were rich former NBA players).

It is profound evidence that the specter of race is at the heart of the decision-making to leave what BART director and transit expert Tom Radulovich calls the optimum transit location in its current site.<sup>20</sup>

Sports sociologist Harry Edwards suggests that a sports facility is the absolute worst investment to make near an impacted community:

"...there is no option but to recognize that for increasing legions of black youths, the issue is neither textbooks nor playbooks—the issue is survival, finding a source of hope, encouragement, and support in developing lives and building legitimate careers and futures.

Without question, the ultimate resolution to this situation must be the overall institutional development of black communities and the creation of greater opportunity for black youths in the broader society.

The current Warriors owners join a long array of sports entrepreneurs—Bob Lurie, Al Davis, Eddie DeBartolo, Larry Ellison, Lew Wolff and Jed York—who have played sports monopoly with Bay Area governments. In every case, the owners win.

### THE PROJECT

The Office of Community Infrastructure and Investment has prepared an EIR<sup>21</sup> on the plan by GSW Arena LLC, an affiliate of the National Basketball Association team Golden State Warriors, to build an 18,000 seat arena, two office buildings, retail and parking spaces on an 11-acre parcel across from the UCSF Mission Bay campus.<sup>22</sup>

Moved from an initial proposal to site the arena on Pier 32, the project takes the current strategy for sports facility development of relying on additional real estate properties to help underwrite the cost. It was also calculated to attempt to avoid the potential for a voter referendum on projects which exceeded height limits on the waterfront.

In addition to the 41 home games, the facility would be in use for as many as 200 events throughout the year, becoming an adjunct to existing convention venues. A memorandum of understanding between the chancellor of UCSF and the Warriors has been touted to address concerns that the arena would hamper traffic to the three new adjacent hospitals.<sup>23</sup>

If completed, the facility would move the franchise from the Oracle Arena in Oakland, which has nearby access to Oakland International Airport, a BART and Amtrak station, a bus yard and Interstates 580 and 880, in addition to parking for the adjacent baseball and football stadium.

The new site would be accessible directly by a station on the Muni T-Line as well as surface streets.

The proposed arena is an addition to expanded use of the T-Line resulting from current construction of the Central Subway to North Beach.<sup>25</sup> This subway, using \$1 billion in federal transit funds, will stop at Union Square, and the Moscone Center with an anticipated 20,000 new riders.

Before voters on Nov. 3 is a proposal to create Mission Rock<sup>26</sup>, a mixed use housing and retail development on the site of the Giants parking lot. More than 6,500 units of housing has been

## I-Templeton

### TECHNICAL FOULS IN THE ENVIRONMENTAL IMPACT PROCESS

The proposed Warriors event center would strangle the only transit lifeline for the largest concentration of affordable housing in San Francisco, increase pollution from waste water and auto emissions and drive up housing costs.

POWER's *Next Stop: Justice: Race and Environment at the Center of Transit Planning* report found:

"Bus riders in the core communities of color in San Francisco are impacted by long waits and overcrowded buses. Comparing the MTA's data on the core lines that POWER members ride with the MTA's recorded system average we found that overwhelmingly, the on-time performance on each of these lines in southeast San Francisco is significantly worse than the system average."

Quoting rider Lorren Dangerfield:

"The T-train at night usually means at least 20-30 minutes waiting. Then often when the train does come, it's only running from downtown to 23<sup>rd</sup> St. It turns around before it even gets to Bayview. The buses that affect the poorest communities are the ones that run the slowest and least often."<sup>31</sup>

The T-Line in 2012 was the city's second most used light rail line, according to Next Stop: Justice, with 30,033 daily riders. It was only on-time 58 percent of the time with headway adherence (scheduled time between trips) on 45.3 percent of trips. At peak evening hours, 17 percent of the trips were overcrowded.<sup>32</sup>

This compares with the performance of the 15-Third bus line that it replaced in 2007:

"15 - Third Street. This is MUNI's primary bus route in the Corridor. The route is operated using articulated motor coaches and serves City College of San Francisco, Downtown, Chinatown, North Beach and Fisherman's Wharf via Third Street, Kearny and Montgomery Streets, and Columbus Avenue. Within the Corridor, the route primarily follows Third Street and Geneva Avenue. It provides regional connections with the Caltrain Terminal at Fourth and Townsend Streets and comes within two blocks of Caltrain's station at Paul Avenue. The route also connects with the BART and MUNI Metro subway systems at both the Montgomery and Embarcadero BART Stations, as well as with BART's Balboa Park Station. The route operates every five minutes during the a.m. peak period, every six to seven minutes during the p.m. peakperiod, and every ten minutes between these periods. Approximately 33 percent of the route's 24,200 daily boardings occur north of Market Street."<sup>33</sup>

The inherent bias towards approval of projects once they reach the stage of Environmental Impact Statement is demonstrated by the No Action option in the 1998 EIR. The same objective of the Third Street Light Rail could have been met by purchasing 40 more articulated

<sup>31</sup> POWER "Next Stop: Justice: Race and Environment at the Center of Transportation Planning," 2012 p. 4

## I-Templeton

buses. Yet, as the civil grand jury notes, the Third Street Light Rail went forward despite costing ten times the originally budgeted amount. The cost overruns would compromise MUNI's ability to conduct scheduled maintenance on its fleet for a decade.

Like a trick shot in pool, it would also impact low-income communities in the Western Addition, Mission and Chinatown as the 22-Fillmore is anticipated to serve the arena and the current 30-Stockton would see its riders use the Central Subway. Additionally, once the Central Subway is completed in 2019, T-Line riders will no longer connect with Muni Metro.

In 2019, the T-Third/Central Subway will become an independent train system with no direct connection to the rest of Muni Metro, BART and the ferry system.<sup>34</sup>

The Memorandum of Understanding between UC-SF and the Warriors is only the latest instance of this project ignoring the principles of environmental justice. Repeatedly, the potential impacts on the people of southeast San Francisco are ignored at every stage of the process. Within more than 2,500 pages, the topic never comes up.<sup>35</sup>

In addition, the Arena's siting and proposed operation is likely to contribute to the dramatic outmigration of African-Americans from San Francisco. Studies of similar sports arenas using the real estate investment strategy show such an effect.<sup>36</sup>

### The Failure of the T-Line

In 1998, a similar environmental impact statement described the T-Line as "a key infrastructure improvement to help support the economic and physical revitalization of the Bayview Hunters Point commercial core and the planned development in Mission Bay."<sup>37</sup>

The Bayview-Hunters Point general plan labels the T-Line as<sup>38</sup>

".. the nucleus for public transit improvements and socio-economic revitalization efforts in the corridor, and prioritize the efficient movement of the light rail by reducing conflicts with automobile and truck traffic."

In 2005, this writer presented an exhibition at the Bayview Branch Library called SFSoul: Taste the Excitement. It documented the role of the two dozen African-American nightclubs

between the 4000 and 6700 block of Third Street, the longest continuous black business district in California.<sup>39</sup>

Those clubs were bases for athletic leagues and charitable drives as the social centers of a majority African-American neighborhood.

The construction of the T-Line for three years created a significant hurdle for those businesses.

However, the benefit to the community was a link which would make the isolated community integrated with the city's main employment centers.

"Buses caught in Corridor traffic often provide unreliable service south of Downtown. Currently, passengers may experience overcrowding and extended waiting times between buses, as well as slower operating times and increased travel times. This situation is projected to worsen as traffic in Downtown and along the Corridor increases to 2015 levels."<sup>40</sup>

In 2015, the Controller's Office found in its 2015 biennial survey of citizen satisfaction with city services that residents of Supervisorial District 10, which is bisected by the T-Line had the lowest satisfaction of any residents in the City with Muni services.<sup>41</sup>

## I-Templeton

The 1998 EIR for the Third Street light rail projected a 39 percent increase in corridor population and a 35 percent increase in corridor employment by 2015.<sup>44</sup>

“As a result of the projected population and employment growth in the Corridor, traffic congestion on major highways and arterials, particularly Highway 101 and Third Street, is expected to increase substantially. Highway 101 at Cesar Chavez is expected to be Level of Service (LOS) F (excessive delays) and LOS E at intersections of Third and Cesar Chavez and at Bayshore and Arleta.”

The first goal of the project was “Improve transit service to from and within the Corridor, thereby enhancing the mobility of Corridor residents, business people and visitors.”<sup>45</sup>

In 1997-98, the 15 Line provided six minute schedules. The No Build alternative would have reduced its schedule to five minute increments. The promise that light rail would improve that performance has proven false. Only 34 percent of District 10 residents give MUNI an A or B grade for on-time performance, one in three.<sup>46</sup>

For the first EIR of the T-Line, the City and County of San Francisco underestimated the 2015 population of San Francisco by 40,000, with much of the unforeseen growth happening along the T-Line corridor.<sup>47</sup>

The Civil Grand Jury also noted that the T-Line Light Rail came in at \$678 million for construction, overwhelming the \$200 million bond passed to address the entire city’s transportation needs.<sup>48</sup>

There is no reason to believe that a hastily done EIR for a second-choice site, without any of the four years of community input which the T-Line conducted from 1993-97, will address the serious issues raised by the original construction of the Third Street Light Rail Line.

Anyone who was using Muni regularly around the time of the T-Third rollout should remember the process as being anything but smooth. One of the reasons cited for the bumpy rollout was the internal decision to use outdated ridership models. The original ridership models forecasted a 2005 opening for the line. However, the line did not open until 2007.<sup>49</sup>

### A Spur for Gentrification

Compared to the relative racetrack pace for the Warriors arena, it took from 1993 to 2007 for the merchants and residents of Third Street to finally see the light rail line which had been promised to them.<sup>50</sup>

The five segments that make up the Corridor between Visitacion Valley and the Caltrain Terminal have a high proportion of minority residents. According to the 1990 Census, 50 percent of this portion of the Corridor is Black, 31 percent is Asian, 15 percent is White, and 10 percent is Hispanic. These proportions contrast with the racial distribution of San Francisco residents, who are less than 1 percent Black and 53.6 percent White. The highest proportion of Black residents is found in Segments 2 and 3 (58 and 67 percent, respectively), while most of the Hispanic population resides in Segments 1 and 2. Asians from the predominant population group in Segment 1; whereas, Segments 4 and 5 have mostly White populations.<sup>51</sup>

In 1992, the San Francisco Human Rights Commission published Unfinished Agenda, a report which described the unequal conditions of African-Americans in San Francisco, then still ten percent of the population of 750,000.<sup>52</sup>

In 1962, poet James Baldwin toured Bayview Hunters Point with a National Educational Television crew describing conditions not unlike Mississippi along the hillside.<sup>53</sup>

The next year, young people from the community launched the most successful civil rights campaign of the 1960s, the United San Francisco Freedom Movement.<sup>54</sup> Led by Bill Bradley Jr., a Marine veteran and law student; and Tracy Sims, a Berkeley High graduate, the

campaign married the resources of the Congress of Racial Equality, NAACP and the Crispus Attucks Clubs of Bayview-Hunters Point, led since 1948 by Mrs. Ardith Nichols.<sup>55</sup>

Highpoints included the Palace Hotel sit-in on March 5, 1964 and the Auto Row sit-ins in May of that year. Eventually, 375 companies signed employment agreements, including all of the Big Three automakers.

Lawyers for the movement, Terry Francois and Willie L. Brown Jr. were elected to the Board of Supervisors and California Assembly. Despite relocation from the building of U.S. 101 and redevelopment activities in South of Market, Western Addition and Hunters Point, the bulk of the black community settled into middle class enclaves of home ownership throughout Bayview and Ocean-Merced-Ingleside. Subsidized apartments in the Western Addition and Hunters Point provided affordable renter space.

As late as 2000, San Francisco had 35 percent of its black labor force in management and professional jobs, the highest percentage in the country.<sup>56</sup>

Disparate policies began to break apart a community that produced the likes of Maya Angelou, Johnny Mathis and Danny Glover in the 1960s. The extended denial of public transit coupled with pollution from U.S. 101 combined with the residue of the Hunters Point Shipyard to create some of the most toxic pollution in the country.

Despite the problems, isolation from the rest of the city allowed the workers from the Butchertown slaughterhouse district and longshoremen to live in stable middle class communities.

“Singing” Sam Jordan, “the mayor of Butchertown”, used those workers as a power base to actually run for mayor of San Francisco in 1963. The former boxer opened his namesake club Sam Jordan’s at 4004 Third Street in 1959.<sup>57</sup>

The Long Island Club became a magnet for entertainers and athletes as the highest paid professional players in baseball and basketball, Willie Mays and Wilt Chamberlain, both competed in San Francisco.

Presence of the Candlestick football and baseball stadium and Cow Palace basketball and boxing arena helped sustain the clubs and bars along Third Street.

However, a series of changes in the sports business would remove those amenities. Although a \$100 million bond to refurbish Candlestick for the 49ers was passed in 1997, the team declined

## I-Templeton

to take the offer.<sup>58</sup> As the Los Angeles Times noted, only ten percent of the 49ers fans actually lived in San Francisco.

The year before, the Giants followed in the wake of Baltimore’s Camden Yards to build a stadium at Third and King Streets. With the presence of the California Institute for Regenerative Medicine, the stadium would spark a nearby real estate boom.<sup>59</sup>

Construction of the Third Street light rail line would not deliver the promised gains for the longtime residents of this area, but a source of construction dust and decay for the Bayview-Hunters Point business district.

When interviewed in 2005 for the SFSoul exhibition, long time owners said they were just barely hanging on with a fraction of their normal customers.<sup>60</sup>

Unlike the EIR for the GS Warriors Arena, the Third Street light rail EIR of 1998 contained a section of “Environmental Justice Considerations” citing Executive Order 12898, signed by President Bill Clinton in Feb. 1994. A memorandum issued with the order said that a National Environmental Protection Act (NEPA) analysis must include “effects on minority communities and low-income communities.”<sup>61</sup>

For the purposes of the analysis, South Bayshore was 91 percent minority in 1998.

The example of the Barclays Center in Brooklyn, opened two years ago, indicates how the new model of sports facility, as a development spur instead of an event venue, worked against the interests of impacted communities.

Messmer analyzed its impact on the population of Brooklyn<sup>62</sup>:

“While NYC as a whole saw a net loss of nonhispanic whites of -2.8, Brooklyn saw a 4.5 percent increase in the number of nonhispanic whites. “

The study also reported a 5.8 percent drop in Brooklyn’s black population.

“As the Barclay Center drove up real estate values, it began pricing economically disadvantaged minorities out of the market,” wrote Messmer.

Since 1992, the date of the Unfinished Agenda report, the black population of San Francisco has fallen from 10 percent to 5.8 percent in 2013.<sup>63</sup>

<sup>58</sup> Simers, T.J. THE NFL / T.J. ## I-Templeton

An outmigration task force in 2010 produced a list of recommendations to address the decline, which were ignored.<sup>64</sup>

In 2014, the San Francisco African-American Chamber of Commerce issued a call for a tourism boycott of San Francisco's \$9 billion industry. An agreement with city officials to remove that call has also been forgotten.<sup>65</sup>

The Golden State Warriors Arena would be the third attempt by Mayor Ed Lee to place a sweetheart deal in the hands of billionaires for the waterfront. The city lost \$11 million on the America's Cup at the hands of Larry Ellison;<sup>66</sup> and the voters blocked the 8 Washington luxury development.

In contrast to the \$11 million to Ellison and the \$34 million in tax breaks to Uber, Twitter, et.al.<sup>67</sup> in Mid-Market, the city has spent less than \$1 million with businesses on Third Street as three-fourths of the historic black restaurants present in 2005 are still in business despite decades of previous success.

The oldest black bookstore in the country, a landmark of black literary genius, was sold at auction because the City refused to extend \$1 million in loans to the business.<sup>68</sup>

These incidents and many others speak to the continuing failure of the City and County of San Francisco to comply with community benefit agreements and to incorporate environmental justice into its land use decision making.

### Community? What Community?

The precedent for environmental justice litigation rests with a train line which runs adjacent to the current site of the Golden State Warriors.

## I-Templeton

"In September 2009, Public Advocates filed a successful civil rights administrative complaint with the Federal Transit Administration (FTA) on behalf of our partners Urban Habitat, Genesis, and TransForm. The complaint challenged Bay Area Rapid Transit's (BART's) controversial Oakland Airport Connector (OAC) project, alleging that in BART's rush to build the OAC, the agency violated federal rules implementing Title VI of the Civil Rights Act of 1964 — rules that require transit agencies to analyze whether their projects have a disproportionately negative impact on low-income and minority populations.

### Why We Advocated Against the OAC

"The \$492 million OAC was conceived as a three-mile elevated tramway connection from the BART Coliseum station to the Oakland International Airport, and would eliminate the existing cost-effective AirBART shuttle service.

"It would provide little, if any, transit mobility benefits to the area's overwhelmingly low-income and minority residents due to its prohibitive \$12 roundtrip fare and its lack of intermediate stops along the job-rich Hegenberger corridor. BART's own analysis predicts that less than 3 percent of the OAC riders will come from the immediate East Oakland neighborhoods surrounding the project.

### Victory! The FTA Acts to Enforce Civil Rights

"In response to our complaint, in October 2009 the FTA began conducting a sweeping on-site compliance review of BART, finding many civil rights deficiencies.

"Based on BART's failure to conduct an equity analysis of the OAC, in February 2010 the FTA pulled \$70 million in American Recovery and Reinvestment Act funds from the project — the first action of its kind in the nation. The strong action underscored a promise made in President Obama's State of the Union address to continue "prosecuting civil rights violations."

"The federal stimulus funds were recaptured by Bay Area transit agencies, including AC Transit, and used to maintain existing transit service and jobs. To remedy the many civil rights deficiencies identified by the FTA, BART was also required to implement a corrective action plan, which we and our allies have been monitoring, and which we responded to in May 2010.

<sup>69</sup> Public Advocates "BART/Oakland Airport Connector" Sept. 3, 2009 <http://www.publicadvocates.org/bartoakland-airport-connector-oac>

## I-Templeton

Not only the City and County of San Francisco, but also the Warriors should have been aware of this precedent. Yet neither the EIR or MOU addresses the transit needs of the South Bayshore community, 91 percent minority in 1998.

According to the San Francisco Housing Element:

Since 2010, the percentage of San Franciscans claiming white racial affiliation increased, totaling nearly 51% of the city's population according to the 2012 American Community Survey (ACS). San Francisco's African-American population continues to decline, dropping from 6.1% in 2010 to 6% in 2012. San Franciscans of Chinese origin declined from 21.4% of the total population in 2010 to 21.2% by 2012. The proportion of San Franciscans identifying with Hispanic origins (of any race) has increased from 14.1% in 2010 to 15.1% in 2012.

1  
[LC-GEN-2]

## I-Templeton

### HACK THE IMPACTS

The Hack a Shack strategy in professional basketball slows down the pace by intentionally fouling a poor free throw shooter. The proposed Golden State Warriors Arena intentionally fouls a low-income, minority community by mischaracterizing impacts which were previously spelled out in the 1998 EIR.

The previous discussion shows that all three tenets of federal environmental justice policy are compromised. Below, impact determinations in the EIR for the project are shown to ignore impacts on low-income and minority communities.

Impact TR-4: The proposed project would not result in a substantial increase in transit demand that could not be accommodated by adjacent Muni transit capacity such that significant adverse impacts to Muni transit service would occur under Existing plus Project conditions without a SF Giants game at AT&T Park LS No mitigation required is described as less than significant effect with mediation when it should be correctly characterized as significant.

*The service standards proposed in 1998 have not been met; residents of District 10, the poorest area of the city are dissatisfied with service. There is a significant case to be made that the current sports facility, AT&T Park, is the primary reason for poor service to the current population. This determination is not credible based on the current difficulties of the T-Line.*

Two of the busiest transit lines in the city, both serving heavily minority populations, would be impacted. The T-Line only serves twenty percent more passengers than the previous 15 bus line, but provides 40 percent slower service. The 30-Stockton runs the same route as the Central Subway under construction. It's 33,000 passengers would be added to the load of the T-Line, which means that the subway would be at capacity with just current riders.<sup>70</sup>

Impact TR-13: The proposed project could result in a substantial increase in transit demand that could not be accommodated by adjacent Muni transit capacity such that significant adverse impacts to Muni transit service would occur under Existing plus Project conditions with an overlapping SF Giants evening game at AT&T Park.

*The only mitigation proposed is use of shared car services, which are much less likely to be available in low-income areas or to be accessible to low-income residents.*

1  
[LC-GEN-2]  
cont.

<sup>70</sup> POWER, Op. cit. Next Stop: Justice pg.8

## I-Templeton

*MUNI demand peaks at 5 p.m. with increases of as much as 100 percent. A recent early evening game at the Levi's Stadium indicates the problems with placing a sports stadium in the midst of a busy commercial/industrial area.<sup>71</sup>*

**Impact TR 14:** The proposed project would result in a substantial increase in transit demand that could not be accommodated by regional transit such that significant adverse impacts to regional transit service would occur under Existing plus Project conditions with an overlapping SF Giants evening game at AT&T Park. SUM

*Paradoxically, the EIR admits that the regional transit system can be overwhelmed but asserts that MUNI, with a fraction of the capacity currently servicing the basketball arena, would not be.*

*The Dept. of Public Health's Climate Action and Health Co-Benefits report states:*

*In order to balance the burdens of our transportation system with the benefits placed on certain communities, special efforts should be made to target service improvements to particularly benefit low income residents, communities of colors, the elderly, and neighborhoods that have a historical legacy of dealing with higher levels of environmental exposures.*

**Impact TR20:** Without implementation of the Muni Special Event Transit Service Plan, the proposed project would result in a substantial increase in transit demand that could not be accommodated by adjacent Muni transit capacity such that significant adverse impacts to Muni transit service would occur under Existing plus Project conditions. SUM

*The design of the T-Line took multiple lanes away from Third Street, reducing the capacity for additional transit service without blocking throughput to other areas. The level of MUNI service traditionally available to 49ers games at Candlestick would be compressed into a much smaller area.*

**Impact TR-21:** Without implementation of the Muni Special Event Transit Service Plan, the proposed project would result in a substantial increase in transit demand that could not be accommodated by regional transit capacity such that significant adverse impacts to regional transit service would occur under Existing plus Project conditions.

*The additional auto traffic on U.S. 101 from the gridlock from events would bring additional sources of pollution into an area which already has to suffer from the city's wastewater treatment plant and dust from Shipyard construction.<sup>72</sup>*

**Impact TR 22:** Without implementation of the Muni Special Event Transit Service Plan, the proposed project could result in a substantial overcrowding on public sidewalks, nor create potentially hazardous conditions for pedestrians, or otherwise interfere with pedestrian accessibility on the site and adjoining areas under Existing plus Project conditions.

<sup>71</sup> Evangelista, Benny "Tech employees work from home to avoid 49ers-Seahawk traffic," *San Francisco Chronicle*, Oct. 22, 2015 <http://www.sfgate.com/business/article/Tech-employees-work-from-home-to-avoid-6585010.php>

<sup>72</sup> Ibid.

1  
[LC-GEN-2]  
cont.

## I-Templeton

*Congestion would make it difficult for residents of Bayview-Hunters Point to walk or ride to downtown amenities, the complete opposite of the goals of the T-Line.<sup>73</sup>*

**Impact PH-1:** Construction of the proposed project would not induce substantial growth in the area, either directly (for example, by constructing new homes or businesses) or indirectly (for example, through extension of roads or other infrastructure).LS No mitigation required

*San Francisco has the highest rental costs in the nation.<sup>74</sup> This arena would not create any additional jobs, but would attract absentee residents to bid up nearby properties so that they could be near the arena, a trend already seen in the city.<sup>75</sup> It would also reduce the supply of housing due to services like AirBnb renting spaces near the arena for 200 days of events.<sup>76</sup> Google's shuttle bus service grew from 155 passengers at two stops in 2004 to 100 buses daily with 10,000 passengers.*

**Impact PH -2:** Construction of the proposed project not displace existing housing units or create substantial demand for additional housing LS No mitigation required

*The City and County of San Francisco is 7,000 units short of replacing housing removed by redevelopment activity according to the Housing Element. Section 8 applicants are currently referred to sites outside the city and homeless African-American women are given tickets to leave the area in return for assistance.<sup>77</sup>*

**Impact PH-4:** Operation of the proposed project would not induce substantial population growth in the area, either directly (for example, by constructing new homes or businesses) or indirectly (for example, through extension of roads or other infrastructure) LS No mitigation required.

*Not a credible statement given the rapid growth of Mission Bay. The 1998 Third Street Light Rail EIR underestimated the city's population by 40,000, more than its daily passenger load.<sup>78</sup>*

<sup>73</sup> Ibid.

<sup>74</sup> Zumper National Rent Report San Francisco remained the most expensive market in the United States for the ninth straight month, with median 1-bedroom rents rising to \$3,460, the highest ever recorded. The gain was particularly notable considering that NYC, the second most expensive market, saw rents plateau in February, even after a slight drop of 3.2% <https://www.zumper.com/blog/2015/03/zumper-us-rent-report-february-2015/>

### Environmental Justice Legal Issues

The proposed MUNI service changes would fly in the face of decades of case law and regulations for environmental justice. For instance, BART is currently conducting an analysis of its new extension in Fremont.

“Federal Transit Administration (FTA) Title VI Circular (Circular) 4702.1B, Title VI Requirements and Guidelines for Federal Transit Administration Recipients(October 1, 2012), the District is required to conduct a Title VI Service and Fare Equity Analysis” <sup>79</sup>

This has not occurred for the proposed transit changes. The BART report had to make the following determination:

“The travel assessment compares the estimated travel time for riders affected by the service change before and after the new service. The results of the travel time assessment found that the Project would benefit all populations, including minority and low-income, within the Project Catchment area. With project service, all populations are expected to experience the same time savings of 11.85 Minutes between Warm Springs and the Fremont Station, a 55.8% reduction in travel time. <sup>80</sup>

“With the exception of Option 3, staff also found that travel times are not expected to change for riders of existing stations, as a result of the proposed options. As proposed in the FY2016 Preliminary Budget, additional cars would be added to the Green and Blue lines, which will lessen peak period crowding. As a result, the study found that minority populations will not experience a disparate impact and low -income populations will not experience a disproportionate burden on their travel times with the new service.” <sup>81</sup>

In the courts, the aforementioned BART connector case set a precedent by showing that the Metropolitan Transportation Commission spent \$9 for every \$0.50 spent on buses for low-income persons.<sup>82</sup> The service designed specifically for an arena to a high-income arena flies in the face of that precedent.

## I-Templeton

In San Diego, Atty. Gen. Harris vision of environmental justice was upheld when a court found that cumulative effects must be considered. A petition to intervene in the case Cleveland National Forest Foundation vs. San Diego Association of Governments in 2012 insisted that government agencies consider environmental justice.<sup>83</sup>

The attorney general warned the regional body in a comment letter that it failed to study the impact of increased pollution on minority communities.

“...the Attorney General is effectively putting lead agencies across the state on notice that a failure to address EJ considerations in the implementation of climate change policies will risk challenges to the legal sufficiency of their environmental impact documents.”

The legislative foundation for environmental justice comes from AB32 in 2006, which established an advisory committee on the issue.<sup>84</sup>

There is also an emerging standard on community participation.

“According to the EPA, “meaningful involvement” in environmental decision making means that: “(1) potentially affected community residents have an appropriate opportunity to participate in decisions about a proposed activity that will affect their environment and/or health; (2) the public's contribution can influence the regulatory agency's decision; (3) the concerns of all participants involved will be considered in the decision making process; and (4) the decision makers seek out and facilitate the involvement of those potentially affected.” However, members of affected communities may lack the technical resources, English language proficiency, access to quality legal representation, or simply the time to participate effectively.”

Similar standards have been enacted by the California Air Resources Board.<sup>85</sup> Its 2001 document asserts:

Local land-use agencies are directly responsible for the siting of new air pollution sources, and local air districts also play an important role by issuing permits for new sources of air pollution. We are committed to working as partners with these agencies to improve the available information that local agencies use to make planning and permitting decisions. <sup>86</sup>

The Air Resources Board also addresses cumulative impacts:

<sup>83</sup> Hsiao, Peter, et.al. “Environmental Justice as Environmental Impact: the Intersection of Environmental Justice, Climate Change and the California Environmental Quality Act” Bloomberg BNA World Climate Change Report Vol. 2012 No. 48 March 12, 2012 p.

<sup>86</sup> Ibid. p. 1

1  
[LC-GEN-2]  
cont.

## I-Templeton

It shall be the ARB's policy to work with local land-use agencies, transportation agencies, and air districts to develop ways to assess, consider, and reduce cumulative emissions, exposures, and health risks from air pollution through general plans, permitting, and other local actions.<sup>87</sup>

The landmark global warming act and subsequent legislation, plus legal opinions from the attorney general and court cases all underscore the importance of addressing potential impacts from the prism of environmental justice.

A DOT Title VI analysis of BART in 2009 found deficiencies in its environmental justice performance.

"FTA recipients should seek out and consider the viewpoints of minority, low-income, and LEP populations in the course of conducting public outreach and involvement activities. An agency's public participation strategy shall offer early and continuous opportunities for the public to be involved in the identification of social, economic, and environmental impacts of proposed transportation decisions."<sup>88</sup>

Based on those state and federal standards, the failure to address environmental justice in the Subsequent Environmental Impact Statement is problematic.

## I-Templeton

### The Demographics of the Impacted Area

Activist Marie Harrison described Bayview Hunters Point as the epicenter for environmental injustice in a 2003 report:

"The neighborhood is home to approximately 34,800 people, and more than 500 heavy and light industrial companies, retail stores, and commercial establishments. According to U.S. 2000 census data, approximately 48% of residents in Bayview Hunters Point are African American, 1.3% American Indian, 23% are Asian and Pacific Islanders, 17% are Hispanic and 10% are White. Income levels are significantly lower, and unemployment rates significantly higher for this small community, than for San Francisco as a whole: Nearly 40% of Bayview Hunters Point residents have annual incomes below \$15,000, while only 20% of the City's population as a whole have income that low, and the unemployment rate is 13% in Bayview Hunters Point, more than twice as high as the City as a whole."

Community victories to close the Hunters Point power plant have had the effect of opening up the area for new migrants. The African-American population of the neighborhood has dropped by 50 percent since 2000.

**Stress Factors Based on Race, Income and Unequal Opportunity.** For the purposes of the critical race theory analysis of environmental justice, the affected population must be viewed through the lens of the traumatic events which have occurred over the past 50 years. Each of these stress factors is known to, or reasonably should be expected to be known to the preparers of the Draft Subsequent Environmental Impact Statement. The civil grand jury wrote in 2004:

"There are deeply rooted social problems that result in part from systematic negligence dating back to World War II. The City of San Francisco has failed to invest significantly in this community for over 60 years."

**Loss of industry in Bayview-Hunters Point.** The General Plan discusses the impact of the closure of the Hunters Point Shipyard, but does not mention the decision to move to containerized shipping, which reduced jobs in the commercial maritime industry. There is a significant history of biomedical innovation in the black community. Dr. Nathaniel Burbridge was a pharmacologist and professor at UCSF, but became known for leading the NAACP during the United San Francisco Freedom Movement.

Eric Williams, the son of Ruth Williams, the namesake for the Ruth Williams Memorial Theater in the Bayview Opera House, holds 20 patents for cardiac stents. A proposal to mark the 50<sup>th</sup> anniversary of the United Freedom Movement with a Nathaniel Burbridge Center for Innovation and Diversity located in the India Basin area has been ignored by city officials despite the evidence from the similar Impact Hub in Oakland, which has spawned close to 1,000 businesses in two years.

1  
[LC-GEN-2]  
cont.

## I-Templeton

Kevin Epps, producer of the documentary Straight Outta Hunters Point, was also unable to gain city support for an incubator to develop media and online businesses. Other entrepreneurs seeking to provide clean renewable power have had a lack of interest from city officials.

The biggest need is to provide 5,000 industrial/assembly/distribution/construction jobs for residents of the area, not temporary event positions.

### Health Disparities

Blackwell wrote:

“Health surveys have shown that Bayview Hunters Point residents suffer from rates of cervical and breast cancer that are double those found in the other parts of the Bay Area, an asthma rate that is three times higher than in the rest of the state, and rates of hospitalization for congestive heart failure, hypertension, diabetes and emphysema that have been determined to be more than three times the statewide average. In addition, children living in the Bayview are far more likely to contract illnesses than children in the rest of the city, and infants are more likely to die.<sup>89</sup>

Income inequality is a significant factor for those health disparities, according to the San Francisco Dept. of Public Health’s Community Health Assessment.

“Although the median household income in San Francisco seems relatively high at \$70,040, San Francisco has the largest income inequality of the nine Bay Area counties... Income inequality is directly related to health inequality, with higher income linked to better health: the greater the gap between the richest and poorest people, the greater the differences in health.”

<sup>89</sup> Blackwell, Savannah Environmental Justice “Real World” Pathfinder: Bayview Hunters Point, San Francisco UC-Berkeley School of Law Jan. 26, 2009 savannahblackwell.com

## I-Templeton

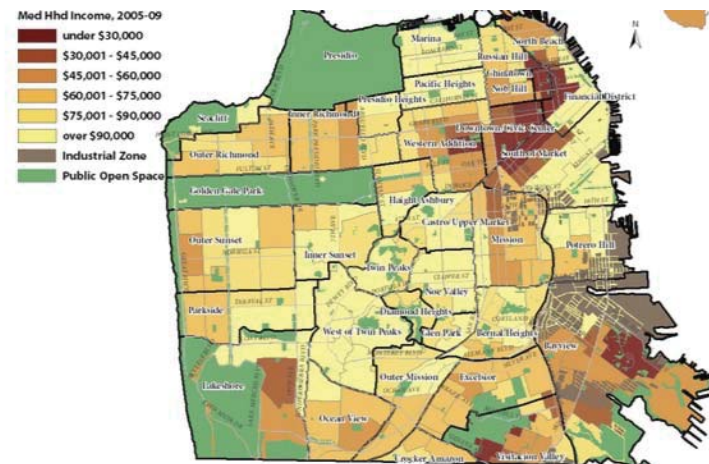

Figure 3 Income Inequality concentrated in District 10. Source San Francisco Dept. of Public Health

### Reduction of Home Ownership.

According to Sen. Diane Feinstein, California had the highest rate of mortgage fraud in the nation,<sup>90</sup> and the problem was concentrated in the Bay Area, with southeast San Francisco, particularly targeted.

This is particularly problematic because the South Bayshore planning district has the third highest percentage of single family homes in the city, with 66 percent. By contrast, downtown has only two percent single family homes.

“Larger households of four or more persons are generally found in the south-eastern neighborhoods of the Mission, Bayview, Visitacion Valley, and the Excelsior where typical housing units have two or more bedrooms.”

According to the 2014 Housing Element, the City has a responsibility to create more affordable housing:

“San Francisco’s share of the regional housing need for 2015 through 2022 has been pegged at 28,870 new units, with almost 60% to be affordable.”

<sup>90</sup> Feinstein, Sen. Diane “Mortgage Fraud and America’s Foreclosure Crisis” 2010 p. 7

## I-Templeton

However, the city's affordable housing policies are not as useful as one might think for African-Americans. The maximum income to qualify for low-income housing allotments in San Francisco at 70 percent of the median income is 50 percent higher than the median income for African-Americans.<sup>91</sup> That means African-Americans are outbid for subsidized housing because their income is significantly less on average than any other group. Developments actually constructed by African-American churches and lodges find themselves hard pressed to accommodate long-time black residents due to the intense competition.

### Foul Air

In 1997, the asthma hospitalization rate for Bayview-Hunters Point African-American children was 820 per 10,000, the highest rate in California.

Air pollution has been linked to asthma, allergies, cardiovascular and respiratory diseases, cancer, neurological and reproductive disorders, and premature death (CARB 2009). In San Francisco, approximately 102,000 children and adults are currently diagnosed with asthma, with children and the elderly having significantly higher rates of asthma (CDPH 2011).<sup>92</sup>

The unavoidable impact of 18,000 persons using the toilet, along with potentially another 45,000 baseball fans smells to high heaven for the residents of southeast San Francisco.

"Sophie Maxwell, the member of the San Francisco Board of Supervisor's whose district includes Bayview Hunters Point, lives within a few blocks of the Southeast sewage plant. In 2006, she told San Francisco Bay Guardian reporter Sarah Phelan that "every time [she] come[s] home and get[s] off the freeway, [she is] constantly reminded the plant is there."

"You can smell it day and night," Maxwell told Phelan. "It's unacceptable."

Originally constructed in 1952 with most of its operations placed outdoors, the plant was expanded in 1987 after a series of public hearings. To overcome residents' resistance to the plans, the city agreed to construct a community college campus in the neighborhood. In addition, officials promised that the facility's increased operations would not be noticeable and would result in "no odors." The fact that those promises have not been kept is impossible to ignore on hot days when the aroma of fecal matter becomes especially repugnant."

The Southeast Waste Treatment Plant uses 11 open air tanks and nine digesters compared to the Oceanside plant on the Great Highway, which is 1.5 miles from the nearest residence and uses an underground tunnel to send waste out into the ocean. Its operations can not be smelled outside

### Conclusion

During the first game of the 2015 NBA Finals, this writer visited restaurants featured in his 2005 exhibit to watch the series. Leaving Paul and San Carlos after the conclusion, he walked approximately 20 blocks to 4000 block of Third Street without having a single T-Line train pass.

After visiting at the historic Sam Jordan's, he then went to the Third and Evans station to wait for a train. It took 67 minutes to arrive, close to two hours without service.

It was consistent with his experience in the previous decade attending community meetings in the Excelsior district for the branch library campaign and in Bayview Hunters Point for the campaign for the brand new library opened last year. Like the young lady in the POWER report, waiting for the T-Line at Third and Revere always takes a lot of patience, particularly at night in the cold.

Since then, he has observed the patterns for other MUNI light rail lines, observing that they adhere to posted schedules. The T-Line is subject to switchback at Marin Street, dumping dozens of riders to a crowded sidewalk at the busy Cesar Chavez intersection.

A review of available evidence confirms the reasoned suspicion that the placement of an event arena and entertainment complex at Third and Sixteenth Street with a single MUNI stop serving it, not directly connected to the rest of the MUNI Metro system, would inexcusably impact a community which has traditionally caught the short end of City policy.

1 bicycle valet parking at the Giants Stadium, which has  
2 150 spaces, we routinely have to turn people away. So,  
3 it's a very popular option.

4 The bike valet parking, along with the  
5 improved bike network and robust encouragement programs  
6 will help make this the single most bicycle-friendly  
7 professional sporting venue in the country upon  
8 completion. So, it could be a real feather in the  
9 City's cap.

10 We also acknowledge that the growing number of  
11 bicycle trips to a venue like this takes an ongoing  
12 effort over time, so we are looking forward to continued  
13 partnership with the Warriors to ensure this project and  
14 the City meet their goals to make this a great place to  
15 bike to.

16 Thank you.

17 CHAIRPERSON ROSALES: Thank you.

18 TOM LIPPE: Good morning, Members of the  
19 Commission. My name is Tom Lippe. I represent the  
20 Mission Bay Alliance.

21 And a couple of points. First of all, on the  
22 secondary use finding, Susan Brandt-Hawley, my  
23 cocounsel, has sent a letter by E-mail yesterday,  
24 contesting the secondary use -- the appropriateness of  
25 finding that this as an allowable secondary use under

Lippe-1  
[LC-PP-1]

59

PH2

1 the Redevelopment Plan. So, I would encourage you to  
2 take a look at that. She's also going to speak today to  
3 flesh out the reasons for that.

4 If it turns out that it is a proper secondary  
5 use, then you actually need a variance under the  
6 Redevelopment Plan. You can't just amend the Design for  
7 Development.

8 And I have a letter on that point, which I'd  
9 like to submit to you today, which I also E-mailed  
10 yesterday, and that is here.

11 (Letter submitted to staff.)

12 With respect to your finding that the EIR  
13 complies with CEQA, it turns out it doesn't for lots of  
14 reasons. One of those reasons has to do with the fact  
15 that the EIR took the position that compliance with the  
16 City's NPDES permit, which is a water-quality permit,  
17 would ensure no water-quality impacts of significance.

18 Well, I objected and said you have to prove  
19 that you comply. And the Response to Comments said,  
20 Well, we comply.

21 So, we got the Water Board enforcement files,  
22 which are five binders of ten years of noncompliance by  
23 the City. So, that simply is not a proper basis to find  
24 that there would be no significant effect on water  
25 quality. So, I'd like to give you those binders.

Lippe-1  
[LC-PP-1]  
cont.

Lippe-2  
[LC-HVD-1]

60

PH2

1 (Binders submitted to staff.)  
2 There's also my comment letter on the EIR,  
3 which is in two binders, with Exhibits A through S.  
4 (Binders submitted to staff.)  
5 CHAIRPERSON ROSALES: So, is this the first  
6 time you're giving us this?  
7 TOM LIPPE: It is.  
8 And just on that point, we only had 11 days  
9 after your staff of 58 people had two months.  
10 Two quick points. The Bay Area Air Quality  
11 Management District is not participating in your offset  
12 mitigation for ozone precursor pollution; therefore --  
13 CHAIRPERSON ROSALES: Continue.  
14 TOM LIPPE: -- that mitigation measure is no  
15 longer effective to reduce -- we never thought it was,  
16 but even on your own terms, it's not effective to reduce  
17 those impacts to less than significant, because the  
18 agency to do the offset program is no longer agreeing to  
19 the price.  
20 And that is a mitigation measure that the  
21 project sponsor apparently has refused to adopt, and  
22 that's a trigger for recirculating the EIR as a draft so  
23 that people can comment on this development. And this  
24 is a development that occurred yesterday, apparently,  
25 based on the letter that was on the table this morning.

1 And then, finally, I have a letter from my  
2 co-counsel, Soluri Meserve, on the noncompliance of the  
3 EIR by CEQA.  
4 (Letter submitted to staff.)  
5 Thank you.  
6 JIM LAZARUS: Commissioners, Jim Lazarus,  
7 San Francisco Chamber, also our partner in labor and  
8 other civic organizations, the Alliance for Jobs.  
9 Our visitor economy will benefit greatly from  
10 this facility. This is a transit-rich location, one  
11 that can accommodate not only the great growth that we  
12 all appreciate at Mission Bay, but the growth of our  
13 visitor industry through the development of this  
14 facility.  
15 I urge people to look at the ballot handbook  
16 from 1996, when the ballpark was on the ballot,  
17 challenged by early residents of Mission Bay and  
18 China Basin.  
19 That ballpark said the world as we know it --  
20 or, that ballot argument said the world as we knew it at  
21 the time would end with the development of AT&T Park --  
22 congestion, driving jobs and tax revenues away from the  
23 City, gridlock -- opposed the ballpark. We know that  
24 didn't happen.  
25 The privately built AT&T Park is one of the

PH2

1 Potrero Hill Neighborhood House. I am here to support  
2 this project with the Warriors.  
3 I've worked with the Warriors for a long time.  
4 They've given us tickets so I could bring my youth to  
5 games. They've supported our educational efforts with  
6 the youth in our communities, and they've just -- this  
7 is a wonderful, wonderful opportunity to bring a  
8 championship team here to San Francisco.  
9 I am here to say ditto to all of those who  
10 support this project, and look forward to welcoming the  
11 Warriors here to our community.  
12 Thank you.  
13 CHAIRPERSON ROSALES: Does the baby want to  
14 say something?  
15 COMMISSION SECRETARY GUERRA: I'm calling, for  
16 the last time, Oscar James, Stuart Canning,  
17 D.J. Brookter, and Ramon Hernandez.  
18 SUSAN BRANDT-HAWLEY: Good afternoon, Members  
19 of the Commission. I am Susan Brandt-Hawley, and it's  
20 hard to follow a baby sleeping in a Warriors' jersey,  
21 but I'll do my best.  
22 We all support the Warriors. That's not the  
23 issue here today, but the public looks to this  
24 Commission to follow the environmental laws in every way  
25 before approving this project or considering approval.

Hawley-1  
[LC-PP-1]

103

PH2

1 You've received a number of letters from me  
2 and others regarding environmental problems, and yet the  
3 Final EIR that we just received a little over a week  
4 ago, with thousands of pages, the approvals are being  
5 rushed through, which is unfair to the Commission and  
6 unfair to the public, because a lot of the environmental  
7 questions have not been solved.  
8 I would like to turn in, for the record, just  
9 a few letters that I've sent to you. But these are hard  
10 copies, in case you don't have them yet.  
11 (Letters submitted to staff.)  
12 I'd like to focus, in just this very short  
13 amount of time, on a really critical underlying issue  
14 and problem here that needs to be solved that we brought  
15 up in the Draft EIR comments in July -- that the EIR  
16 declined to study in any way the land-use consistency of  
17 this plan.  
18 The South Mission Bay Redevelopment Plan sets  
19 out a very careful, planned community in these classic  
20 bare blocks to allow development of the biotech industry  
21 and other compatible uses.  
22 The EIR did not study land use, claiming that  
23 this qualified as a secondary nighttime entertainment.  
24 And as I explained in my letter, none of the secondary  
25 uses -- nighttime entertainment, that's supposed to be

Hawley-1  
[LC-PP-1]  
cont.

104

PH2

1 for bars and small evening establishments; a recreation  
2 building, which is being claimed, when this is actually  
3 entertainment, which is not an active recreation, but  
4 it's, in fact, something that people watch; or a public  
5 structure or use, which, in fact, this is not, because  
6 it's not a public building.

7 You can fix this problem by considering  
8 amendment of the Redevelopment Plan. But right now,  
9 this project is directly inconsistent and does not  
10 qualify for -- as a secondary, much less a primary use.

11 So, we'd ask you to take some more time, look  
12 as the EIR comments that we've submitted, and, in  
13 particular, take a hard look at these findings that are  
14 not supportable regarding the secondary use.

15 I'm not sure. Do I have more time here?

16 CHAIRPERSON ROSALES: I'll allow more time  
17 just to finish.

18 SUSAN BRANDT-HAWLEY: Okay.

19 Well, thank you very much for your attention.  
20 And we ask that you continue this, look at all the  
21 issues that have been raised.

22 And, again, the public is looking to you to  
23 make sure whatever is approved -- we believe, should be  
24 at a -- certainly, at another location -- is fully  
25 resolved and not go forward and create environmental

Hawley-1

105

PH2

1 problems.

2 Thank you.

3 CHAIRPERSON ROSALES: Thank you.

4 COMMISSION SECRETARY GUERRA: Are there any  
5 others that would like to speak?

6 (No response)

7 Madam Chair, I have no further speakers.

8 CHAIRPERSON ROSALES: Okay. And there's no  
9 one in the overflow rooms?

10 There's two overflow rooms.

11 COMMISSION SECRETARY GUERRA: We checked.

12 CHAIRPERSON ROSALES: Okay.

13 We will close the Public Comment. Thank you,  
14 everyone, for speaking.

15 The time is 12:16.

16 I think my fellow Commissioners and I are a  
17 little tired, and I think we need a little break. So,  
18 if we can take a 30-minute break, I think that's fine,  
19 so that we can stretch our legs and come back for the  
20 balance of the calendar.

21 (Luncheon recess taken at 12:17 p.m.)

22  
23 ---oOo---

24  
25

1 here to ask for your support.

2 I'm David Wong. I'm Bay Area Deputy Sheriff  
3 Charitable Foundation executive director. We work with  
4 you, and once a year, we have a shop with the Deputy  
5 Sheriff program where we take 300 to 500 disadvantaged  
6 children to do Christmas shopping. And out of those --  
7 out of that program, we ask a pro sport athlete to  
8 accompany -- to do the shopping, where we guide the kids  
9 to a better direction.

10 I'm a retired Deputy sheriff in San Francisco,  
11 and if we can prevent kids when they're young, we can  
12 prevent a lot of crime. And that's what I do.

13 So, just imagine when Coach Al Attles,  
14 accompanied with a couple of kids to shop, their parent  
15 is so amazingly shocked that, you know, Coach Al Attles  
16 would shop with them.

17 Just imagine if we could tell the parents and  
18 the children that Warriors is -- their home is with us.  
19 And that will be world-class decision. And I hope you  
20 can make that world-class decision.

21 Thank you.

22 JOHN WILLIAM TEMPLETON: John William  
23 Templeton. I'm historian and creator of the California:

1 substantively, every tenet of California's pioneering  
2 Environmental Justice Law and a 1994 federal executive  
3 order.

4 I've submitted a 40-page document that spells  
5 out the many ways that the characterization of impacts  
6 fails to take into account the cumulative effects of 70  
7 years of land use inequity.

8 When I heard Planning Commissioner Ed Maley's  
9 (phonetic) objectionable remarks last week, I conducted  
10 a critical race theory analysis of this EIR to see that  
11 it substantially -- in trying to assemble this into a  
12 document, that certain groups of people are more  
13 valuable than others -- this measure breaks a covenant  
14 with the people of southeast San Francisco that \$2.2  
15 billion spent on their T Lines would link them to the  
16 rest of the City, and negatively impacts them for a  
17 generation to come.

18 In 1951, U.C.S.F. had the opportunity to play  
19 in the Cotton Bowl with the condition that they had to  
20 leave their black players behind. They turned down the  
21 invitation.

22 We shouldn't leave our impacted communities  
23 behind in order to approve this ill-conceived project.

24 CHAIRPERSON ROSALES: Thank you.

25 PAT VALENTINO: Good afternoon -- good

Dear Clerk of the Board of Supervisors

Attached, in .pdf format please find the above referenced appeal brief with exhibits.

Due to the size of the files, the brief and exhibits it will be transmitted in four (4) separate emails.

This email is the first of four. Attached are

- Appellant's Partial Brief Re: Public Comment, Air Quality, Transportation, Water Quality, Biological, and Noise
- Exhibits 1-4 of 15

Eighteen hard copies of same will be hand delivered to your office today by 12noon.

Thank you for your attention to this matter.

List of Exhibits.....	viii
Reference Abbreviations. ....	x
Air Quality.....	x
Transportation. ....	xi
Hydrology, Water Quality, and Biological. ....	xiii
Noise. ....	xiv
I.    INTRODUCTION.....	1
II.   DISCUSSION. ....	2
A.    PUBLIC COMMENT. ....	3
1.    The OCII Thwarted Public Comment on the SEIR. ....	3
B.    THE SEIR IS NOT SUFFICIENT AS AN INFORMATIONAL DOCUMENT WITH RESPECT TO AIR QUALITY IMPACTS. ....	4
1.    The City Cannot Use the SEIR’s Thresholds of Significance for Criteria Air Pollutants until it Formally Adopts Them in a Rule-making Procedure. ....	4
2.    The DSEIR’s Numerical Thresholds of Significance for Criteria Pollutants (Ozone Precursors, PM10, PM2.5) Borrowed from the BAAQMD Are Invalid. ....	5
(a)    The DSEIR’s impact assessments for construction related criteria pollutants (ozone precursors, PM10, PM2.5) and TAC emissions are invalid. ....	11
(1)    Mitigation Measure M-AQ-1 does not comply with CEQA’s legal requirements. ....	12
a.    The Response to Comment AQ-6a is Inadequate. .	12

b.	The Response to Comment AQ-6e is Inadequate..	13
(b)	The DSEIR's impact assessments for operational criteria pollutants (ozone precursors, PM10, PM2.5) and TAC emissions are invalid. ....	15
(1)	The SEIR fails to include vehicle emissions from Warriors game traffic in its analysis of operational emissions....	16
(2)	Mitigation Measure M-AQ-2b does not comply with CEQA's legal requirements.....	17
a.	The Response to Comment AQ-7 is Inadequate. .	18
b.	New information and the refusal of the project sponsor to agree to Mitigation Measure M-AQ-2b since publication of the DSEIR require recirculation of a revised DSEIR.. ....	19
3.	Changes to the Project Since Publication of the DSEIR Require Recirculation of a Revised DSEIR Due to New and More Severe Significant Impacts.....	20
4.	The SEIR's Cancer and Health Risk Assessment for Toxic Air Contaminants Is Invalid, Based on Legal Errors and Not Supported by Substantial Evidence.....	21
(a)	The SEIR's threshold of significance for what is a cumulatively significant TAC impact is legally flawed.....	21
(b)	The SEIR's reliance on "the ambient cancer risk in the most pristine portions of the Bay Area" to support its chosen threshold of significance for TACs is incoherent and inconsistent with CEQA. ....	24
(c)	The SEIR is inadequate because it omits a project-specific assessment of TAC health risks.....	27

(d)	The SEIR's assessment of cumulative TACs is invalid because it fails to include all sources of related impacts.....	35
(e)	The FSEIR fails to provide good-faith response to comments objecting to the analysis of TAC health risks, and the TAC analysis is inadequate because OCII failed to use its best efforts to use current science.....	36
5.	Changes to the Project since Publication of the DSEIR Require Recirculation for Public Comment Due to New and More Severe Significant Impacts.....	40
C.	THE SEIR IS NOT SUFFICIENT AS AN INFORMATIONAL DOCUMENT WITH RESPECT TO TRANSPORTATION IMPACTS. ....	41
1.	The SEIR's Analysis of the Project's Construction-related Traffic Congestion and Delay Impacts Is Based on Invalid Criteria....	41
2.	The SEIR Fails to Assess the Project's Traffic Impacts on the Entire Affected Environment.....	44
	Table 1.....	45
3.	The SEIR Fails to Disclose the Severity of the Project's Impacts on Intersections and Freeway Ramps Which the Project Will Cause to Deteriorate to Level of Service (LOS) F.....	51
	Figure 1: 7th/Mississippi and 16th St.....	52
4.	The SEIR Fails to Identify the Significance and Severity of the Project's Impacts on Intersections Where the Project Will Use Parking Control Officers. ....	54
5.	The SEIR's Analysis of the Project's Operational Traffic and Transit Congestion and Delay Impacts Is Legally Flawed.....	55
(a)	The DSEIR understates traffic and transit volumes in the PM peak period of 4:00 to 6:00 PM by using "time of arrival" at the Arena as a proxy measurement for "time of travel.".....	55

## TABLE OF CONTENTS (con't)

Page

	(b) The DSEIR only analyzes impacts of weeknight basketball games that start at 7:30 PM, not at other start times closer to the PM peak.. . . . .	59
6.	The SEIR's Analysis of the Project's Cumulative Transportation Impacts Does Not Comply With CEQA. . . . .	59
	(a) The 5% threshold of significance for impacts at intersections and freeway ramps operating at LOS E or F violates CEQA.. . . .	59
	(b) The year 2040 baseline for assessing the significance of the Project's cumulative impacts violates CEQA.. . . .	61
	(c) The SEIR's use of a "projection" based approach to the Project's cumulative impacts is misleading.. . . .	62
7.	The DSEIR's Methodology for Analyzing Project Impacts on the Transit System Is Legally Flawed. . . . .	63
	(a) The DSEIR's use of transit screenline and route capacities is misleading and unsupported.. . . .	63
	(b) The SEIR's Cumulative Analysis Fails to Consider and Analyze the Project in the Context of the City's Proposal to Remove the Northern Portion of I-280 as Far South as the Mariposa Street Interchange.. . . .	66
8.	The SEIR's Discussion of Transportation Impacts Is Incomplete.. . . .	66
	(a) The SEIR fails to disclose the significance or severity of transportation impacts when both a Giants game and a Warriors game occur without the Special Events Transit Service Plan. . . . .	66
	(b) The SEIR fails to disclose traffic delays the Project's office and retail operations will cause on days with Giants games but without Project-related events. . . . .	68
9.	The SEIR Impermissibly Characterizes Mitigation Measures for the Project's Transportation Impacts as Components of the Project.. . . .	69

## TABLE OF CONTENTS (con't)

Page

	(a) The SEIR fails to consider other measures to reduce transportation impacts. ....	69
	(b) The SEIR fails to identify enforceable mitigation. ....	69
10.	The SEIR's Identification of Numerous Mitigation Measures is Unlawful for Several Reasons, Including Deferral of Development and Lack of Evidence of Unavoidability.. ....	73
	(a) The SEIR Improperly Defers the Development of Mitigation Measures to Reduce the Project's Construction-related Traffic Impacts to less than Significant.. ....	81
11.	The SEIR's Transit and Traffic Analyses Understate Impacts Because They Rely on Outdated Baseline Data.. ....	82
12.	The SEIR Fails to Consider the Disruptive Impacts of the At-grade Rail Crossing on LOS at 7th/ Mississippi and 16th Street.. ....	83
13.	The SEIR concludes, without adequate foundation, that the project would not have an adverse impact on emergency access to UCSF hospitals.. ....	83
14.	The New Project Variant disclosed in the FSEIR requires recirculation due to new and more severe significant impacts... ....	83
D.	THE SEIR IS NOT SUFFICIENT AS AN INFORMATIONAL DOCUMENT WITH RESPECT TO HYDROLOGY, WATER QUALITY, AND BIOLOGICAL IMPACTS.....	84
1.	The DSEIR Is Not Sufficient as an Informational Document with Respect to the Project's Wastewater Treatment Infrastructure Impacts (Comment UTIL-3). ....	84
	(a) The Response to Comment UTIL-3 is Inadequate... ....	86

2.	The DSEIR Is Not Sufficient as an Informational Document with Respect to the Project's Contaminated Wastewater (I.e. Combined Sewage and Stormwater) Impacts on San Francisco Bay Water Quality or Biological Resources (Including from Inadequately Treated Sewage and Toxic Chemicals (E.g., Pcb's and Metals) (Comments Hyd-3 - Hyd-6).....	87
(a)	The Responses to Comments Hyd-3 - Hyd-6 are Inadequate. . . .	93
3.	The DSEIR Is Not Sufficient as an Informational Document with Respect to Project Impacts on Biological Resources, Including Wetlands and Wildlife.....	96
(a)	The SEIR's exclusion of the Project's impacts on biological resources is erroneous. ....	96
(b)	The SEIR's exclusion of the Project's impacts on biological resources is erroneous because the lead agency failed to prepare any CEQA document that adequately describes the Project's environmental setting to allow an assessment of the Project's impacts on biological resources.....	97
(c)	There is substantial evidence supporting a fair argument the Project will have a significant adverse effect on biological resources. ....	97
(d)	The Response to Comment Bio-5 is Inadequate. ....	100
E.	THE SEIR IS NOT SUFFICIENT AS AN INFORMATIONAL DOCUMENT WITH RESPECT TO NOISE IMPACTS. ....	102
1.	The SEIR's Thresholds of Significance Are Unlawful under CEQA. . .	102
(a)	The SEIR's use of regulatory thresholds of the San Francisco Noise Ordinance as its CEQA thresholds of significance is an error of law.....	102
(b)	The SEIR fails to use thresholds of significance based on human health and welfare. ....	103

	TABLE OF CONTENTS (con't)	Page
2.	The SEIR's Use of "Ambient plus Increment" Thresholds of Significance for All Noise Impacts Is Legal Error.....	105
3.	The Construction Refinements and New Project Require Recirculation. ....	106
III.	CONCLUSION. ....	106

## I. INTRODUCTION

This office represents the Mission Bay Alliance (“Alliance”), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (“Warriors Arena Project” or “Project”).

The Mission Bay Alliance submits this brief in support of its appeal of Commission on Community Investment and Infrastructure Resolution 69-2015, certifying the Final Subsequent Environmental Impact Report for the Warriors Arena Project, and Resolution 70-2015, adopting CEQA Findings for the Warriors Arena Project, both approved on November 3, 2015.

The grounds for this appeal are set forth in this brief and the two companion briefs submitted by my co-counsel, Susan Brandt-Hawley and Soluri Meserve; in the Alliance’s November 13, 2015, Notice of Appeal; and in all previously submitted Alliance comment letters and their exhibits.<sup>12</sup> This brief discusses certain of these grounds in more detail.

This brief discusses several categories of legal defects in the SEIR. First, the DSEIR omitted a large number of resource topics from its scope based on an erroneous use of CEQA “tiering.” This issue is generally discussed in its own section in the brief submitted by Soluri Meserve, and also in the sections relating to specific resources where the evidence requires including of the resource in the SEIR.

Second, regarding resource topics included in the SEIR, the Draft SEIR’s informational deficiencies are described in sections relating to each resource. Where new information, changed circumstances, or changes in the Project coming to light after close of comment on the DSEIR require recirculation of a revised DSEIR, this is also discussed in each section relating to each resource topic.

Third, where the Final SEIR’s responses to substantive comments on the Draft SEIR are inadequate, this is described in relation to the Draft SEIR’s informational deficiencies for each resource topic.<sup>13</sup>

---

<sup>12</sup>References to previous comment letters are abbreviated. See “Reference Abbreviations.”

<sup>13</sup>Where comments seek omitted facts or analysis essential to a draft EIR’s conclusions, the failure to correct those omissions “renders the EIR defective as an informational document.” (*California Oak Foundation v. City of Santa Clarita* (2005) 133 Cal.App.4th 1219, 1244.) The Final SEIR’s responses to substantive comments on the Draft SEIR must contain fact-based analysis. (*People v. County of Kern* (1974) 39 Cal.App.3d 830, 841-842 (duty to provide “good faith, reasoned analysis in response”; Guidelines, § 15088(c) [“Conclusory statements unsupported by factual information will not suffice”]; *Cleary v. County of Stanislaus* (1981) 118 Cal.App.3d 348, 359; see also, *Santa Clarita Organization for Planning the Environment v. County of Los Angeles* (“SCOPE”) (2003) 106 Cal.App.4th 715, 723 [“Problems raised by the public and responsible experts require a good faith reasoned analysis in response. [Citation.] The

## II. DISCUSSION

Preliminarily, the Alliance notes this Board's role and jurisdiction in this proceeding is not limited by Commission on Community Investment and Infrastructure Resolution No. 33-2015. Under both the Dissolution Law (Health and Safety Code § 34170 et seq) and Ordinance No. 215-12, this Board is the legislative authority governing the Successor Agency. Therefore, this appeal is authorized and governed by CEQA sections 21151(c) and 21177.

Also, the City's role in the permit process to date demonstrates the City is no mere responsible agency under CEQA. The City is the lead agency, because OCII is a department of the City. Alternatively, the City is a co-lead agency with OCII. The facts supporting this conclusion are manifold, including:

- The Commission on Community Investment and Infrastructure consists of five members appointed by the Mayor, subject to confirmation by a majority of the Board of Supervisors.
- OCII's budget must be approved by the Board of Supervisors.
- The SEIR preparers include only three people from OCII, but seven from the Planning Department, one from the City Attorneys office, two from the Mayor's Office of Economic Workforce and Development, and two from the City's Municipal Transportation Agency. (SEIR, Vol 3, pp. 9-1, 2.)
- The Notice of Availability of the DSEIR instructed that comments were to be submitted to "Ms Tiffany Bohee, OCII Executive Director, c/o Mr. Brett Bollinger, San Francisco Planning Department."
- The Mayor has been an outspoken advocate of bringing the Warriors to San Francisco and of building this Project in this location since the Warriors's first proposed it. (See news articles attached to November 30, 2015, Appeal Brief submitted by Susan Brandt-Hawley as Exhibit 1.)
- Of the 29 salaried employee positions at OCII, 21 work for the City, but on OCII projects. (See Commission on Community Investment and Infrastructure Resolution No. 62 - 2015, Attachment A, FY 2015-16 Budget, Amended October 20, 2015, attached hereto as Exhibit 1, p. 9.)
- The City is treating this Project like a City-sponsored public works project for which it would be the lead agency. The Transportation Management Plan ("TMP") and Transit Service Plan ("TSP"), which are defined as components of the Project, rely for their implementation on purely voluntary services by various City departments. See Section C.9 below. The Transportation Management Plan necessitates ongoing implementation by the SFMTA, the San Francisco Police

---

requirement of a detailed analysis in response ensures that stubborn problems or serious criticism are not "swept under the rug."].)

Department, and Public Works. (See Exhibit 10, attached hereto.) Funding for both the TMP and TSP are by the City's voluntary appropriation of General Fund revenues, which are within the discretion of every future Board of Supervisors in perpetuity. (Exhibit 10, pp. 6-7.)

Consequently, the Board of Supervisors must decide whether to certify the SEIR and whether it can make the findings required by CEQA Guideline section 15090(a) based on its consideration and determination of all of the issues presented; and the Board must do so using its independent judgment.

## **A. PUBLIC COMMENT.**

### **1. The OCII Thwarted Public Comment on the SEIR.<sup>14</sup>**

The October 23, 2015, notice of publication of the Response to Comments informed the public they would have no further opportunity to comment on the FSEIR/RTC, stating:

The Commission will consider certification of the Final SEIR on this project on November 3, 2015. ¶ The Commission does not conduct a hearing to receive comments on the Responses to Comments document, and no such hearing is required by the California Environmental Quality Act. The public review period on the Draft SEIR ended on July 27, 2015.

(FSEIR, Vol. 4.) But the OCII hearing agenda for November 3, 2015, published on October 29, 2015, suggested that public comment on the FSEIR/RTC would be heard at the hearing, stating:

Special Meeting Agenda Given the Potential for a Large Number of Public Comments, the Commission May Limit the Time Allocated for Each Individual Speaker to Two Minutes or Less. It Is Strongly Recommended That Members of the Public Who Wish to Address the Commission Should Fill out a "Speaker Card" and Submit the Completed Card to the Commission Secretary.

(Items 5(a), 5(b), 5(c) 5(d) and 5(e) related to Golden State Warriors Event Center and Mixed-Use Development on Blocks 29-32 *will be heard together*, but acted on separately)

(November 3, 2015, OCII Hearing Agenda, p. 2 (italics added).) Item 5(a) was Resolution 69-2015 certifying the SEIR, and Items 5(a), 5(b), 5(c) 5(d) and 5(e) were the only items on the agenda for hearing.

The October 23, 2015, notice of publication is inconsistent with CEQA section 21177(a), which contemplates public comment on EIRs up to the end of the hearing at which the project is

---

<sup>14</sup>Nov. 2 Lippe FSEIR, p. 1.

approved. Therefore, the October 23, 2015, notice of publication frustrated the ability of the public to comment. The Board should remedy this misstep by recirculating the FSEIR with full disclosure that the public may comment on the FSEIR/RTC.

**B. THE SEIR IS NOT SUFFICIENT AS AN INFORMATIONAL DOCUMENT WITH RESPECT TO AIR QUALITY IMPACTS.**

**1. The City Cannot Use the SEIR's Thresholds of Significance for Criteria Air Pollutants until it Formally Adopts Them in a Rule-making Procedure.**

The DSEIR's thresholds of significance are:

For the impacts analyzed in this section, the project would have a significant impact related to air quality if it were to:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors);
- Expose sensitive receptors to substantial pollutant concentrations; or
- Result in a cumulative air quality impact in combination with past, present and reasonably foreseeable future projects in the vicinity.

(DSEIR 5.4-23.)

For criteria pollutants, the DSEIR uses numerical thresholds of significance borrowed from the Bay Area Air Quality Management District ("BAAQMD") for ROG (54 lbs/day); NO<sub>x</sub> (54 lbs/day); Exhaust PM<sub>10</sub> (82 lbs/day); Exhaust PM<sub>2.5</sub> (54 lbs/day).

The potential for a project to result in a cumulatively considerable net increase in criteria air pollutants that may contribute to an existing or projected air quality violation is based on the State and federal Clean Air Acts emissions limits for stationary sources. To ensure that new stationary sources do not cause or contribute to a violation of an air quality standard, BAAQMD Regulation 2, Rule 2 requires that any new source that emits criteria air pollutants above a specified emissions limit must offset those emissions. For ozone precursors ROG and NO<sub>x</sub>, the offset emissions level is an annual average of 10 tons per year (or 54 pounds (lbs.) per day). These levels represent emissions below which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants that could result in increased health effects.

(DSEIR p. 5.4-25; see also p. 5.4-31.)

The City uses these numerical thresholds of significance for virtually all land use development projects in the city that require CEQA review. This is shown by excerpts from recent Environmental Impacts Reports and Negative Declarations attached to the July 26 Lippe letter as Exhibits 4 through 16. All of them use the BAAQMD numbers as the thresholds of significance for these pollutants. Therefore, the City is required to undertake its own rule-making proceeding to adopt these thresholds as its own and determine in a public process that they are supported by substantial evidence.

(b) Thresholds of significance to be adopted for general use as part of the lead agency's environmental review process must be adopted by ordinance, resolution, rule, or regulation, and developed through a public review process and be supported by substantial evidence.

(c) When adopting thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence.

(CEQA Guideline, § 15064.7.) Since the City has not formally adopted the air quality significance thresholds in a public process supported by substantial evidence, but continues to consistently use these thresholds on virtually all CEQA Projects in the City, it cannot use these thresholds in this EIR. (See July 26 Lippe, p. 3; July 19 Gilbert, p. 14.)

The Alliance made these comments on the DSEIR. (See July 26 Lippe, p. 3; July 19 Gilbert, p. 14.) The RTC mostly ignores the comment, and takes the position that it can use the BAAQMD's thresholds on as many projects as it wants without formally adopting them. (FSEIR, Vol. 5, p. 13.3-5.) This position directly contradicts CEQA Guideline 15064.7.

## **2. The DSEIR's Numerical Thresholds of Significance for Criteria Pollutants (Ozone Precursors, PM10, PM2.5) Borrowed from the BAAQMD Are Invalid.**

As noted above, for its impact assessment and mitigation strategy for criteria pollutants, the DSEIR uses numerical thresholds of significance borrowed from the BAAQMD. But the DSEIR cannot merely reference a project's compliance with another agency's regulations. Lead agencies must conduct their own fact-based analysis of project impacts, regardless of whether the project complies with other regulatory standards.

The result of using these thresholds is a deeply misleading impact assessment and mitigation strategy because using these invalid thresholds allows the DSEIR to avoid finding impacts are significant, and it allows the DSEIR to understate the severity of impacts deemed "significant" because it implies that most of the quantity of emissions below the thresholds are not "significant." Also, using these invalid thresholds underestimates the degree of mitigation

required to reduce significant impacts to less than significant, and therefore, the DSEIR curtails its consideration of the feasibility of additional mitigation measures that could further substantially reduce emissions.

The numerical thresholds borrowed from the BAAQMD are logically and legally invalid, and they are not supported by substantial evidence. The thresholds are contained in the BAAQMD's "CEQA Air Quality Guidelines."<sup>15</sup> But neither the DSEIR or the BAAQMD CEQA Air Quality Guidelines describe any evidence that might support the use of these thresholds. The same is true of BAAQMD's other publications relating to these thresholds, i.e., Appendix D of the BAAQMD CEQA Air Quality Guidelines, BAAQMD's Revised Draft Options and Justification Report, (October 2009), and the Bay Area AQMD Proposed Air Quality CEQA Thresholds of Significance, published May 3, 2010.

While these BAAQMD publications purport to include substantial evidence supporting the use of these thresholds for all criteria air pollutants for which the Bay Area is in non-attainment, they do not. Instead, the BAAQMD CEQA Air Quality Guidelines merely provide policy rationales for why it is a good idea to have thresholds of significance. Nowhere does the document actually provide evidence for why any number of pounds per day below, for example, 54 for NOx or ROG, is not "cumulatively considerable."

The BAAQMD's Revised Draft Options and Justification Report (October 2009) states the thresholds "are based on the trigger levels for the federal New Source Review (NSR) Program and BAAQMD's Regulation 2, Rule 2 for new or modified sources." (See page 2.) These New Source Review Program rules provides that any new source that will emit pollutants above the levels stated in the left hand column of Table 4 (e.g., 10 lbs/day of NOx and ROG) must impose "Best Available Control Technology ("BACT")." (Id. pp. 16-17.) These rules also provide that any new source emitting pollutants above the levels stated in the right hand column of Table 4 (e.g., 54 lbs/day of NOx and ROG) must offset all emissions. (Id. pp. 16-17.)

In addition to the inherent flaws in the NSR rules described above, it is inappropriate to base the EIR's significance determination for purposes of CEQA on the Air District's "triggers" for an entirely different regulatory program, i.e., New Source Review under the Clean Air Act ("CAA").<sup>16</sup> One of CEQA key purposes is to require "disclosure" of significant impact, and it allows agencies to approve projects where emissions exceed its thresholds of significance after feasible mitigations are first adopted and as long as the project's benefits outweigh the

---

<sup>15</sup>The BAAQMD CEQA Air Quality Guidelines were published May 2010, and updated May 3, 2011.

<sup>16</sup>The CAA establishes health-based ambient air quality standards and ranks air districts nationwide based on their level of attainment of those standards. The CAA also establishes a timetable for air districts to reach attainment, and authorizes specific penalties where a deadline is not met. CEQA, on the other hand, requires lead agencies to analyze and discuss significant impacts on air quality, and to continue to mitigate those impacts so long as they remain significant or no additional mitigation is feasible.

environmental harm. The CAA, in contrast, is not primarily concerned with public disclosure, and it provides absolute limits on emissions (i.e., the offset triggers in Table 4) that cannot be exceeded under any circumstances. A standard that shuts down economic activity (i.e., the CAA offset standard) is necessarily and appropriately different than a standard (i.e. a CEQA threshold of significance) that requires disclosure of the impact to the public and the adoption of feasible mitigation measures.

Indeed, if it is possible to borrow any CAA NSR standard for use as a CEQA threshold of significance, it would be the BACT triggers in Table 4 (i.e., when ROG or NO<sub>x</sub> emissions exceed only 10 lbs/day), because those standards force the adoption of feasible mitigation measures, similar to CEQA's thresholds of significance.

NSR Regulation 2, Rule 2 for new or modified sources requires that if ozone precursor emissions exceed 54 lbs per day (i.e., 10 tpy), the polluter must offset *all* emissions. In contrast, the DSEIR Mitigation Measure M-AQ-2b only requires offsetting emissions above 54 lbs per day (i.e., 10 tpy). This BACT standard is much lower than the NSR offset standard and the DSEIR's threshold of significance of 54 lbs/day. But, there is no parallel requirement in the DSEIR for imposing anything like BACT to this Project's construction or operational emissions that exceed 10 lbs/day.

Regarding NSR Regulation 2, Rule 2's offset standards (i.e., 54 lbs/day for ROG or NO<sub>x</sub>), the BAAQMD's Revised Draft Options and Justification Report (October 2009) observes: "These levels represent a cumulatively considerable contribution."<sup>17</sup> But there is no evidence that emissions below these thresholds are not also "cumulatively considerable."

Moreover, regardless of any evidence included in these other BAAQMD documents, no such evidence can overcome a fundamental logical and legal flaw in the EIR's assumption that these thresholds are appropriate for the purpose for which the DSEIR uses them. Using the DSEIR's logic, if the City finds that one project will add 53 lbs/day of ozone precursors, it is considered a less-than-significant impact, but if that project will add 55 lbs/day of ozone precursors, it is considered significant. Yet, if the City approved two new large projects in the area in the same 2- or 3-year period, or where operational impacts cause increased emissions, each emitting 53 lbs/day of ozone precursors, it is considered a less-than-significant impact even though the total of the two added together equals 106 lbs/day of ozone precursors!

This scenario is not hypothetical; it is unfolding in San Francisco, and in the Mission Bay area now. (See July 21 Wymer, Table 3, for a list of project undergoing or about to undergo construction in this area of San Francisco.)<sup>18</sup> As a result, the thresholds violate a fundamental CEQA principal that regardless of whether projects' incremental impacts are deemed

---

<sup>17</sup>July 26 Lippe, Exhibit 4, p. 2.

<sup>18</sup>July 27 Lippe, Exhibit 2.

insignificant in isolation, they may be cumulatively significant.

The RTC implies that because ozone pollution is getting better, the BAAQMD thresholds are validated. Air Quality specialist Greg Gilbert's October 30, 2015, comments on the OCII's responses are essential reading. The following excerpt provides a flavor of the evidence showing why the response is unfounded and unsupported:

In our comments submitted previously on the DSEIR, we noted that the BAAQMD's CEQA thresholds of significance, applied by the Lead Agency to evaluate the Event Center project's emission impacts, were developed non-scientifically from NSR values that were designed to counterbalance anticipated growth in stationary source facility emissions under the jurisdiction of the BAAQMD. An inherent problem with using NSR emission thresholds for constructing CEQA thresholds is that the 9-county air basin's stationary sources represent no more than a small percentage of the total emissions inventory.

Vehicle emissions within the basin, by contrast, represent the lion's share of criteria pollutants and are chiefly responsible for the basin's ozone nonattainment designations that stretch back decades. Similarly, the region's nonattainment of particulate standards has been heavily influenced by vehicle emissions. To exemplify, fully 84% of NO<sub>x</sub> (ozone precursor) emissions in the Bay Area air basin are emitted by vehicles, and not by stationary sources. The region has been designated nonattainment for PM<sub>2.5</sub>; fine particulate is generated almost entirely by combustion (including internal combustion occurring in vehicle engines), and monitored values in the region continue to climb annually; 28% of the total inventory is attributed to vehicles. Importantly, population (people) regionally continues its historical growth in lockstep with numbers of vehicles and vehicle-miles-traveled; despite substantial advances in technical on-vehicle controls and reductions in tailpipe emissions of both NO<sub>x</sub> and particulates over the years, the region continues to exceed federal and state air quality standards.

As we noted previously, establishing CEQA thresholds of significance levels using NSR levels is to automatically undercut emission reductions that should be obtained from each new "indirect source" (such as the Event Center that will attract new vehicle trips and related emissions) subject to CEQA review. By using outdated, non-scientifically designed NSR values, CEQA thresholds adopted by BAAQMD and borrowed for use by OCII will automatically underrepresent air emission significance, particularly when evaluated against past nonattainment designations and PM<sub>2.5</sub> ambient air monitoring values that, despite recession effects, continue to reflect a slowly worsening trend line.

(Oct 30 Gilbert, pp. 2-3.)

The significance of a cumulative impact depends on the environmental setting in which it occurs, especially the severity of existing environmental harm. (*Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120 (“CBE”) “[T]he relevant question”... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether “any additional amount” of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project’s contribution to cumulative impacts as significant. [footnote omitted]”); *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 720-721.)

This area is in “non-attainment” status under federal and state clean air laws for these criteria pollutants; and this project, along with many others, will substantially contribute to that existing significant adverse impact. There is no evidence to the contrary. The City’s untenable position is that public agencies in the Air Basin can approve project after project, each emitting (in the case of ozone precursors) up to 54 lbs/day of new and additional ozone precursors, without ever causing a cumulatively considerable increase in air pollution. This approach runs counter to the reason for conducting cumulative impact analysis. If the City (and other agencies in the Air Basin) continues to find that projects that make air quality worse - when it is already significantly degraded - do not have a significant adverse cumulative impact on air quality, then the City will have no legal obligation to adopt feasible mitigation measures to reduce the significant cumulative impact.

Here, the BAAQMD CEQA Guidelines present ample evidence that the Bay Area’s air quality is degraded and has been for a very long time. Therefore, the idea that agencies can forever approve multiple projects that each add 53 lbs of ROG and NOx to the air every day and never be deemed cumulatively considerable is absurd. Rather than explain why this is not true, the BAAQMD documents simply ignore the issue.

The DSEIR’s use of the BAAQMD thresholds of significance is erroneous as a matter of law for several other reasons.<sup>19</sup> The DSEIR cannot merely reference a project’s compliance with another agency’s regulations. Lead agencies must conduct their own fact-based analysis of project impacts, regardless of whether the project complies with other regulatory standards. The DSEIR uses BAAQMD’s thresholds of significance uncritically, without any factual analysis of its own, in violation of CEQA.<sup>20</sup> This uncritical application of the BAAQMD’s thresholds of

---

<sup>19</sup> *Endangered Habitats League v. County of Orange* (2005) 131 Cal.App.4th 777, 793 (“The use of an erroneous legal standard [for the threshold of significance in an EIR] is a failure to proceed in the manner required by law that requires reversal.”).

<sup>20</sup> *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1109 [underscore emphasis added], citing *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 114 (“CBE”); accord *Mejia v. City of Los Angeles* (2005) 130 Cal.App.4th 322, 342 [“A threshold of significance is not conclusive...and does not relieve a public agency of the duty to consider the evidence under the fair argument standard.”].)

significance represents a failure of the City to exercise its independent judgment in preparing the DSEIR.<sup>21</sup> Just as disagreement from another agency does not deprive a lead agency of discretion under CEQA to judge whether substantial evidence supports its conclusions,<sup>22</sup> agreement from another agency does not relieve a lead agency of separately discharging its obligations under CEQA. The BAAQMD CEQA Guidelines do not provide any factual explanation as to why the 54 lbs. per day standard represents an appropriate threshold for judging the significance of project-level ozone pollution impacts. More importantly, the DSEIR also fails to include any such explanation, and is therefore inadequate as a matter of law.<sup>23</sup> It is well-settled that compliance with other regulatory standards cannot be used under CEQA as a basis for finding that a project's effects are insignificant, nor can it substitute for a fact-based analysis of those effects.<sup>24</sup>

Also, the DSEIR's reliance on information not contained in the DSEIR for purposes of showing these thresholds are supported by substantial evidence violates CEQA's informational requirements. (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 405 ["whatever is required to be considered in an EIR must be in that formal report; what any official might have known from other writings or oral presentations cannot supply what is lacking in the report"]; *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 442 ["[I]nformation 'scattered here and there in EIR appendices' or a report 'buried in an appendix,' is not a substitute for 'a good faith reasoned analysis'"], 443 ["The audience to whom an EIR must communicate is not the reviewing court but the public and the government officials deciding on the project. That a party's briefs to the court may explain or supplement matters that are obscure or incomplete in the EIR, for example,

<sup>21</sup> *Friends of La Vina v. County of Los Angeles* (1991) 232 Cal.App.3d 1446.

<sup>22</sup> *California Native Plant Society v. City of Rancho Cordova* (2009) 172 Cal.App.4th 603, 626.

<sup>23</sup> *Santiago County Water Dist. v. County of Orange, supra*, 118 Cal.App.3d 818.

<sup>24</sup> See, e.g., *Californians for Alternatives to Toxics v. Department of Food & Agriculture* (2005) 136 Cal.App.4th 1, 16 (lead agencies must review the site-specific impacts of pesticide applications under their jurisdiction, because "DPR's [Department of Pesticide Regulation] registration does not and cannot account for specific uses of pesticides..., such as the specific chemicals used, their amounts and frequency of use, specific sensitive areas targeted for application, and the like"); *Citizens for Non-Toxic Pest Control v. Department of Food & Agriculture* (1986) 187 Cal.App.3d 1575, 1587-1588 (state agency applying pesticides cannot rely on pesticide registration status to avoid further environmental review under CEQA); *Oro Fino Gold Mining Corporation v. County of El Dorado* (1990) 225 Cal.App.3d 872, 881-882 (rejects contention that project noise level would be insignificant simply by being consistent with general plan standards for the zone in question). See also *City of Antioch v. City Council of the City of Pittsburg* (1986) 187 Cal.App.3d 1325, 1331-1332 (EIR required for construction of road and sewer lines even though these were shown on city general plan); *Kings County Farm Bureau v. City of Hanford, supra*, 221 Cal.App.3d at pp. 712-718 (agency erred by "wrongly assum[ing] that, simply because the smokestack emissions would comply with applicable regulations from other agencies regulating air quality, the overall project would not cause significant effects to air quality.").

is irrelevant ... The question is therefore not whether the project's significant environmental effects *can* be clearly explained, but whether they *were*"] (emphasis in original).)

**(a) The DSEIR's impact assessments for construction related criteria pollutants (ozone precursors, PM10, PM2.5) and TAC emissions are invalid.**

DSEIR Table 5.4-8 shows construction-related daily emissions of the ozone precursor ROG at 47 lbs/day (mitigated by Tier 2 and NOx VDECS engines) or 49 lbs/day (mitigated by Tier 4 engines) and of the ozone precursor NOx at 144 lbs/day (mitigated by Tier 2 and NOx VDECS engines) or 73 lbs/day (mitigated by Tier 4 engines).

The DSEIR's impact assessments for construction-related ozone precursor emissions are invalid because the DSEIR uses the invalid thresholds of significance discussed above.

Because NOx construction-related emissions are reported as higher than the applicable (but invalid) threshold of significance for ROG (i.e., 54 lbs/day), the DSEIR concludes the Project's impact on ozone pollution is significant. While this conclusion is correct, it is also misleading because it understates the severity of the impact deemed "significant." The DSEIR implies that the only fraction of the Project's NOx emissions that are "significant" is the fraction above 54 lbs/day. But as discussed above, this threshold of significance is invalid. Using this invalid threshold implies that most of the quantity of emissions below the threshold are not "significant." (*Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831 ["The conclusion that one of the unavoidable adverse impacts of the project will be the 'increased demand upon water available from the Santiago County Water District' is only stating the obvious. What is needed is some information about how adverse the adverse impact will be"].)

The DSEIR assumes that adoption of Mitigation Measure M-AQ-1, requiring use of off-road equipment with engines meeting Tier 2 or Tier 4 standards, will reduce construction-related ROG emissions to 47 or 49 pounds per day, respectively, which are both below the applicable (but invalid) threshold of significance for ROG (i.e., 54 lbs/day). (DSEIR, p. 5.4-33, Table 5.4-8.) But equipment meeting Tier 2 or Tier 4 standards are not sufficiently available to meet either requirement. (See July 26 Lippe, Exhibit 2.) Therefore, the impact assessment must be recalculated to more realistically estimate the percentage of construction equipment that will meet Tier 2 or 4 standards.

Also, the DSEIR incorrectly utilizes a default hauling trip length of 20-miles, provided by the California Emissions Estimator Model ("CalEEMod"), to determine the on-road hauling emissions that would occur during construction. Using this default value, rather than a site-specific trip length to the actual haul destination, results in an underestimation of the Project's construction emissions. Therefore, the impact assessment must be recalculated to realistically account for the actual haul destination of the excavation spoils. (See July 26 Lippe, p. 10; July 20 SWAPE, 2-6.)

**(1) Mitigation Measure M-AQ-1 does not comply with CEQA’s legal requirements.**

Mitigation Measure M-AQ-1 (at DSEIR, p. 5.4-35) does not comply with CEQA’s legal requirements. As discussed above, the requirement that off-road equipment meet Tier 2 standards is illusory, and therefore ineffective, because the Project Sponsor will not be able to obtain enough equipment meeting this standard. (July 26 Lippe, p. 9; July 20 SWAPE, 6-8; October 30 Gilbert, pp. 10-14.)

M-AQ-1 includes a limit on idling time of two minutes, and provides exceptions to this limit as provided in state law (DSEIR, p. 5.4-36), but utterly fails to describe what these exceptions are. The DSEIR must fully describe this measure in order for the public and City decision makers to assess its effectiveness. (See July 26 Lippe, p. 10.)

M-AQ-1 requires the Project Sponsor prepare a Construction Emissions Minimization Plan, and the Project Sponsor must certify compliance with the Plan. (DSEIR, p. 5.4-36.) This is asking the fox to guard the henhouse. (See July 26 Lippe, p. 10; July 19 Gilbert, pp. 7-10; October 30 Gilbert, pp. 14-16.)

**a. The Response to Comment AQ-6a is Inadequate.<sup>25</sup>**

Mitigation Measure M-AQ-1 requires the use of Tier 2 or better engines for all off-road equipment. The “step-downs” from Tier 4 to Tier 3 to Tier 2, or from Tier 3 to Tier 2, are allowed when Tier 4 (or Tier 3) is not “commercially available.” But step-downs from Tier 2 are not available under any scenario.

Mr. Gilbert’s July 19, 2015, letter commented that this mitigation is not feasible because there are not enough Tier 2 or better equipment available for the Project Sponsor to use. The response to this comment states that “in 2014 approximately 59 percent of all off-road equipment in the state were operating with Tier 2 engines or better” and, therefore, it appears the measure is feasible. (RTC, p. 13.13-53.)

But the response does not specify whether the diesel off-road equipment sampled included equipment in private or government fleets that are not potentially available to the Project Sponsor to use, or alternatively, whether it consisted only of equipment that is potentially available to the Project Sponsor to use. If the former is true, then the 59% sampling result is meaningless, because the relevant population to sample is equipment that is potentially available to the Project Sponsor to use. A review of Figure 4 in the document cited in footnote 20 on RTC page 13.13-53 appears to indicate that the population of equipment sampled is all equipment, including equipment that is not potentially available to the Project Sponsor to use. Therefore, the 59% sampling result appears to be meaningless.

---

<sup>25</sup>July 26 Lippe, p. 9; July 20 SWAPE, 6-8; October 30 Gilbert, pp. 10-14.

Moreover, even if the population of equipment sampled is equipment that is potentially available for the Project Sponsor to use, the idea that the Project Sponsor will be able to acquire 100% of its equipment at Tier 2 or better when only 59% of the potentially available equipment is Tier 2 or higher is illogical. It is more plausible that the Project Sponsor will be able to acquire only about 59% of its equipment at Tier 2 or better.

As stated in the Nov 2 Gilbert report:

Further, the statistic provided by the Lead Agency does not say that 59% of all construction equipment vehicles in CA will meet Tier 2 or better status – rather, it says that all **off-road** vehicles do (as of 2014). All off-road vehicles are not all construction vehicles; in fact, construction vehicles are a small subset of all off-road vehicles. Moreover, the rate of compliance for construction vehicles, particularly large, expensive, long-lived ones (scrapers, excavators, pile drivers, etc.) will be far lower than the average for all off-road vehicles that include such non-construction equipment as ground support vehicles at airports, agricultural forklifts, and myriad other off-road, nonconstruction equipment types. Because the statistic represents all off-road vehicles in CA and not construction vehicles, it cannot be used to even roughly determine the proportion of construction vehicles supposedly available to the project with Tier 2 engines, VDECs, and 40% NOx control; hence, the statistic is irrelevant to the Events Center project environmental review and does nothing to refute our concerns expressed clearly at the SDEIR review stage.

(November 2 Gilbert, p. 11.)

**b. The Response to Comment AQ-6e is Inadequate.<sup>26</sup>**

Mr Gilbert's July 19, 2015, letter commented that:

Further, M-AQ-1 specifies numerous sub-part requirements (A 1 through 5) to be included in the Construction Emissions Mitigation Plan, and in each case compliance with those sub-parts is left to the "project sponsor." So, too, is compliance with the Measure's additional duties required under M-AQ-1 items B and C. This is not appropriate when considering the extent, complexity, and costs that will be incurred for effective mitigation measure compliance across the 26-month construction period; permitting the project sponsor to create, implement, report, and determine compliance with the Measure is akin to having the fox guard the henhouse and must not be allowed. As written, the measure is not enforceable due to the subjective, undefined nature of "Air Quality Specialist" who will approve the project sponsor's Construction Emissions Mitigation Plan.

---

<sup>26</sup>July 26 Lippe, p. 10; July 19 Gilbert, pp. 7-10; October 30 Gilbert, pp. 14-16.

Further, it is unacceptable that the Measure will permit the project sponsor to determine compliance with each of the measure's components, record and report information signifying compliance, and then, under part C certify their own compliance with the Plan and its various requirements. We have inspected construction project sites, under air district contract, to determine compliance with air district-imposed construction equipment mitigations and have found uniformly poor compliance; to exemplify, at one residential subdivision project in south Sacramento County we determined that only one off-road construction vehicle out of nearly twenty were actually compliant with the mitigation requirements that had been imposed on the project by the Lead Agency. This is because there has traditionally been very little, if any, post- EIR follow-through to verify mitigation compliance by Lead Agencies or by the local air district after the CEQA project has been approved for development and construction has started. Knowing this, construction and development firms commonly let air quality mitigations go unmet, although records purporting to show compliance can be easily formulated and submitted post hoc in order to fulfill a paper requirement. Without an independent, qualified 3rd party contractor onsite each day to track, verify, and record emissions- and activity-related information on construction vehicles used at the project site to ensure the EIR's mitigations are implemented effectively, the project is very unlikely to produce more than a token of the emission reductions claimed in the DSEIR.

The Responses to Comments (RTC) codes this comment as "AQ-6e." (Volume 5, p. 13.13-60.) The response to comment AQ-6e states:

The City and OCII have successfully monitored implementation of emissions minimization requirements on numerous construction projects over the past several years. Examples of past and ongoing projects with CEMP emissions minimization requirements include Candlestick Point-Hunters Point Shipyard Phase II Development Project, which requires staged increases in the percentage of Tier 4 equipment; the Seismic Upgrade of BDPL Nos. 3 & 4 at Hayward Fault Project, which had one year of tiered engine requirements for on-road spoils hauling trucks and off-road construction equipment; and the Pacific Rod and Gun Club Upland Soil Remedial Action Project, which also had tiered engine requirements for off-road construction equipment.

(Volume 5, p. 13.13-60.)

The RTC's assertion is made without any evidentiary support. Well before the Response to Comments issued, the Alliance attempted to discover if the City or the OCII have any evidence to support the DSEIR's assumption that the Project's compliance with adopted air quality mitigation measures will be effectively monitored. In this regard, on August 13, 2015, I submitted a request to the City and OCII for:

All records relating to monitoring or enforcement of compliance with mitigation measures adopted to reduce potentially significant air quality impacts of development projects approved by the City, the Redevelopment Agency of the City and County of San Francisco, or the Successor Agency to the Redevelopment Agency of the City and County of San Francisco, including any records reflecting audits of such compliance.

(See Nov 2 Lippe FSEIR, Exhibit D attached thereto). In my email to the OCII and City dated September 30, 2015, I provided further definition to this request, stating:

With respect to all construction projects in these areas for which the EIR identified significant air quality impacts from construction activities that could not be entirely avoided, the City, Redevelopment Agency, or the Successor Agency would have adopted mitigation measures to reduce the projects' significant air quality impacts and would have adopted a Mitigation Monitoring and Reporting Plan ("MMRP"). These MMRPs should have resulted in the generation of reports documenting the project's compliance, or lack thereof, with these adopted air quality impact mitigation measures. I want to obtain these reports."

(See Nov 2 Lippe FSEIR, Exhibit E attached thereto [email exchanges between this author and OCII and City dated September 11 through September 30 of 2015].)

Despite these requests, neither OCII nor the City have produced a single record showing they have either themselves conducted monitoring of CEQA required air quality mitigation measures or have taken steps to ensure that Project Sponsors tasked with self-monitoring their own compliance have faithfully done so. The agencies' failure to produce any such records leads inescapably to the conclusion that Mr. Gilbert's observation applies to the OCII and the City, and no such records exist because no such monitoring has been done.

**(b) The DSEIR's impact assessments for operational criteria pollutants (ozone precursors, PM10, PM2.5) and TAC emissions are invalid.**

The operational impact assessments for ozone precursor, PM10, PM2.5 and TAC emissions is invalid for many reasons.

DSEIR Table 5.4-9 shows operational daily emissions of criteria pollutants as follows:

ROG:	79 lbs/day [14 tpy]
NOx:	124 lbs/day [23 tpy]
PM10:	80 lbs/day [14.6 tpy]
PM2.5:	25 lbs/day [4.5 tpy]

(DSEIR, p. 5.4-39.)

The DSEIR's impact assessments for these criteria pollutants emissions are invalid because they are based on the invalid thresholds of significance discussed above.

Because construction-related emissions of ROG and NOx are higher than the applicable (but invalid) threshold of significance for these pollutants, the DSEIR concludes the Project's impact on ozone pollution is significant. As discussed above, while correct, this conclusion is misleading because it understates the severity of the impact deemed "significant" by implying that the only fraction of the Project's NOx emissions is are "significant" is the fraction above 54 lbs/day.

**(1) The SEIR fails to include vehicle emissions from Warriors game traffic in its analysis of operational emissions.<sup>27</sup>**

The DSEIR's impact assessment for operational ozone precursor emissions is also misleading because it omits from its quantitative tally of criteria pollutants the emissions the Project will generate in San Francisco and the Mission Bay neighborhood from basketball game-associated "vehicle miles traveled" (DSEIR, p. 5-37.) The DSEIR's rationale for this startling omission is that moving the Warriors games from Oakland to San Francisco will reduce the same number of "vehicle miles traveled" in Oakland that the Project will generate in San Francisco and the Mission Bay neighborhood.

This rationale is based on the unstated, but incorrect, assumption that the environmental setting at Oracle Arena and the Mission Bay site are identical. These settings are very different, in many crucial respects. The Mission Bay neighborhood and the surrounding areas of San Francisco are populated by San Franciscans, not Oaklanders. The residents, citizens, and registered voters of San Francisco are entitled to know what the Project's air quality impacts will be *on them*, regardless of whether the residents, citizens, and registered voters of Oakland will experience an air quality benefit as a result of the move. (July 26 Lippe, pp. 10-11.)

Also, Oracle Arena sits in the middle of a vast parking lot. To the west is I-880, various commercial properties, wetlands, and the Bay. To the east is the Coliseum, railroad tracks, ABC Supply (provider of industrial equipment), East Bay Truck and Auto Repair, BART tracks and the Coliseum BART Station, and then, over 2,000 feet away to the northeast there is a group of apartment buildings. To the north and south stretch commercial properties for well over a mile without any residences. This stands in stark contrast to the dense residential population surrounding the Mission Bay site.

The DSEIR's suggestion that respiratory disease, heart disease, and cancer-causing air pollution is fungible and transferable, without regard to the location or environmental setting in which it occurs, is unsupported.

---

<sup>27</sup> July 26 Lippe, p. 11; July 19 Gilbert, p. 10; October 30 Gilbert, pp. 6-10.

**(2) Mitigation Measure M-AQ-2b does not comply with CEQA’s legal requirements.<sup>28</sup>**

Mitigation Measure M-AQ-2b requires the Project Sponsor pay a fee to the BAAQMD that the BAAQMD will use to purchase ozone precursor offsets. The purpose is to offset the amount by which the project’s ozone precursors emissions exceed the numerical thresholds discussed in the previous section of this letter.

Therefore, to the extent the thresholds are invalid, as argued above, M-AQ-2b fails to reduce ozone precursor emissions to less-than-significant levels. Further, the DSEIR does not even consider the feasibility or effectiveness of more robust mitigation strategies that could reduce ozone precursor emissions further below the (invalid) thresholds. (See DSEIR, p. 5.4-39, Table 5.4-9, “Estimated Emissions Reduction Required”.)

The amount of the offset fee required by M-AQ-2b is calculated by multiplying the total amount of *annual* criteria pollutant emissions exceeding the annual (invalid) thresholds by \$18,030 per weighted ton of criteria pollutant emissions; then adding 5% of that product for BAAQMD’s administrative fees, as follows:<sup>29</sup>

ROG tons	4.4
NOx tons	12.6
PM tons x 20	<u>0</u>
Subtotal	<u>17</u>
Fee per ton	<u>\$18,030.00</u>
Subtotal	\$306,510.00
Admin fee 5%	0.05
Admin fee	<u>\$15,325.50</u>
Total Fee	\$321,835.50

The DSEIR indicates M-AQ-2b requires the Project Sponsor to pay only \$321,835.50, which is the amount required to offset one year’s worth of the Project’s operational criteria pollutant emissions. (See DSEIR, p. 5.4-41.) But the sports and entertainment arena portion of this Project has an operational life of at least 50 years, probably much longer,<sup>30</sup> and the office towers will last even longer. In contrast, the life spans of offset credit sources are much shorter than the expected life span of this Project. (See July 26 Lippe, July 19 Gilbert.) Therefore, the actual amount required to offset the Project’s above-threshold ozone precursor emissions is much higher than \$321,835.50. Therefore, the DSEIR’s premise that M-AQ-2b will achieve a complete offset of

---

<sup>28</sup>Nov 2 Lippe FSEIR, pp. 5-6; October 30 Gilbert, pp. 17-19; 19-21.

<sup>29</sup>54 lbs per day of ROG emissions equals 10 tons per year.

<sup>30</sup>Oracle Arena was built in 1966, 49 years ago, and is still functional.

the Project's above threshold construction and operational criteria pollutant emissions is misleading and false.<sup>31</sup>

To address this deficiency, M-AQ-2b must be amended. The DSEIR must disclose the average life span of the offset credit sources the BAAQMD typically buys, then amend M-AQ-2b to require recalculation of the offset fee or other offset requirement after the average life span of such offset credit sources to account for their limited life span, changes in emissions, changes in attainment status, etc. In addition, M-AQ-2b must be amended to include a mechanism, in the event that BAAQMD does not spend the offset fee and returns it, to ensure the required offsets are purchased through another bona fide, verifiable offset program.

Accepting, *arguendo*, the validity of the 17 ton offset requirement, the DSEIR's discussion of Mitigation Measure M-AQ-2b leaves many questions unanswered regarding BAAQMD's offset program. For example, the effectiveness of the measure depends directly on the validity of numerous assumptions, including: (1) the assumption that \$18,030 is enough to purchase a ton of criteria pollutant emissions; (2) the assumption that the offset market has 17 tons of criteria pollutant emissions that can be reduced by engine retrofits or other offset techniques; (3) the assumption the Project Sponsor will accurately measure actual construction and operational emissions for purpose of determining how many tons of criteria pollutants must be offset; and (4) the assumption that BAAQMD has and will have reliable verification procedures in place ensuring that 17 tons of offset will actually be achieved.

**a. The Response to Comment AQ-7 is Inadequate.**

Comment AQ-7 is that the per ton charge for emission offsets is too low to achieve complete offset of the Project's emissions. The response is cagey on this point, but it appears the BAAQMD agreed with the comment, because the response states:

SF Planning has been in communication with BAAQMD with regard to its suggestion that a higher fee may be warranted to offset project emissions to a less than significant level and found that BAAQMD could not establish that an increased rate beyond that of the Carl Moyer Program plus a five percent administrative fee could meet the "rough proportionality" standard required under CEQA.

(RTC, p. 13.13-67.) The RTC's rationale for contending that a higher offset fee would not meet the "rough proportionality" standard is that offsets fees in other areas of the state are not higher than the offset fee proposed in the DSEIR. This is an error of law. The "rough proportionality" requirement requires a comparison of the cost of the mitigation to the degree of severity of the impact. The fee charged in other areas of the state are irrelevant to "rough proportionality."

---

<sup>31</sup>The DSEIR indicates that construction-related criteria pollutant emissions are mitigated by including them in the operational period emission mitigation strategy. (DSEIR, p. 5.4-34.)

**b. New information and the refusal of the project sponsor to agree to Mitigation Measure M-AQ-2b since publication of the DSEIR require recirculation of a revised DSEIR.<sup>32</sup>**

By letter dated November 2, 2015 (i.e., after the RTC was issued), to the OCII, the Bay Area Air Quality Management District announced that it would not participate in Mitigation Measure M-AQ-2b's offset plan because the City and Project Sponsor refuse to agree to BAAQMD's offset fees. BAAQMD confirmed that the offset fees stated in the SEIR are insufficient to achieve the complete offset of ozone precursor emissions above the thresholds of significance and that unless the Project Sponsor and OCII agreed to the higher fees demanded, then BAAQMD would not participate in the offset program. The OCII has refused to require the Project Sponsor pay the higher fee. This eliminates a key basis for finding the Project's significant ozone precursor emissions to be substantially reduced and therefore, requires recirculation of the Draft SEIR.

The City cannot find that "Impact AQ-4: Potential conflicts with BAAQMD's 2010 Clean Air Plan" is less than significant with mitigation because the City and Project Sponsor refuse to agree to BAAQMD's offset fees per Mitigation Measure M-AQ-2b. (See November 2, 2015, letter from BAAQMD and November 2, 2015, OCII Memorandum re same.)

There is also no evidence that the "Option 2" offset within Mitigation Measure M-AQ-2b is feasible. There are too many unanswered questions regarding Option 2, including lack of assured verification of offsets to ensure their effectiveness, and lack of assurance that offset sources are available in the quantity required. BAAQMD's offset program at least answers some, if not all, of these questions.

The City and OCII cannot find that all feasible mitigation measures that would substantially reduce "Impact AQ-1: Impacts of Criteria Air Pollutants from Construction" have been adopted as required by CEQA section 21081, because there is no evidence that paying the offset fees demanded by BAAQMD is infeasible. Also, as discussed above, there is no evidence that the "Option 2" offset idea within Mitigation Measure M-AQ-2b is feasible; therefore, it is not an adequate substitute for BAAQMD's offset program. This also applies to Impact AQ-2: Impacts of Criteria Air Pollutants from Project Operations;" Impact C-AQ-1: Project Contribution to Regional Air Quality Impacts; and Impact C-AQ-1: Project Contribution to Regional Air Quality Impacts.

---

<sup>32</sup>Lippe Nov 2 FSEIR, pp. 5-6; October 30 Gilbert, pp. 17-18; Oral testimony of Thomas N. Lippe at November 3, 2015, OCII hearing.

**3. Changes to the Project Since Publication of the DSEIR Require Recirculation of a Revised DSEIR Due to New and More Severe Significant Impacts.<sup>33</sup>**

Under CEQA, if the project changes after publication of the Draft EIR, and these changes create a new significant impact not identified in the Draft EIR, or a substantial increase in severity of a significant impact that was identified in the Draft EIR, the lead agency must recirculate the draft EIR for public comment. (CEQA section 21092.1.)

Here, the RTC describes a number of “construction refinements”, including using dewatering generators, using a soil treatment pug mill, and removing rapid impact compaction from the construction plan. With respect to the air quality impacts of these “construction refinements” the RTC states:

The addition of the construction refinements would not substantially increase (approximately 2 percent for ROG and 4 percent for NOx) the average daily construction-related emissions disclosed in the Draft SEIR. This would not result in a substantial increase in the severity of the previously identified significant and unavoidable impact, and the same mitigation measures would apply requiring the project sponsor to minimize construction emissions.

(RTC, p 12-22.)

The RTC also describes a new variant, the Muni UCSF/Mission Bay Station Variant, and discloses that:

The Muni UCSF/Mission Bay Station Platform Variant would not substantially increase (approximately 2 percent for ROG and 5 percent for NOx) the average daily emissions disclosed in the Draft SEIR for the proposed project (see Table 5.4-7, page 5.4-31). Furthermore, Mitigation Measure M-AQ-1 (Construction Emissions Minimization) would also apply to the variant. While the estimated construction emissions under the variant shown in Table 12-2 are slightly higher than those identified for the proposed project in the Draft SEIR, this impact is not substantially more severe than the previously identified significant and unavoidable impact.

(RTC, p 12-22.)

There are several problems with these assertions. First, the RTC does explain whether construction refinement caused increases of 2 and 4 percent for ROG and NOx, respectively, are included within or additive to the Platform Variant caused increases of 2 and 5 percent for ROG and NOx. Without this information, the public does not know what additional quantum of ozone

---

<sup>33</sup>Lippe Nov 2 FSEIR, pp. 6-7.

pollution the RTC deems insubstantial.

Assuming for the moment that the construction refinement caused increases are included within or the Platform Variant caused increases, the RTC offers no rationale why the 2 and 5 percent increases are not considered a “substantial” increase in the severity of the previously identified significant effect that Project construction will have on ozone precursor pollution. The RTC authors apparently believe these numbers speak for themselves. They do not. In fact, reliance on these appears to reflect a silent assumption that these increases above the previously identified quantities of emissions for these pollutants is “de minimis.” It must be remembered, however, that these increases are not above a previously identified less-than-significant quantity of emissions; the previously identified quantities were significant!

The RTC thus commits the exact errors of law rejected by the Court of Appeal in *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98 (“CBE”), i.e., using a “de minimis” rationale or any type of simple numerical ratio of the incremental impact compared to the pre-existing impact. “[T]he relevant question... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether ‘any additional amount’ of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project’s contribution to cumulative impacts as significant.” (Id. At p. 120; see also *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 720-721.)

These increases should be considered substantial and the SEIR recirculated for public comment. Instead, the October 23, 2015, notice of publication of the Response to Comments informed the public they would have no opportunity to comment on the environmental effects of these changes in the Project.

#### **4. The SEIR’s Cancer and Health Risk Assessment for Toxic Air Contaminants Is Invalid, Based on Legal Errors and Not Supported by Substantial Evidence.**

##### **(a) The SEIR’s threshold of significance for what is a cumulatively significant TAC impact is legally flawed.**

Quoting the discussion of cumulative risk levels in BAAQMD’s 2009 *Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance*, the DSEIR explained that the 100 in one million excess cancer risk threshold was based on USEPA guidance for “acceptable” risk. (DSEIR, p. 5.4-13.) The announced basis of that threshold for toxic air pollutants is identified as the 1989 preamble to the benzene National Emissions Standards for Hazardous Air Pollutants (NESHAP) rulemaking, which is focused on providing the “maximum feasible protection against risks to health ...” (*Id.*, emphasis added.)

In comments on the DSEIR, The Alliance objected that the DSEIR’s reliance on the 100

excess cancer threshold to determine cumulative significance was legally flawed because it improperly imports considerations of the cost and feasibility of mitigation into a determination of significance, even though CEQA requires that these two determinations be made in distinct steps.<sup>34</sup> The Alliance also objected that the DSEIR's purported justification of the 100 excess cancer threshold as representative of "pristine" conditions was not coherent or explained by the DSEIR or the 2009 BAAQMD reports cited by the DSEIR.

The FSEIR response to these comments objecting to the 100 excess cancer cumulative threshold argues that it is justified as the "upper limit of acceptability" under USEPA guidance. (FSEIR, p. 13.13-27.) The FSEIR explained that "pristine" conditions are those that are affected only by cumulative global atmospheric transport of TACs. (Id.) These responses are inconsistent with CEQA.

The SEIR's use of the 100 excess cancers per million threshold was legally flawed for several reasons. First, "a threshold of significance cannot be applied in a way that would foreclose the consideration of other substantial evidence tending to show the environmental effect to which the threshold relates might be significant." (*Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4<sup>th</sup> 1099, 1109.) In light of the obvious conclusion that the risk of the first 100 cancers in one million represent a material and significant health impact, the agency may not simply apply a regulatory standard from the USEPA "as an automatic determinant that the effect is or is not significant." (Id.)

Also, the EIR uncritically relies on an appeal to another agency's standards without justification, even though it is well-settled that mere compliance with another agency's regulatory standards cannot be used under CEQA as a sufficient basis for determining that a project's effects are insignificant. (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 712-718 (improper to conclude that reliance with air quality regulations precludes significant impact); *Ebbetts Pass Forest Watch v. California Department of Forestry & Fire Protection* (2008) 43 Cal.4<sup>th</sup> 936, 957 (err to conclude that compliance with pesticide restrictions precludes significant impact); *Oro Fino Gold Mining Corporation v. County of El Dorado* (1990) 225 Cal.App.3d 872, 881-882 (meeting general plan noise standard does not preclude significant impact).) An agency must conduct its own fact-based analysis of project impacts, regardless of compliance with other regulatory standards. (*Californians for Alternatives to Toxics v. Department of Food & Agriculture* (2005) 136 Cal.App.4<sup>th</sup> 1, 16; *Citizens for Non-Toxic Pest Control v. Department of Food & Agriculture* (1986) 187 Cal.App.3d 1575, 1587-1588.) The OCII's failure to exercise independent judgment, evident in its uncritical reliance on other agency standards, violates CEQA. (CEQA Guidelines, §15084(e); *Friends of La Vina v. County of Los Angeles* (1991) 232 Cal.App.3d 1446, 1452.)

In addition, the DSEIR fails to provide any explanation for why cumulative TACs that do

---

<sup>34</sup>Thomas Lippe, letter to Tiffany Bohee, July 26, 2015, pp. 16-18.

cause the first 100 excess cancers are “acceptable.” An EIR must contain facts and analysis, not just a bare conclusion, e.g., a conclusion as to “acceptable” risk. (*Santiago County Water District v County of Orange* (1981) 118 Cal.App.3d 818, 831.) The EPA standard borrowed by OCII and BAAQMD as the threshold for significant cumulative impact was designed to support a different regulatory scheme, not to support determinations of significance under CEQA. The EPA is permitted and required to consider factors of cost and feasibility in its regulation of toxics under the Clean Air Act. (See July 26 Lippe, pp. 16-18.) However, CEQA neither requires nor allows OCII to use EPA’s judgment of “acceptable” cancer risk to determine the significance of cumulative TAC impacts. The determination of “acceptable” environmental harm arises at the end of the CEQA analysis in the context of a statement of overriding considerations, not at the beginning of the process, in determining whether impacts are significant. (See, e.g., *City of Marina v. Board of Trustees of the California State University* (2006) 39 Cal.4th 341, 368-369.)

Also, the SEIR relies on a simplistic misrepresentation of actual EPA policy. (See July 26 Lippe, pp. 13-18.) The EPA’s actual policy is to assess increased cancer risk based on a host of site-specific factors within a range of values from 1 in one million to 100 in one million. This policy reflects the agency’s attempt to balance the costs and benefits of protecting public health in its implementation of a host of federal environmental laws, including the Clean Air Act, Clean Water Act, Resource Conservation and Recovery Act, CERCLA (Superfund), etc. (See July 26 Lippe, Exhibit 3.)<sup>35</sup>

Instead of following this analytic approach, the DSEIR selects one value at the least environmentally protective end of the EPA’s “acceptable risk” range and uses it to determine the significance of the Project’s impacts, but without regard to the Project’s site-specific

---

<sup>35</sup>“In the proposed NCP [Superfund National Contingency Plan], the Agency [EPA] had defined the acceptable risk range as being from  $10^{-4}$  to  $10^{-7}$ , meaning that when the excess risk to an individual of contracting cancer due to a lifetime exposure to a certain concentration of a carcinogen falls between approximately 1 in 10,000 [100 in one million] and 1 in 10 million, it is judged to be an acceptable exposure. As a measure of additional protection, the proposal provided that there should be a “point of departure” of  $10^{-6}$ , toward the more protective end of the scale, that should be used in setting preliminary remediation goals; if conditions warranted, the final remedy could achieve a level elsewhere within the range. ¶ The final rule maintained the point of departure of  $10^{-6}$ , but narrowed the risk range to  $10^{-4}$  through  $10^{-6}$ . This action was taken in response to public comment and concerns that the Superfund range went below the accepted de minimis level used by other EPA programs and those of other federal agencies. ... the Agency has retained the discretion to select a cleanup level outside the range in appropriate circumstances (e.g., where concerns about sensitive populations, synergistic effects among chemical mixtures, etc., suggest that the remedy should attain a level below  $10^{-6}$ . The use of a range of acceptable risk is general practice for most government programs. As discussed below in the section on role of cost, it affords the Agency the flexibility to take into account different situations, different kinds of threats, and different kinds of technical remedies. If a single risk level had been adopted, (e.g., at the more stringent end of the risk range), fewer alternatives would be expected to pass the protectiveness threshold and qualify for consideration in the balancing phase of the remedy selection process.” (Id., 20 ELR 10237 [footnotes omitted].)

considerations. Again, the DSEIR has cherry-picked a threshold of significance to avoid finding the Project's cancer risk impact significant.

Also, CEQA neither requires nor allows the City to use the EPA's judgment of "acceptable" cancer risk to determine the significance of the Project's impacts. The City's discretion to decide that significant environmental harm is "acceptable" in light of the project's benefits arises at the end of the CEQA analysis, in the context of a statement of overriding considerations, not at the beginning of the process, in determining whether impacts are significant.

A statement of overriding considerations is required, and offers a proper basis for approving a project despite the existence of unmitigated environmental effects, only when the measures necessary to mitigate or avoid those effects have properly been found to be infeasible. (Pub. Resources Code, § 21081, subd. (b).) Given our conclusion the Trustees have abused their discretion in determining that CSUMB's remaining effects cannot feasibly be mitigated, that the Trustees' statement of overriding circumstances is invalid necessarily follows. CEQA does not authorize an agency to proceed with a project that will have significant, unmitigated effects on the environment, based simply on a weighing of those effects against the project's benefits, unless the measures necessary to mitigate those effects are truly infeasible. Such a rule, even were it not wholly inconsistent with the relevant statute (*id.*, § 21081, subd. (b)), would tend to displace the fundamental obligation of "each public agency [to] mitigate or avoid the significant effects on the environment of projects that it carries out or approves whenever it is feasible to do so" (*id.*, § 21002.1, subd. (b)).

*City of Marina v. Board of Trustees of the California State University* (2006) 39 Cal.4th 341, 368-69.

This is a critical distinction, because where the Project does not exceed thresholds of significance that are erroneously inflated by the concept of "acceptable risk," the City is absolved of further legal obligation to mitigate the impact. As a result, the public cannot know whether the City will allow an unknown number of cancer cases to occur that it could have feasibly avoided had it scrupulously followed CEQA. Nor does the public know, had the EIR determined that 46 additional child cancer cases per one million persons is significant, whether or not the City would have found the Project's benefits outweigh its environmental and adverse human health effects.

**(b) The SEIR's reliance on "the ambient cancer risk in the most pristine portions of the Bay Area" to support its chosen threshold of significance for TACs is incoherent and inconsistent with CEQA.**

In its comments on the DSEIR, the Alliance criticized the DSEIR's attempt to support its

“100 in a million excess cancer cases” threshold by stating: “The 100 in a million excess cancer cases is also consistent with the ambient cancer risk in the most pristine portions of the Bay Area based on the District’s recent regional modeling analysis.” (DSEIR p. 5.4-13, citing the 2009 BAAQMD Justifications report, p. 67). (See July 26 Lippe, pp. 16-18.) As the Alliance pointed out, neither the DSEIR nor the 2009 BAAQMD Justification report explains what this means. For example, how are “excess” cancer cases “consistent” with “ambient” cancer risk? What does “most pristine” mean? On a scale of 1 to 10, are Mission Bay and the “most pristine areas” separated by 1 unit, or 10 units, or somewhere in between? (See July 26 Lippe, p. 18.)

The RTC responds that: “It should be noted that when BAAQMD developed its 100 in one million cumulative criterion characterized in its CEQA Air Quality Guidelines as reflective of air quality in a ‘pristine’ portion of the Bay area, it was originally designated as its “Point Reyes” approach, reflecting the air quality in this National Seashore that the U.S. Park Service identifies as a Class I Park and wilderness area. Consequently, even such pristine areas as Point Reyes National Seashore can have a sizeable background cancer risk, largely due to cumulative global atmospheric transport.” (FSEIR, Vol. 4, p. 13.13-27.)

This is a remarkable revelation, because here, the SEIR’s calculation of this Project excess cumulative cancer risk is based on modeling only local TAC sources in the immediate vicinity of the Project and excludes any consideration of this admitted background risk from regional or global sources. As Paul Rosenfeld and Jessie Jaeger explain, the excess cancer risk from cumulative non-Project sources identified in the SEIR (26 excess cancers at Hearst Tower and 44 excess cancers at UCSF Hospital) was based on modeling that takes into account only local sources such as San Francisco’s roadways and Caltrain.<sup>36</sup> Indeed, the documentation for the modeling of Air Pollution Exposure Zones cited by the DSEIR specifically states:

When discussing the maps and drawing conclusions from them, it is important to consider what they portray and how they were produced. Specifically, the dispersion modeling, from which the maps are derived, produced concentrations and risk estimates from direct emissions. The maps themselves therefore portray concentrations of directly emitted PM2.5 and cancer risk associated with directly emitted TAC *at locations near the sources of these emissions. The results do not reflect regional or long-range transport of air pollutants.* Nor do they include the effects of the chemical transformation (formation or loss) of pollutants.<sup>37</sup>

As a result of its exclusive focus on local sources, the SEIR’s assessment of this Project’s excess cumulative cancer risk improperly excludes the ambient cancer risk from regional, statewide, or globally transported TACs from the pre- project, existing-conditions, “baseline.”

---

<sup>36</sup> Nov 20 SWAPE, Exhibit 1 hereto, pp. 4-7.

<sup>37</sup> BAAQMD, SFDPH, and SFPD, *The San Francisco Community Risk Reduction Plan: Technical Support Documentation*, December 2012, p. 37.

The omission was material. This Project's modeled excess cancer risk is 18 in one million for children resident in the UCSF Hearst Tower and 12 in one million for children at the UCSF Hospital. (FSEIR, Table 5.4-11, Revised, p. 14-121.) The HRA reports that the cumulative risk for these receptors, caused by TAC sources from the citywide modeling of local sources and by the Project sources, will be 44 and 56 excess cancers respectively. (*Id.*) But as the RTC now reveals, and Rosenfeld and Jaeger further explain, this risk does not include the baseline risk from regional or globally transported TACs.<sup>38</sup> When that non-local risk is included (i.e., 100 cancers per million), the resulting sum is well over 100 cancers per million. Yet the SEIR fails to disclose this as a significant impact.

Furthermore, in its justification of the cumulative threshold of significance, the SEIR does not explain why it makes sense to count only those excess cancers caused by local sources against the limit of 100 "acceptable" excess cancers. Indeed, the DSEIR's initial reference to "pristine" conditions affected only by the cumulative global atmospheric transport of TACs was incoherent. But when pressed, the RTC now discloses that the SEIR, without explanation or justification, simply ignores the contribution of regionally or globally transported TACs to this Project's cumulative excess cancer risk. The fact that TACs from a particular source may attenuate with distance does not explain why the cumulative background TACs from all sources, including more distant sources, should be ignored in a cumulative analysis.<sup>39</sup> CEQA requires consideration of all related sources of risk in cumulative analysis.

The regionally or globally transported background TACs responsible for 100 excess cancers are not included in, or related to, the SEIR's analysis in any fashion. The SEIR evaluates non-project cumulative TAC impacts by modeling TAC concentrations attributable to specifically identified local TAC sources.<sup>40</sup> Significance is determined by comparing the excess cancers from the modeled local sources to the 100 per million excess cancer threshold. However, if background regionally or globally transported TACs are already responsible for 100 excess cancers, then the SEIR should start with the conclusion that existing global projects are already responsible for a significant cumulative impact. Instead, the SEIR has committed the fundamental error of failing to add the Project's effects to the complete baseline for purposes of

---

<sup>38</sup> As Rosenfeld and Jaeger explain, the SEIR's focus on local sources in evaluating cumulative excess cancers may be consistent with BAAQMD guidance, which restricts cumulative analysis to sources within a 1,000 foot radius. (20 SWAPE, Exhibit 1 hereto, p. 4) BAAQMD guidance justifies ignoring non-local sources because at 1,000 feet the risk from a particular source is sufficiently attenuated as to be indistinguishable from the background TAC risk. However, that does not mean that the background risk is zero or that the background risk should be ignored in cumulative analysis. BAAQMD guidance cannot justify violating CEQA's requirement to consider all related source of a cumulative impact.

<sup>39</sup> For example, the SEIR does not propose to ignore the cumulative effects of globally transported greenhouse gasses.

<sup>40</sup> Nov 20 SWAPE, Exhibit 1, pp. 4-5.

determining significance.<sup>41</sup>

As a result, the SEIR unjustifiably limits the geographic scope of its cumulative impact analysis to local sources, while admitting that the risk is affected materially by regionally or globally transported sources. An agency may not arbitrarily limit the geographic scope of cumulative analysis or omit relevant projects.<sup>42</sup> Lead agencies must “define the geographic scope of the area affected by the cumulative effect and provide a reasonable explanation for the geographic limitation used.” (CEQA Guidelines, § 15130(b)(3), emphasis added; *Citizens to Preserve the Ojai v. County of Ventura* (1985) 126 Cal.App.3d 421, 430 (failure to explain limited scope of cumulative analysis is error); *Bakersfield Citizens, supra*, 124 Cal.App.4th at 1216 (same).) Here, the SEIR provides no explanation, reasonable or otherwise, for omitting the 100 excess cancers attributed to non-local, regionally or globally transported TACs from its analysis.

**(c) The SEIR is inadequate because it omits a project-specific assessment of TAC health risks.**

The DSEIR identified TACs as a health risk, particularly to children, and explained that BAAQMD requires a Health Risk Assessment (HRA) if there is a potential public health risk. (DSEIR, p. 5.4-11.) The DSEIR provides an HRA in the Air Quality Appendix and summarizes its result in Table 5.4-11. (DSEIR, p. 5.4-49.) The HRA shows that, even after mitigation, the Project’s TACs will cause an excess cancer risk of 46 in one million for children resident in the UCSF Hearst Tower and 42 in one million for children at the UCSF Hospital. (DSEIR, Table 5.4-11, p. 5.4-49.) The HRA reports that the cumulative risk for these receptors, caused by the Project’s TAC sources and by background TAC sources, will be 72 and 86 excess cancers respectively. (*Id.*)

The DSEIR adopts the following threshold of significance for the health risk analysis for TACs:

---

<sup>41</sup> See *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 722-723; *Friends of the Eel River v. Sonoma County Water Agency* (2003) 108 Cal.App.4th 859, 881-882. Indeed, the significance of a cumulative impact depends on the environmental setting in which it occurs, including the severity of existing environmental harm. (*Communities for a Better Environment v. California Resources Agency* (“*Communities*”) (2002) 103 Cal.App.4th 98, 120 “[T]he relevant question”... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether “any additional amount” of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project’s contribution to cumulative impacts as significant”].)

<sup>42</sup> *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 721-724 (error to confine cumulative air quality analysis to County where evidence showed sources were basin-wide); *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1213-1214 (ignoring other impact sources was “overarching legal flaw”).

The threshold of significance used to evaluate health risks from new sources of TACs associated with the project is based on the potential for the proposed project to substantially affect the extent and severity of the Air Pollutant Exposure Zone 41 at sensitive receptor locations. The health protective standards used for determining the Air Pollutant Exposure Zone and evidence supporting these standards are discussed in the Setting section above and were developed in consultation with BAAQMD staff as part of the preparation of a Community Risk Reduction Plan.[] The project site is not within an identified health vulnerable zip code; therefore the Air Pollutant Exposure Zone criteria for this location is based on: (1) cumulative PM<sub>2.5</sub> concentrations greater than 10 µg/m<sup>3</sup>, and/or (2) excess cancer risk from the contribution of emissions from all modeled sources greater than 100 per one million population. For projects that could result in sensitive receptor locations meeting the Air Pollutant Exposure Zone criteria that otherwise would not occur without the project, a proposed project that would emit PM<sub>2.5</sub> concentration above 0.3 µg/m<sup>3</sup> or result in an excess cancer risk greater than 10.0 per million would be considered a significant impact. The 0.3 µg/m<sup>3</sup> PM<sub>2.5</sub> concentration and the excess cancer risk of 10.0 per million persons exposed are the levels below which the BAAQMD considers new sources not to make a considerable contribution to cumulative health risks. [] For those locations already meeting the Air Pollutant Exposure Zone criteria, a lower significance standard is required to ensure that a proposed project's contribution to existing health risks would not be significant. Since the project is not within an Air Pollutant Exposure Zone, the above thresholds apply to the proposed project.

(DSEIR, p. 5.4-27, emphasis added, footnotes omitted.) Thus, the DSEIR would find a TAC “significant impact” based on excess cancers only if 1) the cumulative risk from all sources were greater than 100 excess cancers and 2) the project itself contributed more than 10 excess cancers. Similarly, the DSEIR would find a TAC “significant impact” based on PM<sub>2.5</sub> concentrations only if 1) cumulative PM<sub>2.5</sub> concentrations were greater than 10 ug/m<sup>3</sup> and 2) the project itself contributed more than 0.3 ug/m<sup>3</sup> to that PM<sub>2.5</sub> concentration.

Although the HRA reports that the Project would cause well over 10 excess cancers (DSEIR, Table 5.4-11, p. 5.4-49) and its operations would increase PM<sub>2.5</sub> concentrations more than 0.3 ug/m<sup>3</sup> (DSEIR, Table 5.4-10, p. 5.4-48), the DSEIR concludes that the “cancer risk would be less than significant with mitigation” because no offsite receptors would meet the Air Pollution Exposure Zone (APEZ) criteria of PM<sub>2.5</sub> concentration over 10 ug/m<sup>3</sup> or 100 excess cancers.<sup>43</sup> (DSEIR, pp. 5.4-48, 5.4-49.)

---

<sup>43</sup> The DSEIR reports that the City and BAAQMD modeled health risks from TACs throughout the City from roadways, permitted stationary sources, port and maritime sources, and Caltrain sources in 2012 to identify areas in which the excess cancer risk from all modeled sources was greater than 100 in one million to identify Air Pollution Exposure Zones and that the Project is not located in such a zone. (DSEIR, p. 5.4-12.)

The DSEIR's discussion of the methodology for its analysis of cumulative TAC impacts equates the project-level and cumulative analyses as follows:

... the HRA takes into account the cumulative contribution of localized health risks to sensitive receptors from sources included in the Citywide modeling plus the proposed project's sources. Other future projects, whose emissions have not been incorporated into the existing Citywide health risk modeling, such as Pier 70 and Seawall Lot 337/Pier 48 would similarly be subject to CEQA requirements to analyze the health risk impact of their project. However, health risk impacts are localized, and health risks from sources decrease substantially with increasing distance.[] Thus cumulative impacts from the Pier 70 and Seawall Lot 337/Pier 48 would not combine with the proposed project's emissions to substantially increase health risks within the project vicinity. Thus, because the project-level analysis includes health risks from all known existing sources, the project-level analysis is also a cumulative health risk analysis.

(DSEIR, p. 5.4-28, emphasis added, footnote omitted.)

In comments on the DSEIR, The Alliance objected that the DSEIR ignored BAAQMD's stated threshold of risk of 10 excess cancers for single source impacts and instead relied only on the BAAQMD 100 excess cancer risk for assessing cumulative impacts.<sup>44</sup> The Alliance objected that the acknowledged Project-caused risks of 46, 38, and 42 excess cancers (to child residents of Hearst Tower, adult residents of Hearst Tower, and child residents of UCSF Hospital respectively) exceed the BAAQMD thresholds for determining the significance of single source impacts.<sup>45</sup>

In support of these comments, the Alliance provided a technical letter from Paul Rosenfeld and Jessie Jaeger explaining that the DSEIR should have applied the BAAQMD threshold of 10 excess cancers or an increase of PM2.5 concentrations greater than 0.3 ug/m3 to the Project's individual impact. (July 20 SWAPE, pp, 8-10.) Rosenfeld and Jaeger explained that BAAQMD intended that the 10 in one million excess cancer threshold apply to all sources of emissions from a single project.

The FSEIR response AQ-1c to these DSEIR comments objecting to the lack of a project-specific TAC significance determination argues that the DSEIR did not ignore BAAQMD's 10 excess cancer threshold for individual projects because the DSEIR thresholds "are based on a combination of the BAAQMD 2010 CEQA Guidelines and assessments by the City of localized sources of toxic air contaminants and proximity to sensitive receptors." (FSEIR, p. 13.13-25, emphasis added.) The FSEIR argues that the "the project site conditions were such that the [10

---

<sup>44</sup>July 26 Lippe, pp. 13-18.

<sup>45</sup>*Id.* at 13-15.

in one million excess cancer] threshold did not apply in this instance as further explained below.” *Id.* The explanation is that the DSEIR would only apply the 10 excess cancer threshold for individual projects only if there is a significant cumulative impact, i.e., only if the Project’s sensitive receptors were located in an APEZ:

The City in partnership with the BAAQMD has identified the Air Pollutant Exposure Zone in the City – areas with poor air quality under existing and cumulative conditions[.]. The project site is not located within an Air Pollutant Exposure Zone. The SEIR states that in such a case, if the project could result in sensitive receptor locations meeting the Air Pollutant Exposure Zone criteria that otherwise would not occur without the project, a significant impact would occur if the proposed project results in an excess cancer risk greater than 10.0 per million (page 5.427). The analysis demonstrated that the project would not result in sensitive receptor locations meeting the Air Pollutant Exposure Zone criteria. Therefore, the 10.0 per million excess cancer risk criterion does not apply.

(FSEIR, p. 13.13-25, emphasis added, footnotes omitted.)

The FSEIR also provides a new HRA based on changes to the project description that relocate three emergency diesel generators and reduce Project-caused excess cancers. (FSEIR, p. 13.13-27; FSEIR, Appendix AQ2, pp. 9-17.) Because the revised Table 5.4-11 no longer shows unmitigated cumulative TAC impacts greater than 100 excess cancers and because the FSEIR accordingly determines that mitigation is not required for this impact, the FSEIR concludes that the impact is “less than significant” rather than “less than significant with mitigation.” (FSEIR, p. 14-121.)

The Alliance responded to the FSEIR by reiterating that the DSEIR fails to provide a project specific assessment of TAC health risks.<sup>46</sup> The Alliance explained that this omission is prejudicial by submitting a letter report from Paul Rosenfeld and Jessie Jaeger explaining that the Project’s impacts exceed the 10 excess cancer in one million risk thresholds for project-specific analysis used by BAAQMD and the majority of California air districts.<sup>47</sup>

As the attached letter from Paul Rosenfeld and Jessie Jaeger explains, the FSEIR’s new HRA also fails to assess individual health risk from proposed project by comparing it to a project-specific threshold of significance.<sup>48</sup> The project will still, by itself, cause excess cancers in excess of the 10 excess cancer threshold used by the majority of California air districts to determine the significance of project-specific impacts. In particular, child residents of Hearst

---

<sup>46</sup>Nov 2 Farrow, pp. 1-3.

<sup>47</sup>Nov 2 SWAPE, pp. 2-4.

<sup>48</sup>Nov 20 SWAPE, Exhibit 1, pp. 2-4.

Tower will suffer a risk of 18 excess cancers and child residents of UCSF Hospital will suffer a risk of 12 excess cancers. (FSEIR, Table 5.4-11, p. 14-121.)

The SEIR's failure to provide a project-specific assessment of the Project's TAC impact was legally erroneous and prejudicial to informed public participation and decision making.

As the Alliance objected, the DSEIR fails to provide a project-specific assessment of TAC health risks because it does not adopt and does not apply a threshold of significance for the project-specific impact. The SEIR's only thresholds of significance for TACs are thresholds for cumulative impacts. The SEIR's thresholds would find a considerable contribution to a significant cumulative impact only if (1) there were 100 excess cancers from all sources and (2) the project itself contributed 10 excess cancers. The SEIR's approach is wrong as a matter of law because it conflates project-specific and cumulative analysis and because it assumes without justification that the only relevant thresholds are the thresholds for cumulative impacts. This ignores the significance of the actual cancers the Project causes, by itself, independent of the cumulative context.

CEQA requires that an EIR assess both project-specific and cumulative impacts. (CEQA Guidelines, §§ 15126.2, 15130.) Because assessment of project-specific and assessment of cumulative impacts are distinct obligations, they require distinct thresholds of significance. Whereas a project-specific analysis requires only that an EIR compare a project's effects to a single threshold, cumulative analysis requires two thresholds because cumulative impact analysis is a two-step process. In cumulative analysis an agency must separately (1) determine whether the impacts of the project in combination with those from other projects with related impacts are cumulatively significant by comparing that total impact to a "step-one" threshold, and (2) if so, determine whether the project's own effect is a considerable contribution by comparing the project's own effect to a "step-two" threshold. (CEQA Guidelines, § 15130(a); *see* Kostka and Zischke, *Practice Under the California Environmental Quality Act* (2nd Ed., 2011 Update), §§ 13.39. 15.52; Remy, Thomas, et al, *Guide to CEQA* (11th Ed., 2007), pp. 474-475.)

CEQA recognizes that the thresholds used for project-specific analysis and for the second step of cumulative analysis differ. The step-two threshold of significance in cumulative analysis is used to determine whether the project's contribution to a significant cumulative impact is "considerable," i.e., "whether 'any additional amount' of effect should be considered significant in the context of the existing cumulative effect." (*Communities for a Better Environment v. California Resources Agency* ("CBE") (2002) 103 Cal.App.4th 98,119.) Even if a project's impact is "individually minor" and, thus, not found significant in a project-specific analysis, it may make a considerable contribution because it is "collectively significant." (*Id.* at 119-120; *Los Angeles Unified School Dist. v. City of Los Angeles* ("LAUSD") (1997) 58 Cal.App.4th 1019, 1025-1026.) Indeed, the step-two threshold may need to be a sliding scale because "the greater the existing environmental problems are, the lower the threshold should be for treating a project's contribution to cumulative impacts as significant." *CBE*, *supra*, 103 Cal.App.4th at 120. In sum, because CEQA specifically recognizes that the step-two threshold in cumulative analysis

may be lower than the threshold to determine whether an impact is individually significant, there can be no *a priori* assumption that the project-specific threshold is the same as the threshold for step-two in a cumulative analysis.

Here, the SEIR does not provide, much less justify, any threshold for a project-specific analysis. The only form of analysis is the two-step cumulative analysis under which the SEIR first determines whether cumulative risk exceeds 100 cancers and then goes on to consider whether the a project makes a considerable contribution. The SEIR simply declines to consider whether the Project's TAC impacts would be individually significant.

Not only is the omission of a separate project-specific analysis erroneous as a matter of law, it runs counter to the BAAQMD guidance. BAAQMD's 2009 Justification Report recommends a CEQA threshold for siting a new project of 10 excess cancers, applicable to stationary, area, and mobile sources of TAC emissions.<sup>49</sup> This is a project-specific, not a cumulative threshold. The 2009 Justification Report separately recommended cumulative threshold: 100 excess cancers from all sources within 1,000 feet.<sup>50</sup> Similarly, the May 2010 BAAQMD Guidelines identify separate thresholds for individual projects and for cumulative sources. Under that guidance, risk from an individual project is significant if it increases cancer risk by more than 10 in one million.<sup>51</sup> Risk from all sources is cumulatively significant if the risk from any source results in a total risk greater than 100 excess cancers.<sup>52</sup> Furthermore, the May 2010 BAAQMD Guidelines specifically provides that the "cumulative threshold sets a level beyond which any additional risk is significant."<sup>53, 54</sup> Thus, contrary to the SEIR's implication,

---

<sup>50</sup> *Id.* at 68.

<sup>51</sup> BAAQMD, California Environmental Quality Act Guidelines Update, Proposed Air Quality CEQA Thresholds of Significance, May 3, 2010, p. 33.

<sup>52</sup> *Id.* at 34; *see also id.* at 46 ("Projects proposed in areas where a CRRP [Community Risk Reduction Plan] has not been adopted and that have the potential to expose sensitive receptors or the general public to emissions-related risk in excess of the following thresholds from the aggregate of cumulative source would be considered to have a significant air quality impact. ... Emissions from a new source or emissions affecting a new receptor would be considered significant where ground-level concentrations of carcinogenic TACs from any source result in an increased cancer risk greater than 100.0 in one million.")

<sup>53</sup> BAAQMD, California Environmental Quality Act Guidelines Update, Proposed Air Quality CEQA Thresholds of Significance, May 3, 2010, p. 36, emphasis added.

<sup>54</sup> These risk thresholds for evaluating the significance of the risks from single source impacts and from cumulative sources are also set out in BAAQMD's 2011 update. *See* BAAQMD, California Environmental Quality Act Air Quality Guidelines, updated May 2011, pp. 5-3 (identifying 10 excess cancers as the threshold of significance for siting an individual new project), 5-15 (identifying 100 excess cancers as the cumulative threshold of significance). The individual project and cumulative risk thresholds are separately

the BAAQMD guidance does not permit an additional 10 excess cancers without mitigation where the cumulative risk is under 100.

The fact that BAAQMD calls for a cumulative significance determination and for mitigation when cumulative excess cancers from sources within the 1,000 foot zone of influence are over 100 per million if a project adds any excess cancers does not vitiate the validity of a project-level threshold of 10 per million. A project may make a considerable contribution to a significant cumulative impact even when the project-specific impact is individually minor and not significant. (*CBE, supra*, 103 Cal.App.4th at 119-120; *LAUSD, supra*, 58 Cal.App.4th at 1025-1026.) Conversely, a project make cause a significant impact by itself even if the cumulative impact is not significant. The SEIR simply ignores this fact. But this project level impact must be evaluated and disclosed in the SEIR.

The City of San Francisco has in the past applied the BAAQMD thresholds to provide distinct project-specific and cumulative analyses. For example, the 801 Brannan and One Henry Adams Streets Project DEIR states:

The following are thresholds for project-specific impacts: (1) an increase in lifetime cancer risk of 10 chances in one million, (2) an increase in the noncancer risk equivalent to a chronic or acute “Hazard Index” greater than 1.0,[ft] or (3) an increase in the annual average concentration of PM2.5 in excess of 0.3 micrograms per cubic meter. BAAQMD also recommends cumulative thresholds of 100-in-one-million cancer risk, a Hazard Index greater than 10.0, and a PM2.5 concentration greater than 0.8 micrograms per cubic meter.<sup>55</sup>

Accordingly, that EIR separately evaluates and identifies both project-specific impacts and cumulative impacts by preparing distinct analyses as to whether 1) the project itself causes more than 10 excess cancers or 2) cumulative sources cause more than 100 excess cancers.<sup>56</sup> This is as it should be, because CEQA recognizes that the project-specific and cumulative analyses are distinct obligations.

---

stated and not dependent on each other. Individual risks are significant if the project causes over 10 excess cancers. (*Id.* at 5-3.) And where the cumulative risk is over 100 excess cancers there is no minimum contribution required from a project to trigger a cumulative significance determination with the obligation to mitigate: “A project would have a significant cumulative impact if the total of all past, present, and foreseeable future sources within a 1,000 foot radius (or beyond where appropriate) from the fence line of a source, or from the location of a receptor, plus the contribution from the project exceeds the following: . . . [a]n excess cancer risk levels of more than 100 in one million ... or 0.8 ug/m3 annual average PM2.5.” (*Id.* at 5-15.)

<sup>55</sup> 810 Brannan and One Henry Adams Streets Project DEIR, Exhibit 2, p. 266.

<sup>56</sup> *Id.*, pp. 281-284 (separately determining that project-specific impacts would be significant because excess cancers are over 10 and that cumulative impacts would be significant because over 100).

The City has also in the past found project-specific impacts to be significant because individual project TAC risk exceeds 10 excess cancers *even when the cumulative risk does not exceed 100 excess cancers*. For example, the EIR for the 706 Mission Street project concluded that cumulative TAC impacts from that would not be significant because excess cancers would not exceed 100.<sup>57</sup> The same EIR determined that the project-specific construction TAC impact would be significant because construction would cause 27.3 excess cancers.<sup>58</sup> Accordingly, mitigation was proposed to reduce risk below the project-specific threshold of 10 excess cancers.

Here, based on the SEIR's own analysis, the result should be the same as occurred in 706 Mission Street project EIR: the individual risk is acknowledged to be over 10 excess cancers even though the cumulative risk is reported to be under 100. Thus, the consequence of the omission of a project-specific analysis is the failure to disclose that the project will cause a significant impact, by itself, regardless of the cumulative context. It is undisputed that the Project will cause a risk of at least 12 excess cancers to child residents of the UCSF Hospital and at least 18 excess cancers to child residents of Hearst Tower (FSEIR, p. 14-121) and that this increased risk exceeds the project-specific threshold of significance recommended by the majority of California air districts, including BAAQMD.<sup>59</sup>

Because OCII did not propose, justify, or apply a threshold of significance for project-specific impacts, the EIR is legally inadequate. Regardless of the conclusion that the EIR might have reached had it provided and justified a project-specific threshold of significance and applied it in a project-specific analysis, the EIR is insufficient as an informational document without this analysis. The omission is prejudicial because there is substantial evidence that a project-specific analysis would have disclosed a significant unmitigated impact. Under the circumstances, the EIR must be revised and recirculated.

The FSEIR fails to address the gravamen of the comments objecting to the absence of a project-specific analysis. The FSEIR responds to these objections by claiming that the DSEIR "did not ignore the threshold of 10 per one million for individual projects emissions," arguing that this BAAQMD threshold simply did not apply because cumulative impacts are not significant. (FSEIR, p. 13.13-25.) This response simply conflates the project-specific and cumulative analyses, as explained above.

<sup>57</sup> 706 Mission Street- The Mexican Museum and Residential Tower Project DEIR, June 27, 2012, Exhibit 3, pp. IV.G47 to IV.G.50.

<sup>58</sup>Exhibit 3, at pp. IV.G31 to IV.G.36.

<sup>59</sup>Nov 20 SWAPE, Exhibit 1, p. 2.

**(d) The SEIR's assessment of cumulative TACs is invalid because it fails to include all sources of related impacts.**

The DSEIR's analysis of cumulative TAC sources other than the Project-caused sources was based on a local-scale citywide modeling effort conducted in 2012. (DSEIR, p. 5.4-11 to 5.4-12, 5.4-28.) Thus, the background cumulative non-Project risk of excess cancers from TACs was taken from "the Citywide HRA database for all receptors." (DSEIR, Appendix AQ, Table 6.1-8, fn 5; *see also* FSEIR, Appendix AQ2, Table 6.1-8, fn. 6 (same).) This cumulative background risk is stated as 44 excess cancers in one million for child receptors at the UCSF Hospital and 26 in one million for child and adult receptors at the Hearst Tower. *Id.* The DSEIR acknowledges that the prior environmental review for the Mission Bay project did not quantitatively assess TACs. (DSEIR, p. 5.4-50.)

The Alliance has objected that the cumulative analysis did not in fact evaluate all sources of TACs that would affect sensitive receptors because it omits foreseeable future sources of TACs from adjacent development already approved as part of the Mission Bay redevelopment program. (Nov 2 Farrow FSEIR, p. 3.) The Alliance demonstrated that the omission was prejudicial by submitting a technical report from Paul Rosenfeld and Jessie Jaeger explaining that the SEIR fails to include foreseeable future development in its analysis of cumulative TAC health risks.<sup>60</sup> Rosenfeld and Jaeger explain that the City's designation of Air Pollution Exposure Zones does not include TAC impacts in the Project area from the future redevelopment of the Mission Bay area. This build-out was projected in the Mission Bay EIR to generate 218,549 vehicle trips and 2,684 truck trips per day. This level of additional traffic has the potential to cause excess cancers greater than the 100 cancer threshold identified by the EIR for a significant cumulative impact.

Cumulative analysis must include all sources of "related impacts," including past, present, and potential future projects. (CEQA Guidelines, § 15130(a)(1), (b).) The unjustified omission of related sources of TACs is an error because without this disclosure the public and decision makers cannot "determine whether such information would have revealed a more severe impact." (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 720, 724.) The future development of the rest of the Mission Bay project is clearly foreseeable because it has already been approved at the program level. The Warriors Arena Project is but one phase of the overall Mission Bay project. The California Supreme Court has held that it is error for an EIR for one phase of a project to omit impacts from future phases in its analysis of cumulative impacts. (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 396.) The omission of this foreseeable future development is error.

The DSEIR implies that impacts from future development may be ignored because "[o]ther future projects, whose emissions have not been incorporated into the existing Citywide health risk modeling ... would similarly be subject to CEQA requirements to analyze the health

---

<sup>60</sup>Nov. 2 SWAPE, pp. 4-12.

risk impact of their project.”<sup>61</sup> (DSEIR, p. 4.4-28.) However, the SEIR may not tier from future environmental reviews: “CEQA’s informational purpose ‘is not satisfied by simply stating information will be provided in the future.’” (*Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 440-441 (emphasis in original).)

**(e) The FSEIR fails to provide good-faith response to comments objecting to the analysis of TAC health risks, and the TAC analysis is inadequate because OCII failed to use its best efforts to use current science.**

The SEIR’s HRA determines the number of excess cancers from the Project itself based on the modeled concentration of TACs from construction and operation of the Project, toxicity values for those TACs and a number of exposure parameters. (DSEIR, Appendix AQ, pp. 9-17; FSEIR Appendix AQ2, pp. 9-17.) The exposure parameters are intended “to estimate excess lifetime cancer risks for all potentially exposed populations for the construction and operation” of the Project. (FSEIR, App. AQ2, p. 13.) These exposure parameters include daily breathing rate, exposure time, exposure frequency, exposure duration, averaging time, and intake factor for inhalation. (DSEIR, Appendix AQ, p. 14; FSEIR Appendix AQ2, p. 14.) The SEIR reports that the exposure parameters are based on 2003 guidance from Cal/EPA’s Office of Environmental Health Hazard Assessment (OEHHA) and 2010 guidance from BAAQMD.

As noted above, the DSEIR’s analysis of cumulative TAC sources other than the project-caused sources was based on citywide modeling in 2012. (DSEIR, p. 5.4-11 to 5.4-12, 5.4-28.) The background cumulative non-Project risk of excess cancers from TACs was taken from “the Citywide HRA database for all receptors.” (DSEIR Appendix AQ, Table 6.1-8, fn 5.) The SEIR does not report the exposure parameters that were used for that 2012 modeling.

Comments on the DSEIR objected that the health risk assessment fails to use the most recent OEHHA Air Toxics Hotspots Program Risk Assessment Guidelines. (July 19 Gilbert, pp. 13-14.) The comments pointed out that current OEHHA exposure parameters call for the use of differential breathing rates for each age period in a health-risk analysis and incorporate higher breathing rates for children than those used in the SEIR’s HRA. The comments conclude that the SEIR’s HRA likely underestimates potential excess cancer risks due to its use of out-of-date data. The comments requested that the EIR recalculate excess cancers using differential breathing rates, including the correct daily breathing rate for children.

In response, the FSEIR does not dispute the validity of the new OEHHA guidance. Indeed, the FSEIR admits that BAAQMD intends to use the revised guidance in the future. (FSEIR, p. 13.13-50.) However, the FSEIR declines to provide a new assessment of health risks based on differential breathing rates, including the current understanding of children’s breathing

---

<sup>61</sup>The DSEIR mentions Pier 70 and Seawall Lot 337/Pier 48 as examples of such future projects, and then dismisses their impacts because they are allegedly too distant to affect the same receptors. (DSEIR, p. 5.4-28.) But the DSEIR ignores the Mission Bay buildout adjacent to the project.

rates, or to discuss the likely effect of the use of correct breathing rates in the analysis. The FSEIR argues 1) that the new OEHHA guidance post-dates the Notice of Preparation, 2) that air districts may not always adopt OEHHA guidance timely, and 3) that the San Joaquin Valley Air Pollution Control District responded to the new breathing rates by increasing its threshold of significance to one that is less stringent than OEHHA recommends. (*Id.*) The FSEIR also argues that because the analysis in the DSEIR is consistent with the methods previously used to determine existing risks it “represents a valid conservative estimate of incremental health risk.” *Id.*

As noted, the FSEIR also provides a new HRA based a change to the Project description, which relocates three emergency diesel generators. (FSEIR, p. 13.13-27; FSEIR, Appendix AQ2, pp. 9-17.) Despite the necessity of recalculating all of the Project-caused excess cancers, the new HRA does not use the current OEHHA breathing rates.

The Alliance objected that the FSEIR had not provided the requested analysis.<sup>62</sup> The Alliance objected that the FSEIR response fails to acknowledge that OEHHA had recommended the higher children’s breathing rates in guidance issued in 2012, well before the 2014 Notice of Preparation. *Id.* The Alliance provided technical analysis demonstrating that the effect of the increased breathing rate can be to approximately double the excess cancer risk for children for some TAC sources compared to analysis using the out-of-date breathing rate assumption. *Id.*

Paul Rosenfeld and Jessie Jaeger reiterate that the effect of the currently recommended differential breathing rates can be to materially increase the excess cancer risk for children from Project-caused TACs compared to analysis using the out-of-date breathing rate assumption (see Exhibit 1).<sup>63</sup> Using the data for Project-caused TAC risks from the SEIR rather than the hypothetical exposure scenario in their November 2, 2015 letter, Rosenfeld and Jaeger determined the Project-caused excess cancers for child and adult receptors at Hearst Tower and child receptors at the UCSF Hospital using the currently recommended differential breathing rates. Excess cancer risk from project-caused TACs would increase materially compared to the risks determined using the out-of-date breathing rates – from 42% to 71%. For example, risk for a child resident of the Hearst Tower from Project-caused sources would increase 71%, from 18 to 31 excess cancers.

For the TAC risks from cumulative sources, Rosenfeld and Jaeger explain that the SEIR does not disclose the necessary information to calculate excess cancers using the 2012 and 2015 OEHHA guidance. For example, the SEIR does not provide either the TAC concentrations or the exposure parameters used to determine the cumulative non-Project excess cancers, i.e., the “2014 background risk” identified in the Appendices AQ and AQ2, Table 6.1-8. However, Rosenfeld and Jaeger explain that it is apparent from the FSEIR’s characterization of these data that the

---

<sup>62</sup>Nov. 2 Farrow, pp. 4-5; Nov 2 SWAPE, pp. 12-15.

<sup>63</sup>Nov 20 SWAPE, Exhibit 1, pp 4-6.

cumulative non-Project background risk was not calculated with the differential breathing rate recommended by OEHHA in its 2012 and 2015 guidance. Accordingly, Rosenfeld and Jaeger conclude that the SEIR materially understates total risk and that the actual risk may in fact exceed the 100 excess cancer cumulative threshold for some receptors.

Comments by responsible experts raised a substantive issue regarding the currency of the data on children's breathing rates that was used to determine TAC risks. The response was anything but good-faith reasoned analysis. Even though the FSEIR provided an entirely new HRA to reflect changes to the project, the FSEIR did not provide the requested analysis, or even discuss the likely effect of the use of current data regarding children's breathing rates on the SEIR's analysis. (FSEIR, p. 13.13-50.) Instead of providing the information requested, or a discussion of its effect on the analysis, the FSEIR offered formalistic evasion.

For example, the fact that BAAQMD has not yet revised its guidance is simply irrelevant to a discussion of the substantive issue raised in the comments, i.e., the actual risk to children. The facts of children's breathing rates determine the impact, not whether BAAQMD has yet incorporated those facts into a guidance document. OCII is obliged to "use its best efforts to find out and disclose all that it reasonably can." (CEQA Guidelines, § 15144.) This requires a substantive response to the issue raised in comments.

The FSEIR responds that, in response to the information that higher children's breathing rates result in risks that are higher than they understood them to be, the San Joaquin Valley Air Pollution Control District (SJVAPCD) has apparently chosen to adopt less stringent health protection than it previously required. That response is also irrelevant and evasive. If the SJVAPCD had previously set a health-protective risk level, it is difficult to understand how its discovery that the risk to children is higher than it had understood could justify relaxing that health-protective standard. If SJVAPCD's previous threshold was set and then relaxed based on considerations of cost or feasibility of mitigation, e.g., as a standard of "acceptable" risk, that was improper for the reasons discussed in section 6(a) above. Regardless, the FSEIR's response does not suggest that OCII or BAAQMD have changed the threshold of significance and does not suggest any basis for doing so; so the response does not address the concern in comments that the SEIR has failed to disclose the actual level of the risk. The comment requested that OCII disclose the actual risk based on current science, not that OCII re-characterize the significance of that risk.

Finally, as Rosenfeld and Jaeger explain, it is simply not true that OEHHA had not already recommended use of age-specific breathing rates, including the 1,090 L/kg-day rate for children, at the time of the Notice of Preparation.<sup>64</sup> OEHHA published and recommended use of higher, differential breathing rates for children in its *Technical Support Document for Exposure Assessment and Stochastic Analysis* in August 2012 well before the November 2014 Notice of Preparation and well before the SEIR's HRAs were prepared. This recommendation was made

---

<sup>64</sup>Nov 2 SWAPE, p. 13.

pursuant to a mandate from the Children's Environmental Health Protection Act. And, as noted, the second HRA post-dates the OEHHA March 2015 guidance, in which OEHHA again recommended use of the higher differential breathing rates. Despite this, the FSEIR argues that it is somehow relevant that the second OEHHA guidance on this topic had not been issued prior to the DSEIR. (FSEIR, p. 13.13.50.) The implication of the FSEIR that the breathing rates were not well understood or established or that they somehow remained controversial is simply disingenuous.

Refusal to respond to responsible comments from experts regarding analytic parameters with reasoned analysis, as well as mischaracterization of the currency of those parameter, are failures to meet CEQA's disclosure obligations. For example, a court set aside an analysis of TACs that was based on outdated CARB guidance after comments pointed out this flaw and the final EIR declined to provide corrected analysis:

... the use in the final EIR of data extrapolated from CARB's 1991 speciation profile # 508 for measuring aircraft emission of TAC's did not meet the standard of "a good faith effort at full disclosure" required by CEQA. (Guidelines, § 15151.) "[W]here comments from responsible experts or sister agencies disclose new or conflicting data or opinions that cause concern that the agency may not have fully evaluated the project and its alternatives, these comments may not simply be ignored. There must be good faith, reasoned analysis in response." [citation omitted] By using scientifically outdated information derived from the 1991 profile, we conclude the EIR was not a reasoned and good faith effort to inform decision makers and the public about the increase in TAC emissions that will occur as a consequence of the Airport expansion.

*(Berkeley Keep Jets Over the Bay Committee v. Board of Port Com'rs (2001) 91 Cal.App.4th 1344, 1367 [111 Cal.Rptr.2d 598, 615], as modified on denial of reh'g (Sept. 26, 2001.)*

Here, the failure to meet CEQA's mandate to use best efforts at analysis and to provide reasoned good-faith facts and analysis in response to comments was clearly prejudicial. Rosenfeld and Jaeger demonstrate that if excess cancers were determined using the OEHHA guidance for children's breathing rate rather than the outdated 2000 guidance, excess cancers would be materially increased and may exceed the threshold for a significant cumulative impact.<sup>65</sup> Because the FSEIR failed to respond substantively to the DSEIR comments and the SEIR fails to provide adequate information to determine how the changes to breathing rate data would affect the cumulative analysis, the SEIR fails as a disclosure document.

Here, the EIR should be revised and recirculated to provide a health risk assessment that is based on current science regarding the parameters that determine actual risk to children. The areas of maximum vulnerability to TACs from the Project include child receptors. (FSEIR, p. 14-

---

<sup>65</sup>Nov 2 SWAPE, pp. 14-15; Nov 20 SWAPE, Exhibit 1, pp. 5-6.

114, 14-121.) And children are the most vulnerable to TAC exposure, as evidenced by the elevated excess cancer rates for children as compared to adults. (*See, e.g., FSEIR, Table 5.4-11, p. 14-121*).

**5. Changes to the Project since Publication of the DSEIR Require Recirculation for Public Comment Due to New and More Severe Significant Impacts.<sup>66</sup>**

Under CEQA, if the project changes after publication of the Draft EIR, and these changes create a new significant impact not identified in the Draft EIR, or a substantial increase in severity of a significant impact that was identified in the Draft EIR, the lead agency must recirculate the draft EIR for public comment. (CEQA section 21092.1.)

Here, the RTC describes a number of “construction refinements”, including using dewatering generators, using a soil treatment pug mill, and removing rapid impact compaction from the construction plan. With respect to the air quality impacts of these “construction refinements” the RTC states:

The addition of the construction refinements would not substantially increase (approximately 2 percent for ROG and 4 percent for NOx) the average daily construction-related emissions disclosed in the Draft SEIR. This would not result in a substantial increase in the severity of the previously identified significant and unavoidable impact, and the same mitigation measures would apply requiring the project sponsor to minimize construction emissions.

(RTC, p 12-22.)

The RTC also describes a new variant, the Muni UCSF/Mission Bay Station Variant, and discloses that:

The Muni UCSF/Mission Bay Station Platform Variant would not substantially increase (approximately 2 percent for ROG and 5 percent for NOx) the average daily emissions disclosed in the Draft SEIR for the proposed project (see Table 5.4-7, page 5.4-31). Furthermore, Mitigation Measure M-AQ-1 (Construction Emissions Minimization) would also apply to the variant. While the estimated construction emissions under the variant shown in Table 12-2 are slightly higher than those identified for the proposed project in the Draft SEIR, this impact is not substantially more severe than the previously identified significant and unavoidable impact.

(RTC, p 12-22.)

---

<sup>66</sup>Nov. 2 Lippe FSEIR, pp 6-7.

There are several problems with these assertions. First, the RTC does not explain whether construction refinement caused increases of 2 and 4 percent for ROG and NOx, respectively, are included within or additive to the Platform Variant caused increases of 2 and 5 percent for ROG and NOx. Without this information, the public does not know what additional quantum of ozone pollution the RTC deems insubstantial.

Assuming for the moment that the increases caused by the construction refinements and the increases caused by the Platform Variant are summed together to reach the 2 and 5 percent numbers, the RTC offers no rationale why the 2 and 5 percent increases are not considered a “substantial” increase in the severity of the previously identified significant effect that Project construction will have on ozone precursor pollution. The RTC authors apparently believe these numbers speak for themselves. They do not. In fact, reliance on these numbers appears to reflect a silent assumption that these increases above the previously identified quantities of emissions for these pollutants is “de minimis.” It must be remembered, however, that these increases are not above a previously identified less-than-significant quantity of emissions; the previously identified quantities were significant!

The RTC thus commits the exact error of law rejected by the Court of Appeal in *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98 (“CBE”), i.e., using a “de minimis” rationale or any type of simple numerical ratio of the incremental impact compared to the pre-existing impact. “[T]he relevant question... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether ‘any additional amount’ of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project’s contribution to cumulative impacts as significant.” (Id. At p. 120; see also *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 720-721.)

These increases should be considered substantial and the SEIR recirculated for public comment. Instead, the October 23, 2015, notice of publication of the Response to Comments informed the public they would have no opportunity to comment on the environmental effects of these changes in the Project.

## **C. THE SEIR IS NOT SUFFICIENT AS AN INFORMATIONAL DOCUMENT WITH RESPECT TO TRANSPORTATION IMPACTS.**

### **1. The SEIR’s Analysis of the Project’s Construction-related Traffic Congestion and Delay Impacts Is Based on Invalid Criteria.<sup>67</sup>**

The DSEIR’s analysis of the Project’s construction related traffic congestion and delay impacts is legally flawed because it is based on invalid criteria, it fails to lawfully assess the

---

<sup>67</sup>July 27 Lippe, pp. 5-7; July 23 Smith, p. 15; Nov 2 Smith FSEIR p. 22.

Project's cumulative construction period impacts, and it improperly defers the development of mitigation measures to reduce the Project's construction-related traffic impacts to less than significant.

The DSEIR states "Construction related impacts generally would not be considered significant due to their temporary and limited duration." (DSEIR, p. 5.2-46.) This statement is placed in the section describing the DSEIR's thresholds of significance. Therefore, it appears this conclusion reflects a policy decision rather than a fact-based assessment.

In the impacts analysis section, the DSEIR similarly states: "Construction related impacts generally would not be considered significant due to their temporary and limited duration." (DSEIR p 5.2-111). Elsewhere the DSEIR quantifies the construction period's "temporary and limited duration" as 26 months. (DSEIR, p. 5.2-112.) However, the notion that the DSEIR can determine the Project's construction related traffic impacts to be "less than significant" based primarily on their temporary duration is legally and logically flawed because from a cumulative standpoint, the Project's construction impacts are part of an essentially permanent, not temporary, condition of ongoing construction in this part of San Francisco. Indeed, the DSEIR's discussion of the Project's cumulative construction period impacts recognizes there are numerous other construction projects planned in Mission Bay and that the construction related traffic impacts of these projects will combine with this Project's construction related impacts. (DSEIR, p. 5.2-210 (Impact C-TR-1.)

However, the DSEIR's discussion of the Project's cumulative construction period impacts is flawed because it is constrained by several artificial limits. First, as discussed in section I.A above, the impact assessment is limited to impacts and intersections and freeway ramps within the artificially restricted geographic "study area." Second, the impact assessment considers only construction projects within the Mission Bay neighborhood without regard to whether other "past, present, or reasonably foreseeable future projects" may be "closely related" because their impacts may combine with the Project's impacts.

Third, the DSEIR's analysis of cumulative traffic impacts for *construction* of the project only references a handful of foreseeable projects located very close to the Project, and the DSEIR's discussion of these projects is solely in terms of whether their construction periods overlap with construction of this Project, as if the operational impacts of other "past, present, and reasonably foreseeable future projects" are not "closely related." (See DSEIR, p. 5.2-10 and 11.)<sup>68</sup> This is incorrect because "closely related" simply means the other projects' impacts may

---

<sup>68</sup>These projects are:

- 1.13 million gsf of UCSF LRDP projects under construction at the Mission Bay Campus, including, the UCSF East Campus project on Blocks 33/34,
- Construction of Bayfront Park,
- realignment of Terry A. Francois Boulevard,
- construction of a neighborhood park on the north side of Mariposa Street east of Owens Street,

combine with the Project's impacts.

Table 3 in the July 21 Wymer, report shows that it is possible to include a broader range of projects - across both time and area - in the assessment of the Project's cumulative construction period traffic impacts, and that when this is done, there are many Projects that will be under construction or operational in the period before, during, and after construction of the Project whose effects will combine with those of the Warriors Arena construction. Therefore, the Project's construction impacts are part of an essentially permanent, not temporary, condition of ongoing construction and increasing operational impacts from new projects in this part of San Francisco. Therefore, the SEIR errs by artificially separating the Project's construction period impacts from its operational impacts and then basing its determination of significance on the "limited duration" of the construction period. (DSEIR, p. 5.2-212.)

The second basis for the DSEIR's less-than-significant determination is the DSEIR's statement that "construction activities would be ... required to be conducted in accordance with City requirements." (DSEIR, p. 5.2-212.) This vague assurance is meaningless because the SEIR does not specify what these "City requirements" are, does not specify a performance standard that these City requirements would either impose or achieve, and presents no evidence that these unspecified "City requirements" are likely to avoid significant cumulative construction related traffic effects. (See *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 95 (CBE); *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359; 1394 (Gentry).

The third and final basis for the DSEIR's less-than-significant determination is "Improvement Measure I-TR-1: Construction Management Plan and Public Updates." The DSEIR suggests this Plan would help avoid significant cumulative construction related traffic effects. (DSEIR, p. 5.2-212.) But it is improper for the DSEIR to rely on Improvement Measure I-TR-1 to help reduce impacts to less than significant because it is not identified as a mitigation measure necessary to substantially reduce significant Project impacts; therefore, it is not enforceable. (CEQA Guideline 15126.4(a)(4).)

Finally, the DSEIR fails to quantify the Projects' construction period impacts, presumably based on its qualitative conclusion that unspecified "City requirements" and "Improvement Measure I-TR-1" will avoid significant impacts. This puts the cart before the horse.<sup>69</sup>

- 
- the Exchange project on Mission Bay Block 40,
  - the Family House project on Mission Bay Block 7 East,
  - the Residential and Hotel project on Mission Bay Block 1,
  - the 360 Berry Street project on Mission Bay Block N4/P3, and
  - Caltrain's Peninsula Corridor Electrification Project.

<sup>69</sup>CEQA does not permit an agency to simply adopt mitigation measures in lieu of fully assessing a project's potentially significant environmental impacts because mere acknowledgment that an impact would be significant is inadequate; the EIR must include a detailed analysis of "how adverse" the impact would be.

The RTC acknowledges that construction impacts, even if temporary, may be significant:

While in most instances, construction-related transportation impacts are determined to be less than significant, some projects involving concurrent construction of multiple buildings on a constrained site, prolonged construction period, high intensity of construction activities, and with likely impacts to adjacent or nearby traffic, transit, pedestrian, and bicycle circulation have been determined to have significant and unavoidable construction-related transportation impacts (e.g., 5M Project).

(FSEIR vol. 4, p. 13.11-155). Thus, the City cannot simply dismiss these impacts as less than significant without independent analysis of the project itself, rather than an assumption that a temporary impact is by its very nature less than significant.

The RTC also argues the Planning Department's qualitative (rather than quantitative) analysis in this case is based on a several types of information that support the SEIR's "less-than-significant" conclusion. (FSEIR, Vol. 5, p. 13.11-155.) The problem with the SEIR's qualitative analysis is that, other than identifying these types of sources of information, it does not disclose either the specific *items* of information that support the SEIR's "less-than-significant" conclusion or *how* these sources of information support that conclusion.

## **2. The SEIR Fails to Assess the Project's Traffic Impacts on the Entire Affected Environment.<sup>70</sup>**

The DSEIR studies Project-induced increases in congestion and delay, for both incremental and cumulative impacts, at twenty-two (22) intersections and six (6) freeway ramps, as shown in Table 1.

//

//

//

//

---

(*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 655-56 *Galante Vineyards v. Monterey Peninsula Water Management Dist.* (1997) 60 Cal.App.4th 1109, 1123; *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831.)

<sup>70</sup>July 27 Lippe, p. 1; July 23 Smith, p. 8; July 21 Wymer, pp. 1-12; Nov 2 Smith FSEIR pp. 5-8; Nov 2 Wymer FSEIR.

**Table 1**

Incremental Impact Assessment (With Implementation of the Special Events Transit Service Plan)	Incremental Impact Assessment (Without Implementation of the Special Events Transit Service Plan)	Cumulative Impact Assessment
Intersections at DSEIR, p. 5.2-18, Table 5.2-34 p. 5.2-121, Table 5.2-35 p. 5.2-123, Table 5.2-36 p. 5.2-172, Table 5.2-47 p. 5.2-174, Table 5.2-48	Intersections at DSEIR, p. 5.2-192, Table 5.2-53 p. 5.2-193, Table 5.2-54	Intersections at DSEIR, p. 5.2-214, Table 5.2-59 p. 5.2-217, Table 5.2-60.
Freeway ramps at DSEIR, p. 5.2-133, Table 5.2-37 p. 5.2-133, Table 5.2-38 p. 5.2-134, Table 5.2-39 p. 5.2-181, Table 5.2-49 p. 5.2-181, Table 5.2-50	Freeway ramps at DSEIR, p. 5.2-198, Table 5.2-55 p. 5.2-198, Table 5.2-66	Freeway ramps at DSEIR, p. 5.2-221, Table 5.2-61 p. 5.2-221, Table 5.2-62

Remarkably, the DSEIR fails to disclose the criteria the City used to *exclude* other intersections and freeway ramps. The omission of this fundamentally important information renders the DSEIR so legally inadequate as an informational document that it frustrates CEQA's goal of providing the public with a meaningful opportunity to comment on the DSEIR.

Also, as shown in the letter reports from traffic engineers Larry Wymer and Dan Smith, the DSEIR omitted from its area of study numerous intersections and freeway ramps that will also suffer potentially substantial increases in traffic congestion and delay. (July 23 Smith, p. 8; July 21 Wymer, pp. 1-12; Nov 2 Smith FSEIR pp. 5-8; Nov 2 Wymer FSEIR.) The omission of these intersections and freeway ramps from the DSEIR's analysis of the Project's effect on traffic also renders the DSEIR so legally inadequate as an informational document that it frustrates CEQA's goal of providing the public with a meaningful opportunity to comment on the DSEIR.

How did this happen? The DSEIR simply states: "The traffic impact assessment for the proposed project was conducted for 23 study intersections and six freeway ramp locations in the vicinity of the project site" (DSEIR, p. 5.2-72),<sup>71</sup> with no further explanation. The same is true for the six freeway ramps. (DSEIR, p. 5.2-74.)

The DSEIR does inform the reader that:

---

<sup>71</sup>The DSEIR actually studies 22 intersections, not 23, in the tables listed in footnote 1.

The impacts of the proposed project on the surrounding transportation network were analyzed using the Transportation Impact Analysis Guidelines issued by the Planning Department in 2002 (SF Guidelines 2002), which provides direction for analyzing transportation conditions and in identifying the transportation impacts of a proposed project.

(DSEIR, p. 5.2-69.) These Guidelines provide:

## 2. Project Setting

The setting information shall be presented immediately following the Project Description as a discrete chapter or report section. The goal is to provide a brief but complete description of existing transportation infrastructure and conditions in the vicinity of the project. Normally, the described vicinity is a radius between two blocks and 0.25 mile, however, a larger area may be determined in the scoping process. *The specific perimeters of the study area, for both setting and project impact analysis, are to be confirmed as part of the approval for the scope of work.*

(Transportation Impact Analysis Guidelines (October 2002), pp.6-7 (italics added).) Based on this text, the reader would expect to find the criteria and rationale for delimiting “the specific perimeters of the study area” in the Scope of Work which the City approved pursuant to these Guidelines as a prerequisite to preparation of the DSEIR. Unfortunately, this expectation is disappointing, because the City-approved Scope of Work is also silent on the topic. (DSEIR, Appendix TR, pp. TR-8 to TR 14.)

The RTC’s responses are inadequate. The RTC relies on the fact that similar approaches were used in other EIRs.<sup>72</sup> This is not relevant because the other referenced EIRs are not before this Board and are not adjudicated in a published Court of Appeal decision.

The RTC also responds that the lead agency has discretion to determine the geographic scope of the assessment area. (RTC, p. 13.11-25.) This response is not relevant to the comment here, i.e., on these facts the lead agency abused its discretion. These facts include the many recently built and approved projects in the downtown area whose traffic impacts will combine with the Projects impacts at many intersections outside the study area.

The RTC also responds that:

---

<sup>72</sup>“The depth and approach of the analysis of freeway conditions presented in the SEIR is consistent with similar evaluations of transportation conditions conducted as part of recently completed or ongoing large planning studies in San Francisco, including the Central Corridor EIR, UCSF 2014 Long Range Development Plan (LRDP) EIR, California Pacific Medical Center LRDP EIR, etc. The 1998 Mission Bay FSEIR also did not address freeway ramp operation or queuing as a distinct transportation topic.” (RTC, p. 13.11-25.)

The study intersections were selected because they a) represent access points to the regional highway system, b) are located along major street corridors serving the Mission Bay Area, or c) are located in the immediate vicinity of the project site, and because they are the intersections most likely to be potentially affected by traffic generated by the proposed project. As stated on SEIR p. 5.2-15, the freeway ramps were selected for ramp operations analysis (i.e., four on-ramps and two off-ramps) as they represent the regional highway facilities most likely to be impacted by traffic generated by the proposed project.

(RTC, p. 13.11-25, 26.) Reasons a) and b) are non-responsive to the comment that the DSEIR failed to explain why it excluded large areas of the affected environment from the study area, because even if they support, including the intersections and ramps that were *included*, they say nothing about why additional intersections and ramps that were *excluded*.

Reason c), that “they are the intersections most likely to be potentially affected by traffic generated by the proposed project” is entirely conclusory and circular because the RTC justifies this unsupported assertion from the DSEIR by simply repeating it. Reason c) is also non-responsive, because the fact that intersections outside the study area are somewhat less likely than intersections within the study area to be affected does not mean they will not be affected in a potentially significant way. In sum, instead of data to support the exclusion of large portions of affected environment, the RTC offers up empty verbiage.

The RTC also relies to an unstated extent on “the Transportation Impact Analysis Guidelines issued by the Planning Department in 2002 (SF Guidelines)” which “suggests that a project study area would encompass a radius between two blocks and 0.25 miles, but that a larger area may be determined depending on the type of project.” (RTC, p. 13.11-27.) This document cannot lawfully excuse the lead agency from basing the size and location of the study area on the relevant facts of the case, including but not limited to “the type of project.”<sup>73</sup>

The RTC rejects the comment that the study area must include many South of Market intersections between downtown and Mission Bay because:

A comment noted that because some of the basketball game attendees would be arriving from the San Francisco downtown and Financial District areas, they would be required to pass through SoMa to arrive at the project site, so that additional intersections in the SoMa area would have to be evaluated. Mode of travel and place of origin surveys of baseball game attendees conducted by the SF Giants, as well as available parking occupancy surveys, suggest that many of those game attendees that drove to work at their jobs in the Financial District and SoMa areas, tend to walk, ride transit, or take a taxi to AT&T Park, leaving their cars at their commuter parking locations in order to avoid the evening commute congestion that typically occurs near I-80 and AT&T Park and having to re-park their cars at game-day rates. It is likely that a similar condition would occur with the proposed project, with many of those working in downtown riding Muni or special event shuttles, and taking taxis or TNC vehicles<sup>2</sup>, such as Uber or Lyft to the event center, rather than driving and having to park again with limited space availability.

(RTC, pp. 13.11-27, 28.)

The idea that people who work downtown would walk to the Warriors Arena because people who work downtown tend to walk to AT&T Park is unfounded and unsupported. A look at actual data suggests otherwise. According to Google Maps, walking from the Bank of America Building at California and Montgomery to AT&T Park takes 25 minutes; but to the Arena site, 41 minutes. Walking from the Transamerica Building at Washington and Montgomery to AT&T Park takes 29 minutes; but to the Arena site, 44 minutes. There is a time-of-walking tipping point beyond which people tend not to walk. The EIR's assumption that people will be willing to walk from downtown to Warriors games than it takes to walk to Giants games is unsupported.<sup>74</sup>

The idea that people who work downtown would take taxis or an Uber or Lyft type ride service to the Warriors Arena because people who work downtown tend to do so to AT&T Park supports the Alliance's comment, and more so, because these vehicles will travel through SOMA during the extremely congested peak PM time period, thereby making many intersections not included in the study area worse, and then they will return from the Arena in the same time

---

sewer lines even though these were shown on city general plan); *Kings County Farm Bureau v. City of Hanford*, *supra*, 221 Cal.App.3d at pp. 712-718 (agency erred by "wrongly assum[ing] that, simply because the smokestack emissions would comply with applicable regulations from other agencies regulating air quality, the overall project would not cause significant effects to air quality.")..)

<sup>74</sup>See Nov 28 Smith, p. 1-2 and Exhibit A thereto.

period!

This response also ignores the fact that some people on the way to a Warriors game, after checking their online traffic maps, will exit from the Bay Bridge at Fremont and Harrison Streets and travel to the Arena through the SOMA intersections identified by Mr. Wymer as operating at LOS E or F but excluded from the study area. These people are traveling “from the downtown area” but are not considered in the response to comments because they do not “work” downtown.

In addition, the City’s response assumes that SOMA is so congested before game time that people would rather walk through SOMA than drive. If the environmental setting within a mile of the Arena is that heavily impacted (and the Alliance agrees it is), the SEIR cannot lawfully omit a full description of these conditions. (See *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 722-723; *Friends of the Eel River v. Sonoma County Water Agency* (2003) 108 Cal.App.4th 859, 881-882.) Indeed, the significance of a cumulative impact depends on the environmental setting in which it occurs, including the severity of existing environmental harm. (*Communities for a Better Environment v. California Resources Agency* (“*Communities*”) (2002) 103 Cal.App.4th 98, 120 [“[T]he relevant question”... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether “any additional amount” of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project’s contribution to cumulative impacts as significant. [footnote omitted]”]; *Kings County, supra*, 221 Cal. App. 3d at 720-721.) Therefore, the omission of this information from the SEIR represents a prejudicial failure to disclose required information.

The SEIR’s failure to study the affected area and to respond to comments on this issue are ably discussed by traffic engineer Dan Smith in his November 2, 2015, letter submitted to the OCII on November 3, 2015 (at pages 5-8 thereof). Reading his report is essential, but for present purposes I highlight one of his points: i.e., the SEIR excludes from its study area many intersections that are on the access route to and from the two UCSF hospitals located a block from the Project.

For example, using UCSF’s web interface for directions to the Medical Center to identify recommended emergency routes for Hyde and Bay, the primary recommended route is the Embarcadero to King, then Third. The secondary route is Hyde, then 8th. For the Transamerica building, the primary route is Clay/Drumm/Washington to Embarcadero, King, Third. The secondary route is Davis/Beale/Bryant/Embarcadero/Third. For Union Square, the primary is west on Geary, down Hyde/8th/Brannan/7th/16th. For the Bay Bridge, the primary is off at 8th and Harrison, down 8th/Brannan/7th/16th.<sup>75</sup> These documented emergency routes, and you could run plenty of other examples, demonstrate why the intersections along Eighth and along the Embarcadero should have been studied. The key intersections are the nine along the

---

<sup>75</sup>See Nov 28 Smith, p. 2; Exhibit 14 to this brief

Embarcadero with Broadway, Washington, Market, Mission, Howard, Folsom, Harrison, Bryant and Brannan and the six on Eighth with Market, Mission, Howard, Folsom, and especially Harrison and Bryant.

Mr. Smith also refutes the response as follows:

the response cites 9 intersections along the Embarcadero and 15 along or east of Fourth Street that we claimed should have been studied. It claims that because the Project is shifted to its current location farther south-west from the originally proposed location on Piers 30-32, the primary routes to and from the Project site from Downtown, SOMA, the northern parts of the City and from the North Bay and the I-80 ramps would be shifted farther west, away from these intersections. But this is not true. Except for the relatively few instances in which there is a concurrent evening Giants game at AT&T park, the routes along the Embarcadero and along and east of Fourth Street remain the most effective and imageable routes to the currently proposed Project site and the parking facilities that serve it from much of the Downtown, SOMA, northern parts of the City, the North Bay and the I-80 ramps to and from the East Bay. Those paths are only likely to be altered on evenings with a concurrent Giants game. And if a massive shift of traffic further west was assumed in the City's thinking as it scoped the current SEIR and excluded the intersections along the Embarcadero and on and east of Fourth on that assumption, why didn't it add more intersections in the Eighth Street corridor (including but not limited to the ramps and intersections at Eighth and Harrison, Eighth and Bryant) and other intersections in the Van Ness, Franklin, Gough, Octavia corridors for example? The City has no good answer.

(Nov 2 Smith FSEIR p. 7.)

The RTC studies one intersection outside the study area, at 8th St and Brannan. But as Mr. Smith points out, this anecdotal approach is not a reliable indicator of effects at other intersections identified by Mr. Wyer as needing study, because this unusual intersection is "anomalous rather than exemplar of anything elsewhere" (Nov 2 Smith FSEIR p. 8.)

Consequently, the City must revise the DSEIR to include an analysis of the Project's congestion and delay impacts on the excluded intersections and freeway ramps and then recirculate the Revised DSEIR for at least 45 days for public review and comment.

**3. The SEIR Fails to Disclose the Severity of the Project's Impacts on Intersections and Freeway Ramps Which the Project Will Cause to Deteriorate to Level of Service (LOS) F.<sup>76</sup>**

In comments on the DSEIR, The Alliance objected that the DSEIR fails to disclose the severity of the Project's congestion and delay impacts on intersections and freeway ramps which the Project will cause to deteriorate to Level of Service (LOS) F. (July 27 Lippe, pp. 3-4.) For intersections and freeway ramps in the study area where Project-induced increases in congestion and delay will cause deterioration to LOS F, the DSEIR fails to provide a full measurement of the degree of severity of the significant impact. Instead, for intersections pushed to LOS F, instead of presenting a measure of average delay, the DSEIR provides a "greater than" measurement of "80 seconds per vehicle." (See 5.2-74 and Tables cited above.) For freeway ramps pushed to LOS F, instead of providing the average density, the DSEIR provides no measurement of "existing plus project" density. Instead, the severity of the Project's impacts at intersections and freeway ramps pushed to LOS F has no upper limit, and remains undisclosed, other than to note that "demand exceeds capacity." (See 5.2-75, Table 5.2-19 and Tables cited above.)

Thus, the DSEIR fails to comply with CEQA because, other than making the binary determination that the Project's impacts on these intersections and freeway ramps are significant, the DSEIR fails to disclose the severity of these significant impacts. (See *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831 ["The conclusion that one of the unavoidable adverse impacts of the project will be the 'increased demand upon water available from the Santiago County Water District' is only stating the obvious. What is needed is some information about how adverse the adverse impact will be"].) Consequently, the City must revise the DSEIR to include this missing information, then recirculate the Revised DSEIR for at least 45 days for public review and comment.

The RTC's response is inadequate for several reasons. First, it caricatures the Alliance's comments, stating:

The comment appears to state that an EIR, having determined that a project would cause or contribute to LOS F conditions, must also identify the specific number of seconds of delay expected to occur. That is, the comment appears to state that the EIR must state not merely that delay would be in excess of 80 seconds per vehicle, and therefore unacceptable; rather, the comment states the EIR must also identify how many seconds of delay, beyond the 80 seconds of average control delay signified by "LOS F," would occur.

(RTC, p. 13-11.49.) The RTC then argues that "CEQA does not require this." (RTC, p. 13-11.49.) The Alliance's actual comment is that, in addition to identifying these impacts as

---

<sup>76</sup>July 27 Lippe, p. 3; July 23 Smith, p. 11; July 21 Wymer, p. 12-13; Nov 2 Smith FSEIR, p. 16-18; Nov 28 Smith, pp. 2-3.

significant, the SEIR must disclose their severity. The lead agency, not the Alliance, chose to use a “seconds of delay” metric. Having done so, the agency cannot refuse to disclose the severity of the impacts on the ground that CEQA does not require using this particular metric.

A good example of the SEIR’s failure to disclose relative severity of significant impacts is its impact assessment for the intersection of 7th/ Mississippi and 16th Street. Figure 1 contrasts the impact assessment data for this intersection for the Weekday PM Peak Hour (i.e., 4 - 6 p.m) and Weekday Evening time periods as shown in the DSEIR, at Table 5.2-34 (p. 5.2-118) and Table 5.2-47 (p. 5.2-172) with the impact assessment data for this intersection shown in the Appendix containing the transportation analysis raw data (i.e., SEIR, Vol. 3, Appendix-TR.)

**Figure 1: 7th/Mississippi and 16th St**

	Existing Without Giants Game	Existing Plus Project - Without Giants Game			Existing With Giants Game	Existing Plus Project - With Giants Game
	Existing	No Event	convention	Basketball Game	Existing	Basketball Game
Time Period	Delay LOS	Delay LOS	Delay LOS	Delay LOS	Delay LOS	Delay LOS
DSEIR, PM Peak	68.6 E <i>Table 5.2-34</i>	>80 F <i>Table 5.2-34</i>	>80 F <i>Table 5.2-34</i>	>80 F <i>Table 5.2-34</i>	>80 F <i>Table 5.2-47</i>	>80 F <i>Table 5.2-47</i>
Appendix, PM Peak <i>Appendix Page #</i>	68.6 E <i>TR-179</i>	87.8 F <i>TR-275</i>	83 F <i>TR-299</i>	80.8 F <i>TR-311</i>	84.7 F <i>TR-191</i>	151.9 F <i>TR-323</i>
DSEIR, Evening	60.1 E <i>Table 5.2-35</i>	NA	NA	>80 F <i>Table 5.2-35</i>	75.6 E <i>Table 5.2-48</i>	>80 F <i>Table 5.2-48</i>
Appendix, Evening <i>Appendix Page #</i>	68.6 E <i>TR-203</i>	NA	NA	107.6 F <i>TR-335</i>	75.6 E <i>TR-215</i>	178.7 F <i>TR-347</i>

As this table shows, for certain conditions, the LOS data in the Appendix shows much greater LOS impacts for than the SEIR discloses in its summary tables, in some cases showing double or more than double the “>80” figure used in the summary tables (see yellow highlighted cells). This example is only one of 22 intersections in the study area.

The RTC argues that LOS metrics are not “reliable” above LOS F.<sup>77</sup> As traffic engineer Smith points out, where the above-LOS F delay calculations are substantial, they are meaningful even if somewhat imprecise, and should have been disclosed. (Nov 2 Smith FSEIR p. 17 [“where “the results might be 27 seconds added instead of a half-minute or 55 seconds added instead of a minute”]; Nov 28 Smith, pp 203.)

Also, the RTC’s response that LOS metrics are not “reliable” above LOS F is non-responsive to the Alliance’s actual comment (i.e., the SEIR must disclose the severity of significant impacts), rather than the RTC’s caricature of the comment focused solely on LOS metrics. If another metric is better, the SEIR should use it.

The RTC also argues that the Legislature has delegated to the Secretary of Resources the authority to change the legal standards governing an EIR’s analysis of traffic impacts in this location. (RTC, p. 13-11.51, 52.) Since such changes have not occurred, and may never occur, the possibility that they could occur cannot excuse the lead agency’s compliance with the law in effect now.

The RTC also suggests that increased traffic congestion is not an “environmental” impact under CEQA at all, stating: “In general, the effects of worsened congestion translate primarily into increased inconvenience to people, but not into adverse effects on public health or ecosystems.” (RTC, p. 13-11.51.) But the lead agency has demonstrated no courage in this conviction since it devoted hundreds of pages and thousands of dollars to the SEIR’s analysis of traffic impacts. Moreover, the Legislature’s amendment of CEQA to delegate authority to the Secretary of Resources to change the legal standards governing an EIR’s analysis of traffic impacts conclusively demonstrates that traffic impacts are “environmental” impacts under CEQA.

The RTC also argues that using LOS F as a metric for significance without disclosing the severity of the impacts at these intersections is sufficient for purposes of considering mitigation measures to reduce these impacts. (RTC, p. 13-11.50.) Even if this is true, the SEIR remains informationally deficient in this regard because without a legally adequate description of the nature and extent of the Project’s environmental harm, the lead agency cannot properly weigh whether the Project’s benefits outweigh that harm.

---

<sup>77</sup>RTC, p. 13-11.50 [“LOS F reflects unstable traffic conditions whose severity is not reliably replicated for future conditions by the traffic LOS analysis tools used for traffic impact studies”].

#### **4. The SEIR Fails to Identify the Significance and Severity of the Project's Impacts on Intersections Where the Project Will Use Parking Control Officers.**

The Alliance commented that the DSEIR failed to provide quantitative impact assessments for two intersections (King/Third and King/Fourth) when the Project's basketball games coincide with a Giants' game in the Weekday PM/Saturday Evening Peak Hour and Weekday Evening/Late Evening Peak Hour time periods. (DSEIR, p. 5.2-172, Table 5.2-47; p. 5.2-174, Table 5.2-48)". Because the DSEIR provides no LOS or delay measurements for Project impacts with a Giants' game at these times, it does not inform the public whether the Project's congestion and delay impacts on these intersections are significant, and if so, the severity of these significant impacts. (July 27 Lippe, p. 4, July 23 Smith, p. 11; Nov 2 Smith FSEIR pp. 16-18.)<sup>78</sup>

The RTC responds that "the intersection LOS and delay values for the intersections of King/Third and King/Fourth are provided on SEIR Table 5.2-34 through Table 5.2-36 for the various analysis hours." (FSEIR, Vol. 4, p. 13.11-53.) This is non-responsive because these tables describe the Project's impacts *without a Giant's game*.

The RTC also responds that: "the analytical tools and measurements appropriate for assessing the effectiveness of mechanized systems do not apply to PCO-controlled intersections. For all of these reasons, the intersection LOS at PCO-controlled intersections does not provide meaningful information and is not presented for those locations where PCOs already actively manage intersection operations." (FSEIR, Vol. 4, p. 13.11-53.) As discussed in section II.C.3 above, if another metric is better, the SEIR should use it, and the lack of precision in above-LOS F delay calculations are not relevant where the delays are substantial and the margin of error is slight (e.g., where "the results might be 27 seconds added instead of a half-minute or 55 seconds added instead of a minute." (Nov 2 Smith FSEIR p. 17.)

The RTC also responds that: "PCOs are an effective way to minimize traffic impacts that may occur otherwise." (FSEIR, Vol. 4, p. 13.11-53.) This is non-responsive because, under CEQA, mitigating impacts occurs after determining their significance and severity, not before. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 655-56.)

---

<sup>78</sup>Instead, the DSEIR indicates that the Project calls for posting Parking Control Officers (PCOs) at these intersections at the times indicated. But the adoption of a mitigation measure cannot substitute for disclosing whether the Project's impacts on these intersections are significant or their severity CEQA does not permit an agency to simply adopt mitigation measures in lieu of fully assessing a project's potentially significant environmental impacts because mere acknowledgment that an impact would be significant is inadequate; the EIR must include a detailed analysis of "how adverse" the impact would be. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 655-56 *Galante Vineyards v. Monterey Peninsula Water Management Dist.* (1997) 60 Cal.App.4th 1109, 1123; *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831.)

The RTC also responds that the SEIR “describes the potential impacts at the study intersections in detail without the implementation of any of the proposed mitigation measures.” (FSEIR, Vol. 4, p. 13.11-54.) This is simply not true for overlapping Giants and Warriors games in the PM Peak and Evening hours at the King/Third and King/Fourth intersections (see SEIR, Vol 1, pp. 5.2-171-180.)

**5. The SEIR’s Analysis of the Project’s Operational Traffic and Transit Congestion and Delay Impacts Is Legally Flawed.**

**(a) The DSEIR understates traffic and transit volumes in the PM peak period of 4:00 to 6:00 PM by using “time of arrival” at the Arena as a proxy measurement for “time of travel.”**

The Alliance commented on the DSEIR that it used insufficient information and patently flawed logic in assuming only 5% of basketball game attendees will be traveling in the “study area” in the PM peak period of 4:00 to 6:00 p.m. (July 27 Lippe, pp. 7-11; July 23 Smith, p. 1; July 21 Wymer, p. 12-13; Nov 2 Smith FSEIR p. 13-16).

Table 5.2-21 states that 5% of arrivals are expected before 6:00 p.m. for 7:30 p.m. weekday basketball games; another 11% will arrive between 6:00 and 6:30 p.m. (DSEIR, p. 5.2-83.) This data is based on turnstile counts of people entering the arena. As explained by Dan Smith, this proxy measurement does not provide reliable data as to when game or event attendees are actually traveling through affected intersections or freeway ramps or using affected transit routes, and this error infects the entire analysis of the Project’s transit and traffic impacts. (July 23 Smith, p. 3.)<sup>79</sup>

Common sense indicates that many or most of the 11% that the DSEIR says arrive at the turnstile between 6:00 and 6:30 p.m. would be traveling to the event in the PM peak period of 4:00 to 6:00 pm. This minimal adjustment alone changes the assumption on which the modeling is based from 5% to 16% traveling in the “study area” in the PM peak period of 4:00 to 6:00 pm. As shown by Mr. Smith, this minimal adjustment more than doubles the Project’s contribution of traffic to affected intersections, and would change the DSEIR’s determination from less-than-significant to significant at some intersections. (July 23 Smith, p. 3.)

This issue was flagged in public scoping comments on the DSEIR. (DSEIR, p. 2-15.)

---

<sup>79</sup>In his analysis, Mr. Smith found: “it seems highly probable that as much as one-third or more of the trips that the DSEIR considers to take place in the 6 to 7 PM period and the 7 to 8 PM period would actually be on the transportation system in the more critical 5 to 6 PM commute peak hour. That would put 7,466 event-related travelers on the transportation system in the 5 PM to 6 PM period instead of the 1,866 assumed in the DSEIR, a difference that would likely result in transportation impacts not disclosed in the DSEIR and/or intensification of impacts and mitigation needs of those that were disclosed.” (July 23 Smith, p. 3.)

Yet, somehow, the DSEIR did not adjust its reliance on turnstile data to develop a reliable metric to use instead. Instead, the DSEIR offers a series of weak or irrelevant rationales for its methodology, including:

because basketball games typically start at 7:30 p.m. a higher percentage of inbound event attendees would travel to the event center during the 6:00 to 8:00 p.m. period than during the 4:00 to 6:00 p.m. commute peak period.

(DSEIR p. 5.2-71); and

the SF Guidelines do not include travel demand characteristics for the specialized uses (e.g., sports events, conventions, and other events) that would take place at the proposed event center. Similarly, standard trip generation resources, such as the Institute of Transportation Engineer's Trip Generation Manual, do not include sufficiently detailed trip generation data for such specialized uses. Therefore, the travel demand for the event center component of the proposed project was based on the estimated attendance, as well as information on current travel characteristics of Golden State Warriors basketball attendees at the Oracle arena in Oakland.

(DSEIR, p. 5.2-81); and

The data are based on information provided by the Golden State Warriors for their current facility, which was then adjusted to provide for earlier arrival patterns based on comparable information collected at similar NBA facilities to account for the increased availability of retail and restaurant uses at the proposed project site compared to Oracle Arena in Oakland. A summary of this data is provided in the travel demand technical memorandum included in Appendix TR.

(DSEIR, p. 5.2-82.)<sup>80</sup>

---

<sup>80</sup> In the "Travel Demand Methodology and Results" section of Chapter 5.2, the DSEIR states:

The Basketball Game scenario reflects the travel demand of the office, retail and restaurant uses, plus an evening basketball game. The transportation impact analysis of the Basketball Game scenario was conducted for four analysis hours (weekday p.m., weekday evening, weekday late evening, and Saturday evening), for conditions without and with an overlapping SF Giants evening game at AT&T Park.

Table 5.2-21 presents the expected temporal distribution of arrival and departure patterns for basketball game attendees of the proposed project. The data are based on information provided by the Golden State Warriors for their current facility, which was then adjusted to provide for earlier arrival patterns based on comparable information collected at similar NBA facilities to account for the increased availability of retail and restaurant uses at the

A discussion and summary of the data from other venues than Oracle is provided in DSEIR, Appendix TR, at pp. TR-21 to TR-25 and TR-37 [Appendix A, p. A-9]. The table at page TR-37 provides time of arrival data from, in addition to Oracle, six purportedly “comparable” venues, namely: Icon Venue Group, Houston, Phoenix, Sacramento, Brooklyn (2013-2014), and Brooklyn (2014-2015). An interesting fact about this table is that the data for 4:00 to 6:00 p.m. arrivals at four of these six venues (i.e., Icon Venue Group, Houston, Phoenix, Sacramento) is “included in” the data for later time periods. So, in fact, the only purportedly comparable venue for which the DSEIR presents supporting data is Brooklyn (2013-2014 and 2014-2015). The venue with the largest proportion of arrivals in the 4:00 to 6:00 p.m. period is Brooklyn (2014-2015), with 4.1%.

In short, the City and the Warriors failed to develop accurate, reliable data on the key variable in the entire transportation analysis, i.e., the number of people traveling to events in the peak PM time period when traffic and transit crowding are at their worst. A lead agency “must use its best efforts to find out and disclose all that it reasonably can.” (CEQA Guideline, § 15144.)

The above quoted rationales do not excuse this failure. The scoping comments flagging this issue were submitted to the City between November 19, 2014, and December 19, 2014, during the middle of the basketball season. (DSEIR, p. 2-8 and 2-9, 2-15.) The Warriors played fifty-seven (57) games between December 19, 2014, through the close of the regular season on April 15, 2015.<sup>81</sup> There are thirty (30) teams in the NBA.<sup>82</sup> That means there were approximately eight-hundred and fifty five (i.e.,  $15 \times 57 = 855$ ) regular season games played in the 2014-2015 regular season after December 19, 2014. In the playoffs following the regular season, sixteen teams played a total of seventy-nine games after April 15, 2015.<sup>83</sup>

---

proposed project site compared to Oracle Arena in Oakland. A summary of this data is provided in the travel demand technical memorandum included in Appendix TR. Based on this information, it was assumed that approximately 5 percent of arrivals to a basketball game would occur during the p.m. peak hour (5:00 to 6:00 p.m.), and up to 66 percent of arrivals would occur during the evening peak hour (7:00 to 8:00 p.m.). Similarly, up to 70 percent of the departures would occur during the late evening peak hour (9:00 to 10:00 p.m.). Event staff for basketball games would be expected to arrive between 4:30 and 5:00 p.m. and would be on post prior to the gate opening time; event staff would leave between 11:00 and 11:30 p.m.

(DSEIR, p. 5.2-82.)

<sup>81</sup><http://www.nba.com/warriors/schedule>

<sup>82</sup><http://www.nba.com/teams/?ls=iref:nba:gnav>

<sup>83</sup><http://www.nba.com/playoffs/>

Therefore, both the Warriors and the City had ample opportunity to conduct market research by interviews and exit polling of a sample of the hundreds of thousands of fans attending these games to discover how far in advance of arriving at the turnstile they traveled through the traffic and transit impacted area surrounding the venue. The City's and Warriors' decision to pass up this opportunity after being informed of the issue does not satisfy their duty to use best efforts to find out and disclose all they reasonably can.

Indeed, the City was fully aware of the need to gather information more relevant to fans "time of travel" than turnstile counts and made some efforts to do so. But it failed to disclose that there are alternative metrics for "time of travel" or the results of its efforts in this regard. For example, an email exchange dated January 12, 2015, between the City's EIR consultant (ESA) and City Planning officials includes data on arrivals before 6:00 p.m. at the Arco Arena parking lot for a 7:00 p.m. Sacramento Kings game and arrivals before 6:00 p.m. in buildings for other NBA venues. (See July 27 Lippe, Exhibit 3.) Thus, the City was aware of other measurements (e.g., parking lot entry rather than turnstile counts) that could more accurately predict peak PM period travel to games.

Also, the arrival numbers cited in this email exchange show 14% arriving at the Arco Arena parking lot before 6 p.m. for one 7 p.m. game and 9% arriving before 6 p.m. in buildings for other NBA venues. These numbers indicate the DSEIR's assumption that 5% of fans will be traveling through the study area before 6 p.m. for 7:30 p.m. games is vastly understated. Yet the DSEIR fails to reference these numbers.

The RTC responds by reciting the information presented in the DSEIR from other NBA venues that the Alliance's comment on the DSEIR critiqued as irrelevant. (See July 27 Lippe, pp. 9-11; FSEIR, Vol. 4 pp. 13.11-41, 42.) The RTC also responds that: "Additional surveys of attendee arrivals at the Oracle Arena where the Golden State Warriors currently play or other NBA facilities, as suggested in a comment, were deemed unnecessary, because, as noted above, arrivals to the Oracle Arena during the 5:00 to 6:00 p.m. peak hour are low (about 1 percent of the total) and because data from another location with similar urban and development conditions to the proposed project (i.e., Barclays Center in Brooklyn, New York) was already available." FSEIR, Vol. 4 pp. 13.11-42.) These responses, however, are non-responsive to the comments that turnstile data, no matter what venue it is from, is not a valid proxy for travel in the 4-6 PM peak period for a 7:30 PM game time, and the Warriors and City's failure to gather relevant data renders the SEIR informationally deficient.

The RTC also responds by contesting Mr. Smith's estimate that as many as one-third of game patrons may be traveling to the Arena in the 4-6 PM park period, stating: "Though some of the points raised in the comments seem intuitively believable, actual data from comparable situations show that the comments have exaggerated the likely numbers of people would arrive before 6:00 p.m. for a 7:30 p.m. event." (FSEIR, Vol 4, p. 13.11-41.) This response, however, is non-responsive to the "common sense" point made above that many or most of the 11% that the DSEIR says arrive at the turnstile between 6:00 and 6:30 p.m. would be traveling to the event in

the PM peak period of 4:00 to 6:00 pm, and even this minimal adjustment would change the DSEIR's determination from less-than-significant to significant at some intersections. (July 27 Lippe, p. 8; July 23 Smith, p. 3.)

**(b) The DSEIR only analyzes impacts of weeknight basketball games that start at 7:30 PM, not at other start times closer to the PM peak.<sup>84</sup>**

The Alliance commented on the SEIR that it fails to include reasonably foreseeable weekday Warriors basketball games starting at 6:00 pm rather than 7:30 pm, and this omission is important because even using the SEIR's turnstile count as a proxy for travel time to the Arena, 6:00 pm games require that fans travel in the 4-6 pm peak period, and this scenario should have been included in the impact assessment. (See July 23 Smith, p. 5 at COM-129.)

The RTC responds that "The variability of preseason and postseason games' timing is due in part to TV deals, opposing team traveling schedules, and/or outcomes of postseason series that are beyond the scope of Golden State Warriors control" (FSEIR, Vol. 4, p. 3.11-11) and that it is not precisely known how many of these games there will be. This is non-responsive, because under CEQA, the test for whether future activities associated with a project must be included in the impact assessment is not whether such activities are under the Project Sponsor's exclusive control, it is whether the future activities are reasonably foreseeable and may contribute to significant environmental effects. (*Laurel Heights Improvement Assn. v. Regents of the University of California* (1988) 47 Cal.3d 376, 395-396.) Here, both parts of the test are met. The Warriors have played in Oakland for 50 years and have won two NBA championships in that time period. Therefore, the frequency of 6:00 pm games in the past 50 years is known, and can easily be translated into an annual average that could be used for the next 50 years when the Warriors intend to play in San Francisco. Also, because traffic conditions are so bad already, small increments are enough to register as cumulatively significant. (*Communities for a Better Environment v. California Resources Agency* ("CBE") (2002) 103 Cal.App.4th 98,119-120.) Therefore, the omission of 6:00 pm games from the Project description and impact assessment is prejudicial.

**6. The SEIR's Analysis of the Project's Cumulative Transportation Impacts Does Not Comply With CEQA.**

**(a) The 5% threshold of significance for impacts at intersections and freeway ramps operating at LOS E or F violates CEQA.<sup>85</sup>**

For intersections operating at LOS E or F, the DSEIR uses a threshold of significance of "a contribution of 5 percent or more to the traffic volumes at the critical movements operating at

---

<sup>84</sup>July 23 Smith, p. 5; July 21 Wymer, pp. 12-13; Nov 2 Smith FSEIR pp. 3-5.

<sup>85</sup>July 27 Lippe, p. 11. [Comment 2i.]

LOS E or LOS F” (DSEIR, p. 5.2-73-74.) For freeway ramps operating at LOS E or F, the DSEIR uses a threshold of significance of “a contribution of 5 percent or more to the traffic volumes on the ramp.” (DSEIR, p. 5.2-74.)<sup>86</sup>

No rationale for the 5% threshold is provided. Indeed, blind reliance on this number ignores the law governing the assessment of cumulative impacts, which requires a fact based assessment that takes into account the severity of preexisting impacts. A one-size-fits-all “ratio” violates CEQA. (See *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120 (“*Communities*”); *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 720-21 (*Kings County*). *Communities* and *Kings County* teach that the significance of a cumulative impact depends on the environmental setting in which it occurs, especially the severity of existing environmental harm, and that focusing on the magnitude (i.e., “ratio”) of the Project’s incremental contribution to severe preexisting harm is inconsistent with the definition of cumulative impacts under CEQA.<sup>87</sup>

The RTC says: “Using their expertise regarding traffic analysis in the city, the City and its traffic consultants determined that using a ‘5 percent contribution’ as the threshold of significance was appropriate.” (FSEIR, Vol. 4, p. 13.11-72.) But invoking the agency’s expertise can only go so far. That expertise must be “supported by facts” and cannot be “unsubstantiated.” (CEQA Guideline 15384.) “A clearly inadequate or unsupported study is entitled to no judicial deference.” (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 410, ft. 12.) Here, the Planning Department’s “expert opinion” is based on legal error because it views transportation impacts as less deserving of scrupulous compliance with CEQA information disclosure requirements as other types of environmental. (See FSEIR, Vol. 4, p. 13.11-73.) Again, as noted above, the Legislature’s amendment of CEQA to delegate authority to the Secretary of Resources to change the legal standards governing an EIR’s analysis

---

<sup>86</sup>“The project may result in significant adverse impacts at intersections that operate at LOS E or LOS F under existing conditions depending upon the magnitude of the project’s contribution to the worsening of the average delay per vehicle.” (DSEIR, p. 5.2-45.)

<sup>87</sup>(*Communities*, 103 Cal.App.4th at p. 120 [“[T]he relevant question”... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether “any additional amount” of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project’s contribution to cumulative impacts as significant. [footnote omitted]”]; *Kings County*, 221 Cal.App.3d at pp. 720-21 [“They contend in assessing significance the EIR focuses upon the ratio between the project’s impacts and the overall problem, contrary to the intent of CEQA.... We find the analysis used in the EIR and urged by GWF avoids analyzing the severity of the problem and allows the approval of projects which, when taken in isolation, appear insignificant, but when viewed together, appear startling. Under GWF’s ‘ratio’ theory, the greater the overall problem, the less significance a project has in a cumulative impacts analysis. We conclude the standard for a cumulative impacts analysis is defined by the use of the term ‘collectively significant’ in Guidelines section 15355 and the analysis must assess the collective or combined effect of energy development”].)

of traffic impacts conclusively demonstrates that traffic impacts are “environmental” impacts under CEQA.

**(b) The year 2040 baseline for assessing the significance of the Project’s cumulative impacts violates CEQA.<sup>88</sup>**

The SEIR’s excessively distant time frame and massive development assumptions masks the Project’s nearer term cumulative impacts. The SEIR assesses the Project’s incremental traffic and transit impacts and its cumulative traffic and transit impacts pegged to the year 2040, which is 25 years in the future.<sup>89</sup> While the Alliance supports such long range forecasting in general, as used in this SEIR the year 2040 baseline for assessing the significance of the Project’s cumulative impacts is misleading, for two reasons.

First, this approach overlooks the Project’s cumulative traffic and transit impacts pegged to its first 1 to 10 years of operations. This time period is of immediate interest to the citizens of San Francisco because the traffic mess predicted by the DSEIR will be upon them then. And who among them know whether they will even be in the City by the year 2040. Thus, while including a year 2040 baseline is not in itself objectionable, the omission of a baseline 5 to 10 years in the future renders the DSEIR informationally defective.

Second, by using a baseline projected to the year 2040, the SEIR inflates the denominator in the 5% “ratio” it uses to determine the significance of Project cumulative impacts at LOS E and F intersections, thereby masking actual near-term significant effects. (See July 23 Smith, p. 25.)

The RTC states: “CEQA contains no rule fixing the time horizon for cumulative impacts analyses.” (FSEIR, Vol. 4, p. 13.11-65.) This is true, but all it means it that the time horizon or horizons selected must provide meaningful public disclosure of the Project’s environmental effects. The SEIR fails to disclose the significance of the Project’s cumulative impacts for the next 25 years!

The SEIR fails to respond to the Alliance’s comment that using the projection based approach over a 25 year future time horizon inflates the denominator in the calculation that is compared to the 5% threshold used to determine the significance of Project cumulative impacts at LOS E and F intersections. Elsewhere, the RTC contends that increasing the geographic scope the traffic study area risks diluting the Project’s contribution to impacts to the point of masking

---

<sup>88</sup>July 27 Lippe, p. 12; July 23 Smith, pp. 25-26; Nov 2 Smith FSEIR pp. 20-22. [Comment 2h.]

<sup>89</sup>“Future 2040 cumulative traffic volumes were estimated based on cumulative development and growth identified by the San Francisco County Transportation Authority SF-CHAMP travel demand model, using model output that represents Existing conditions and model output for 2040 cumulative conditions.” (DSEIR, p. 5.2-110.)

the Project's impacts. (FSEIR, Vol. 4, p. 13.11-26 ["As noted in CEQA case law related to the analysis of cumulative impacts, a geographic scope that is too extensive may dilute the significance of potential impacts"].) This risk also applies to the time horizon as well as geographic space. The amount of "cumulative" traffic against which this Project's contribution must be judged in terms of whether it is "cumulatively considerable" is higher the more future years are included. Using a 25 year horizon only, and ignoring a 10 or 15 year horizon makes it that much more difficult for this Project's contribution to tip the 5% threshold.

**(c) The SEIR's use of a "projection" based approach to the Project's cumulative impacts is misleading.<sup>90</sup>**

The DSEIR states that:

Future 2040 cumulative traffic volumes were estimated based on cumulative development and growth identified by the San Francisco County Transportation Authority SF-CHAMP travel demand model, using model output that represents Existing conditions and model output for 2040 cumulative conditions. .... The 2040 cumulative traffic volumes take into account cumulative development projects in the project vicinity, such as the build-out of the Mission Bay Area, completion of the UCSF Research Campus and the UCSF Medical Center, the Mission Rock Project at Seawall Lot 337, Pier 70, etc., as well as the additional vehicle trips generated by the proposed project.

(DSEIR, p. 5.2-110.)<sup>91</sup>

The DSEIR presents no evidence supporting the DSEIR's assumption that the year 2040 projection is reliable for predicting future traffic and transit demand, other than the vague assertion that the "SF-CHAMP travel demand model, using model output that represents Existing conditions and model output for 2040 cumulative conditions ... has been validated to represent future transportation conditions in San Francisco." (DSEIR, p. 5.2-110.) But, as explained by Mr

---

<sup>90</sup>July 27 Lippe, p. 13.

<sup>91</sup>In the section titled "Approach to Cumulative Impact Analysis" (DSEIR 5.1-6, § 5.1.5), the DSEIR asserts that the CEQA Guidelines provide "two approaches to a cumulative impact analysis ... (a) the analysis can be based on a list of past, present, and probable future projects producing related or cumulative impacts; or (b) a summary of projections contained in a general plan or related planning document can be used to determine cumulative impacts. The projections model includes individual projects and applies a quantitative growth factor to account for other growth that may occur in the area." (DSEIR, p. 5.1-7.) The DSEIR asserts that "The analyses in this SEIR employ both the list-based approach and a projections-based approach, depending on which approach best suits the individual resource topic being analyzed ... the Transportation and Circulation analysis relies on a citywide growth projection model that also encompasses many individual projects anticipated in and surrounding the project site vicinity, which is the typical methodology the San Francisco Planning Department applies to analysis of transportation impacts." (DSEIR, p. 5.1-7.)

Smith, the SF-CHAMP model's margin of error is greater than the 5% threshold used to determine the significance of Project cumulative impacts at LOS E and F intersections. (See July 23 Smith, p. 25.) Therefore, SF-CHAMP is the wrong tool for the task.

Further, given the sheer number of developments in this area of the City (see July 21 Wymer, Table 3) and the breakneck pace of their approval and implementation, the projection approach is misleading, not informative. Therefore, the DSEIR's cumulative impact assessment must use a list based approach to forecast reasonably foreseeable travel demand, and do so in a meaningful time frame.

The RTC does not specifically respond to this Alliance comment, but it does offer a general justification for using the projection approach, which is that the CEQA Guidelines authorize, and the City has a longstanding practice of, doing so. (FSEIR, Vol. 4, p. 13.11-65.) But these justifications fail where, as here, the analysis is misleading or fails to provide required information.

## **7. The DSEIR's Methodology for Analyzing Project Impacts on the Transit System Is Legally Flawed.**

The DSEIR summarizes its methodology for analyzing Project Impacts on the transit system, as follows:

The impact of additional transit ridership generated by the proposed project on local and regional transit providers was assessed by comparing the projected ridership to the available transit capacity at the maximum load point. Transit "capacity utilization" refers to transit riders as a percentage of the capacity of the transit line, or group of lines combined and analyzed as screenlines across which transit lines travel. The transit analyses were conducted for the peak direction of travel for each of the analysis time periods.

(DSEIR, p. 5.2-75.)

This methodology contains two flaws. First, it suffers from the same unwarranted and unsupported assumptions about basketball fans' time of travel to the arena for games described above. Second, the DSEIR's use of transit screenline and route capacities is also misleading and unsupported.

### **(a) The DSEIR's use of transit screenline and route capacities is misleading and unsupported.<sup>92</sup>**

The SEIR's use of transit screenline and route capacities is misleading and unsupported,

---

<sup>92</sup>July 27 Lippe, p. 14; July 23 Smith, pp. 5-8; Nov 2 Smith FSEIR p. 18-20.

so the City's process for evaluating a project's impacts on public transit evades disclosure of significant impacts. The SEIR's use of a project specific threshold of significant impact of 100 percent of screenline capacity rather than the normal 85 percent of screenline capacity exacerbates overcrowding impacts on the regular user community of and is unsupported and unwarranted.

For its Project specific (or incremental) transit impact analysis, the DSEIR uses the following thresholds of significance:

The proposed project was determined to have a significant transit impact if project-generated transit trips would cause downtown or regional screenlines, and, where applicable, directly affected routes, operating at less than its capacity utilization standard under existing conditions, to operate at more than capacity utilization standard. For Muni, the capacity utilization standard is 85 percent for conditions without an event at the project site, and 100 percent for conditions with an event at the project site. For regional operators, the capacity utilization standard is 100 percent for conditions without and with an event at the project site.

(DSEIR, p. 5.2-76, 77.)

For its cumulative transit impact analysis, the DSEIR uses the following thresholds of significance:

Under 2040 cumulative conditions, the proposed project was determined to have a significant cumulative impact if its implementation would cause the capacity utilization at the Muni and regional screenlines and/or corridors within the screenlines to exceed the capacity utilization standard noted above for conditions without and with an event at the project site, or if its implementation would contribute considerably to a screenline or corridor projected to operate at greater than the capacity utilization standard under 2040 cumulative plus project conditions (i.e., a contribution of 5 percent or more to the transit ridership on the screenline or route). In addition, if it was determined that the proposed project would have a significant project-specific transit impact under existing plus project conditions, then the impact would also be considered a significant cumulative impact under 2040 cumulative conditions.

(DSEIR, p. 5.2-76, 77.)

For both Project specific (incremental) and cumulative impacts, the DSEIR uses "capacity utilization standards" as baselines against which to measure the Project's impacts. Capacity utilization standards are specific percentages of the theoretical maximum capacity of a transit screenline or transit line.

For Project specific (or incremental) thresholds of significance for Muni, the DSEIR uses two different capacity utilization standards against which to measure the Project's impacts. For conditions without an event at the Project site, the capacity utilization standard is 85 percent of maximum theoretical capacity of the transit screenline or line. For conditions with an event at the Project site, the capacity utilization standard is 100 percent of maximum theoretical capacity.

If the question to be answered by the transit impact analysis is whether the Project will inflict significant suffering on people riding Muni, why does the DSEIR use two different baselines for its impact assessment. If exceeding 85% inflicts suffering without an event, then exceeding 85% will inflict suffering with an event.

The DSEIR does not examine this use of inconsistent baselines. However, the June 21, 2013, Planning Department Memorandum "Transit Data for Transportation Impact Studies" (at Appendix-TR, p. TR-624) states:

The SFMTA Board has adopted an "85 percent" capacity utilization standard for transit vehicle loads. In other words, transit lines should operate at or below 85 percent capacity utilization. The SFMTA Board has determined that this threshold more accurately reflects actual operations and the likelihood of "pass-ups" (i.e., vehicles not stopping to pick up more passengers). The Planning Department, in preparing and reviewing transportation impact studies, has similarly utilized the 85 percent capacity utilization as a threshold of significance for determining peak period transit demand impacts to the SFMTA lines.

(DSEIR, Appendix-TR, p. TR-624.) Thus, the 85 percent capacity utilization threshold apparently has nothing to do with the suffering of Muni's passengers; it simply reflects the reality of Muni's operations. And even if 85% of capacity is the break point at which Muni drivers tend to refuse to pick up more passengers due to overcrowding, then using 100% of capacity as a threshold of significance is entirely unsupportable.

For its cumulative impact analysis, the DSEIR uses the same baselines and thresholds of significance discussed above plus one more if the Project "would contribute considerably to a screenline or corridor projected to operate at greater than the capacity utilization standard under 2040 cumulative plus project conditions (i.e., a contribution of 5 percent or more to the transit ridership on the screenline or route)."

The 5% threshold for determining a Project's contribution to be "considerable" is stated at Appendix-TR, p. TR-625. No rationale for this number is provided. This approach leads to illogical and unsupportable results. For example, a Project contributing 1% more capacity utilization to a screenline that usually operates at 84%, resulting in a total capacity utilization of 85%, would be deemed to contribute considerably to a significant impact, while a Project contributing 1% more capacity utilization to a screenline that usually operates at 94%, resulting in a total capacity utilization of 95%, would be deemed to not contribute considerably to a

significant impact, even though the latter scenario should be deemed a more significant change than the former. (See *Communities, supra*; *Kings County, supra*.) In short, a one-size-fits-all “ratio” violates CEQA.

**(b) The SEIR’s Cumulative Analysis Fails to Consider and Analyze the Project in the Context of the City’s Proposal to Remove the Northern Portion of I-280 as Far South as the Mariposa Street Interchange.**

This issue is discussed in July 23 Smith, at page 13 which is incorporated herein by reference.

**8. The SEIR’s Discussion of Transportation Impacts Is Incomplete.<sup>93</sup>**

**(a) The SEIR fails to disclose the significance or severity of transportation impacts when both a Giants game and a Warriors game occur without the Special Events Transit Service Plan.**

The SEIR analyzes transportation impacts in two broad scenarios: with and without implementation of the Special Events Transit Service Plan. But the DSEIR failed to provide a quantitative analysis of the significance or severity of the scenario in which both a Giants game and a Warriors game occur without the Special Events Transit Service Plan. The RTC admits this fact, but offers several justifications for this omission. (FSEIR, Vol 4, p. 13.11-9.)

The RTC’s argues that “it represents a worst-of-the-worst scenario, which would be expected to occur, on average, about nine times a year.” (FSEIR, Vol 4, p. 13.11-9.) This justification fails because the RTC also admits that this scenario’s additional impacts are on top of the significant impacts already identified in the “basketball game only - without Special Events Transit Service Plan” scenario. (FSEIR, Vol 4, p. 13.11-9.) The fact that the impact is significant is only part of the information required by CEQA. The other part is disclosing how severe the significant impact is. (*Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831.) The SEIR fails in this regard.

As a result, the public was deprived of information essential to meaningful public participation. (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 392 [“An EIR is an ‘environmental ‘alarm bell’ whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return.’ [citations] The EIR is also intended ‘to demonstrate to an apprehensive citizenry that the agency has, in fact, analyzed and considered the ecological implications of its action’”].)

Moreover, without information regarding the extent of the Project’s significant

---

<sup>93</sup>July 27 Lippe, p. 18; Nov 2 Smith FSEIR p. 1-3.

environmental harm, the OCCI and the City cannot weigh whether the Project's benefits outweigh that harm, which is the final step in the CEQA process where, as here, the impact remains significant after mitigation.<sup>94</sup>

The RTC also argues that the "Giants and Warriors game without Special Events Transit Service Plan" scenario is "unlikely" because there is a planned funding mechanism (i.e., the Transportation Improvement Fund Ordinance currently pending before this Board) for the Transit Service Plan. (FSEIR, Vol 4, p. 13.11-9.) This justification fails for two reasons.

First, said funding is not assured, even if the Board adopts the Transportation Improvement Fund Ordinance ("Fund Ordinance"). Since the Fund Ordinance is not a Charter amendment, every future appropriation is subject to discretionary approval by future Boards of Supervisors. (*McMahan v. City and County of San Francisco* (2005) 127 Cal.App.4th 1368.) Setting this deficiency aside, SFMTA has acknowledged that the Budget and Finance Committee purported to make the Warriors responsible for any future budget shortfalls to the Fund Ordinance, yet all that the Warriors are actually required to do in this instance is engage in other transportation-related mitigation measures, much of it deferred, that is unrelated to the specific transportation mitigation measures specified by the MTA and funded by the Fund Ordinance. (See Exhibit 10, November 6, 2015, Budget and Legislative Analyst Report to the Budget and Finance Committee ("Nov 6 Budget Analyst Report"), p. 10 ["the Warriors will be responsible to provide additional transportation services to comply with EIR Mitigation Measures TR-2b and TR-18".]) Thus, funding for critical transportation mitigation is in no way assured.

Second, Under CEQA, an impact cannot be both significant and unlikely to occur. The likelihood of an impact occurring is a factor considered in the threshold determination of whether an impact is "reasonably foreseeable" and thus must be analyzed in an EIR/SED. (See CEQA Guidelines, § 15064, subd. (d).) The likelihood of an impact occurring is also a factor in the discussion of cumulative impacts. (See CEQA Guidelines, § 15030, subd. (b) [cumulative impacts shall reflect the severity of the impacts and their likelihood of occurrence].) Here, the SEIR determined that the "Warriors game without Special Events Transit Service Plan" scenario is likely enough to occur to identify the scenario as having significant impacts. Having done so, the agency cannot discharge its obligation to disclose the increased severity of impacts in the "Giants and Warriors game without Special Events Transit Service Plan" scenario by characterizing the "without Special Events Transit Service Plan" portion of the scenario as unlikely to occur.

---

<sup>94</sup>See OCII Resolution No. 70-2015, pp. 43-45, ¶'s 7-10 [Impact TR-18: Effect of Project on Traffic Without Muni Special Event Transit Service Plan (DSEIR p. 5.2-191, RTC, Response TR-2); Impact TR-19: Effect of Project Traffic on Freeway Ramps Without Muni Special Event Transit Service Plan (DSEIR p. 5.2-197); Impact TR-20: Effect of Project Transit Demand Without Muni Special Event Transit Service Plan (DSEIR p. 5.2-199; RTC, Response TR-2; Response TR-5); Impact TR-21: Effect of Project Regional Transit Demand Without Muni Special Event Transit Service Plan (DSEIR p. 5.2-202, RTC, Response TR-2)].

**(b) The SEIR fails to disclose traffic delays the Project's office and retail operations will cause on days with Giants games but without Project-related events.**

Figure 1 above also illustrates the SEIR's failure to disclose traffic delays the Project's office and retail operations will cause on days with Giants games but without Project-related events (i.e., convention, basketball game, or concert). And, using the delay numbers in the transportation appendix creatively reveals that such impacts are significant, at least for certain locations and time periods.

For example, in the PM peak period at the 7th/Mississippi and 16th St intersection, DSEIR page TR-179 shows "existing without Giants game" delay is 68.6 seconds; while page TR-275 shows "existing plus project without Giants game" delay is 87.8 seconds. This is an increment of 19.2 seconds of delay represents the contribution of traffic to the intersection from the Project's office and retail operations only, and is more than enough to tip this intersection from LOS E to F, which is a significant change.

Page TR-191 shows "existing with Giants game" delay is 84.7 seconds. The SEIR does not disclose, either in the body of the EIR or in its Appendices, the delay for "existing plus project with Giants game but without a Project-related event." To approximate this number, one can add the 19.2 second increment derived above (i.e., the contribution of traffic to the intersection from the Project's office and retail operations only) to 84.7 seconds. The result is 103.9 second of delay, a significant increase in the severity of existing significant delay.

According to the 2016 Giants schedule, the team will play 44 weekday evening regular season games plus 2 weekday evening preseason games (against the A's which are normally sold out) between the beginning of April to the end of September. If the team went all the way to the World Series and each of the playoff series went the maximum number of games, the team could play a maximum of about 11 weekday evening games in October. That totals 46 to 57 weekday evening games in a 7 month period. The use of the Warriors proposed event center is more difficult to assess. According to the information contained on DSEIR Volume 3, Appendix TR, page TR-19, Table 2, the proposed Warriors event facility could host a maximum of about 59 weekday events over the same beginning of April through end of October period (mix of Warriors regular season and playoff games, concerts, family-oriented shows, other sporting and convention/corporate events at average occurrences described in the referenced table). In that 7-month period, there are 156 weekdays. So there could be as many as 57 days per year where there is a weekday evening Giants game and no Warriors event center event, i.e., the undisclosed scenario described above. Also, the above example is just one of 22 intersections in the study area and at least 25 intersections outside the study area that will be affected to an unknown degree.

**9. The SEIR Impermissibly Characterizes Mitigation Measures for the Project's Transportation Impacts as Components of the Project.<sup>95</sup>**

**(a) The SEIR fails to consider other measures to reduce transportation impacts.**

The SEIR buries measures to reduce the Project's significant transportation impacts in the "project description" instead of identifying them as mitigation measures. These measures include both one-time capital improvements and ongoing expenditures as set forth in the Transportation Management Plan ("TMP") and Transit Service Plan ("TSP"). This conflation of design features and mitigation measures violates CEQA because it insulates the measures from the analysis applicable to mitigation measures, i.e., are they feasible and effective. (See, *Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 657 [the EIR "fail[s] to consider whether other possible mitigation measures would be more effective"].) For example, as discussed in section C.8.(a) above, the SEIR fails to provide assess the significance or severity of the scenario in which both a Giants game and a Warriors game occur without the Special Events Transit Service Plan. As a result, potentially significant transportation impacts are completely unanalyzed, and unmitigated.

**(b) The SEIR fails to identify enforceable mitigation.**

The SEIR's conflation of design features and mitigation measures undermines the Mitigation Monitoring and Reporting Plan ("MMRP") because the TMP and TSP are not identified as enforceable mitigation measures, but rather "summarized" in a segregated "Section D" that is not adopted by the City as part of its findings for the Project or certification of the FSEIR. (Even if they are adopted as mitigation measures, however, the operational components of the TMP and TSP are unenforceable. (See July 23 Smith, at FSEIR, Vol. 4, pp. Com-135 - 139.)

Also, the SFMTA concedes that the TMP and TSP are unenforceable because necessary funding is not guaranteed, stating in relevant part:

The SFMTA cannot unequivocally guarantee future funding for the TSP at the levels analyzed in the Project Description in perpetuity; nevertheless, I am confident the SFMTA will be able to deliver the proposed service for the following reasons: ...

The SFMTA supports the Project with the understanding that the City, the Golden State Warriors, and SFMTA do not expect the SFMTA operating and capital budgets to experience any adverse impact associated with implementing the proposed Transit Service Plan and the capital investments to support it. SFMTA is further encouraged by the proposed ordinance that will establish The Mission Bay

---

<sup>95</sup>Nov 3 Soluri Meserve to SFMTA, pp. 1-3; July 26 Smith at FSEIR, Vol. 6, pp. Com-135-139; July 27 Lippe at FSEIR, p. Com-126.

Transportation Improvement Fund and Designated Overlapping Event Reserve, funds from which would be appropriated by the Board of Supervisors as needed.

(MTA staff report dated November 3, 2015, enclosure 3.)

This error also obscures the City's massive public subsidy for the Project. A fundamental principle of CEQA is that development projects should mitigate their impacts to the extent feasible. (See, e.g., Pub. Resources Code, § 21002; see also CEQA Guidelines, § 15126.4.) With respect to the Project's transportation impacts, however, the City purports to adopt a "fair share" fee program to mitigate Project-level impacts. (*Anderson First Coalition v. City of Anderson* (2005) 130 Cal.App.4th 1173 ("Anderson First").) As a threshold matter, the SEIR never clearly discloses to the public that it relies upon purported "fair share" payments to fund transportation improvement to reduce the Project's significant transportation impacts. This renders the SEIR defective as an informational document because the omitted information is required to assess the feasibility of the TMP and TSP.

In addition, the purported "fair share" is not fully enforceable, and therefore, cannot be considered part of an "effective" mitigation plan. The payment of impact fees may constitute adequate mitigation if "part of a reasonable plan of actual mitigation that the relevant agency commits itself to implementing." (Id.) The *Anderson First* decision identified the information that is required in an EIR to establish the adequacy of a "fair share" mitigation measure, which includes the following: (i) identification of the required improvement; (ii) estimate of the cost of the required improvement; (iii) sufficient information to determine how much the project would pay towards the improvement; and (iv) the fees must be part of a reasonable, enforceable plan or program sufficiently tied to the actual mitigation of the impacts at issue. (*Anderson First, supra*, 130 Cal.App.4th at 1189-90.) The SEIR fails to provide this necessary information.

While the SEIR mentions the TMP and TSP as reducing the Project's transportation impacts, the SEIR fails to identify the total costs of the improvements, the Project's allocated contribution, and the reasonable and enforceable program to pay for the Project's impacts. Although withheld from the Project's CEQA documentation, important information bearing on these questions is contained in the November 6 Budget Analyst Report (Exhibit 10), released after certification of the SEIR. The November 6 Budget Analyst Report makes the following "Key Points:"

- The proposed ordinance establishes the Mission Bay Transportation Improvement Fund (Fund) as a category four fund, setting aside General Fund monies to pay for services provided by SFMTA, SFPD, and DPW to the Warriors Project. It is anticipated that the revenues to be realized from the Warriors Project will provide for the needed funding sources to the General Fund.

**Fiscal Impact**

- SFMTA's estimated costs to purchase four new light rail vehicles and make other transportation system improvements to accommodate the Warriors Project

are \$55.3 million. Estimated revenues generated by the Warriors Project to pay these costs are \$25.4 million, resulting in a revenue shortfall of \$29.9 million. The estimated revenue shortfall of \$29.9 million will be financed through sale of SFMTA revenue bonds or other financing source. Annual debt service is projected to be paid from tax revenues generated by the Warriors Project.

- SFMTA's expenditures for transportation services to the Warriors Project will be paid by SFMTA fare and parking revenues generated by these services. The Mission Bay Transportation Improvement Fund will pay for SFMTA service to the Warriors Project not covered by these fare and parking revenues, and for SFPD and DPW services to the Warriors Project.
- City departments' estimated annual expenditures to provide services to the Warriors Project are \$10.1 million. These expenditures will be funded by an estimated \$11.6 million in revenues generated by the Warriors Project, resulting in net revenues of \$1.5 million.

#### **Policy Consideration**

- If the Warriors Project generates insufficient General Fund tax revenues to pay for all of SFMTA's costs to provide transportation services to the Warriors Project, the Warriors will need to directly provide some transportation services.
- Only General Fund tax revenues directly generated by the Warriors Project should be included in the Controller's estimates of Project revenues to the City.

#### **Recommendations**

- Amend the proposed ordinance to specify that if the annual cap of 90 percent of General Fund revenues from the Project site and events at the Event Center is insufficient to cover SFMTA's expenditures for transportation services to the Warriors Project, then the Warriors will be responsible to provide the additional transportation services to comply with EIR Mitigation Measures TR.2b and TR.18.
- Amend the proposed ordinance to specify that only tax revenues generated on-site by the Warriors Project are included in the Controller's estimates of General Fund revenue generated by the Warriors Project for the purpose of calculating the annual General Fund contribution to the Mission Bay Transportation Improvement Fund.

(November 6 Budget Analyst Report, pp. 1-2.)

Thus, documents prepared outside the CEQA process concede the project applicant is not being asked to bear the full cost of its own project-level mitigation. Moreover, the SEIR and the November 6 Budget Analyst Report fail to disclose that the "estimated revenues generated by the Warriors Project to pay these costs" are not payments directly by the project applicant, but rather the re-direction of sales and other taxes generally attributable to Project operations that would otherwise flow to the City's General Fund for other citywide services or transportation improvements. This information was hidden in the Event Center Expenditure Plan, which the SFMTA approved on November 3, 2015 ("Expenditure Plan"). (See Enclosure 3 to SFMTA

staff report dated November 3, 2015.)

In other words, rather than simply require the project applicant to be financially responsible for the capital improvements needed to mitigate its project-level impacts, the City is establishing a fee program that does not even require the applicant to pay the cost of the needed improvements. Instead the City is voluntarily giving up tax generated General Fund revenues that would otherwise support other City programs and services. By cloaking this deficient mitigation strategy as a design feature of the Project, the City never engages in a meaningful analysis of potentially feasible mitigation measures involving the project applicant actually mitigating these project-level impacts. Therefore, the first three categories of information required by *Anderson First* are completely missing from the Project's CEQA documentation.

The fourth category of information required by *Anderson First*, namely information about a reasonable and enforceable plan, is lacking altogether because there simply is no enforceable plan to cover the funding gap for project-level mitigation. The November 6 Budget Analyst Report speculates that the acknowledged \$29.9 million funding gap can be "financed through sale of SFMTA revenue bonds or other financing source." (November 6 Budget Analyst Report, p. 1.) Incredibly, as of three days after FSEIR certification, there was no plan at all, much less an enforceable plan, about how to fund the shortfall and ensure the necessary project-level mitigation gets implemented.

In an attempt to address the lack of an actual plan, the November 6 Budget Analyst Report states, "Annual debt service is projected to be paid from tax revenues generated by the Warriors Project." (November 6 Budget Analyst Report, p.1.) This speculation, however, fails for at least three reasons. First, the available information calls into question whether such tax revenues will be adequate to actually cover the annual debt service. The November 6 Budget Analyst Report estimates annual costs for project-level transportation mitigation at \$10.1 million and total Project tax revenues at 11.6 million that could be redirected to pay for these costs. As explained by economist Jon Haveman, however, these revenue estimates are far from conservative.<sup>96</sup> In fact, should attendance fail to materialize as predicted, revenues may not be adequate to cover the estimate annual payments on the speculative finance mechanism for the \$29.9 million infrastructure costs.

Second, implicitly acknowledging the speculative nature of the Project's revenue and expense projections, the November 6 Budget Analyst Report claims that the project applicant should be required to make up any annual shortfall based on the Mission Bay Transportation Improvement Fund ("Fund"). However, it is not at all clear that the referenced provision of the Fund ordinance requiring the project applicant to cover any deficiencies in annual expenses also applies to the cost associated with debt service on the outstanding \$29.9 million in addition to the

---

<sup>96</sup>"Warriors Stadium Economics: Uncertainty and Alternatives, version 2.0," prepared by Jon Haveman, Ph.D. of Marin Economic Consulting, dated November 29, 2015, is attached to the November 30, 2015 "Appeal Brief" submitted by Soluri Meserve as Exhibit 4.

ongoing annual operational expenses. Further, the revision to the Fund ordinance recommended by the Budget Analyst requiring the Warriors to “directly provide some transportation services” in the event of a General Fund shortfall does not actually require the Warriors to make up the financial deficiency, but rather to engage in other, unrelated transportation mitigation measures set forth in M-TR-2b and M-TR-18. (November 6 Budget Analyst Report , p. 10.) The Legislative Analyst’s proposal therefore provides no greater certainty that the mitigation measures identified in the TMP, and funded by the Fund ordinance, will actually be implemented.

Third, since the vast majority of the project applicant’s financial contributions to transportation mitigation going forward is not based on a payments to a dedicated impact fee program but rather the City’s voluntary redirection of General Fund revenues, a Charter amendment would be required to actually bind future Boards (*McMahan v. City and County of San Francisco* (2005) 127 Cal.App.4th 1368) and thereby establish an enforceable program as contemplated in *Anderson First* and its progeny.

**10. The SEIR’s Identification of Numerous Mitigation Measures is Unlawful for Several Reasons, Including Deferral of Development and Lack of Evidence of Unavoidability.<sup>97</sup>**

One of the main purposes of an EIR is to identify ways to mitigate or avoid potentially significant impacts. Pub. Res. Code §§ 21002.1(a), 21061. CEQA therefore requires that the lead agency propose and describe mitigation measures aimed at minimizing any significant impact identified in an EIR. Pub. Res. Code §§ 21002.1(a), 21100(b)(3); 14 Cal. Code Regs. §§ 15121(a), 15126.4.

The SEIR takes the position that the City and the project proponent can devise specific mitigation measures later, well after the public has had its opportunity to review the SEIR and comment on the efficacy of mitigation measures. Mitigation Measure TR-2b states that:

The project sponsor *shall work with the City to pursue and implement, if feasible, additional strategies* to reduce transportation impacts. In addition, the City shall pursue and implement, if feasible, additional strategies that could be implemented by the City or other public agency (e.g., Caltrans). These strategies could include the following... .

(DSEIR, p. 5.2-129 (emphasis added). The strategies compound the problem by including measures that include equivocal language such as “explore,” “work to identify off-site parking lot(s)” (which should have been done as part of the preparation of the SEIR), “work to include,” “seek partnerships,” “meet to discuss,” and “encourage.” (DSEIR, p. 5.2-129 to 130). The above referenced language does not commit the City or the project sponsor to any course of action to

---

<sup>97</sup>July 27 Lippe, p. 16; July 23 Smith, pp. 17-25.

mitigate the identified environmental impacts. Mitigations that are “not guaranteed to occur at any particular time or in any particular manner” are inadequate. *Preserve Wild Santee v. City of Santee* (2012) 210 Cal.App.4th 260, 281; *see also, Federation of Hillside & Canyon Associations v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1260 (remote and speculative mitigations were inadequate); *Gray v. County of Madera* (2008) 167 Cal.App.4th 1099, 1119 (mitigation measure rejected because it identified general goal for mitigation rather than a specific performance standard).

Mitigation TR-9d makes the same mistake regarding a serious safety issue at the UCSF helipad. In this instance, the City simply defers the development of a lighting plan that fails to include specific measures. It only requires consultation with SFO staff concerning the effects of lighting on pilots and consultations and approvals regarding firework displays and laser light shows with advance notification to UCSF. Furthermore, the DSEIR calls for the development of “specialized lighting guidelines.” (DSEIR, p. 5.2-272). Mitigation TR-9a has a similar flaw.

The FSEIR’s response to comments actually supports the Alliance’s point. The response cites CEQA Guideline § 15126.4(a)(1)(B) to support the notion that deferral is appropriate. While the response stretches the meaning of section 15126.4(a)(1)(B) and the cases interpreting it, these authorities stand for the proposition that deferral is permissible if there are specified performance standards and the mitigations can be accomplished in more than one way. Then the response to comments states that “performance criteria must be sufficiently definite to ensure that the potential impacts would be mitigated.” (SFEIR, p. 13.11-201.) That is the problem with TR-2b. There are no performance criteria at all, let alone sufficiently definite ones. The mitigation is simply a menu of options for the City and the project sponsor to consider at a later date.

Mitigation TR-11c suffers from the same infirmity because it merely requires “the project sponsor to *continue to work with the City* to pursue additional strategies to reduce impacts during overlapping events.” (DSEIR p. 13.11-174 (emphasis added)). In fact, TR-11c is even worse, because the SEIR admits there is no evidence the mitigation is feasible, stating:

However, due to the physical limitations of the City’s street grid, land may not be available for City purchase that would allow for the expansion of street width to accommodate additional travel lanes or other design techniques to achieve the standard of LOS D or better, and City policies disfavor expansion of roadway capacity in order to achieve the City’s Transit First and other goals that attempt to limit private vehicle use. Consequently, it cannot be determined what mitigation measures may be available for affected areas, and then whether the measures would be feasible given the physical constraints of the street network and the availability of funding to implement the measures. The City would implement those measures *that it deems feasible...*

(DSEIR, p. 13.11-175 (italics added).) Not only is the City deferring the formulation of the mitigation, it has not even made the pre-requisite determination of whether a mitigation is even

available or feasible. (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 727 [agreement that called for purchase of replacement groundwater was an inadequate mitigation measure because there was no indication that such water was even available]. A vague and unenforceable promise to simply examine matters later is not a mitigation at all.

Mitigation TR-11c adds even more wiggle room to allow the project sponsor to escape implementation. For additional strategies to reduce impacts, Mitigation TR-11c adds that “The project sponsor shall exercise *commercially reasonable efforts*” to “avoid scheduling non-Golden State Warriors events of 12,500 or more event center attendees that start within 60 minutes of the start (respectively) of events at AT&T Park,” and to “negotiate with the event promoter to stagger start times... .” It also requires that “the project sponsor shall: (1) make *commercially reasonable efforts* to negotiate with the Port of San Francisco” regarding parking “and (2) (if such negotiations are successful) provide free shuttles” from such parking. (DSEIR, p. 13.11-180 (italics added).) The determination whether efforts are “commercially reasonable” is within the discretion of the project sponsor, and therefore unenforceable and illusory.

Also, “commercially reasonable efforts” is not the correct standard for determining a mitigation’s feasibility. “What is required is evidence that the *additional* costs or lost profitability are sufficiently severe as to render it impractical to proceed with the project” if the Sponsor is *required* to avoid scheduling non-Golden State Warriors events of 12,500 or more attendees within the start of events at AT&T Park. (*Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 599 (emphasis added).)

TR-11c also states that:

in the event the off-site parking lots at 19th Street and the Western Pacific site are implemented, the SFMTA shall consult with Caltrans in assessing the feasibility of signalizing the intersection of Pennsylvania/I-280 southbound off-ramp. If determined feasible by the SFMTA and Caltrans, the SFMTA and Caltrans shall establish the level of traffic volumes that would trigger the need for a signal, and the project sponsor shall fund its fair share...

(DSEIR, p. 13.11-180 (italics added).) Again, the SEIR defers all the analysis concerning its feasibility.

Mitigation TR-13 states that to accommodate Muni transit demand during overlapping events at both AT&T Park and the proposed project, “the project sponsor shall work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate with the SFMTA to provide additional shuttle buses between key Market Street locations and the project. Examples of the additional service include...” Again, there is no definite mitigation provided and the City is simply asking the project proponent to discuss the matter in the future. (DSEIR, p. 5.2-184).

A similar requirement is set forth in Mitigation TR-11b:

As a mitigation measure to optimize effectiveness of the transportation management strategies for day-to-day operations and events in the Mission Bay area, at AT&T Park, UCSF Mission Bay campus, and the proposed project, the project sponsor shall actively participate as a member of the Ballpark/Mission Bay Transportation Coordinating Committee in order to ***evaluate and plan*** for operations of all three facilities (i.e., AT&T Park, UCSF Mission Bay Campus, and the proposed event center)...

The Transportation Coordinating Committee ***shall consult on changes to and expansion of transit services, and for developing and implementing strategies within their purview that address transportation issues*** and conflicts as they arise.

(DSEIR, Vol 1, p. 5.2-179 (emphasis added)). This mitigation highlights the illegality of the City's approach. The Committee will "evaluate and plan" and shall "develop" strategies later. This is required to be considered as part of the environmental review process, not deferred to a later date, after project approval.

With respect to TR-5a, TR-5b and TR-14 (requiring the Project Sponsor to ask Caltrain, ferry operators, and BART, to provide additional service for Project events, the RTC simply states the impact is significant and unavoidable: "Therefore, the SEIR does not rely on these measures to find the corresponding impacts less than significant, but rather determines the impact would be significant and unavoidable without mitigation." (FSEIR, p. 13.11-200). In this scenario, the finding of "unavoidability" is defective because there is no evidence it is infeasible to require the Project Sponsor to execute a contract with some or all of these third-party transit service providers to provide additional service for Project events. (*City of Marina v. Board of Trustees of the California State University* (2006) 39 Cal.4th 341, 350, 355-356, 360-361.)

The SEIR states that:

In order to accommodate the additional transit demand to the South Bay during weekday and Saturday evening conditions, one additional train car (average capacity of 130 passengers per car) on at least one inbound train per hour would be needed. For the weekday late evening period, two additional train cars (average capacity of 130 passengers per car) on at least one outbound train per hour would be needed. Alternatively, the transit demand could be accommodated within one special outbound train (total capacity up to 650 passengers) at the end of the basketball game, similar to the service currently being offered to SF Giants home games (two special outbound trains).

In order to accommodate the additional transit demand to the North Bay, four additional Golden Gate Transit buses (40 passengers per bus) plus one ferry boat (250 to 350 passengers per boat) per hour, or alternatively seven additional buses per hour would need to be provided.

(DSEIR, p. 5.3-146).<sup>98</sup> While the SEIR clearly identifies the need, Mitigation TR-5 completely misses the mark. Instead of providing concrete requirements to address this lack of transit, the mitigation states as follows:

However, since the provision of additional South Bay and North Bay service is uncertain and full funding for the service has not yet been identified, implementation of both mitigation measures remain uncertain. Accordingly, the proposed project's significant impacts to Caltrain, Golden Gate Transit and WETA transit capacity would remain *significant and unavoidable with mitigation*.

(DSEIR, p. 5.3-146 to 147; *see also*, DSEIR 5.2-185). This approach has been condemned by the courts.

CEQA requires the agency to find, based on substantial evidence, that the mitigation measures are “required in, or incorporated into, the project”; or that the measures are the responsibility of another agency and have been, or can and should be, adopted by the other agency; or that mitigation is infeasible and overriding considerations outweigh the significant environmental effects. (§ 21081; Guidelines, § 15091, subd. (b).) In addition, the agency “shall provide that measures to mitigate or avoid significant effects on the environment are fully enforceable through permit conditions, agreements, or other measures” ([Public Resources Code] § 21081.6, subd. (b)) and must adopt a monitoring program to ensure that the mitigation measures are implemented ([Public Resources Code] § 21081.6, subd. (a)). *The purpose of these requirements is to ensure that feasible mitigation measures will actually be implemented as a condition of development, and not merely adopted and then neglected or disregarded.* (See § 21002.1, subd. (b).) . . . .

The city acknowledged in the TIMP that there was great uncertainty as to whether the mitigation measures would ever be funded or implemented. Although the city adopted the mitigation measures, it did not require that they be implemented as a condition of the development allowed under the GPF and made no provision to ensure that they will actually be implemented or “fully enforceable” (§ 21081.6, subd. (b)). We therefore conclude that there is no substantial evidence in the record to support a finding that the mitigation measures have been “required in, or incorporated into” (§ 21081, subd. (a)(1)) the GPF in the manner contemplated by CEQA, and the city failed to provide that the mitigation measures would actually be implemented under the GPF (§ 21081.6, subd. (b)).

*Federation of Hillside & Canyon Associations v. City of Los Angeles* (2000) 83 Cal.App.4th

---

<sup>98</sup>The SEIR admits that these are “*new significant* impacts not previously identified in the Mission Bay FSEIR.” (DSEIR, p. 5.2-147).

1252, 1260–126 (italics in original, fn. omitted)<sup>99</sup>; see also, *Anderson First Coalition v. City of Anderson* (2005) 130 Cal.App.4th 1173, 1188 (“To be adequate, these mitigation fees, in line with the principle discussed above, must be part of a reasonable plan of actual mitigation that the relevant agency commits itself to implementing.”)

Mitigation TR-5 suffers from the flaws identified in this line of cases. Again, the SEIR and lead agency uses the determination that the impact is significant and unavoidable as a justification for having an unenforceable mitigation, but the finding of “unavoidability” is defective because there is no evidence it is infeasible to require the Project Sponsor to execute a contract with third-party transit service providers to provide additional service for Project events. Further, the approving agencies have failed to fill this gap, because these Mitigations do not commit these agencies to implement these measures.

TR-5a also uses equivocal language and further states that “the project sponsor shall work with Caltrain to provide additional Caltrain service to and from San Francisco on weekdays and weekends. The need for additional service shall be based on surveys of event center attendees conducted as part of the TMP.” (DSEIR, p. 5.2-147). TR-5b contains nearly identical language providing that the project sponsor shall work with Golden Gate Transit regarding providing ferry and bus service. (DSEIR, p. 5.2-147). The problem with these mitigation measures are two-fold. First, the SEIR identifies the need for additional transit with specificity (e.g., two additional train cars), then the mitigation simply ignores the analysis and says the mitigation will be based on “surveys of event center attendees.” If the problem has been identified, a subsequent survey, without specified parameters or controls, cannot dictate the required transportation needs. And, the City may not cede responsibility for assessing an impact to a project proponent. *California Clean Energy Committee v. City of Woodland*, supra, 225 Cal.App.4th 173, 194. The public and decisionmakers are entitled to be informed of the transit need, as the SEIR has identified, and then mitigations must be developed to address that identified need. Second, while the impact has been identified, and the mitigation for the impact also identified (e.g., two additional train cars), the mitigation only requires the project sponsor to “work” on transportation issues, but does not require it to pay its fair share to fund the actual mitigation.

Caltrain, for its part, invited the City and the project sponsor to work with it to develop the appropriate mitigation, stating:

Caltrain agrees with the DSEIR’s analysis of capacity impacts to our service, the conclusion that additional service has the potential to mitigate a portion of these impacts, and the statement that additional Caltrain service has not yet been defined, funded or agreed to. Caltrain understands the importance of the regional

---

<sup>99</sup> The court in *Federation of Hillside & Canyon Associations v. City of Los Angeles* used the substantial evidence test, but the Alliance believes based on subsequent construction of the standard of review by the courts, that the failure to require implementation of a mitigation measure is a failure to proceed in a manner required by law.

transportation services we provide and we look forward to working collaboratively with the City and County of San Francisco and the project sponsors to address the transportation challenges and opportunities presented by this unique project. As the project advances through the environmental process we encourage the City and the project sponsors to engage with us directly to more formally define, analyze and identify funding for any contemplated increase in Caltrain service.

(FSEIR, Vol. 6, p. COM-20 [Caltrain letter dated July 27, 2015].) The mitigation measure provides no assurance that the mitigation will happen and dismisses the mitigation by simply calling the impact significant and unavoidable when there is a potentially feasible mitigation present.

The SEIR makes the same mistake with respect to Mitigation TR-14 regarding impacts on BART during overlapping events at AT&T Park and the proposed project. The SEIR simply says “since the provision of additional East Bay, South Bay, and North Bay Service is uncertain and full funding for the service has not yet been identified, implementation of these mitigation measures remain uncertain.” The SEIR then states that

the project sponsor shall work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate with BART to provide additional service from San Francisco following weekday and weekend evening events. The additional East Bay BART service could be provided by operating longer trains. The need for additional BART service shall be based on characteristics of the overlapping events... .

(DSEIR, p. 5.2-185).

The response to comments attempts to rehabilitate these fatal flaws in the SEIR by stating:

because some or all of the additional demand could be accommodate (sic) by other transit providers serving the East Bay, North Bay, and South Bay (e.g., BART also serves the South Bay and not projected to operate at more than 100 percent capacity utilization), the actual additional service needed to accommodate the demand may be less than identified in the SEIR. Thus, in order to provide additional transit most efficiently, the amount of additional service should be responsive to the actual travel patterns, as determined during monitoring of events.

(FSEIR, p. 13.11-193). There are several problems with this response. First, the SEIR attempts to have it both ways. On the one hand it provides analysis of the transportation need, then on the other it attempts to downplay the need by saying it may not reflect the situation accurately. This

argument either calls into question the SEIR's impacts analysis, or is an attempt to avoid mitigating the clearly significant impact. Second, it allows the project sponsor to determine the need for additional transportation at a later date. There are no parameters specified as to the conduct of the surveys, and no way to tell whether the surveys will be accurate. There is no indication as to whether the City will verify the accuracy of the surveys. Third, it still does not solve the problem of providing the funding for the mitigation. The response further states:

Neither the project sponsor nor the City has the legal authority and logistical ability to provide the additional service to and/or from the North Bay and South Bay, or to commit to funding of the additional service. However, the proposed TMP and Mitigation Measures require that the City and project sponsor to work with the regional transit agencies to provide additional service. Despite the lack of any guaranteed outcome, such efforts might well bear fruit, based on past experience. The provision of additional regional transit service during special events is common in San Francisco. As noted in the SEIR, additional service can include adding cars to scheduled trains, or provision of special event trains.

(FSEIR, p. 13.11-183). There are multiple problems with this response. First, the notion that the City can simply shed its responsibility to provide for mitigations because other agencies are responsible for implementation was rejected in *City of Marina v. Board of Trustees of the California State University, supra*, and *County of San Diego v. Grossmont-Cuyamaca Community College Dist.* (2006) 141 Cal.App.4th 86, 97–98. Second, as stated above, a promise to “work with regional transit agencies” is not a mitigation. Third, if the provision of additional service during special events is common in San Francisco, there should be no barriers to providing the necessary mitigations for these impacts.

CEQA requires the City to identify “both the significant effects of proposed projects and the feasible alternatives or feasible mitigation measures which will avoid or substantially lessen such significant effects.” Pub. Res. Code § 21002; 14 Cal. Code Regs. § 15126.4(a)(1). Here, the SEIR identifies both the effects and the necessary solution. But, the SEIR does not mandate the solution as a mitigation. “Each public agency shall mitigate or avoid the significant effects on the environment of projects that it carries out or approves whenever it is feasible to do so.” Pub. Res. Code § 21002.1(b). “The core of an [Environmental Impact Report (EIR)] is the mitigation and alternatives sections.” *Preservation Action Council v. City of San Jose* (2006) 141 Cal.App.4th 1336, 1350. It is completely feasible to mitigate the significant effect by funding the fair share of the transit impact. Caltrain is willing to work with the City and the project sponsor to craft the mitigation. The City simply fails to require a feasible mitigation.

The CEQA Guidelines specifically recognize that requiring a project to implement or fund its “fair share” of a measure designed to mitigate a cumulative impact is an effective way to address the project's contribution to the impact. 14 Cal. Code Regs. § 15130(a)(3). Even where fees are required, the courts have required that fees translate into actual mitigations. “A commitment to pay fees without any evidence that mitigation will actually occur is inadequate.”

*Save Our Peninsula Committee v. Monterey County Bd. of Supervisors* (2001) 87 Cal.App.4th 99, 140. Here, the problem is worse. No mitigation fees are even required to be paid for an identified significant impact. CEQA requires that an EIR propose specific mitigations to reduce identified traffic impacts. *Federation of Hillside & Canyon Associations v. City of Los Angeles*, *supra*, 83 Cal.App.4th at 1261 (EIR invalid because mitigation measures were not “required in, or incorporated into” (§ 21081, subd. (a)(1)) the General Plan Framework (GPF) in the manner contemplated by CEQA, and the city failed to provide that the mitigation measures would actually be implemented under the GPF (§ 21081.6, subd. (b)).) For these reasons, mitigations for transit impacts are inadequate.

**(a) The SEIR Improperly Defers the Development of Mitigation Measures to Reduce the Project’s Construction-related Traffic Impacts to less than Significant.<sup>100</sup>**

With respect to cumulative construction impacts related to ground transportation (Impact C-TR-1), the SEIR asserts the impacts are less than significant. (FSEIR Vol. 4, p. 13.11-157; DSEIR vol. 1, p. 5.2-212.) The Alliance discusses this conclusion in section II. C. above.

Since the impact was improperly determined to be less than significant, mitigation is necessary to reduce the impact. However, Improvement Measure I-TR-1, which calls for the preparation of a Construction Management Plan and Public Updates, was improperly deferred. I-TR-1 merely calls for the project sponsor to require the contractor to:

prepare a Construction Management Plan for the project construction period. The preparation of a Construction Management Plan could be a requirement included in the construction bid package. Prior to finalizing the Plan, the project sponsor/construction contractor(s) shall meet with DPW, SFMTA, the Fire Department, Muni Operations and other City agencies to coordinate feasible measures to include in the Construction Management Plan to reduce traffic congestion, including temporary transit stop relocations and other measures to reduce potential traffic, bicycle, and transit disruption and pedestrian circulation effects during construction of the proposed project. This review should consider other ongoing construction in the project vicinity, such as construction of the nearby UCSF LRDP projects and construction on Blocks 26 and 27.

(DSEIR, p. 1-14). The mitigation has no performance standards or other specific requirements. It is simply at the discretion of the project sponsor and the contractor. Meeting and coordinating with City officials, without any specific requirements or performance standards, is an illusory mitigation at best. And, there is no basis in which the public can understand the efficacy of the measures. The Construction Management Plan “could” “encourage” carpools, transit, bicycles and walking for construction workers, identify parking for construction workers, and “could” provide construction updates to businesses and residents. (DSEIR, p. 5.2-116 to 117). There are

---

<sup>100</sup>July 27 Lippe, pp. 5-7; July 23 Smith, p. 15; Nov 2 Smith FSEIR p. 22.

no specific mandates included in I-TR-1. The CEQA Guidelines require that “Mitigation measures must be fully enforceable through permit conditions, agreements, or other legally-binding instruments. In the case of the adoption of a plan, policy, regulation, or other public project, mitigation measures can be incorporated into the plan, policy, regulation, or project design.” 14 Cal. Code Regs. 15126.4(a)(2). Nothing in I-TR-1 is enforceable, let alone fully enforceable, through conditions, agreements or other legally binding instruments. The measure cannot even be quantified since it relies on future contractors hired by the Project sponsor. Therefore, it is wholly inadequate as a mitigation measure.

#### **11. The SEIR’s Transit and Traffic Analyses Understate Impacts Because They Rely on Outdated Baseline Data.<sup>101</sup>**

The Alliance commented that the SEIR’s transit and traffic analyses understate impacts because they rely on outdated baseline data. “In assessing the impact of a proposed project on the environment, the lead agency should normally limit its examination to changes in the existing physical conditions in the affected area as they exist at the time the notice of preparation is published, or where no notice of preparation is published, at the time environmental analysis is commenced.” (*Save Our Peninsula Committee v. Monterey County Bd. Of Supervisors* (2001) 87 Cal.App.4th 99, 123, citing CEQA Guideline § 15126.2; see also, *County of Amador v. El Dorado County Water Agency* (1999) 76 Cal.App.4th 931, 953; CEQA Guideline § 15125(a). )

However, the case law also recognizes that factors after the issuance of the NOP may influence the selection of the correct baseline. “Environmental conditions may vary from year to year and in some cases it is necessary to consider conditions over a range of time periods.” *Save Our Peninsula Committee v. Monterey County Bd. Of Supervisors* (2001) 87 Cal.App.4th at 125. Speaking specifically to traffic, the Court stated: “Since the environmental review process can take a number of years, *traffic levels as of the time the project is approved may be a more accurate representation of the existing baseline against which to measure the impact of the project.* (See, e.g. *Fairview Neighbors v. County of Ventura* (1999) 70 Cal.App.4th 238 [maximum estimated traffic was appropriate baseline].)” *Ibid.* at 126 (emphasis added).

The RTC contends the transit and traffic data used were up-to-date and adjusted to account for recent developments and growth. This is incorrect, both factually and legally. As shown by traffic engineer Smith, the SEIR does not present baseline data current to either the issuance of the NOP, or a later time that would account for the continued phenomenal growth in Mission Bay and the surrounding environs. Instead, the City relies on stale data that meets neither legal test and results in an underestimate of the environmental transit and traffic impacts. (Nov 2 Smith FSEIR, p. 9-13.)

Smith shows the transit data is from 2010 and 2011, well before the NOP was issued. Smith notes that when the NOP was issued, large number of development projects were

---

<sup>101</sup>July 23 Smith, p. 9; Nov 2 Smith FSEIR pp. 9-13.

completed and occupied and the recovering economy increased ridership considerably. The City claims it took steps to ensure that the data was up-to-date, but Smith provides detailed analysis of why the City actually did not update the analysis, and that some of the data being represented as updated is actually old data from 2012 and 2013. It is certainly not up-to-date and is not representative of existing conditions at the time the NOP was issued in November of 2014, nor takes into account additional development since then. As Smith notes, BART's comment on the DSEIR states that "Given strong job expansion in San Francisco, BART has experienced unprecedented ridership growth (~25% over the last four years) which creates a number of peak period capacity challenges." (Nov 2 Smith FSEIR, p. 10 [FSEIR Vol. 4, p. COM-19].)

Smith also shows the traffic data fails to include traffic volumes associated with developments in northern Mission Bay, SOMA and the C-3 that were completed after 2013 or were nearing completion by 2015. (Nov 2 Smith FSEIR, p. 9-13.)

**12. The SEIR Fails to Consider the Disruptive Impacts of the At-grade Rail Crossing on LOS at 7th/ Mississippi and 16th Street.**

This issue is discussed in July 23 Smith at page 14; the FSEIR's responses to comments at Vol. 4, pp. 13.11-55, 56; Nov 2 Smith FSEIR, at page 18, and Nov 28 Smith FSEIR (Exhibit 12 hereto) at pages 4-7, all of which are incorporated herein by reference.

**13. The SEIR concludes, without adequate foundation, that the project would not have an adverse impact on emergency access to UCSF hospitals.**

This issue is discussed in July 23 Smith at page 16; Nov 2 Smith FSEIR at page 22; Nov 10 Smith FSEIR Access; and Nov 28 Smith FSEIR (Exhibit 12 hereto) at page 2, all of which are incorporated herein by reference.

**14. The New Project Variant disclosed in the FSEIR requires recirculation due to new and more severe significant impacts.<sup>102</sup>**

The new project variant will dig up King Street for six months and Third Street for fourteen months. (FSEIR, pp. 12-11, 12-25.) This will exacerbate construction phase impacts on traffic, creating new significant impacts not previously identified in the SEIR.

This issue is discussed in Nov 13 Smith FSEIR King St., and Nov 17 Smith FSEIR 3rd St., all of which are incorporated herein by reference.

**D. THE SEIR IS NOT SUFFICIENT AS AN INFORMATIONAL DOCUMENT WITH RESPECT TO HYDROLOGY, WATER QUALITY, AND BIOLOGICAL IMPACTS.**

**1. The DSEIR Is Not Sufficient as an Informational Document with Respect to the Project's Wastewater Treatment Infrastructure Impacts (Comment UTIL-3).<sup>103</sup>**

The DSEIR concedes the Project's cumulative wastewater flow, in combination with other approved projects, will exceed the Mariposa Pump Station's capacity, and therefore, the Project will have a significant and unavoidable impact because it "would require or result in the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects." (DSEIR, p. 5.7-13 - 5.7-20 [Impact C-UT-2].) But the DSEIR's disclosure of the nature and severity of the potentially significant impacts of building these new wastewater treatment facilities falls far short of CEQA's requirements.

The DSEIR generally describes the type of new wastewater treatment facilities that might be built. (DSEIR, p. 5.7-14.) The DSEIR then identifies a number of potentially significant impacts of constructing new wastewater treatment facilities necessitated by the Project, stating:

These construction activities would be expected to result in temporary increases in truck and construction employee traffic, noise, and air pollutant and greenhouse gas emissions. In addition, depending on the site-specific design and location, the pump station improvements could result in physical effects on cultural resources, biological resources, water quality, and hazardous materials.

(DSEIR, p. 5.7-14.) The DSEIR then vaguely suggests that these impacts could be mitigated to less than significant levels by adopting "typical" mitigation measures, stating:

Most, if not all, of these potential impacts can generally be mitigated to a less-than-significant level with typical mitigation measures, similar to those identified in the Initial Study and the SEIR for this project. Long-term operational impacts would likely be less than significant because operation of the pump stations would be similar to existing operations of these facilities.

(DSEIR, p. 5.7-14.)

These vague descriptions fail to discharge the City's legal obligations under CEQA to fully describe the Project, including its "reasonably foreseeable consequence" of necessitating the construction of additional wastewater treatment facilities, and to include an "analysis of the

---

<sup>103</sup>July 26 Lippe, pp. 1-10; July 19 Gilbert, pp. 2-3; Nov 2 Lippe FSEIR, pp. 8-12, Nov 2 BSK; Nov 2 Ringelberg..

environmental effects” of this future action and the mitigation measures that may reduce those impacts. (See e.g., *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 396 (*Laurel Heights I*) [“an EIR must include a analysis of the environmental effects of future expansion or other action if: (1) it is a reasonably foreseeable consequence of the initial project; and (2) the future expansion or action will be significant in that it will likely change the scope or nature of the initial project or its environmental effects].)

As shown in both the DSEIR’s analysis of mitigation measures and the Mission Bay Alliance’s comments on many types of impacts that construction of additional wastewater treatment facilities will cause (e.g., air quality, noise, traffic), the “mitigation measures ... identified in the Initial Study and the SEIR for this project” do not ensure that “impacts can generally be mitigated to a less-than-significant level.”

Finally, the DSEIR states:

In the event that additional future wastewater flows would exceed the pump station capacities before the needed wastewater system improvements could be completed, it is assumed that the SFPUC would make internal operational or piping changes to accommodate the additional flows in the interim in order to remain in compliance with RWQCB permit requirements. The interim system modifications would be subject to the approval of the RWQCB under the terms of the Bayside NPDES permit. Approval by the RWQCB would ensure that water quality of the Bay would be protected during the interim period. Any interim system modifications are assumed to be operational or internal to the existing pump stations and therefore would not result in any physical environmental effects.

This remarkable passage suggests that the City is prepared to approve and allow construction of this Project without ensuring the construction of additional, adequate, sewage treatment capacity required by the Project. This is the opposite of responsible planning. Moreover, the City is apparently poised to take this action based on several unsupported assumptions. First, the DSEIR assumes, without discussion or evidentiary support, that interim modifications will not have a significant effect on the environment.

Second, the DSEIR assumes the Project’s wastewater impacts on the Bay will only be “interim” until the SFPUC builds or expands permanent new wastewater treatment facilities; and that in this supposedly “interim” period, the Regional Water Quality Control Board will mitigate any “interim” impacts to less than significant. But there is no evidence to support the assumption the Project’s wastewater can be treated to avoid significant adverse effects on Bay water quality before the SFPUC builds or expands permanent wastewater treatment facilities. Nor is there evidence that Regional Water Quality Control Board regulation during any purported “interim” period would avoid significant adverse effects on Bay water quality. Nor is there any evidence as to how long this purportedly “interim” period will last, or how many other projects that will

cumulatively exceed the Mariposa Pump Station’s capacity will commence operations during this purportedly “interim” period.

Indeed, this DSEIR’s approach represents a total abdication of the City’s legal responsibility under CEQA to identify the Project’s significant effects, to identify mitigation measures that would substantially reduce those effects, and to adopt all feasible mitigation measures that would substantially reduce those effects. To put it colloquially, punting the problem to the SFPUC or Regional Water Quality Control Board does not pass muster under CEQA.

**(a) The Response to Comment UTIL-3 is Inadequate.<sup>104</sup>**

The RTC for Comment UTIL-3 essentially says that the Project is “first come, first served” for purposes of using up remaining sewer system capacity in the Mariposa sub-basin. (FSEIR, Vol. 5, pp. 13.17-11.) But the assertion that the cumulative future projects listed in the referenced report by Hydroconsult Engineers (i.e., Blocks 25b, 33-34, 40 and Hospital Phase 2),<sup>105</sup> will be operational further in the future than the Project is unsupported. In fact, these cumulative future projects are not even listed in the cumulative future projects list at DSEIR, pages 5.1-8 - 10. As a result, the SEIR’s assertions are unsupported and untestable.

The response’s assertion that “Future improvements in the SFPUC’s wastewater system are beyond the project sponsor’s control” is also unsupported; in fact, it is contradicted by overwhelming evidence. Where it is advantageous to the project, the SEIR assumes the City will do things over which the project sponsor has no control to support the project, e.g., comply with its NPDES permit, provide transportation infrastructure to handle the crowds, etc. Indeed, the City is named as a responsible party or is directly involved in dozens of mitigation measures identified in the proposed Mitigation Monitoring and Reporting Program.<sup>106</sup> But here, the SEIR takes an inconsistent position, disclaiming any Project Sponsor control over a different matter within the City’s control, i.e., expansion of the sewer system, apparently for no reason other than it is advantageous to the project to do so.<sup>107</sup>

---

<sup>104</sup>July 26 Lippe, pp. 1-10; July 19 Gilbert, pp. 2-3; Nov 2 Lippe FSEIR, pp. 8-12, Nov 2 BSK; Nov 2 Ringelberg..

<sup>105</sup>Hydroconsult Engineers, Inc. 2015. Combined Sewer Impact Analysis, Golden State Warriors Arena EIR. February 25, referenced on RTC, p. 13.17-15, n 8.

<sup>106</sup>One example is Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts: “The project sponsor shall work with the City to pursue and implement commercially reasonable, if feasible, additional strategies (i.e., in addition to those included in the project TMP) to reduce transportation impacts. In addition, the City shall pursue and implement, if feasible, additional strategies to that could be implemented by the City or other public agency (e.g., Caltrans).”

<sup>107</sup>The San Francisco Public Utilities Commission is a department of the City and County of San Francisco.

**2. The DSEIR Is Not Sufficient as an Informational Document with Respect to the Project's Contaminated Wastewater (I.e. Combined Sewage and Stormwater) Impacts on San Francisco Bay Water Quality or Biological Resources (Including from Inadequately Treated Sewage and Toxic Chemicals (E.g., Pcb's and Metals) (Comments Hyd-3 - Hyd-6).<sup>108</sup>**

In the chapter on the Project's Water Quality impacts, the DSEIR evaluates the impact of Combined Sewage Discharges (CSDs or CSOs) to the Bay that exceed treatment capacity of the Mariposa Pump Station due to the combination of increased storm water flows combined with sewage wastewater flows. The DSEIR uses two thresholds of significance based on the City's NPDES permit, stating:

- Wet weather flows to combined sewer system: The impact analysis examines whether project related increases in wastewater flows would contribute to combined sewer discharges during wet weather. The impact is considered less than significant if the increased flows would not increase the frequency of combined sewer discharges above the long-term average specified in the NPDES permit for the SEWPCP, the North Point Wet Weather Facility, and Bayside wet-weather facilities.
- Effluent discharges from SEWPCP: For the analysis of impacts related to changes in the quality of effluent discharges from the SEWPCP, the analysis considers whether discharges of wastewater to the combined sewer system would cause effluent quality to exceed the discharge limitations of the NPDES permit for the SEWPCP. If not, the impact is considered less than significant.

(DSEIR, p. 5.9-30.)

Thus, for purposes of complying with CEQA's requirement that it identify the Project's significant impacts, the DSEIR makes two unsupported assumptions: (1) that City compliance with its NPDES permits will avoid significant impacts, and (2) that the City will in fact comply with its NPDES permits. The DSEIR must support these assumptions with evidence.

In addition, the first threshold quoted above only looks at "frequency of combined sewer discharges above the long-term average" and ignores increases in quantity and duration of overflows. (See DSEIR, pp. 5.9-34 to 5.9-36.) The DSEIR notes:

The model analyzed the effects of discharging the average flows from the proposed project in combination with the existing average flows in the drainage area. Under this scenario, the frequency of CSDs would not increase, but the

---

<sup>108</sup>July 24 Lippe, pp. 4-10; Nov 2 Lippe FSEIR, pp. 10-12; July 21 Hageman; Nov 2 Hageman; Nov. 2 BSK; July 22 Cline, pp. 1-15.

volume of the CSDs would increase from 5.34 to 5.63 million gallons and the duration would increase from 17.2 to 17.3 hours.

(DSEIR, 5.9-35.) The DSEIR finds this impact less than significant because it defines “significance” solely in terms of the *number* of CSD events and compliance with the City’s NPDES permit, regardless of the *quantity* of sewage discharged, stating:

Because average and peak wastewater flows from the project site would not increase the frequency of CSD events from the Mariposa sub-basin and would be consistent with the requirements of the NPDES permit, project level water quality impacts related to contributions to an increase in CSD frequency would be *less than significant*.

(DSEIR, 5.9-35, 36.) The DSEIR makes the same finding for the Project’s cumulative impact based on the same evidence and the same rationale. (DSEIR, 5.9-35, 36.)

This is a legal error because the DSEIR cannot merely reference a project’s compliance with another agency’s regulations. Lead agencies must conduct their own fact-based analysis of project impacts, regardless of whether the project complies with other regulatory standards.<sup>109</sup>

The 1998 Mission Bay FSEIR sets the stage for this legal error in its finding that CSO impacts on the Bay are less than significant, stating:

The same conclusions for the proposed project apply to the cumulative effects of Bayside projects, in that the cumulative increase in pollutant mass load from these projects would have a less-than-significant effect on water quality. As shown in Table V.K.8, the project would represent less than 3% of the increased total pollutant load from the Bayside. The cumulative loads for pollutants would

---

<sup>109</sup> See, e.g., *Californians for Alternatives to Toxics v. Department of Food & Agriculture* (2005) 136 Cal.App.4th 1, 16 (lead agencies must review the site-specific impacts of pesticide applications under their jurisdiction, because “DPR’s [Department of Pesticide Regulation] registration does not and cannot account for specific uses of pesticides..., such as the specific chemicals used, their amounts and frequency of use, specific sensitive areas targeted for application, and the like”); *Citizens for Non-Toxic Pest Control v. Department of Food & Agriculture* (1986) 187 Cal.App.3d 1575, 1587-1588 (state agency applying pesticides cannot rely on pesticide registration status to avoid further environmental review under CEQA); *Oro Fino Gold Mining Corporation v. County of El Dorado* (1990) 225 Cal.App.3d 872, 881-882 (rejects contention that project noise level would be insignificant simply by being consistent with general plan standards for the zone in question). See also *City of Antioch v. City Council of the City of Pittsburg* (1986) 187 Cal.App.3d 1325, 1331-1332 (EIR required for construction of road and sewer lines even though these were shown on city’s general plan); *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 712-718 (agency erred by “wrongly assum[ing] that, simply because the smokestack emissions would comply with applicable regulations from other agencies regulating air quality, the overall project would not cause significant effects to air quality.”).

generally increase by 4-6%. Thus, the project would cause approximately half of this cumulative increase for the Bayside. To put this in context, City discharges are a very small portion of the region-wide discharges to the Bay. Compared to municipal dischargers in the Bay Area, the load contribution of the Southeast Plant represents about 12% of all other municipal dischargers, and the Mission Bay project would represent less than 3% of that 12% (or 0.36% of all municipal wastewater discharged to the Bay). In addition, besides municipal wastewater, other sources of pollutant loading to San Francisco Bay include riverine inputs, nonurban runoff, urban runoff, point sources, dredging/sediment disposal, spills, and atmospheric deposition. Of these sources, point sources, including municipal dischargers and other permitted industrial dischargers, represent about 1-6% of the total load input to the Bay-Delta estuary. Regarding stormwater discharges, San Francisco Bayside stormwater flows are about 1.8% of the total regional urban storm flow to the Bay. Considering the contribution of the project and of the cumulative Bayside projects in the context of all the other pollutant inputs to the Bay, the cumulative pollutant loading from Bayside projects would be extremely small.

(1998 MB FSEIR, p. V.K.52.)

This logic reflects the “de minimis” and “ratio” rationales rejected in *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120 (“CBE”) [“[T]he relevant question”... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether “any additional amount” of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project’s contribution to cumulative impacts as significant. [footnote omitted]”], and *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 720-21 [“They contend in assessing significance the EIR focuses upon the ratio between the project’s impacts and the overall problem, contrary to the intent of CEQA.... We find the analysis used in the EIR and urged by GWF avoids analyzing the severity of the problem and allows the approval of projects which, when taken in isolation, appear insignificant, but when viewed together, appear startling. Under GWF’s ‘ratio’ theory, the greater the overall problem, the less significance a project has in a cumulative impacts analysis. We conclude the standard for a cumulative impacts analysis is defined by the use of the term ‘collectively significant’ in Guidelines section 15355 and the analysis must assess the collective or combined effect of energy development”].) *Communities* and *Kings County* teach that the significance of a cumulative impact depends on the environmental setting in which it occurs, especially the severity of existing environmental harm.

Therefore, accepting the Hydroconsult numbers at face value, the starting point for

assessing whether adding 2.9 million gallons per year<sup>110</sup> of incompletely treated CSD pollution to the existing condition of San Francisco Bay is significant is the existing condition of San Francisco Bay.<sup>111</sup> The DSEIR says very little on the topic. The 1998 Mission Bay FSEIR provides some information, but the DSEIR does not discuss how much of the 1998 Mission Bay FSEIR's information may be outdated as a result of the passage of seventeen years, and is, therefore, unknown.

The 1998 Mission Bay FSEIR characterizes “municipal wastewater” as follows:

Municipal wastewater is a relatively strong waste stream containing high concentrations of organic matter that will decompose (measured as biochemical oxygen demand because the decomposition requires oxygen), inorganic particulates (measured as total suspended solids), nutrients (measured as total nitrogen and phosphorus), and pathogenic microorganisms. It also contains oil and grease and small quantities of toxic metals, pesticides, solvents, and plasticizers (additives in plastics that maintain softness and pliability). Conventional secondary treatment, as employed by San Francisco at its Southeast Water Pollution Control Plant, greatly reduces the concentrations of most substances in municipal wastewater. On the other hand, dissolved metals and organic substances that are resistant to breakdown by bacteria, may pass through the plant relatively unaltered. This waste stream, after treatment, is referred to as municipal wastewater effluent in this SEIR.

(1998 MB FSEIR, p. V.K.4.)

The 1998 Mission Bay FSEIR characterizes “urban stormwater ” as follows:

Urban stormwater is a large-volume wastewater stream. Pollutants contained in urban runoff include street litter, sediment (mostly inorganic particulates, measured as total suspended solids), oil and grease, oxygen-demanding substances, pathogenic microorganisms, toxic metals, and pesticides. The concentrations of oxygen-demanding substances, nutrients, and pathogenic microorganisms are much lower than in untreated municipal wastewater. CSOs exhibit a blend of the untreated characteristics of municipal wastewater and urban

---

<sup>110</sup>  $5.63 - 5.34 = 0.29 \times 10 = 2.9$ .

<sup>111</sup> “If the rainstorm is a large one, and the capacity of the storage/transport box sewers is exceeded, treated combined sewer overflows (CSOs) occur at outfalls along the City's shoreline. When combined sewage is temporarily stored in transport/storage structures, floating materials are removed from the water surface and some solids settle to the bottom of the structures. The accumulated solids are then flushed to the treatment plant after the storm has subsided. The treatment that occurs within the structures is approximately equivalent to primary treatment.” (1998 MB FSEIR, p. V.K.8-9.)

stormwater runoff.

(1998 MB FSEIR, p. V.K.4.)

The 1998 Mission Bay FSEIR characterizes the “impairment of Central San Francisco Bay” as follows:

The State Water Resources Control Board (SWRCB) has listed central San Francisco Bay as impaired on the basis of field surveys of the water column, sediments, sediment toxicity, bivalve bioaccumulation, and water toxicity. The determination relates to mercury, copper, selenium, diazinon, and polychlorinated biphenyls (PCBs).

- Mercury. The main source of mercury in the Bay is erosion and drainage from abandoned gold and mercury mines. Other sources include natural sources, atmospheric deposition, and various industrial and municipal sources.
- Copper. Copper enters the Bay through municipal sources, stormwater runoff (primarily through automobile brake pad dust), and other nonpoint sources (such as soils and abandoned mines). These are the three main sources, and they contribute roughly equivalent amounts.
- Selenium. Selenium enters the Bay through industrial point sources (e.g., oil refineries), agriculture, and natural sources. Control programs are in place to address selenium discharges from oil refineries
- Diazinon. Diazinon is a pesticide that enters the Bay as runoff from agriculture and, to a lesser extent, residential land uses. Diazinon is a primary component of insecticides. Homeowner pesticide use peaks in late spring and early summer.
- PCBs. Although PCBs are no longer manufactured in the U.S., PCBs previously released to the environment enter the Bay through stormwater runoff and transport through the food chain. PCB levels in fish have resulted in health advisories for fish consumption.

(1998 MB FSEIR, p. V.K.8-9.)

The above information shows the existing environmental harm (or “preexisting cumulative effect” in the words of *Communities, supra*) is severe, and this Project will make it worse. Therefore, the DSEIR’s finding that the Project’s cumulative CSD impacts on the Bay are less-than-significant is erroneous as a matter of law. It is based on two legal errors: (1) the exclusion of CSD *quantity* from its threshold of significance, which reflects the “de minimis” and “ratio” rationales rejected in *Communities, supra* and *Kings County, supra*; and (2) the DSEIR’s reliance on another agency’s regulatory standards (i.e., the NPDES permit) to determine significance under CEQA.

As discussed in July 21 Hageman, Nov 2 Hageman, and Nov 2 Ringelberg, the Project’s CEQA documents (i.e., the 1998 Mission Bay FSEIR, 2014 NOP/IS, and 2015 DSEIR), fail to

analyze or develop mitigation measures to reduce the Project's likely contribution of a suite of toxic chemicals, including PCBs, to San Francisco Bay in amounts deleterious to the Bay's biota.

Further, it is impossible to place the discussion of this entire issue (at DSEIR pages 5.9-34 to 5.9-36) in a meaningful context, because the DSEIR does not inform the reader if the discussion assumes construction or expansion of permanent wastewater treatment facilities by the SFPUC.

Also, the DSEIR says: "the [Hydroconsult] model estimated the annual average frequency, volume, and duration of CSDs that would occur once the Mariposa wet- and dry-weather pump stations reach the combined capacity of 11.2 mgd under existing and project conditions. The model estimates that under existing conditions, CSDs from the Mariposa sub-basin occur approximately 10 times per year with an average volume of 5.34 million gallons and duration of 17.2 hours." (DSEIR, p. 5.9-35.) This text implies that the "Hydroconsult" model includes wet-weather flows and wet-weather CSDs. But the only Hydroconsult memo cited and included in Appendix HYD states:

Three scenarios were analyzed: base case, project, and cumulative. The base case scenario includes existing conditions plus developments and improvements expected to be substantially complete previous to occupancy of the GSW arena. The project scenario adds the DWF from the arena only and the cumulative scenario adds the project DWF plus DWF from reasonably foreseeable projects in the basin. In all three scenarios, the wet weather flow (stormwater runoff) is assumed to not contribute to the CSS; rather is treated and pumped directly to the Bay. All DWF from the proposed GSW arena is assumed to flow to the Mariposa pump station (MPS), therefore Mariposa is the only basin analyzed.

(DSEIR, Appendix HYD, p.1.) The statement "wet weather flow (stormwater runoff) is assumed to not contribute to the CSS; rather is treated and pumped directly to the Bay" makes sense if it refers only to stormwater from the Mission Bay Redevelopment Area, because all of that stormwater will be separated from wastewater flows when the separate stormwater system for Mission Bay is completed in 2015. (See DSEIR, p. 5.7-4.)<sup>112</sup> But the DSEIR also states that storm water from areas outside Mission Bay will continue to combine with wastewater flows to

---

<sup>112</sup>"The separate stormwater system for the Mission Bay South Plan area is currently being implemented by the master developer and includes four drainage zones within the geographic boundaries of the reconfigured Central sub-basin that have already been constructed and one drainage zone within the geographic boundaries of the reconfigured Mariposa sub-basin which is currently under construction. Stormwater in each of the drainage zones flows by gravity to one of five stormwater pump stations in the locations shown on **Figure 5.7-2**, including Pump Station SDPS-5 near the east end of 16th Street. When construction of the fifth drainage basin is completed (anticipated in 2015, prior to construction and operation of the proposed project), all stormwater runoff from Mission Bay South will be conveyed through the separate stormwater system and discharged to the Bay and China Basin Channel (Mission Creek)." (DSEIR, p. 5.7-4 (pdf151).)

the Mariposa Pump Station and will contribute to wet weather CSDs. (DSEIR, p. 5.7-7.)<sup>113</sup> If this is correct, then the Hydroconsult dry-weather analysis is beside the point.

Also, the numbers for Mariposa Pump Station capacity and wastewater or stormwater flows are confusing. For example, DSEIR page 5.9-35 says the Mariposa wet- and dry-weather pump stations have a “combined capacity of 11.2 mgd.” DSEIR page 5.7-7 also refers to “the combined capacity of the Mariposa pump station and transport/storage structure (11.2 mgd).”<sup>114</sup> But DSEIR page 5.9-34 says: “The potential effect would be greatest in the reconfigured Mariposa sub-basin, which has a *wet weather capacity of 12 mgd* (italics added).”

**(a) The Responses to Comments Hyd-3 - Hyd-6 are Inadequate.**

The Alliance’s comments letter regarding hydrology, water quality and biological impacts observed that the DSEIR’s heavy reliance on City compliance with its NPDES permit to ensure the Project’s combined stormwater and sewage impacts are less than significant is an unsupported assumption. (July 24 Lippe, p. 4-10.) The RTC simply repeats this unsupported assumption many times. (See RTC at pp. 13.21-17; 13.18.)

Compliance with these plans, policies, and water quality criteria and objectives as enforced through the Bayside NPDES permit ensures that discharges of treated effluent from the SEWPCP are protective of water quality in San Francisco Bay. Therefore, compliance with the Bayside NPDES permit effluent and receiving water limitations is protective of water quality and it is appropriate to use the requirements of the NPDES permit as a threshold of significance for effluent discharges from the SEWPCP. Using this threshold, the SEIR properly concluded that water quality impacts related to effluent discharges from the SEWPCP are less than significant as described in Impact HYD-6 (pp. 5.9-33 to 5.9-41).

(RTC at p. 13.21-19.)

The Alliance’s previous comment requested that the City support this assumption with

---

<sup>113</sup>“The 240-acre reconfigured Mariposa sub-basin of the combined sewer system is divided into two tributary areas that direct flow to the Mariposa Pump Station. Tributary B includes Potrero Hill to the south of Mariposa Street and is outside of the Mission Bay Plan area; this tributary area directs both rainwater and wastewater to the pump station. Tributary A includes areas to the north of Mariposa Street that are located within the Plan area; in this area, stormwater flows are directed to the separate stormwater system constructed for the Mission Bay South development, and only wastewater flows are directed to the Mariposa Pump Station.” (DSEIR, p. 5.7-7.)

<sup>114</sup>“In the event that wet weather flows in the Mariposa subbasin exceed the combined capacity of the Mariposa pump station and transport/storage structure (11.2 mgd), the excess flows are discharged to the Bay as a combined sewer discharge after receiving flow-through treatment in the transport and storage structure.”

evidence. The RTC fails to do so. Therefore, the Alliance gathered that evidence, and it shows the City has a continuous, consistent, and pervasive pattern of violating its NPDES permits. (See Nov 2 Lippe FSEIR, Exhibit M.) Therefore, the SEIR's assumed basis for finding water quality impacts less than significant is false.

My July 24, 2015, comment letter regarding hydrology, water quality and biological impacts observed that the DSEIR's threshold of significance for the effect of untreated wastewater discharges to the Bay, which consists of limiting such discharges to 10 per year, ignores the quantity and duration of such discharges. The response stresses the work the City must do to prevent municipal wastewater from degrading water quality in the Bay, stating:

As described in the permit, and on p. 5.9-20 of the SEIR, the SFPUC must implement the following nine minimum controls in accordance with the Combined Sewer Overflow Policy to reduce the frequency of combined sewer discharges and their effect on receiving water quality:

1. Conduct proper operation and regular maintenance programs for the combined sewer system and combined sewer discharge outfalls;
2. Maximize the use of the collection system for storage;
3. Review and modify pretreatment programs to minimize the effect of non-domestic discharges to the collection system;
4. Maximize flow to the SEWPCP and North Point Facility for treatment;
5. Prohibit combined sewer discharges during dry weather;
6. Control solids and floatable materials in combined sewer discharges;
7. Develop and implement a pollution prevention program focused on reducing the effect of combined sewer discharges on receiving waters;
8. Notify the public of combined sewer discharges; and
9. Monitor to effectively characterize combined sewer discharge effects and the efficacy of combined sewer discharge controls.

These controls represent the best conventional and best available technology economically achievable as required under the Clean Water Act. The City is currently implementing these controls as required by the Combined Sewer Overflow Control Policy.

(RTC at p. 13.21-26.) This is all good and important work, but it is non-responsive to the Alliance's comment. The fact that these measures are the best the City can, or is legally required to do, is not relevant to whether the impact is significant. It may be relevant to whether further mitigation of the impact is feasible or effective, but these considerations cannot affect whether the impact is deemed significant.

The top two paragraphs on page 13.21-27 of the RTC assert that all waste water is treated. This is beside the point that the City anticipates and is allowed by its NPDES permit up to 10 discharges per year of waste water subject to only primary, rather than secondary, treatment.

The RTC appears to reject the Alliance's comment that the SEIR ignores duration and quantity, not just frequency, of the 10 discharges per year on grounds the NPDES permit does not address the duration and quantity of these discharges. But the issue here is whether impacts on Bay water quality are significant. CEQA does not allow the use of the NPDES permit terms as an absolute proxy for that determination.

In addition, the RTC fails to adequately respond to the Alliance's comments that the Project will cause potentially significant harm by mobilizing and transporting hazardous materials, including PCBs, to the Bay in stormwater runoff.

As hydrologist Matt Hageman states:

Our comments noted the detection of PCB in soil at the Project site and the need to implement measures during soil disturbing construction activities to prevent the transport of contamination to San Francisco Bay via stormwater. Response HYD-2 simply states that stormwater BMPs for PCBs must be consistent with best available technology economically achievable to meet requirements of the California Construction General Permit (p. 13.21-12). However, the Response does not specify BMPs that would meet this requirement. It is key that certification of the FSEIR is upheld until BMPs specific to preventing the spread of PCB contamination are identified.

(See Nov 1 SWAPE, p. 1.) Biologist Erik Ringelberg makes the same points for a broader range of materials, stating:

Stormwater Mitigation. The biological effects of stormwater on the environment are not properly analyzed. The offered responses to comments regarding stormwater mitigation are particularly ironic given that the site has demonstrably failed to maintain its Best Management Practices (BMPs) and has visible waste material literally clogging its stormwater drains. (See BSK comments.) The concept that simply stating that a BMP will work, without analyzing the nature of the impacts, and without maintaining those BMPs calls into question every part of the DSEIR that relates to sediment, toxins and wildlife exposures. For illustration, the BMPs at the site currently are not properly maintained and have been filled in or partly filled in with sediment, or breached completely. However, even if these sediment BMPs had been installed correctly and maintained, they do nothing for dissolved-fraction toxic chemicals. The project fails to implement the sediment BMPs correctly and does not even offer readily implementable BMPs for dissolved-fraction chemicals found at the site 4, 5, 6, 7. Yet, the Response states unequivocally, any potential effects associated with contaminated stormwater runoff into San Francisco Bay would be avoided during construction through compliance with the Construction General Permit and implementation of a Stormwater Pollution Prevention Plan (SWPPP) as described in the Section

13.21, Response HYD-2. (p. 13.19-22) The SWPPP is solely intended to manage ordinary construction sediment and has no specific intent to manage hazardous waste, and in any case does nothing for dissolved hazardous chemicals.

(Nov 2 Ringelberg, pp. 10-11.)

**3. The DSEIR Is Not Sufficient as an Informational Document with Respect to Project Impacts on Biological Resources, Including Wetlands and Wildlife.<sup>115</sup>**

**(a) The SEIR's exclusion of the Project's impacts on biological resources is erroneous.**

The lead agencies' decision to exclude the Project's impacts on biological resources from the DSEIR (see DSEIR, p. 5.1-1) is erroneous as a matter of law. Both the NOP/IS and the DSEIR announce that their analyses are "tiered" to the 1998 Mission Bay FSEIR pursuant to CEQA Guideline 15168(c). (IS, p. 23-24; DSEIR, pp. 1-1, 5.1-2, 3.) Both the NOP/IS and the DSEIR also announce that the standards used to exclude resource topics from the DSEIR are the standards used to determine if a subsequent EIR is required under CEQA section 21166 and Guideline section 15162. (See NOP/IS, pp. 23-25; DSEIR, p. 5.1-3.)

Based on these predicates, the City decided to prepare a focused EIR, and to conduct no environmental review with respect to the following resources: Biological Resources, Aesthetics, Land Use Cultural Resources, Paleontological Resources, Geology and Soils, Recreation, Hazardous Materials, and Population and Housing. As discussed in more detail in the July 27, 2015, letter from the Mission Bay Alliance's legal counsel regarding "tiering," the City's assumption that it may prepare an EIR for this Project that tiers to the 1998 Mission Bay FSEIR is legally incorrect. As discussed in several comment letters submitted on behalf of the Mission Bay Alliance, and below regarding the Project's impacts on biological resources, the evidence relating to these excluded resource topics meets both the "fair argument" standard, as well as the CEQA section 21166 standards. Moreover, the SEIR's exclusion of the Project's impacts on biological resources is an omission of required information under CEQA that is reviewed de novo by the courts. (*Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1207-08.) Therefore, the City must prepare and recirculate for public review a Revised Draft EIR addressing all of the Project's environmental impacts.

---

<sup>115</sup> July 26 Lippe, pp. 11-15; July 16 BSK Wetland; July 21 Ringelberg; Oct 29 BSK Wetland; Nov 2 Lippe FSEIR, pp. 10-15; Nov 2 BSK; Nov 2 Ringelberg; October 7, 2015, letter to OCII from Soluri Meserve regarding Clean Water Act 404 and CZMA Consistency.

- (b) The SEIR's exclusion of the Project's impacts on biological resources is erroneous because the lead agency failed to prepare any CEQA document that adequately describes the Project's environmental setting to allow an assessment of the Project's impacts on biological resources.**

The principal BSK Associates reports referenced here establish that the SEIR fails to adequately describe the environmental setting.<sup>116</sup> "An EIR must contain an accurate description of the project's environmental setting. ... There is good reason for this requirement: 'Knowledge of the regional setting is critical to the assessment of environmental impacts.'" (*Friends of the Eel River v. Sonoma County Water Agency* (2003) 108 Cal.App.4th 859, 874.)

The full range of environmental setting information which the SEIR fails to describe is discussed in the four BSK Associates reports referenced here which are incorporated herein by this reference.

- (c) There is substantial evidence supporting a fair argument the Project will have a significant adverse effect on biological resources.**

While the NOP/IS give short shrift to on-site biological resources, there is substantial evidence, in the NOP/IS and in July 21 Hageman, Nov 2 Hageman, July 21 Ringelberg, Nov 2 BSK, and Nov 2 Ringelberg, supporting a fair argument the Project may have significant effects on (1) migratory birds; (2) off-site special status species downstream of the Project, including steelhead (*Oncorhynchus mykiss*); and (3) the on-site wetland and its ecology and associated wildlife.

With respect to migratory birds, the NOP/IS admits that the 1998 Mission Bay FSEIR did not assess the Redevelopment Plan's effects on migratory birds. (NOP/IS, p. 81.) In addition, the NOP/IS concedes the Project may have significant impacts on migratory birds because it recommends the adoption of mitigation measures to substantially reduce these impacts, stating: "With implementation Mitigation Measures M-BI-4a, Preconstruction Surveys for Nesting Birds, and M-BI-4b, Bird Safe Building Practices, the project would not result in any new or substantially more severe significant impacts on resident or migratory bird species than those identified in the FSEIR." (NOP/IS, p. 81.)

This approach violates CEQA in a number of ways. First, as discussed above, the Project is a separate project from the 1998 Redevelopment Plan, or at a minimum, is not within the scope of the 1998 Mission Bay FSEIR. This fact precludes the City from "tiering" to the 1998 FSEIR for any resource, including impacts on biological resources such as migratory birds.<sup>117</sup> Second, trying to mitigate significant impacts before assessing their nature and extent puts the cart before

---

<sup>116</sup>July 21 Ringelberg, Nov 2 BSK, Nov 2 Ringelberg, July 16 BSK Wetland, and Oct 29 BSK Wetland.

<sup>117</sup>*Sierra Nevada Conservation, supra.*

the horse.<sup>118</sup> Third, as discussed above, the NOP/IS's concession that the Project may have significant impacts on migratory birds is substantial evidence supporting a fair argument the Project will have a significant adverse effect on migratory birds; therefore, the City is required to include an assessment of these impacts in the DSEIR.<sup>119</sup> Fourth, even if the City's assumption that CEQA section 21166 applies is correct, the addition of a 750,000 square foot sports arena and an additional 160 foot office tower to the Mission Bay Redevelopment Plan are substantial changes in the Redevelopment Plan that give rise to new potentially significant effects on birds that must be analyzed in the subsequent EIR.

With respect to impacts on special status species, the NOP/IS states:

At the time of preparation of the Mission Bay FSEIR, the project site contained several buildings and facilities and was noted as lacking any notable vegetative habitat, with no state listed threatened, endangered or rare plants, or rare, threatened or endangered animal species known to occur in the upland portion of the Mission Bay plan area, including the project site. Subsequent to that time, the project site has been subject to building removal, grading, excavation, and construction of paved surface parking lots, fencing and utilities on portions of the site. Other than the creation of the depression as a result of remediation actions, no other changes in the site since the preparation of the FSEIR have altered the characteristics of the site in relation to biological habitat. These changes in conditions on the project site have not altered the fact that the site provides no suitable habitat for any sensitive or special status species due to the sparse and ruderal nature of onsite vegetation, as well as the site's location in a densely urbanized environment, as confirmed through the reconnaissance survey and database review of special status species occurrences within the vicinity of the project site. In addition, there have been no substantial changes with respect to the circumstances under which the project would be undertaken, nor has any new information become available that demonstrates new or more severe impacts associated with the proposed project.

(NOP/IS, pp. 78-79.)

But as Mr Ringelberg points out:

---

<sup>118</sup>CEQA does not permit an agency to simply adopt mitigation measures in lieu of fully assessing a project's potentially significant environmental impacts because mere acknowledgment that an impact would be significant is inadequate; the EIR must include a detailed analysis of "how adverse" the impact would be. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 655-56; *Galante Vineyards v. Monterey Peninsula Water Management Dist.* (1997) 60 Cal.App.4th 1109, 1123; *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831.)

<sup>119</sup>*Protect the Historic Amador Waterways, supra.*

the potential project impacts to the closest federally designated critical habitat is steelhead *Oncorhynchus mykiss* are ignored. This habitat runs directly adjacent to the project area. In addition, San Francisco manzanita (*Arctostaphylos franciscana*) critical habitat is present approximately 2.6 miles to the west and should also have been identified and analyzed. The federal critical habitat analysis is missing, and the provided analysis itself is defective. The potential project's impact(s) to these listed species and their critical habitat are therefore unexamined. The project's dust, stormwater, surface flooding, and groundwater place those species at risk from hazardous chemicals.

(July 21 Ringelberg, p. 11.)

As both Mr. Hageman and Mr. Ringelberg point out, none of the Project's CEQA documents assess the effects of toxic chemical runoff on Bay biota, including steelhead. Where, as here, the lead agency fails to study an area of possible environmental impact, a fair argument may be based on the limited facts in the record because deficiencies in the record may enlarge the scope of fair argument by lending a logical plausibility to a wider range of inferences." (*Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 311.)

Further, there is substantial evidence in July 21 Hageman, Nov 2 Hageman, July 21 Ringelberg, Nov 2 BSK, and Nov 2 Ringelberg, supporting a fair argument the Project may have significant effects on steelhead from toxic runoff. Again, even if CEQA section 21166 applies, CEQA requires including this issue in the subsequent EIR. The Phase 11 reports showing the site is contaminated with a suite of toxic compounds is significant new information showing the potential for new significant effects not previously identified.<sup>120</sup>

With respect to potential impacts on the on-site wetland, the NOP/IS indicates the DSEIR will not assess impacts on the wetland even though the 1998 FSEIR did not, and could not have, analyzed the wetland since it was apparently created sometime after 2005. (See July 21 Ringelberg, Figure 1 and accompanying text.)

Typically, if there is a potential wetland resource, there would be a formal delineation prior to release of the DEIR so the resource can be analyzed, and appropriate mitigation developed. Here, the NOP/IS claims it may not be jurisdictional (p. 80), and at the same time attempts to suggest mitigation (p. 81) in case it is. But the mitigation suggested is not enforceable, in violation of CEQA. Further, as discussed above, trying to mitigate impacts before assessing their significance puts the cart before the horse. (*Lotus v. Department of*

---

<sup>120</sup> See Letter to Marty Glick re: Phase 2 Subsurface Investigation Approval, Golden State Warriors Arena, Blocks 29-32, San Francisco, CA 94158; Phase II Environmental Site Assessment, Golden State Warriors Arena, Blocks 29-32, Mission Bay, San Francisco, California.

*Transportation, supra.*)<sup>121</sup>

In addition, the NOP/IS' evidentiary basis for dismissing the wetland from the DSEIR is flimsy, stating:

Because the excavation depressions on the site are small, isolated features resulting from recently completed hazardous materials remediation activities and are surrounded by paved areas and urban development, these features do not provide the important biological habitat functions and values that are typically associated with federally protected wetlands.

(NOP/IS, pp. 78-79.) But as Mr. Ringelberg points out:

Conversely, and in rebuttal to their prior assertion that there are readily substitutable habitats nearby, small wetland features can have exceptional ecological value, in particular if they are one of the few remaining features in an urban setting.

(July 21 Ringelberg, p. 6.)

Further, there is substantial evidence in the report from Erik Ringelberg supporting a fair argument the Project may have a significant effect by destroying the on-site wetland. Again, even if CEQA section 21166 applies, CEQA requires, including this issue in the subsequent EIR, because the presence of the wetland is a change in circumstances since certification of the 1998 FSEIR that gives rise to the potential for new significant effects not previously identified.

**(d) The Response to Comment Bio-5 is Inadequate.**

The FSEIR argues that the wetland feature on the site is not a state or federal wetland. Yet Response BIO-5 provides no evidence of consultation with either the U.S. Army Corps of Engineers ("Corps") or the State Water Resources Control Board ("SWRCB") regarding the status of the feature. With respect to the jurisdiction of the Corps, the FSEIR claims that under draft regulations that are stayed, the feature would be exempted from jurisdiction. This interpretation is not supported by any specific language in the referenced Sixth Circuit Court of Appeals decision, and thus has no authority.

The FSEIR also argues that the site was never abandoned such that the feature would have been "recaptured" as a wetland under the Clean Water Act. Yet no explanation is provided for the lack of any activities at the site or changes to the wetland feature between 2007 and 2014, a period of seven years. This inactivity at the site is demonstrated in the plates included in the July 16 BSK Wetland report, at Figures 2a-2e.

---

<sup>121</sup> Also, the NOP/IS fails to even mention the state wetland policy (WRAPP) under Porter Cologne (fn. 49).

The FSEIR also makes the circular argument that the existence of priority pollutants within the wetland feature is irrelevant because the City does not consider the wetland feature to be jurisdictional. Again, no credible evidence is provided to support the argument that the wetland is not subject to federal jurisdiction in the first place.

The FSEIR incorrectly relies exclusively on federal law and ignores the broader jurisdiction of the state over all of its waters, including wholly constructed features. As such the SEIR fails to adequately describe the sites physical features, the relevant regulatory requirements, and the avoidance, minimization and mitigation requirements it would be subject to. State waters are more broadly defined than waters of the U.S.: “‘Waters of the state’ means any surface water or groundwater, including saline waters, within the boundaries of the state.” (Wat. Code, 13050, subd. (e).) This has been interpreted by the SWRCB to literally “include all waters within the state’s boundaries, whether private or public, including waters in both natural and artificial channels.” Contrary to RTC BIO-5, the fact that the remediation at the site was at one time overseen by the San Francisco Regional Water Quality Control Board (“RWQCB”) has no bearing on whether the feature would be considered jurisdictional by the SWRCB. While the SWRCB may choose to follow jurisdictional determinations by the Corps, the SWRCB has much broader authorities and may also assert jurisdiction under the parameters of Water Code section 13050, subdivision (e). As the FSEIR cannot point to any jurisdictional determination by the Corps, there is nothing for the SWRCB to follow; therefore, it would follow its own regulations and orders.<sup>122</sup>

As explained in comments submitted by the Alliance, the need for a Clean Water Act (“CWA”) section 404 fill permit also requires the Corps to prepare a Coastal Zone Management Act (“CZMA”) consistency finding, as required by the Bay Conservation Development Commission. (See Oct 7, SM Law, CWA 404.) The FSEIR’s attempted rebuttal of the need for a Coastal Zone Management Act (“CZMA”) consistency determination is also incorrect. In addition to claiming that the requirement does not apply because the City (not the Corps or the SWRCB) has determined that the feature is not jurisdictional, the FSEIR argues that filling the wetland would have no effect on resources in the coastal zone. As explained below, however, the wetland complex has significant habitat value to biological resources and supports coastal resources. As a result, a CZMA consistency determination is required.

To further substantiate the existence of the wetland features on the site, BSK Associates has prepared a desktop delineation for submittal to the Corps to finally resolve the issue of

---

<sup>122</sup>See Executive Order W-59-93 attached as Exhibit N to Nov 2 Lippe FSEIR; State Water Resources Control Board Memorandum, January 25, 2001, Effect of SWANCC v. United States on the 401 Certification Program attached as Exhibit O to Nov 2 Lippe FSEIR; State Water Resources Control Board Guidance, June 25, 2004, for Regulation of Discharges to “Isolated” Waters attached as Exhibit P to Nov 2 Lippe FSEIR; State Water Resources Control Board Order NO. 2004-0004-DWQ attached as Exhibit Q to Nov 2 Lippe FSEIR; State Water Resources Control Board Resolution NO. 2008-0026 attached as Exhibit P to Nov 2 Lippe FSEIR.

jurisdiction. (See Exhibit L to Nov 2 Lippe FSEIR.) BSK determined there are 0.51 acres of permanent wetlands at the site. The delineation also explains that the wetland provides the following nexus functions with the San Francisco Bay: (i) Sediment trapping, (ii) Nutrient recycling, (iii) Pollutant trapping, transformation, filtering, and transport, (iv) Retention and attenuation of flood waters, (v) Runoff storage, (vi) Export of organic matter, (vii) Export of food resources, and (ix) Provision of life cycle dependent aquatic habitat (such as foraging, feeding, nesting, breeding, spawning, or use as a nursery area) for species.

The purpose of environmental review is to inform the public of the likely effects of carrying out a project. Here, the IS/NOP failed to accurately describe the wetland on the site, or to even provide a process by which the feature would be further investigated and the appropriate mitigation required. The information submitted by the Alliance constitutes substantial evidence of a fair argument that the Project will have a significant adverse effect on biological resources. In the alternative, per CEQA section 21166 and CEQA Guidelines section 15162, the facts described above constitute a change in circumstances since the 1998 SEIR involving, and significant new information showing, a new significant effect not previously analyzed in the 1998 SEIR. Under either standard, the OCII and the City must prepare and circulate for public comment an environmental impact report to review the Project's impacts on this wetland resource.

Despite the existence of likely jurisdictional wetlands on the site, the DSEIR ignores the Project's need for a 404 CWA fill permit and the accompanying CZMA consistency determination in the list of project approvals. (DSEIR, pp. 3-51 to 52.) The DSEIR also fails to address the potential jurisdiction of the SWRCB over wetland and other biological resources on the site. As a result of these omissions, the DSEIR fails as an informational document.

**E. THE SEIR IS NOT SUFFICIENT AS AN INFORMATIONAL DOCUMENT WITH RESPECT TO NOISE IMPACTS.<sup>123</sup>**

**1. The SEIR's Thresholds of Significance Are Unlawful under CEQA.**

**(a) The SEIR's use of regulatory thresholds of the San Francisco Noise Ordinance as its CEQA thresholds of significance is an error of law.<sup>124</sup>**

For purposes of both operational noise sources such as crowds and traffic and construction noise sources such as both impact and non-impact equipment, the SEIR uses regulatory thresholds of the San Francisco Noise Ordinance as thresholds of significance for CEQA purposes. This is an error of law, because it injects the question of what is "allowed," the which is the final step in the CEQA process, into the determination of "significance," which is

---

<sup>123</sup>July 25 Lippe; July 24 Hubach; Nov 2 Lippe FSEIR, pp. 1-2, 14-15; Nov 2 Hubach.

<sup>124</sup>July 25 Lippe; July 24 Hubach; Nov 2 Lippe FSEIR, pp. 1-2, 14-15; Nov 2 Hubach.

the first step in the CEQA process. The question of what is allowed, in both the final step of the CEQA process and in San Francisco's legislative decision to set regulatory thresholds in the Noise Ordinance, involves weighing considerations relating to the social and economic benefits of the Project. The determination of "significance" under CEQA does not.

Injecting consideration of what is "allowed" into the determination of "significance" subverts the integrity of the entire analysis. For projects for which an EIR has been prepared, both the EIR and the mandatory findings required by CEQA section 21081, the analysis starts with whether an impact is significant. A finding of significance triggers the obligation to identify and adopt feasible mitigation measures that are effective in substantially reducing the significant impact. Once all feasible and effective mitigation measures have been identified and adopted, if the impact remains significant, the agency may approve the project if it finds that social or economic considerations outweigh environmental harm. Each of these steps in the analysis is distinct.

The RTC's responses to comments conflate and confuse these steps, and thereby undermine the integrity of the analysis. This conflation of the distinct steps in the analysis explains why the FSEIR/RTC's insistence on using the San Francisco Police Code's regulatory requirements (i.e., the City's final resolution of what is allowed and what is not allowed) as thresholds of significance is inconsistent with CEQA. The Police Code's regulatory requirements reflect the City's effort to balance the protection of people from harmful noise against the need for social and economic activity. That balance does not necessarily reflect the point at which impacts become significant. Under CEQA, such balancing is also required, but not where significance is determined. In short, even where the lead agency believes an activity should be "allowed" because the social or economic considerations outweigh the environmental harm, the EIR must still disclose whether the impact is significant.

**(b) The SEIR fails to use thresholds of significance based on human health and welfare.<sup>125</sup>**

The SEIR's use of regulatory thresholds of the San Francisco Noise Ordinance as its CEQA thresholds of significance and its reliance on other agencies' thresholds of significance are errors of law because the SEIR fails to use thresholds of significance based on human health and welfare. The DSEIR refers to the World Health Organization (WHO) as "perhaps the best source of current knowledge regarding the health effects of noise impacts because European nations have continued to study noise and its health effects, while the United States Environmental Protection Agency all but eliminated its noise investigation and control program in the 1970s." (DSEIR, p. 5.3-4.) The DSEIR also cites WHO's Guidelines for Community Noise and its thresholds for adverse effects of noise on people.

In contrast to many other environmental problems, noise pollution continues to

---

<sup>125</sup> July 25 Lippe, pp. 4-7; July 24 Hubach, pp. 3-6, Nov 2 Lippe FSEIR, pp. 1-2, 14-15; Nov 2 Hubach.

grow and it is accompanied by an increasing number of complaints from people exposed to the noise. The growth in noise pollution is unsustainable because it involves direct, as well as cumulative, adverse health effects.

(WHO, Guidelines for Community Noise, p. vii.)

Specific effects to be considered when setting community noise guidelines include: interference with communication; noise-induced hearing loss; sleep disturbance effects; cardiovascular and psycho-physiological effects; performance reduction effects; annoyance responses; and effects on social behaviour.

(WHO, Guidelines for Community Noise, p. v.)

The scope of WHO's effort to derive guidelines for community noise is to consolidate actual scientific knowledge on the health impacts of community noise and to provide guidance to environmental health authorities and professionals trying to protect people from the harmful effects of noise in non-industrial environments.

(WHO, Guidelines for Community Noise, p. iii.)

As discussed by Mr. Hubach:

WHO's night-time standard for sleep disturbance inside bedrooms is 30 dBA, and outside bedrooms with "window open (outdoor values)" is 45 dBA. WHO's night-time and daytime standard for "speech intelligibility and moderate annoyance" for inside dwellings is 35 dBA. For outdoor living areas, WHO's daytime and evening standard for moderate annoyance is 50 dBA and for serious annoyance is 55 dBA.

(July 24 Hubach, p. 3.) Yet, despite citing the WHO Guidelines, the DSEIR fails to use these standards as its thresholds of significance, and finds that "ambient plus project" noise levels much higher than the WHO's standards for harmful noise are less than significant.

Another human health and welfare based standard is provided by the State of California:

State regulations include requirements for the construction of new hotels, motels, apartment houses, and dwellings other than detached single-family dwellings that are intended to limit the extent of noise transmitted into habitable spaces. These requirements are collectively known as the California Noise Insulation Standards and are found in Title 24 of the California Code of Regulations.

The State of California updated its Building Code requirements with respect to

sound transmission, effective January 2014. Section 1207 of the California Building Code (Title 24 of the California Code of Regulations) establishes material requirements in terms of sound transmission class (STC) 13 rating of 50 for all common interior walls and floor/ceiling assemblies between adjacent dwelling units or between dwelling units and adjacent public area. The previous code requirements (before 2014) set an interior performance standard of 45 dBA from exterior noise sources. This requirement will be re-instated in July of 2015.

(DSEIR, p. 5.3-10.) DSEIR does not tell us what buildings in area comply with this code. (See DSEIR § 5.3.3.4 [Sensitive Receptors], and Table 5.3-4.) However, as Mr. Hubach observes:

Table 5.3-8 shows that all three receptors chosen for analysis will add construction noise to pre-existing ambient noise levels that already exceed the health and welfare based standards discussed above. As a result of construction operations (assuming all noise producing construction operations occur at the same time, noise levels at the Madrone Residential Tower will rise from 70.1 to 70.9 dBA (hourly Leq), at the Hearst Residential Tower from 71.2 to 80.8 dBA (hourly Leq), and at UCSF Hospital from 67 to 72.8 dBA (hourly Leq).

(July 24 Hubach, p. 4.) Since the Project's noise, when added to background or ambient noise, exceeds the above health and welfare based standards, the impact is significant even if the impact does not violate the San Francisco Police Code.

## **2. The SEIR's Use of "Ambient plus Increment" Thresholds of Significance for All Noise Impacts Is Legal Error.<sup>126</sup>**

As described by Mr. Hubach in the context of operational noise impacts (Impact NO-5), the DSEIR uses a series of "ambient plus increment" thresholds. As discussed by Mr. Hubach, using "ambient plus increment" thresholds where existing noise levels are already high:

disregards the fact the Project will make severe conditions worse. In addition, using these "ambient plus increment" thresholds for operational noise results in an unsustainable gradual increase in ambient noise. It is a formula for ever-increasing noise levels because each new project establishes a new, higher, baseline; then when the next project is approved, the incremental change will be added to the new baseline.

(July 24 Hubach, p. 5.)

By ignoring the severity of existing noise levels and only looking to the "de minimis" nature of the Project's incremental effect, the DSEIR's noise impact determinations violate

CEQA. (See *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120 (“CBE”) [“[T]he relevant question”... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether “any additional amount” of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project’s contribution to cumulative impacts as significant. [footnote omitted]”].)<sup>127</sup> *Communities* and *Kings County* teach that the significance of a cumulative impact depends on the environmental setting in which it occurs, especially the severity of existing environmental harm.

### **3. The Construction Refinements and New Project Require Recirculation.**

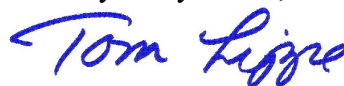

As noted above, the RTC describes a number of “construction refinements,” including using dewatering generators, using a soil treatment pug mill, and removing rapid impact compaction from the construction plan and a new Project Variant. With respect to the air quality impacts of these construction refinements and new Project Variant, the RTC finds these changes do not create a new significant noise impact, or a substantial increase in severity of a previously identified significant noise impact, and therefore, recirculation is not required.

As described in the Nov 2 Hubach letter, the construction refinements and new Project Variant will create new significant impacts. The RTC’s findings to the contrary reflect the same flawed “existing ambient plus project increment” thresholds of significance discussed above regarding noise impacts.

## **III. CONCLUSION**

For the reasons described above, the Board of Supervisors should grant this appeal and void the OCII’s certification of the SEIR.

Very Truly Yours,

Thomas N. Lippe

**Subject:       Comments on the Event Center and Mixed-Use Development Project at  
Mission Bay Blocks 29-32**

---

Dear Mr. Lippe:

We previously reviewed the October 23, 2015 Final Subsequent Environmental Impact Report (FSEIR) for the Event Center and Mixed-Use Development at Mission Bay Blocks 29-32 Project ("Project") and submitted a November 2, 2015 letter addressing deficiencies in the FSEIR's impact analyses. After submission of our November 2 letter, we reviewed the CEQA findings rejecting the alternative project site proposed by Mission Bay Alliance (MBA) and the new health risk assessment in the FSEIR. We have determined that the rejection of the MBA alternative location based on the claim that it would have more severe air quality impacts is unjustified. We have also confirmed that the new health risk assessment in the FSEIR does not alter the conclusions in our November 2, 2015 letter that the SEIR fails to adequately evaluate the Project's health risks.

### **Failure to Adequately Evaluate Project Health Risk**

In our November 2 letter, we found that the health risk assessment conducted in the FSEIR was inadequate for the following three reasons:

1. The FSEIR failed to provide a project-specific health risk assessment for the Project;
2. The FSEIR's cumulative health risk assessment does not account for all foreseeable sources of toxic air contaminant (TAC) emissions; and
3. The FSEIR failed to incorporate updated child breathing rates, set forth by the Office of Environmental Health Hazard Assessment (OEHHHA) in their 2012 and 2015 recent guidance.

We have reviewed the FSEIR's updated health risk assessment, and have determined that it does not change the conclusions made in our November 2 letter.

## Failure to Assess Individual Health Risk from Proposed Project

The FSEIR's updated health risk assessment is based on revisions to the Project description that would make a number of changes affecting toxic air contaminants, including locating the proposed emergency generators above grade, rather than within the parking structure on Lower Parking Level 1, as originally proposed in the DSEIR (FSEIR, p. 14-118). While this change in location reduces the Project's health risk impact, it does not reduce it to below applicable significance thresholds, nor does it change the fact that both the DSEIR and FSEIR incorrectly rely upon cumulative criteria used to identify Air Pollutant Exposure Zone (APEZ) communities to make significance determinations.

As previously discussed in our November 2 letter, the FSEIR fails to assess the Project's individual health risk. Instead, the FSEIR assesses only the Project's cumulative health risk impact. This approach, however, is inadequate, as CEQA requires the assessment of both cumulative and project-specific impacts. The Project's individual health risk should have been compared to a threshold of significance for project-specific impacts, such as the Bay Area Air Quality Management District's (BAAQMD) project-level significance threshold of 10 in one million.<sup>1</sup> This is the threshold of significance used by the majority of California air districts.<sup>2</sup>

Our November 2 letter demonstrated that the Project's excess cancers were well in excess of the 10 in one million threshold used by BAAQMD (see table below) (DSEIR, Table 5.4-11, p. 5.4-49).

DSEIR Health Risk Assessment			
Sensitive Receptor	Project Risk	Threshold	Exceed?
<i>Excess Cancers in One Million</i>			
UCSF Hearst Tower Child Resident	46	10	<b>Yes</b>
UCSF Hearst Tower Adult Resident	38	10	<b>Yes</b>
UCSF Hospital Child Resident	42	10	<b>Yes</b>

This analysis relied upon data from the DSEIR's health risk assessment. When the Project-level risk from the FSEIR's health risk assessment is compared to this same threshold, we still find that the Project poses a significant health risk at three of the four sensitive receptors (see table below) (FSEIR, Table 5.4-11 Revised, p. 14-121).

FSEIR Health Risk Assessment			
Sensitive Receptor	Project Risk	Threshold	Exceed?
<i>Excess Cancers in One Million</i>			
UCSF Hearst Tower Child Resident	18	10	<b>Yes</b>
UCSF Hearst Tower Adult Resident	8	10	<b>No</b>
UCSF Hospital Child Resident	12	10	<b>Yes</b>

<sup>2</sup> "Health Risk Assessments for Proposed Land Use Projects," California Air Pollution Control Officers Association 2009, page 11, available at: [http://www.capcoa.org/wp-content/uploads/2012/03/CAPCOA\\_HRA\\_LU\\_Guidelines\\_8-6-09.pdf](http://www.capcoa.org/wp-content/uploads/2012/03/CAPCOA_HRA_LU_Guidelines_8-6-09.pdf).

The health risk posed to a child resident of 18 in one million at the UCSF Hearst Tower well exceeds the 10 in one million threshold, nearly doubling it. Therefore, even using these updated risk values, the Project will still, by itself, have a significant health risk impact.

### Failure to Include All Local Sources in Cumulative Analysis

In our November 2, 2015 letter we explained that, by relying on citywide modeling that omits local impacts from new mobile-source emissions within the Project vicinity, the DSEIR's cumulative health risk assessment is not representative of all foreseeable sources of diesel particulate matter. We pointed out that the Mission Bay EIR provides that, at buildout, the proposed developments are anticipated to generate approximately 218,549 vehicle trips per day, and approximately 2,684 truck trips per day.<sup>3</sup> We demonstrated that a significant portion of that new development would occur within the 1,000 foot radius used by the SEIR to evaluate cancer risk. We also pointed out that construction emissions from major developments within the area, while analyzed, were not included in the citywide model. We concluded that the DSEIR greatly underestimated the cumulative health risk by omitting these foreseeable future sources.

The FSEIR's new health risk assessment does not correct these omissions. The new assessment uses the same values, assumptions, and sources for the non-Project "2014 Background Risk" as the analysis in the DSEIR (see tables below).

**DSEIR Background Cancer Risk (DSEIR, Volume 3, pdf p. 1225)**

Source	UCSF Hearst Tower		UCSF Hospital Receptor
	Child Resident	Adult Resident	Child Resident
Background at the maximally impacted receptor	26	26	44

**FSEIR Background Cancer Risk (FSEIR, Volume 6, pdf p. 412)**

Scenario	Units	Dormitory Receptor		Hospital Child Receptor
		Child Resident	Adult Resident	
Diesel PM Cancer Potency Factor (CPF) <sup>1</sup>	[mg/kg-day] <sup>-1</sup>	1.1	1.1	1.1
Excess Cancer Risk from Uncontrolled Construction Emissions <sup>2,3</sup>	[in a million]	54 55	2.8 2.9	28
Excess Cancer Risk from Tier 4 Controlled Construction Emissions <sup>2,3</sup>	[in a million]	7.7 8.6	0.40 0.45	4.0 4.1
Excess Cancer Risk from Tier 2 + ARB NOx VDECS Controlled Construction Emissions <sup>2,3</sup>	[in a million]	9.2 11	0.48 0.55	4.8 4.9
Excess Cancer Risk from Operational Traffic Emissions <sup>4</sup>	[in a million]	7.2	7.2	7.2
Excess Cancer Risk from Emergency Diesel Generators <sup>4</sup>	[in a million]	30	30	30
Excess Cancer Risk from South Street Tower Emergency Diesel Generator <sup>5</sup>	[in a million]	0.085	0.050	0.0045
Excess Cancer Risk from 16 <sup>th</sup> Street Tower Emergency Diesel Generator <sup>5</sup>	[in a million]	0.033	0.019	0.013
Excess Cancer Risk from GSW Arena Emergency Diesel Generators <sup>5</sup>	[in a million]	0.12	0.072	0.038
2014 Background Risk <sup>6</sup>	[in a million]	26	26	44

Accordingly, the objection that this non-Project cumulative risk does not include all foreseeable sources as set out in our November 2 letter still applies.

<sup>3</sup> "Final Mission Bay Subsequent Environmental Impact Report." San Francisco Planning Department, September 17, 1998, available at: <http://www.sfocii.org/index.aspx?page=61>

## Cumulative Analysis Omits Excess Cancers Caused by Regional TAC Sources

The SEIR states that it relies upon a radius of 1,000 feet from the Project fence line to assess cumulative risk (p. 5.4-17, 5.4-50, 5.4-56). This buffer distance is consistent with BAAQMD guidance,<sup>4</sup> which requires the consideration of all “sources within 1,000 foot radius” when determining cumulative health risk impacts.<sup>5</sup> The DSEIR also notes that this buffer distance is consistent with studies conducted by the California Air Resources Board (CARB), in which it found “ground-level TAC emissions to return to background levels” at a distance beyond 1,000 feet (p. 5.4-56).<sup>6</sup> However, regardless whether a particular source attenuates at 1,000 feet, it is improper to ignore regional transport of TACs from sources beyond 1,000 feet where there is evidence that the combined effect of those sources would result in a substantial increase in cancer risk. Ignoring material levels of regional TAC sources that are generated from multiple sources beyond 1,000 feet results in a failure to assess the actual excess cancers attributable to all cumulative sources of TACs. Because the SEIR does in fact ignore the excess cancers attributable to regional or global background TACs, cumulative health risk impacts at the Project site are greatly underestimated.

The SEIR utilizes risk values from a local-scale citywide modeling effort conducted in 2012 to represent background ambient risk at the Project site (DSEIR p. 5.4-11 to 12), and then combines the Project’s health risk with this “background” risk to determine whether or not the Project would have a cumulatively considerable impact (DSEIR, App. AQ, Table 6.1-8; FSEIR, App. AQ2, Refined Table 6.1-8). This citywide model, however, is not representative of ambient background risks, as it only takes into account risk from local emission sources. According to *The San Francisco Community Risk Reduction Plan: Technical Support Documentation*, which describes the methods and specific emission sources used within this model, “...the dispersion modeling, from which the maps are derived, produced concentrations and risk estimates from direct emissions. The maps themselves therefore portray concentrations of directly emitted PM2.5 and cancer risk associated with directly emitted TAC at locations near the sources of these emissions. The results do not reflect regional or long-range transport of air pollutants. Nor do they include the effects of the chemical transformation (formation or loss) of pollutants.”<sup>7</sup> As such, the “background” risk used by the SEIR, in combination with the Project-specific risk, does not accurately represent the cumulative risk within the Project area.

<sup>6</sup> See also California Environmental Quality Act Guidelines Update, Proposed Thresholds of Significance, May 3, 2010, BAAQMD, pp.41, 43 (finding that TAC concentrations from identified sources approach background levels at 1,000 feet).

<sup>7</sup> “The San Francisco Community Risk Reduction Plan: Technical Support Documentation.” BAAQMD, December 2012, *available at*:

[http://www.gsweventcenter.com/Draft\\_SEIR\\_References%5C2012\\_12\\_BAAQMD\\_SF\\_CRRP\\_Methods\\_and\\_Findings\\_v9.pdf](http://www.gsweventcenter.com/Draft_SEIR_References%5C2012_12_BAAQMD_SF_CRRP_Methods_and_Findings_v9.pdf), p. 37

The DSEIR attempts to justify limiting cumulative sources to those generated within 1,000 feet, stating that because “the contribution of project emissions would be greatly dispersed through both distance and intervening structures...their contribution would be expected to be minimal” (p. 5.4-56). This statement, however, addresses only the dispersal of a particular project’s emissions and the attenuated effect of that particular project on receptors beyond 1,000 feet. The statement provides no justification for ignoring the combined effects of multiple projects that may have impacts at a particular location even if they are not within 1,000 feet of the Project site. Considering such effects is one of the purposes of a cumulative analysis.

Other air districts, such as the South Coast Air Quality Management District (SCAQMD), and CARB recognize the importance of considering regional transport of TACs in cumulative analysis. According to CARB’s *Air Quality and Land Use Handbook: A Community Health Perspective*, (“Land Use Handbook”), “The broad concept of cumulative air pollution impacts reflects the combination of regional air pollution levels and any localized impacts. Many factors contribute to air pollution levels experienced in any location. These include urban background air pollution, historic land use patterns, the prevalence of freeways and other transportation corridors, the concentration of industrial and commercial businesses, and local meteorology and terrain.”<sup>8</sup> The Land Use Handbook continues on to state, “Urban background levels are a major contributor to the overall risk from air toxics in urban areas...When localized elevated air pollutant levels were measured, they were usually associated with local ground-level sources of toxic pollutants. The most common source of this type was busy streets and freeways. The impact these ground-level sources had on local air quality decreased rapidly with distance from the source. Pollutant levels usually returned to urban background levels within a few hundred meters of the source. These results indicate that tools to assess cumulative impacts must be able to account for both localized, near-source impacts, as well as regional background air pollution.”<sup>9</sup> Therefore, it is extremely important that “both localized, near-source impacts, as well as regional background air pollution” be considered when assessing cumulative health risk impacts.

Simply because emission concentrations from individual sources significantly decrease with distance does not mean that these sources do not contribute to overall risk from air toxics in urban areas. As is explained in SCAQMD’s *Final Methodology to Calculate Particulate Matter (PM) 2.5 and PM2.5 Significance Thresholds*, “When fugitive dust enters the atmosphere, the larger particles of dust typically fall quickly to the ground, but smaller particles less than 10 microns in diameter may remain suspended for longer periods, giving the particles time to travel across a regional area and affecting receptors at some distance from the original emissions source. Fine PM2.5 particles have even longer atmospheric residency times.”<sup>10</sup> Since diesel exhaust particulate matter, a known toxic air contaminant (TAC), is composed of

---

<sup>8</sup> “Air Quality and Land Use Handbook: A Community Health Perspective.” CARB, April 2005, *available at*: <http://www.arb.ca.gov/ch/handbook.pdf>, p. 39

<sup>9</sup> “Air Quality and Land Use Handbook: A Community Health Perspective.” CARB, April 2005, *available at*: <http://www.arb.ca.gov/ch/handbook.pdf>, Appendix C, p. C-3

<sup>10</sup> “Final Methodology to Calculate Particulate Matter (PM) 2.5 and PM2.5 Significance Thresholds.” SCAQMD, October 2006, *available at*: <http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance->

both coarse (PM10) and fine particulate matter (PM2.5), impacts from regional, long-transporting PM should have been included in the SEIR's cumulative health risk assessment.<sup>11</sup>

There is evidence to further support our conclusion that regional sources contribute substantially to background health risks, and that health risk from these regional sources were not included in the SEIR's cumulative analysis. First, the DSEIR states that "the 100 per million excess cancer cases is...consistent with the ambient cancer risk in the most pristine portions of the Bay Area based on BAAQMD regional modeling," which suggests that the regional contribution to background excess cancers at the Project site would, at the very least, be equal to approximately 100 in one million (p. 5.4-13). Furthermore, the FSEIR states that this background excess cancer risk is due to globally transported TACs (p. 13.13-27). Therefore, if the health risk from both regional and local sources were included in the SEIR's cumulative impact assessment, contributions from background sources alone would exceed the 100 in one million threshold. Since this is not the case with regards to the SEIR's analysis, it is clear that regional sources were not included.

Second, although the citywide model did not include health risk impacts from regional sources, the model did disclose a substantial citywide background concentration of PM2.5 from non-local sources.<sup>12</sup> This background PM2.5 concentration was determined by measuring the actual PM2.5 concentrations at each monitoring station, and then by subtracting the modeled PM2.5 concentrations from the measured value. This resulted in a regional background PM2.5 value of 8.06 µg/m<sup>3</sup>, which is an order of magnitude higher than the modeled PM2.5 values, which, on average, were equal to approximately 0.55 µg/m<sup>3</sup>. Based on the relation of modeled PM2.5 to measured PM2.5, it is evident that actual concentrations of PM2.5 are primarily derived from regional or global sources, not from local sources.. Diesel Particulate Matter (DPM), which is a known TAC, is largely composed of fine particulate matter (PM2.5); thus PM2.5 can be used as a proxy for DPM in health risk assessments. Based on the high levels of measured PM2.5 that are not accounted for in the local citywide model, we conclude that there may be substantial sources of regional DPM that are not accounted for.

Again, it is important to note that the citywide model used to determine Air Pollution Exposure Zones did not include the health risks from regional emission sources:

When discussing the maps and drawing conclusions from them, it is important to consider what they portray and how they were produced. Specifically, the dispersion modeling, from which the maps are derived, produced concentrations and risk estimates from direct emissions. The maps

[http://www.gsweventcenter.com/Draft\\_SEIR\\_References%5C2012\\_12\\_BAAQMD\\_SF\\_CRRP\\_Methods\\_and\\_Finding\\_s\\_v9.pdf](http://www.gsweventcenter.com/Draft_SEIR_References%5C2012_12_BAAQMD_SF_CRRP_Methods_and_Finding_s_v9.pdf), p. 37

themselves therefore portray concentrations of directly emitted PM<sub>2.5</sub> and cancer risk associated with directly emitted TAC at locations near the sources of these emissions. The results do not reflect regional or long-range transport of air pollutants. Nor do they include the effects of the chemical transformation (formation or loss) of pollutants.

The modeling results, in particular maps of impacts of all sources combined, are intended to aid local planning efforts by identifying areas where emission reductions or other efforts may be implemented to help protect current and future residents from major local sources of air pollution. Impacted areas were identified by comparing modeled results of local contributions to CRRP thresholds. For cancer risk, this local contribution was used directly for comparison to a CRRP threshold. For PM<sub>2.5</sub>, the local contribution was added to a background concentration for comparison to a CRRP threshold.

To estimate the background concentration of PM<sub>2.5</sub>, monitored levels from six locations (Figure 10) were compared to the value predicted from dispersion modeling for the base year (2010) at those locations. Monitoring data from a special study conducted in 2008 were used along with routinely collected data from the BAAQMD routine monitoring site at the Arkansas Street site for the same year.

**Table 14.** Measured and modeled PM<sub>2.5</sub> concentrations (µg/m<sup>3</sup>) and their differences at San Francisco monitoring sites.

Monitoring Location	Measured Value (µg/m <sup>3</sup> )	Modeled Value (µg/m <sup>3</sup> )	Difference (µg/m <sup>3</sup> )
BAAQMD Arkansas St	9.10	0.88	8.22
SFDPH Arkansas St	8.90	0.88	8.02
Southeast Community Center	9.30	0.84	8.46
Muni Maintenance Yard	8.90	0.44	8.46
Potrero Recreation Center	7.60	0.21	7.39
Malcolm X Academy	7.90	0.06	7.84
<b>Average Difference</b>			<b>8.06</b>

The average difference between the monitored and modeled values (8.06 µg/m<sup>3</sup>; Table 14) was used as the citywide ambient level for PM<sub>2.5</sub>. This difference was added to the predicted value at each receptor site for comparison to the CRRP threshold for PM<sub>2.5</sub>.<sup>13</sup>

In sum, the SEIR omits regional sources of TACs in its cumulative health risk assessment. This omission is material because regionally or globally transported TACs substantially contribute to health risk impacts. As such, the SEIR's cumulative health risk assessment is not representative of all cumulative sources, as the background health risks relied upon only account for local sources.

<sup>13</sup> *Id.*

## Failure to Utilize Values from Updated Health Risk Assessment Guidelines

As comments on the DSEIR objected, the DSEIR failed to incorporate recommended age specific inhalation rates set forth by OEHHA in their 2012 and 2015 guidance into their health risk assessment. We discussed the consequences of this failure in our November 2 letter; however, we relied upon information from the DSEIR's outdated health risk assessment. Therefore, in an effort to determine if this same conclusion can be made with regard to the new health risk assessment provided in the FSEIR, we reviewed that updated health risk assessment.

Review of both health risk assessments demonstrates that the DSEIR and the FSEIR fail to use these updated age-specific breathing rates for children and infants in their health risk assessments, and as a result, the Project's health risk impacts are greatly underestimated. We maintain that prior to certification of the FSEIR an updated health risk assessment should be prepared to include these updated values.

As was discussed in our November 2 letter, we conducted a simple analysis in an effort to demonstrate the effect that use of these updated breathing rates can have on estimated health risk values. Our analysis demonstrated that if all other exposure variables are held constant, the use of current recommended breathing rates would nearly double a child resident's health risk, when compared to a health risk that uses outdated breathing rates, such as in the DSEIR and FSEIR. This simple analysis did not use site specific information, and was intended to provide an example of the effect that adjustments to this critical parameter can have on health risk. In an effort to provide a more site-specific assessment, we conducted an additional analysis, as discussed herein.

The FSEIR uses the following default values and input parameters to estimate health risk (Volume 6, Table 6.1-7, pp. 411).

Exposure Parameter			Child Resident		Adult Resident		Hospital Child	
Units			Construction	Operation	Construction	Operation	Construction	Operation
DBR	Daily Breathing Rate	L/kg-day	581	302	302	302	581	581
ET	Exposure Time	hrs/24 hrs	1	1	1	1	1	1
EF	Exposure Frequency	days/year	350	350	350	350	365	365
ED	Exposure Duration	years	2	70	2	70	1	1
AT	Averaging Time	days	25550	25550	25550	25550	25550	25550
IF	Intake Factor	(m <sup>3</sup> /kg-day)	0.016	0.290	0.0083	0.290	0.0083	0.0083
ASF	Age Sensitivity Factor	-	10	1.7	1	1	10	10
MAF	Modeling Adjustment Factor	-	-	-	-	-	-	-

While the old OEHHA guidance allowed for only one breathing rate for a child (581 L/kg-day), and one breathing rate for an adult (302 L/kg-day), the updated OEHHA guidance requires that different

breathing rates be used for an infant from ages zero to two (1090 L/kg-day), for a child from ages two to sixteen (745 L/kg-day), and for an adult from ages sixteen to seventy (290 L/kg-day) (see table below).<sup>14</sup>

**Table 3.1. Recommended Point Estimates for Long-Term Daily Breathing Rates**

	3 <sup>rd</sup> Trimester	0<2 years	2<9 years	2<16 years	16<30 years	16<70 years
<b>L/kg-day</b>						
Mean	225	658	535	452	210	185
95th Percentile	361	1090	861	745	335	290
<b>m<sup>3</sup>/day</b>						
Mean	15.3	6.2	10.7	13.3	15.0	13.9
95th Percentile	23.4	11.2	16.4	22.6	23.5	22.9

Furthermore, the updated OEHHA guidance requires that an age sensitivity factor (ASF) of 10 be used for infant exposures, and an ASF of 3 be used for child exposures. Therefore, using these updated breathing rates and age sensitivity factors, calculating and summing age specific risks for each age bracket, and using the FSEIR's other exposure parameters as listed in the table above, we estimated the following project-specific health risk (see table below).

<b>Total Project Cancer Risk</b>	<b>Child Resident</b>	<b>Adult Resident</b>	<b>Hospital Child</b>
FSEIR Assessment	18	8	12
BAAQMD Threshold	10	10	10
<b>Exceed?</b>	<b>Yes</b>	<b>No</b>	<b>Yes</b>
SWAPE Assessment	31	11	17
BAAQMD Threshold	10	10	10
<b>Exceed?</b>	<b>Yes</b>	<b>Yes</b>	<b>Yes</b>
Percent Increase	71%	42%	45%

As you can see, when age specific breathing rates from the updated OEHHA guidance are used, the Project's health risk increases by as much as 71 percent.<sup>15</sup> Furthermore, the adult resident health risk increases from 8 in one million to 11 in one million, which exceeds the 10 in one million threshold. By relying upon outdated breathing rates, the FSEIR is greatly underestimating the Project's health risk.

<sup>14</sup> "Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessment." Office of Environmental Health Hazard Assessment, February 2015, available at:

[http://oehha.ca.gov/air/hot\\_spots/hotspots2015.html](http://oehha.ca.gov/air/hot_spots/hotspots2015.html)

<sup>15</sup> We calculated a 70-year health risk in an effort to demonstrate the effects of the updated breathing rates compared to the breathing rates used in the FSEIR. When a 30-year exposure duration is used, as is recommended in the updated OEHHA guidance, changes to the health risk are negligible. For example, the health risk for a child resident for a 70-year exposure is 31 in one million and for a 30-year exposure is 30 in one million. Similarly, the adult resident health risk is 11 in one million for both exposure durations. This is due to the adjustment in breathing rates between the 16 to 30 year age bracket (335 L/kg-day) and the 16 to 70 year age bracket (290 L/kg-day).

We were unable to conduct an updated cumulative analysis due to lack of data available to us. As previously discussed, the background risks used in the SEIR were taken from a citywide modeling effort. However, neither the DSEIR nor the FSEIR provide the annual average concentrations these background risks were derived from. According to the FSEIR, the methods used in this citywide model follow “BAAQMD’s existing health risk assessment methodology protocols,” which means that the background risks were estimated using the same outdated breathing rates as the FSEIR (p. 13.13-50). Furthermore, the FSEIR relies upon the BAAQMD County Surface Street Screening Tables for San Francisco County to estimate emissions from mobile sources (Volume 6, Table 6.1-4, pp. 408). Similar to the citywide model, this screening tool also estimates a 70-year cancer risk using these outdated breathing rates. As such, the cancer risk from these mobile sources is also likely to increase when updated breathing rates are applied.

Even though we were unable to conduct a cumulative health risk assessment, our analysis demonstrates that when these updated breathing rates are applied, the health risk at each sensitive receptor substantially increases. As a result, when the background risk and risk from mobile-sources are estimated using OEHHA’s updated breathing rates, the cumulative risk at each sensitive receptor location will substantially increase, which may result in an exceedance of the 100 in one million cumulative health risk threshold.

## Unjustified Rejection of Pier 80 Alternative Site Based on Health Risks

The Mission Bay Alliance submitted comments in which they identified an alternative site located near San Francisco’s Pier 80 that would both meet fundamental Project objectives and substantially reduce environmental impacts. The Project’s CEQA findings reject this site. The rejection is based in part on the finding that, because the MBA Alternative Site is located in an Air Pollution Exposure Zone, it would result in substantially more severe air quality health risk impacts than the Project.

Our analysis, based on available data from the City of San Francisco, demonstrates the contrary. Specifically, we evaluated the health risk impacts of the alternative location, and compared them to Project location’s impacts, as proposed in the FSEIR. Our findings demonstrate that the health risk impacts at the alternative location would be substantially less when compared to the health risk impacts at the proposed Project site.

The alternative location identified by the Mission Bay Alliance is an approximately 21-acre site located just east of Pier 80. Consistent with the methods used in the FSEIR to determine health risk impacts, we determined what portion of the Project site was located within an Air Pollutant Exposure Zone (APEZ). Using the San Francisco Property Information Map<sup>16</sup> we found that approximately 75 percent of this site is located within an APEZ (see figure below).<sup>17</sup>

---

<sup>16</sup> San Francisco Property Information Map, available at: <http://propertymap.sfplanning.org/?dept=planning>

<sup>17</sup> Parcels located within an APEZ are highlighted in blue, and the alternative site is outlined in red in the figure below.

Even though the alternative site would place some portion of the Project within an APEZ, it is still the superior option when compared to the currently proposed location for several reasons.

First, the entire site is not located within an APEZ. Of the 21-acre site, approximately 15 acres are within an APEZ, and approximately 6 acres are not within an APEZ. The Project is much smaller than the alternative location, only taking up a portion of the site. For example, the arena would only require 7 acres of the 21-acre site. Therefore, if placed strategically, only a fraction of the arena would need to be located within an APEZ. The figure below demonstrates how this could be achieved.

Second, although the Project would be located within an APEZ at this alternative site, it would not be required to comply with the enhanced ventilation requirements set forth by Article 38, as it is not a sensitive use development.<sup>18</sup> The purpose of Article 38 is to protect the public health and welfare by establishing an Air Pollutant Exposure Zone and imposing an enhanced ventilation requirement for all urban infill sensitive use development within the Air Pollutant Exposure Zone. Sensitive use developments are defined as any building or facility designed for residential use, or any facility containing child daycares, schools, and hospitals.<sup>19</sup> Using this definition, the Project is not considered to be a sensitive use development, and as such, is not subject to the enhanced ventilation requirement under Article 38.

This conclusion is further supported by the San Francisco Planning Department. According to a July 29, 2015 Preliminary Project Assessment, when a “project site is located within an Air Pollutant Exposure Zone, as mapped and defined by Health Code, Article 38... Should the proposed project include new sensitive land uses (for example, day care facilities), those facilities would be subject to the requirements of Health Code Article 38.”<sup>20</sup>

In addition to the enhanced ventilation requirement, projects located within an Air Pollutant Exposure Zone would also need to: (1) require that all stationary sources (i.e. backup diesel generators) meet Tier

<sup>18</sup> Article 38 of the San Francisco Health Code, available at: <https://www.sfdph.org/dph/EH/Air/Article38.asp>

<sup>19</sup> Article 38, Section 3804, available at:

[http://library.amlegal.com/nxt/gateway.dll/California/health/article38enhancedventilationrequiredforu?f=templates\\$fn=default.htm\\$3.0\\$vid=amlegal:sanfrancisco\\_ca](http://library.amlegal.com/nxt/gateway.dll/California/health/article38enhancedventilationrequiredforu?f=templates$fn=default.htm$3.0$vid=amlegal:sanfrancisco_ca)

<sup>20</sup> Preliminary Project Assessment, San Francisco Planning Department, July 29, 2015 available at: <http://www.sf-planning.org/ftp/files/notice/2015-004256PPA.pdf>

4 requirements, and (2) quantify and minimize construction emissions. According to the FSEIR, the proposed diesel generators will already meet these Tier 4 requirements (p. 14-118). Furthermore, the FSEIR is proposing to implement multiple mitigation measures, such as the use of Tier 2 off-road equipment, to minimize construction emissions (p. 14-120). Therefore, relocating the Project at this alternative site would not require implementation of additional mitigation measures.

Third, because the proposed land uses would be farther from sensitive receptors, the MBA Alternative Site would reduce health risk impacts caused by the Project itself compared to the preferred location. The Project would generate new sources of toxic air contaminants including, diesel generators, on-road vehicles, and off-road equipment. Since the Project does not propose to locate sensitive receptors on-site, it would not expose on-site sensitive receptors to toxic air contaminants. Accordingly, we assessed the impacts to existing and foreseeable future off-site receptors. Based on the San Francisco July 2015 Zoning Map, the majority of the areas surrounding the alternative Project site are zoned for industrial, commercial, and other non-residential uses (see figure below).<sup>21, 22</sup>

<sup>21</sup> San Francisco Zoning Map, July 2015, available at: <http://www.sf-planning.org/modules/showdocument.aspx?documentid=9016>

<sup>22</sup> The parcels colored in dark blue are zoned as Production, Distribution, and Repair Districts (PDR). According to Section 210.7 of Article 2 of the San Francisco Planning Code, PDR “districts provide space for a wide variety of PDR (production, distribution and repair) and other non-residential activities in districts where these uses are free from inherent economic and operational competition and conflicts with housing, large office developments, and large-scale retail, which are not permitted in these districts.”

As a result, there should be few, if any, sensitive receptors permitted in the future within the vicinity of this alternative site because residential use is not permitted. We relied upon resources provided by the San Francisco Planning Department to determine if there were existing sensitive receptors within the area. Utilizing the same 1,000-foot zone of influence as the FSEIR to assess health risks from Project emissions, we identified two sensitive receptors: (1) the Rise Institute approximately 760 feet northwest of the site; and (2) an affordable housing development approximately 1,020 feet north of the site (see figure below).

It should be noted that the two identified sensitive receptors would only be within or close to 1,000 feet of the alternative site if the Project were built directly adjacent to Interstate 280, which would most likely not occur. As demonstrated in the figure below, when a 1,000 foot radius is taken from the center of the site, both of the identified sensitive receptors are well out of range of the alternative site, with the Rise Institute approximately 1,600 feet away, and the affordable housing development approximately 1,800 feet away.

Thus, based on the SEIR's own approach to determining significance, there would be no significant impact to this receptor from the Project. Due to lack of available data, we were unable to conduct a full, site-specific health risk assessment to determine health risk impact values at this alternative location. However, even without a health risk assessment, based on the location of sensitive receptors and the APEZ we can still conclude that, when compared to the current Project site, the proposed alternative site would have a substantially reduced health risk impact.

Sincerely,

Paul Rosenfeld

Paul Rosenfeld, PhD

JJ

Jessie Jaeger

## IMPACTS

Air quality impacts from land development projects result from project construction and operation. Construction emissions, primarily dust generated by earthmoving activities and criteria air pollutants emitted by construction vehicles, would have a short-term effect on air quality. Operational emissions, generated by project-related traffic and by combustion of natural gas for building space and water heating, would continue to affect air quality throughout the lifetime of the project.

### Significance Criteria

A project would have a significant air quality effect on the environment if it were to:

- Conflict with or obstruct implementation of the applicable air quality plan.
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation.
- Result in a cumulatively considerable net increase of any criteria air pollutant for which the project region is non-attainment under an applicable federal, state, or regional ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors).
- Expose sensitive receptors to substantial pollutant concentrations.
- Create objectionable odors affecting a substantial number of people.

As stated above, in 2010 BAAQMD adopted new significance thresholds for air quality for CEQA analysis. Under the new BAAQMD *CEQA Air Quality Guidelines* and thresholds,<sup>158</sup> the significance thresholds for criteria air pollutant emissions from project construction and operations have generally been lowered. The new thresholds are as follows: for ROG, NOx, and PM2.5, a net increase of 54 pounds per day or 10 tons per year (tpy) would be considered significant, while for PM10, a net increase of 82 pounds per day or 15 tpy would be considered significant. For CO, an increase would be considered significant if it leads to or contributes to CO concentrations exceeding the State Ambient Air Quality Standard (SAAQS). Quantification of the CO concentrations would not be required if a project is consistent with the local congestion management program and plans, and if traffic volumes at affected intersections are below 44,000 vehicles per hour, or below 24,000 vehicles per year in tunnel-like conditions. For construction-period impacts, the same thresholds apply for ROG, NOx, PM2.5, and PM10, except that the thresholds for PM2.5 and PM10 apply only to exhaust emissions. There are no quantitative thresholds for construction dust emissions; instead, impacts are considered less than significant if the

---

<sup>158</sup> BAAQMD, *California Environmental Quality Act (CEQA) Air Quality Guidelines*, June 2010; and adopted Thresholds of Significance, June 2010. Available online at <http://www.baaqmd.gov/Divisions/Planning-and-Research/CEQA-GUIDELINES/Updated-CEQA-Guidelines.aspx>, accessed May 2, 2011.

BAAQMD Best Management Practices are employed to control dust during construction activities, including demolition and excavation.

BAAQMD considers projects that exceed these criteria air pollutant standards also to result in a cumulatively considerable air quality impact upon the region. According to BAAQMD, no further cumulative analysis should be required beyond the analysis of whether a proposed project's impacts would contribute considerably to ambient levels of pollutants or GHGs,<sup>159</sup> with the exception of the following cumulative risk and hazard analysis for toxic air contaminants.

For health risks and hazards resulting from emissions of toxic air contaminants, BAAQMD recommends either that a project be found to be in compliance with a "qualified community risk reduction plan," or that significance thresholds be used for both construction and operational emissions based on commonly used standards employed in health risk assessment. The following are thresholds for project-specific impacts: (1) an increase in lifetime cancer risk of 10 chances in one million, (2) an increase in the non-cancer risk equivalent to a chronic or acute "Hazard Index" greater than 1.0,<sup>160</sup> or (3) an increase in the annual average concentration of PM<sub>2.5</sub> in excess of 0.3 micrograms per cubic meter. BAAQMD also recommends cumulative thresholds of 100-in-one-million cancer risk, a Hazard Index greater than 10.0, and a PM<sub>2.5</sub> concentration greater than 0.8 micrograms per cubic meter. Unlike the volume-based thresholds for criteria air pollutants noted above, the toxic air contaminant thresholds are used for specific receptor locations when a risk analysis is required for specific project components, such as stationary sources (common in industrial operations) or the use of diesel-powered equipment, including construction equipment.

## Approach to Analysis

The URBEMIS model was used to determine the proposed project's criteria air pollutant emissions as well as those from the two variants. A Health Risk Assessment was also conducted to determine if the proposed project would expose sensitive receptors to substantial levels of pollution. The results of these analyses are presented in an Air Quality Technical Report for this project (AQTR).<sup>161</sup> This methodology section summarizes the approaches, while more detail is provided in the impact analysis.

---

<sup>159</sup> *Ibid.*

<sup>160</sup> Hazard Index represents the ratio of expected exposure levels to an acceptable reference exposure levels.

<sup>161</sup> Donald Ballanti, Certified Consulting Meteorologist, *Air Quality Impact Report and Health Risk Assessment for the 801 Brannan and One Henry Adams Project* (AQTR), San Francisco, March 4, 2011, p. 4-5. This analysis is available for public review at the San Francisco Planning Department, 1650 Mission Street, Fourth Floor, San Francisco as part of Case File 2000.618E.

- All contractors shall use equipment that meets ARB's most recent certification standard for off-road heavy-duty diesel engines.

The implementation of **Mitigation Measure M-AQ-7** could potentially reduce the construction health risk impacts. However, the effectiveness of these mitigation measures in reducing health risks is unknown at this time. Since it cannot be stated with certainty that cancer risk, non-cancer, or PM2.5 concentrations would be reduced to below the BAAQMD-recommended significance thresholds, this impact is conservatively judged as *significant and unavoidable with mitigation* for the proposed project, or either variant.

**Impact AQ-8: Operation of the proposed project, or either variant, would expose sensitive receptors to substantial levels of air pollutants from roadway mobile sources and stationary sources, including PM2.5 and other TACs associated with cancer, and non-cancer health risks, which would exceed the BAAQMD project-level cancer risk threshold of significance of 10 in one million. (Significant and Unavoidable)**

#### *Mobile Sources*

As discussed above, proximity to high traffic volume roadways creates exposure to toxic air contaminants. A Health Risk Assessment was conducted for the project and its variants to determine if the proposed project, or either variant, would expose sensitive receptors to substantial levels of pollution.<sup>169</sup> Mobile-source diesel particulate, PM2.5 and TOG (Total Organic Gases) concentrations on the two project sites were evaluated with the EPA approved dispersion model CAL3QHCR. The definition of links and traffic volumes were identical to those used by the San Francisco City and County Department of Public Health's preliminary analysis of mobile-source particulate impacts. The model was run on one year of meteorological data provided by the Bay Area Air Quality Management District from the Mission Bay monitoring site in San Francisco. Vehicle volumes from the SF CHAMP traffic model maintained by the San Francisco County Transportation Agency were used. Emission factors were determined using the CT-EMFAC program, the California Department of Transportation's emission model, for the County of San Francisco. Emission factors assumed a 2012 vehicle mix, which is conservative since construction ends in 2014.

#### *Permitted Stationary Sources*

The vicinity of the two project sites includes a number of existing sources of air pollutants. There are 21 sources of air pollutants permitted by the BAAQMD within the project sites' zone of influence for air

---

<sup>169</sup> Donald Ballanti, AQTR, *op. cit.*

quality analysis (1,000-ft). Based on toxic risk screening using data mandated by the BAAQMD, 10 permitted sources (backup diesel generators) in the project sites' zone of influence have associated cancer risk values greater than the individual source threshold of 10 in one million, the BAAQMD TAC screening level. For the 10 permitted sources that failed the screening procedure, the ISCST-PRIME air pollution model was used to analyze the impacts of these 10 permitted sources on the new residences at the two project sites.<sup>170</sup> Actual locations of the permitted sources were determined during a field reconnaissance.<sup>171</sup> Two sources at the San Francisco Hall of Justice/County Jail complex could not be located so they were, as a worst-case assumption, assumed to be as located at the point of minimal distance to the project sites (i.e., at the southwest corner of that parcel). All sources utilized BAAQMD default stack parameters. Building wake effects were included. The ISCST-PRIME model was run for the same ground-based receptors defined for the CAL3QHCR model. The program was run on the same weather file used for the CAL3QHCR program. For all other permitted sources, BAAQMD permit HRAs, adjusted screening values or unadjusted screening values for cancer risk, non-cancer health hazards and PM<sub>2.5</sub> concentration were used to assess health effects.

#### *Health Risk Assessment for Mobile and Stationary Sources*

The modeling procedures described above provided TOG, diesel PM and PM<sub>2.5</sub> concentrations separately for mobile sources and for 10 permitted stationary sources (diesel generators) that were modeled using the ISCST-PRIME model. The risk components for each TAC were computed for each receptor point. The BAAQMD's screening cancer risk values for permitted sources not modeled were summed and added to the calculated risk for each receptor point. Data are shown for the receptor at each site with the maximum cancer risk for each source type (roadway or point source).

The BAAQMD *CEQA Guidelines* provide that a project would have a project-level significant air quality impact if any of the following thresholds to be exceeded:

1. Expose sensitive receptors to substantial levels of TACs such that the probability of contracting cancer for the maximally exposed individual (MEI) exceeds 10 in one million from an individual source within the 1,000-foot zone of influence.
2. Expose sensitive receptors to TACs from an individual source within the 1,000-foot zone of influence such that a non-cancer Hazard Index of 1.0 would be exceeded.
3. Expose sensitive receptors to, or incrementally increase localized annual average concentrations of PM<sub>2.5</sub> exceeding 0.3 micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ).

---

<sup>170</sup> *Ibid.*

<sup>171</sup> Donald Ballanti site reconnaissance on December 6, 2010.

BAAQMD also recommends cumulative thresholds of 100-in-one-million cancer risk, a Hazard Index greater than 10.0, and a PM<sub>2.5</sub> concentration greater than 0.8 micrograms per cubic meter from all sources within the zone of influence for those receptors within 1,000 feet of the project site. (Cumulative Roadways plus Cumulative Point Sources).

#### *Particulate Matter (PM<sub>2.5</sub>)*

Maximum predicted PM<sub>2.5</sub> concentrations at the 801 Brannan site and One Henry Adams site are shown in Table 21 on the following page. The data in Table 21 is for Receptor 11, located at the Eighth Street/ Brannan Street corner of the project site. Cumulative roadway concentrations represent the contribution of traffic within roughly 1,000 feet of the site.

#### 801 Brannan Site

Table 21 indicates that the individual source project-level threshold of significance for PM<sub>2.5</sub> would be exceeded at the 801 Brannan site by the contribution from the I-80 Freeway directly west of the project site, with a concentration of 0.33 µg/m<sup>3</sup>. All other roadways would be below the 0.3 µg/m<sup>3</sup> standard. The cumulative concentration of PM<sub>2.5</sub> from all point sources in the project vicinity is below the 0.3 µg/m<sup>3</sup> threshold.<sup>172</sup> Because at least one of the PM<sub>2.5</sub> thresholds of significance would be exceeded at the 801 Brannan site, the proposed project, or either variant, would have a significant PM<sub>2.5</sub> TAC impact as stated in the summary statement above, Impact AQ-8: Operational Health Risk – TACs, including PM<sub>2.5</sub>.

#### One Henry Adams Site

Table 21 on the following page indicates that the individual source project-level threshold of significance for PM<sub>2.5</sub> concentration would not be exceeded at the One Henry Adams site under the proposed project, or either variant. Therefore, sensitive receptors at the One Henry Adams site would not be exposed to elevated levels of PM<sub>2.5</sub>. None of the individual roadways near the site was found to exceed the project-level 0.3 µg/m<sup>3</sup> threshold. The cumulative PM<sub>2.5</sub> concentration of 0.369 would not exceed the cumulative threshold of significance of 0.8 µg/m<sup>3</sup>.<sup>173</sup> Therefore, PM<sub>2.5</sub> thresholds of significance would not be exceeded at the One Henry Adams site, and there would be no health risk impacts from exposure to PM<sub>2.5</sub> at the One Henry Adams site.

---

<sup>172</sup> Donald Ballanti, AQTR, *op. cit.*

<sup>173</sup> *Ibid.*

Table 21 PM2.5 Concentrations			
Source	Concentration ( $\mu\text{g}/\text{m}^3$ )	Threshold ( $\mu\text{g}/\text{m}^3$ )	Exceeds Threshold
<b>801 Brannan site</b>

### Cancer and Non-Cancer Health Risks

Tables 22 and 23 on the following pages provide a summary of the results for cumulative and individual source of cancer and non-cancer health risks at the 801 Brannan and One Henry Adams sites, respectively. Cancer risks related to roadway sources are due to exposure to diesel particulate and TOG from vehicle exhaust. Point source cancer risks are almost exclusively due to exposure to diesel particulate emissions from back-up generators. Cumulative roadway cancer and non-cancer risks are based on CAL3QHCR modeling of emissions from nearby roads and freeways. The contributions of individual roads were also examined to determine which exceed the individual source thresholds. Cumulative point source cancer and non-cancer risks are based on ISTSC-Prime modeling of emissions and BAAQMD screening values for identified permitted sources within 1,000 feet of the project sites. considering each source as a source group, the contributions of each individual source were also examined to determine which individual source thresholds are exceeded.

#### 801 Brannan Site

Table 22, -page 282, indicates that the project level individual source threshold of significance for cancer risk (10 in one million) would be exceeded at the 801 Brannan site for three roadways: I-80, Brannan Street, and Eighth Street. The cumulative cancer risk threshold of significance of 100 in one million would also be exceeded at the 801 Brannan site. The individual source non-cancer hazard index of 1.0 (acute and chronic) would not be exceeded, nor would the cumulative non- cancer hazard index of 10 (acute and chronic). Because at least one threshold of TAC impact significance would be exceeded at the 801 Brannan site, the proposed project, or either variant, would have a significant operational health risk impact as stated in the summary above, Impact AQ-8: Operational Health Risks – TACs, including PM2.5. Mitigation Measure M-AQ-8, below, would reduce sensitive receptor exposure to TACs by reducing resident exposure through the improvement of indoor air quality. This would be achieved through the use of filtration systems as described above. However, because Mitigation Measure M-AQ-8 would not reduce impacts to a less-than-significant with certainty, the impact would remain significant and unavoidable after mitigation.

#### One Henry Adams Site

Table 23 on page 283 indicates that the project level individual source threshold of significance for cancer risk (10 in one million) would be exceeded at the One Henry Adams site due to emissions from the I-80 freeway. The cumulative cancer risk threshold of significance of 100 in one million would also be exceeded at the One Henry Adams site. The individual source non-cancer hazard index of 1.0 (acute and chronic) would not be exceeded, nor would the cumulative non-cancer hazard index of 10 (acute and chronic).

Because at least one threshold of TAC impact significance would be exceeded at the One Henry Adams site, the proposed project, or either variant, would have a *significant* operational health risk impact as indicated in the summary statement above, Impact AQ-8: Operational Health Risk – TACs, including PM2.5. Mitigation Measure M-AQ-8, below, would reduce sensitive receptor exposure to TACs. However, because Mitigation Measure M-AQ-8 would not reduce impacts to a less-than-significant level with certainty, the impact would remain *significant and unavoidable with mitigation*.

**MITIGATION MEASURE M-AQ-8 (OPERATIONAL HEALTH RISK – TACs, INCLUDING PM2.5):**

To minimize residents' exposure to TAC-related health risks while indoors, the project sponsor has indicated that the proposed project, or either variant, would install the filtration system as required by DPH with a system whose air intake is located on the roof of the buildings and capable of removing 80 percent of PM2.5. The intake for the filtered air handling systems for the three residential buildings at the 801 Brannan site and two buildings at the One Henry Adams site shall be located to minimize exposure of residents to diesel particulate, TOG and PM2.5. Minimum exposure will be accomplished by placing filters as close as possible to the northern corner of each structure at the 801 Brannan site (Brannan Street side, towards Seventh Street) and as close as possible to the northeast corner of each structure at One Henry Adams (Rhode Island Street side, towards Division Street). Based on the risk calculation results reflecting these locations for air intake, the cumulative cancer risk in at this location would range from 59/million to 96/million, which is 40-63% lower than the maximally exposed individual (MEI) risk of 159/million.

At the One Henry Adams site, the intake for the filtered air handling system will be designed such that it is located as close as possible to the northeast corners of buildings (Rhode Island Street side, towards Division Street). Based on the risk calculation results reflecting these locations for air intake, the cumulative cancer risk in at this location would range from 64/million to 77/million, which is 28-40 percent lower than the MEI risk of 106/million.

However, the mitigation measure would not improve outdoor air quality. The air filtration systems, together with strategic location of air intakes, would reduce the cancer risk for exposure while indoors substantially. When incorporating the implementation of air filtration systems at each site, indoor risks at the 801 Brannan site would decrease to 11.8-19.2/million for cancer after mitigation and at One Henry Adams around 12.7-15.4/million for cancer risk after mitigation. However, health risk impacts under either the proposed project, or either variant, are conservatively judged to remain significant after mitigation.

**Impact C-AQ-9: Operation of the proposed project, or either variant, would expose sensitive receptors to substantial levels of air pollutants from roadway mobile sources and stationary sources, including PM2.5 and other TACs associated with cancer, and non-cancer health risks, which would exceed the BAAQMD cumulative cancer risk threshold of significance of 100 in one million. (Significant and Unavoidable with Mitigation)**

The engine would likely be located in the basement with vents for exhaust and intake being oriented toward the north property line at or above the first floor. Development of the proposed project would introduce additional vehicular traffic in the project vicinity.

## APPROACH TO ANALYSIS

This section discusses the thresholds for determining whether a project would result in a significant air quality impact. Table IV.G.4: Air Quality Significance Thresholds, below, summarizes the air quality thresholds of significance. The table is followed by a discussion of each threshold.

**Table IV.G.4: Air Quality Significance Thresholds**

	Construction Thresholds	Operational Thresholds	
Pollutant	Average Daily Emissions (lb/day)	Average Daily Emissions (lb/day)	Annual Average Emissions (tons/year)
Criteria Air Pollutants			
ROG	54	54	10
NOx	54	54	10
PM <sub>10</sub>	82	82	15
PM <sub>2.5</sub>	54	54	10
CO	Not Applicable	9.0 ppm (8-hour average) or 20.0 ppm (1-hour average)	
Fugitive Dust	Construction Dust Ordinance or other Best Management Practices	Not Applicable	
Health Risks and Hazards for New Sources			
Excess Cancer Risk	10 per one million		
Chronic or Acute Hazard Index	1.0		
Incremental annual average PM <sub>2.5</sub>	0.3 µg/m <sup>3</sup>		
Health Risks and Hazards for Sensitive Receptors (Cumulative from Sources within 1,000-foot zone of influence) and Cumulative Thresholds for New Sources			
Excess Cancer Risk	100 per one million		
Chronic Hazard Index	10.0		
Annual Average PM <sub>2.5</sub>	0.8 µg/m <sup>3</sup>		

Although BAAQMD's adoption of significance thresholds in 2010 and 2011 are the subject of recent judicial actions, the Planning Department has determined that Appendix D of the BAAQMD *CEQA Air Quality Guidelines*,<sup>26</sup> in combination with BAAQMD's *Revised Draft*

<sup>26</sup> BAAQMD *Guidelines*, Appendix D.

**Impact AQ-3: Construction of the proposed project would generate emissions of PM<sub>2.5</sub> and toxic air contaminants, including diesel particulate matter, at levels that would expose sensitive receptors to substantial pollutant concentrations. (*Less than Significant with Mitigation*) (Criterion G.4)**

As discussed above, a proposed project would result in a significant health risk and hazards impact if construction activities would result in the following at the maximally exposed individual sensitive receptor (MEI): excess cancer risk of 10 per million, chronic or acute HI of 1.0, or annual average PM<sub>2.5</sub> concentrations in excess of 0.3 micrograms per cubic meter. Diesel-powered construction equipment generates emissions of PM<sub>2.5</sub> that is by definition diesel particulate matter (DPM), which is identified as a TAC and carcinogen by ARB. Of the pollutants emitted by construction activities, DPM is a primary concern because many toxic compounds adhere to diesel exhaust particles. Diesel fuel use also results in non-cancer hazards due to other TACs that occur in the organic compounds of diesel exhaust. The proposed residential uses would only become occupied after construction is complete. However, existing off-site residential uses would be exposed to construction pollutant emissions. The sensitive receptor locations for the proposed project are presented in Table IV.G.6: Existing and Proposed Sensitive Receptors.

**Table IV.G.6: Existing and Proposed Sensitive Receptors on or near the Project Site**

*Source: Aspen Environmental Group, 706 Mission Street Air Quality Technical Report, February 2012*

The *Air Quality Technical Report* prepared for the proposed project analyzed whether or not construction emissions during the three-year construction period could result in adverse health effects at nearby sensitive receptors. The analysis considered sensitive receptors within the 1,000-foot zone of influence and conservatively assumed the exposed population would be a resident child (see Table IV.G.6). To accomplish this, the cancer risks are weighted by age-sensitivity factors from the state Office of Environmental Health Hazard Assessment (OEHHA) to account for the possible differences in risk associated with a population that is early-in-life during the construction emissions. This analysis weighted the construction cancer risk by a factor of 10, consistent with OEHHA recommendations for exposures that occur from

the third trimester of pregnancy to 2 years of age. Mass emissions of construction-related PM<sub>2.5</sub> in the diesel exhaust from on-site diesel-powered construction equipment were entered into the project-specific ISC dispersion model to estimate ambient concentrations of PM<sub>2.5</sub> for all off-site sensitive receptors (residences and day care). Concentrations of TACs that occur in the diesel exhaust were also estimated, because of their potential to result in non-cancer health hazards. Construction emissions were modeled using average emission rates with adjustment factors to account for higher short-term rates because emissions would vary during the construction period. Emissions would diminish substantially during the final phase of interior and finishing activities. In the refined dispersion model, construction emissions were modeled as volume sources with a release height of 12 feet to correspond with typical equipment tailpipe locations. The offsite receptors were placed at 10-meter intervals with the receptor heights corresponding with the actual lowest upper-floor elevations occupied by residences. Receptors were not placed within areas covered by roadways or other nearby properties unless those properties were occupied by sensitive land uses (as in Table IV.G.6). Other details on source parameters, meteorological parameters, and receptor parameters for the refined modeling and risk calculations are discussed in the *Air Quality Technical Report*.

Table IV.G.7: Summary of Risk and Hazards, Unmitigated Construction Impacts to Sensitive Receptors, shows the results of refined modeling for the proposed construction-phase emissions.

**Table IV.G.7: Summary of Risk and Hazards, Unmitigated Construction Impacts to Sensitive Receptors**

Location	Excess Cancer Risk (per million)	Chronic Non-Cancer Hazard Index	Acute Non-Cancer Hazard Index	Incremental Annual Average PM <sub>2.5</sub> (µg/m <sup>3</sup> )
Existing Resident Child (MEI) - Off-Site Residences	27.3	0.121	0.019	0.1998
Existing Day Care - Off-Site	1.6	0.013	0.002	0.0214
<b>Significance Thresholds</b>	<b>10</b>	<b>1.0</b>	<b>1.0</b>	<b>0.3</b>
<b>Significant?</b>	<b>Yes</b>	<b>No</b>	<b>No</b>	<b>No</b>

Source: Aspen Environmental Group, 706 Mission Street Air Quality Technical Report, February 2012. ISC modeling results.

Unmitigated emissions would result in an excess cancer risk of 27.3 at the project MEI. The compact project site and lack of buffer space between the site boundary and sensitive receptors limit the ability for construction-phase emissions to disperse. The MEI location and the highest pollutant concentrations would occur at the existing residential receptors across Third Street about 100 feet to the northeast. The pollutant concentrations experienced at the nearest day care location, approximately 920 feet to the south, would be substantially lower and would not exceed the thresholds for risk or hazards.

Construction-phase risk and hazards would be dominated by the emissions of DPM and PM<sub>2.5</sub>. Incremental concentrations of PM<sub>2.5</sub> in the ambient air from construction-phase activity would not exceed the project-level threshold for community risk from PM<sub>2.5</sub> (0.3 µg/m<sup>3</sup>). However, maximum excess lifetime cancer risk would be 27.3 per one million at the nearest sensitive receptors, which exceeds the project-level threshold (10 per million). The non-cancer hazards would be below the hazard thresholds and minor in comparison to the potential cancer risk. Mitigation would be required to address the increased cancer risk from DPM.

Construction-phase cancer risk and PM<sub>2.5</sub> concentrations could be substantially reduced with implementation of feasible mitigation measures to reduce construction-related emissions. Unmitigated construction-phase impacts (Table IV.G.7) could be reduced with aggressive control of diesel construction equipment emissions. Because unmitigated construction-phase cancer risk would exceed the thresholds of significance for the nearest off-site sensitive receptor and because construction-phase cancer risk would be dominated by risk due to exposure to DPM, feasible mitigation would be needed to reduce DPM emissions from the construction equipment used on site (including excavators, cranes, and generators). Construction impacts would need to be reduced by approximately 65 percent from the level shown in Table IV.G.7 to result in an impact that is below the cancer risk threshold. An analysis of possible methods to reduce construction emissions was undertaken, as reported in the *Air Quality Technical Report*. This analysis includes a project-specific review of controlling the proposed construction fleet. For example, certain equipment can be powered primarily by electricity distributed from the grid or by propane fuel, which eliminates DPM emissions from that equipment. Similarly if equipment were to meet Interim Tier 4 diesel engine standards, or were to be retrofitted with a Level 3 Verified Diesel Emissions Control Strategy (VDECS), DPM emissions from that equipment could potentially be reduced by as much as 85 percent, depending on the engine. As part of the *Air Quality Technical Report*,<sup>55</sup> the sponsor coordinated with likely construction equipment fleet owners and operators to determine project-specific levels of feasible emission controls for each type of equipment in the proposed construction fleet. Emission factors reflecting the feasible controls were applied to the inventory of equipment provided by the sponsor to analyze the effectiveness of emissions minimization approaches, and the results of that review are identified as mitigation. Accordingly, Mitigation Measure M-AQ-3: Construction Emissions Minimization, shown below, specifies the necessary and feasible controls required to reduce construction emissions by 65 percent in order to result in less-than-significant impacts to off-site receptors. Table IV.G.8: Summary of Risk and Hazards, Mitigated Construction Impacts to Sensitive Receptors, shows the mitigated construction air quality impact results for risk and hazards with implementation of the Construction Emissions Minimization Plan, delineated below.

---

<sup>55</sup> *Air Quality Technical Report*, pp. 25-26.

<b>Significance Thresholds</b>	<b>10</b>	<b>0.3</b>
<b>Significant?</b>	<b>No</b>	<b>No</b>

*Source:* Aspen Environmental Group, 706 Mission Street Air Quality Technical Report, February 2012. ISC modeling results, with a 65 percent reduction of DPM emissions.

Implementation of Mitigation Measure M-AQ-3 would reduce the estimated cancer risk impacts experienced by off-site receptors to below the project-level threshold of significance.

#### **Mitigation Measure M-AQ-3: Construction Emissions Minimization**

To reduce the potential health risk resulting from project construction activities, the project sponsor shall prepare a Construction Emissions Minimization Plan (included as Appendix G) designed to reduce construction-related diesel particulate matter emissions from off-road construction equipment used at the site by at least 65 percent as compared to the construction equipment list, schedule, and inventory provided by the sponsor on May 27, 2011.<sup>56</sup>

The project sponsor shall include all requirements identified in the Construction Emissions Minimization Plan in contract specifications for the entire duration of construction activities.

The Construction Emissions Minimization Plan shall include the following requirements, which would achieve the required 65 percent reduction in construction period diesel particulate matter emissions:

- Limit idling times by either shutting equipment off when not in use or reducing the maximum idling time to two minutes.
- Prohibit use of diesel generators for electric power because on-site distribution of electricity is available.
- Require construction contractors to use electric or propane powered devices for the following types of equipment:
  - Tower Crane
  - Fork Lifts and Manlifts
  - Portable Welders
  - Concrete Placing Booms
- Require construction contractors to use portable compressors that are either electric powered or powered by gasoline engines or engines compliant with Tier 4 standards.

<sup>56</sup> *Air Quality Technical Report, Attachment A08.*

- Require use of Interim Tier 4 or Tier 4 equipment where such equipment is available and feasible for use. Use of Interim Tier 4 or Tier 4 equipment would be feasible for the following types of equipment:
  - Backhoes
  - Rubber-Tired Dozers
- Require use of Tier 2/Tier 3 equipment retrofitted with ARB Level 3 Verified Diesel Emissions Control System (VDECS, which includes diesel particulate filters). The following types of equipment are identified as candidates for retrofitting with ARB-certified Level 3 VDECS (which are capable of reducing DPM emissions by 85 percent or more), due to their expected operating modes (i.e., fairly constant use at high revolutions per minute):
  - Excavators
  - Concrete Boom Pumps
  - Concrete Trailer Pumps
- Use of Tier 3 equipment for the following types of equipment:
  - Portable Cranes
  - Soil Mix Drill Rigs
  - Soldier Pile Drill Rigs
  - Shoring Drill Rigs

If the foregoing requirements are implemented, no further quantification of emissions shall be required. Alternatively, the project sponsor may elect to substitute alternative measures in the Construction Emissions Minimization Plan for review and approval by the Environmental Review Officer (ERO). Such alternative measures would be subject to demonstrating that the alternative measures would achieve the required 65 percent reduction in construction period diesel particulate matter emissions, including without limitation the following:

- Use of other late-model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, and add-on devices such as particulate filters; and
- Other options as such become available.

The project sponsor shall submit the Construction Emissions Minimization Plan to the ERO for review and approval by an Environmental Planning Air Quality Specialist prior to the commencement of construction activities.

#### Level of Significance with Mitigation

Feasible control strategies to reduce DPM emissions were identified in the *Air Quality Technical Report*.<sup>57</sup> Mitigation Measure M-AQ-3: Construction Emissions Minimization would require on-site construction equipment to be powered primarily by electricity distributed from the grid,

---

<sup>57</sup> *Air Quality Technical Report*, pp. 25-26.

propane fuel, or the lowest-emitting engines found feasible, including engines retrofitted with diesel particulate filters. Use of an alternative fuel like propane, which is a consumer-quality gaseous fuel, would result in some TAC emissions; however, because emissions and health effects from alternative fuel use would be minor compared to the adverse effects of DPM, substantially reducing or eliminating DPM emissions would be the primary risk management strategy. By requiring that the equipment specified in the measure like cranes, excavators, forklifts, backhoes, and pumps avoid diesel fuel use or use the lowest-emitting diesel powered engines available, this construction mitigation measure would avoid 65 percent of the DPM and PM<sub>2.5</sub> emissions that would otherwise occur with a comparable baseline fleet of Tier 2/Tier 3 equipment. The proposed construction fleet, emissions factors for equipment with and without controls, and the effectiveness of these controls for the project-specific construction fleet appear in the *Air Quality Technical Report*.<sup>58</sup>

Implementation of Mitigation Measure M-AQ-3 would result in the maximum feasible emissions reductions, thereby reducing the cancer risk and PM<sub>2.5</sub> concentrations to which sensitive receptors would be exposed. With the mix of diesel-powered construction equipment specified by this measure, the construction air quality impact related to health risks and hazards would be reduced to a less-than-significant level.

#### **Operational Air Quality Impacts**

**Impact AQ-4: Operation of the proposed project would not violate an air quality standard or contribute substantially to an existing or projected air quality violation; nor would it result in a cumulatively considerable net increase of any criteria air pollutant for which the project region is in nonattainment under an applicable ambient air quality standard. (*Less than Significant*) (Criteria G.2 and G.3)**

The potential for project-related operational emissions to violate any air quality standard or contribute substantially to an existing or projected violation is described below.

The emissions increases attributable to operation of the proposed project would be from the total of project-related stationary sources (a diesel-fueled back-up emergency generator engine and natural-gas-fired mechanical systems or boilers), operational vehicle trips generated by onsite project uses, and area sources such as use of natural gas for heating and cooking. Emissions were quantified for operation of the proposed land uses using URBEMIS, which provides average daily and annual emission rates based on the expected vehicle trip generation rates and overall land use characteristics. Project-specific details are shown in the *Air Quality Technical Report*.

---

<sup>58</sup> *Air Quality Technical Report*, Attachment A08.

Project-related stationary source emissions are based upon the following regulatory requirements:

- Back-up emergency generator engine compliant with USEPA Tier 2 emission standards, or higher, and compliant with Airborne Toxic Control Measure (ATCM) and Best Available Control Technology (BACT) in compliance with current regulations.
- Natural gas-fired mechanical systems compliant with BAAQMD Regulation 9, Rule 7 and BACT.

Total criteria pollutant emissions from the anticipated operation-related sources are quantified in Table IV.G.9: Operation-Related Daily Emissions of Criteria Air Pollutants, and Table IV.G.10: Operation-Related Annual Emissions of Criteria Air Pollutants. These tables show that the criteria air pollutant emissions would be below the applicable significance thresholds.

**Table IV.G.9: Operation-Related Daily Emissions of Criteria Air Pollutants (lb/day)**

Sources	ROG	NOx	Exhaust PM <sub>10</sub>	Exhaust PM <sub>2.5</sub>

*Source:* Aspen Environmental Group, 706 Mission Street Air Quality Technical Report, February 2012. URBEMIS results and supporting calculations.

Emissions from traffic at congested intersections can, under certain circumstances, cause a localized build-up of CO concentrations. However, the proposed project would be consistent with an applicable congestion management program established by the county congestion management agency for designated roads or highways, regional transportation plan, and local congestion management agency plans. The project traffic from the proposed project would not increase traffic volumes at affected intersections to more than 44,000 vehicles per hour. Nor would project traffic from the proposed project increase traffic volumes at affected intersections to more than 24,000 vehicles per hour where vertical and/or horizontal mixing is substantially limited (e.g., tunnel, parking garage, bridge underpass, natural or urban street canyon, below-grade roadway). Because these criteria would be met for the proposed project, there would be no violation of ambient air quality standards with respect to localized CO. Therefore, no further analysis would be required, and there would be no significant impact related to CO concentrations.

The unmitigated criteria air pollutant emissions during the operational phase would be below the thresholds of significance. Project operational criteria air pollutant emissions that are at levels below the applicable thresholds would not violate an existing ambient air quality standard, contribute substantially to an existing or projected air quality violation, or result in a cumulatively considerable net increase in emissions of any criteria air pollutant. Therefore, effects related to operational criteria air pollutant emissions would be less than significant, and no mitigation measures are necessary.

**Impact AQ-5: Operation of the proposed project would not generate emissions of PM<sub>2.5</sub> and toxic air contaminants, including diesel particulate matter, at levels that would expose sensitive receptors to substantial pollutant concentrations. (*Less than Significant*) (Criterion G.4)**

The proposed project would introduce new stationary sources to the project vicinity, including a diesel-fueled compression-ignition internal combustion engine for use as a back-up generator. Table IV.G.11: Summary of Risk and Hazards, Proposed Project New Sources, shows the results of refined modeling for the proposed new back-up generator engine. Impacts from the back-up generator were analyzed with the project-specific air dispersion modeling and risk assessment using the ISC3-Prime dispersion model. Both proposed on-site and existing off-site receptors (residences and day care) were included in the modeling and risk calculations. For on-site and off-site receptors, the analysis conservatively assumed that the exposed population would begin as a resident child and experience continuous lifetime (70-year) exposure to operational emissions. To accomplish this, the cancer risks were weighted by age-sensitivity factors from the state OEHHA for infants, children through 15 years of age, and adults aged to 70 years. The refined dispersion modeling considered the worst-case emissions release parameters with a horizontal engine exhaust outlet near ground level to correspond with typical equipment tailpipe locations for the backup generator. Other details on source parameters, meteorological

parameters, and receptor parameters for the refined modeling and risk calculations are discussed in the *Air Quality Technical Report*.

The proposed project would also add natural gas-fired systems for heating, ventilation, and hot water, but the natural gas-fired systems would be “minor, low-impact sources” and unlikely to pose a significant community risk or hazard or adverse health impact.<sup>59</sup> In addition, there would be some incremental risk associated with emissions from project-related traffic. However, project trip generation rates would be less than 1,200 vehicle trips per day, and because this level of traffic would be well below 10,000 vehicles per day (the level for a “minor, low-impact” road, according to BAAQMD),<sup>60</sup> project traffic would not substantially contribute to incremental risk.

The location of the MEI for the proposed back-up generator engine would be a new project resident on the fourth floor of the north side of the project site, the lowest elevation where outdoor air could be drawn into residences. The maximum excess lifetime cancer risk due to this individual source would be 5.6 per one million. Other existing offsite residential receptors in the project area would be further from the proposed source so that risk and hazards would be lower than those shown in Table IV.G.11. Compared with the proposed new back-up generator engine, negligible contributions to incremental risk would occur with the proposed “minor, low-impact” natural-gas-fired systems and project traffic on surrounding roadways. No existing or proposed receptors would experience increased cancer risk or hazards exceeding the significance threshold for new sources, and the threshold for incremental PM<sub>2.5</sub> concentrations would not be exceeded at any receptor. Because the proposed new back-up generator engine, proposed “minor, low-impact sources,” and project traffic would not cause potentially significant levels of increased cancer

<sup>59</sup> BAAQMD, *Recommended Methods for Screening and Modeling Local Risks and Hazards*, May 2011, (hereinafter referred to as “BAAQMD, *Recommended Methods*”). <sup>60</sup> BAAQMD, *Recommended Methods*, p. 12, p. 84.

risk, hazards, or PM<sub>2.5</sub> concentrations, this impact would be less than significant, and no mitigation measures are necessary.

**Impact AQ-6: Operation of the proposed project would not expose new on-site sensitive receptors to substantial pollutant concentrations. (Less than Significant) (Criterion G.4)**

The proposed project would introduce new residential receptors to an area affected by emissions from various existing permitted stationary sources, major roadways, and the new proposed back-up generator. In addition to the proposed generator engine, on-site sensitive receptors (residences) would be exposed to TACs emitted by the existing stationary sources and traffic on the roadways. As discussed in the “Approach to Analysis” on p. IV.G.25, the analysis for new receptors exposed to health risks and hazards considers all potential sources of TACs within a 1,000-foot zone of influence that may pose a significant health risk, and therefore represents a cumulative impact to new sensitive receptors.<sup>61</sup>

BAAQMD records indicate that there are 24 existing BAAQMD-permitted stationary sources of air pollutants within or near the recommended 1,000-foot radius; these are shown in Table IV.G.12: Stationary Emission Sources Within or Near a 1,000-Foot Radius of the Project Site, and in Figure IV.G.1, p. IV.G.12.

The permitted facilities in the vicinity are made up of stationary diesel engines for back-up power generators or fire water pump engines, that are for emergency use only, with some additional permitted natural gas-fired (non-diesel) heating systems. Each facility with a stationary diesel engine was included in the refined modeling as a point source of PM<sub>2.5</sub>, DPM, and other contaminants. Because the BAAQMD considers non-diesel-fueled sources to be “minor, low-impact” and unlikely to pose a significant health impact,<sup>62</sup> only facilities with diesel-fueled sources were modeled as stationary sources. Field observations and aerial photos were used to determine the height of the emitting sources for modeling with exhaust points on roof tiers or mezzanine levels, and emission rates were provided by the BAAQMD inventory. Each of the existing facilities with diesel sources was analyzed for the potential to cause health risks and hazards for new receptors.

---

<sup>61</sup> As used in this discussion, “cumulative” means the accumulation of multiple sources of emissions on new sensitive receptors at the project site, rather than the cumulative impact of past, present, and reasonably foreseeable future projects as the term “cumulative impacts” is explained in CEQA Guidelines Sections 15065(a)(3) and 15130.

Motor vehicle traffic flows on arterial streets in the existing local roadway system are modeled as sources of PM<sub>2.5</sub>, DPM, and other TACs. The major roadways that may contribute to elevated concentrations of pollutants in the vicinity are the 10 nearby streets that have at least 10,000 vehicles in annual average daily traffic, as identified in Table IV.G.13: Major Roadways Within a 1,000-Foot Radius of the Project Site. In the refined modeling, all mobile sources on each roadway were grouped into adjacent volume sources within the public right-of-way for each street in the vicinity, and emission rates were based on San Francisco County fleet-wide average emissions per vehicle-mile-traveled within each segment. The emission rates for each stationary source and traffic on each major roadway, along with details of the source release parameters, meteorological parameters, and receptor parameters are discussed in the *Air Quality Technical*

Second Street	22,400

*Source:* Roadway Segment Volumes, San Francisco County Transportation Authority CHAMP Model data provided by Planning Department as of 3/2/2011

*Report.* All segments of the 10 major roadways within 1,000 feet of the project site were analyzed for the potential to cause health risks and hazards for new receptors.

The project would result in negligible contributions to incremental risk with the proposed “minor, low-impact” natural-gas-fired systems, and from the addition of project traffic on surrounding roadways. Therefore, these sources are not considered further in this analysis, as explained in Impact AQ-5 on pp. IV.G.38-IV.G.40.

The proposed project would include emissions from a new stationary source, the proposed back-up generator. As discussed under Impact AQ-5, the maximum excess lifetime cancer risk for new residents due to this individual source would be 5.6 in one million. The health risks and hazards found for the proposed back-up generator (Impact AQ-5) were included in this evaluation of risks and hazards for new receptors.

The individual contributions of each of the existing sources and roadways, along with the proposed back-up generator, were added together to arrive at the total health risks and hazards for the proposed new receptors, and these results were compared with the cumulative thresholds for new receptors in Table IV.G.4, p. IV.G.20. To determine whether proposed on-site residences would be exposed to substantial pollutant concentrations the analysis considers exposure from all of the existing and proposed sources that may pose a significant risk or hazard within the 1,000-foot zone of influence for the project site.

Table IV.G.14: Summary of Risk and Hazards, Proposed Project New Receptors, shows the results of refined modeling for sources potentially affecting the proposed new receptors. Table IV.G.14 shows that the existing and proposed sources would not expose the proposed new receptors to substantial pollutant concentrations of PM<sub>2.5</sub> or TACs because new receptors would

experience excess cancer risk less than 100 per one million; a chronic non-cancer HI of less than 10.0; and an incremental PM<sub>2.5</sub> concentrations less than 0.8 µg/m<sup>3</sup>. Therefore, the impact would be less than significant, and no mitigation measures are necessary.

**Impact AQ-7: Construction and operation of the proposed project would not conflict with or obstruct implementation of the Bay Area 2010 Clean Air Plan (CAP), the applicable air quality plan. (*Less than Significant*) (Criterion G.1)**

The most recently adopted air quality plan for the San Francisco Bay Area Air Basin is the *2010 Clean Air Plan*. The *2010 Clean Air Plan* is a road map showing how the San Francisco Bay Area will achieve compliance with the state ozone standards as expeditiously as practicable and how the region will reduce transport of ozone and ozone precursors to neighboring air basins. In determining consistency with the *2010 Clean Air Plan*, this analysis considers whether the project would (1) support the primary goals of the CAP, (2) include applicable control measures from the CAP, and (3) avoid disrupting or hindering implementation of control measures identified in the CAP.

The primary goals of the *2010 Clean Air Plan* are to attain air quality standards, reduce pollutant exposure and protect public health, and reduce greenhouse gas (GHG) emissions. The discussion of project GHG emissions appears in Section IV.H, which demonstrates that the proposed project would comply with the applicable provisions of the City's Greenhouse Gas Reduction Strategy.

The proposed project would be a high-density mixed-use infill development in a transit-oriented area that would intensify the density of land uses on the site. Development of the proposed project would generate emissions during construction (see Table IV.G.5, p. IV.G.29) and would cause an increase in emissions from mobile sources due to motor vehicle trips and from other sources (area sources and the proposed stationary sources) during the operation of the project (see Table IV.G.9 and Table IV.G.10, p. IV.G.37); as shown above, the emission increases would not exceed the applicable significance thresholds.

The analysis above illustrates that neither project construction nor operation would contribute substantial levels of emissions, and that project-related emissions would not be likely to impede attainment of the air quality standards. As the proposed project would not result in substantial, long-term increases in criteria air pollutants, the proposed project would support the primary goal of the *2010 Clean Air Plan* to attain the air quality standards.

Project sources could increase exposure of sensitive receptors to pollutants that increase public health risks. Diesel-powered construction equipment emissions would increase exposure of sensitive receptors to TACs temporarily during construction, but mitigation identified above would reduce these emissions to the maximum extent feasible and would reduce the impact to be less than significant with mitigation. The incremental exposure of receptors to TACs during

operation would be due to the presence of existing sources, one new stationary source (the proposed back-up generator), area sources, and mobile sources, but these sources would not expose receptors to substantial pollutant concentrations. As the proposed project would not expose receptors to substantial pollutant concentrations, the proposed project would support the primary goal of the *2010 Clean Air Plan* to reduce pollutant exposure and protect public health.

In summary, as the proposed project would not result in substantial, long-term increases in criteria air pollutants, TAC, or GHG emissions, the proposed project would be considered to support the primary goals of the *2010 Clean Air Plan*.

To meet the primary goals, the CAP recommends specific control measures and actions. These control measures are grouped into various categories and include stationary and area source measures, mobile source measures, transportation control measures, land use measures, and energy and climate measures. The CAP recognizes that to a great extent, community design dictates individual travel mode and that a key long-term control strategy to reduce emissions of criteria pollutants, air toxics, and GHGs from motor vehicles is to channel future Bay Area growth into vibrant urban communities where goods and services are close at hand, and people have a range of viable transportation options. To this end, the *2010 Clean Air Plan* includes 55 control measures aimed at reducing air pollution in the SFBAAB.

The measures most applicable to the proposed project are transportation control measures and energy and climate control measures. The proposed project would be consistent with energy and climate control measures as discussed in Section IV.H, Greenhouse Gas Emissions, which demonstrates that the proposed project would comply with the applicable provisions of the City's Greenhouse Gas Reduction Strategy.

The compact development of the proposed project and high availability of viable transportation options ensure that visitors could bicycle, walk, and ride transit to and from the project site instead of taking trips via private automobile. These features ensure that the project would avoid substantial growth in transportation demand of automobile trips and vehicle miles traveled. The proposed project would require an amendment to the Planning Code Zoning Map to increase the height limit at the project site, and the project would be generally consistent with the *San Francisco General Plan* as discussed in Chapter III, Plans and Policies. Transportation control measures that are identified in the *2010 Clean Air Plan* are implemented by the *San Francisco General Plan* and the Planning Code, for example, through the City's Transit First Policy, bicycle parking requirements, and transit impact development fees applicable to the proposed project. By complying with these applicable requirements, the project would include relevant transportation control measures specified by the *2010 Clean Air Plan*.

Examples of a project that could cause the disruption or delay of CAP control measures are projects that would preclude the extension of a transit line or bike path, or projects that propose excessive parking beyond parking requirements. The proposed project would add residential and other uses to a dense, walkable urban area near a concentration of regional and local transit service, services and other attractions. It would not preclude the extension of a transit line or a bike path or any other transit improvement, and as such, the proposed project would avoid disrupting or hindering implementation of control measures identified in the CAP.

For the reasons described above, the proposed project would not interfere with implementation of the *2010 Clean Air Plan*, and because the proposed project would be consistent with the air quality plan that shows how the region will improve ambient air quality and achieve the state and federal ambient air quality standards, this impact would be less than significant. No mitigation measures are necessary.

**Impact AQ-8: Construction and operation of the proposed project would not expose a substantial number of people to objectionable odors. (*Less than Significant*) (Criterion G.5)**

No notable odor sources would occur as part of the proposed project. There may be some potential for small-scale, localized odor issues to emerge as a result of construction activities or sources common to the proposed residential and commercial uses, such as solid waste collection or food preparation, etc. However, substantial odor sources and consequent effects to on-site and off-site sensitive receptors would be unlikely. Exposure to odors would be significant if sensitive receptors would be introduced to a location with more than five confirmed complaints per year averaged over three years. Because no confirmed odor complaints have occurred near the project site in the previous three years reported by BAAQMD, this impact would be less than significant, and no mitigation measures are necessary.

## **CUMULATIVE IMPACT EVALUATION**

As discussed above, regional air pollution is by its very nature largely a cumulative impact. Emissions from past, present and future projects contribute to the region's adverse air quality on a cumulative basis. No single project by itself would be sufficient in size to result in regional nonattainment of ambient air quality standards. Instead, a project's individual emissions contribute to existing cumulative adverse air quality impacts.<sup>63</sup> The project-level thresholds for criteria air pollutants are based on levels by which new sources are not anticipated to contribute to

---

<sup>63</sup> BAAQMD, *California Environmental Quality Act (CEQA) Air Quality Guidelines*, June 2010; and adopted Thresholds of Significance, June 2010, p. 2-1. Available online at <http://www.baaqmd.gov/Divisions/Planning-and-Research/CEQA-GUIDELINES/Updated-CEQA-Guidelines.aspx>. Accessed April 18, 2012.

an air quality violation or result in a considerable net increase in criteria air pollutants. Therefore, because the proposed project's construction (Impact AQ-1) and operational (Impact AQ-4) emissions would not exceed the project-level thresholds for criteria air pollutants, the proposed project would not be considered to result in a cumulatively considerable contribution to regional air quality impacts.

**Impact C-AQ-1: Construction and operation of the proposed project, in combination with other past, present, and reasonably foreseeable future projects, would not result in a cumulatively considerable contribution to exposure of sensitive receptors to significant cumulative substantial pollutant concentrations. (*Less than Significant*) (Criterion G.4)**

The cumulative air quality impact analysis for health risks and hazards considers all potential sources of TACs within a 1,000-foot zone of influence that may pose a significant health risk to sensitive receptors. The methodology and assumptions used for assessing construction and operational health risks and hazards are described above (under Impact AQ-3, Impact AQ-5, and Impact AQ-6), with additional details provided in the *Air Quality Technical Report* prepared for the proposed project.<sup>64</sup>

The proposed project's construction activities would contribute to cumulative health risks and hazards at the construction MEI. To determine the maximum potential cumulative risks and hazards during construction, the effects at the MEI for construction were added to the effects at the on-site project MEI for existing permitted sources and major roadways. This conservatively over-estimates the cumulative risk because the increased risk and hazards experience by the on-site MEI would be greater than those at the construction MEI. Cumulative sources, in addition to project construction activities, include the contribution from roadways with greater than 10,000 vehicles per day, construction of other projects, and permitted stationary sources, as well as project-generated emissions. Combining unmitigated emissions from construction, permitted sources, and roadways results in an estimated cumulative cancer risk of 77.8 in one million, less than the cumulative significance threshold of 100 in one million. The cumulative chronic Hazard Index would be less than 0.3, below the significance threshold of 10. The cumulative incremental annual average PM<sub>2.5</sub> concentration would be 0.55 micrograms per cubic meter, less than the significance threshold of 0.8 micrograms per cubic meter.

Furthermore, the proposed project would be required to implement Mitigation Measure M-AQ-3, which would reduce construction emissions by approximately 65 percent. This mitigation measure is based on strategies developed by the project sponsor to control diesel construction equipment emissions and was determined to be feasible based on information obtained by the project sponsor from likely construction equipment fleet owners and operators. Therefore,

---

<sup>64</sup> *Air Quality Technical Report*, pp. 16-24.

cumulative health risks and hazards would be further reduced, and incorporation of Mitigation Measure M-AQ-3 would result in an estimated cumulative cancer risk of 60.2 in one million, less than the cumulative significance threshold of 100 in one million. The cumulative chronic Hazard Index would be less than 0.3, well below the significance threshold of 10. The annual average PM<sub>2.5</sub> concentration would be 0.42 micrograms per cubic meter, less than the cumulative significance threshold of 0.8 micrograms per cubic meter.

To determine cumulative construction-phase impacts, the effects of project construction were combined with the impacts of the construction of reasonably foreseeable nearby development projects, where information about construction emissions from these projects exists or can be estimated. Reasonably foreseeable projects for purposes of the cumulative construction-phase air quality analysis are those that have filed formal applications or have construction schedules that may overlap with construction of the proposed project. The construction MEI at existing residential receptors about 100 feet to the northeast of the project site would be far enough away from most other nearby construction activities such that they would not be exposed cumulative impacts from the other construction; however, the two construction projects nearest the MEI, the Palace Hotel Project (2 New Montgomery Street) and SFMOMA Expansion (151 Third Street), could contribute to cumulative risks and hazards. These nearby construction activities are further discussed below.<sup>65</sup>

The pollutants generated during construction of the Palace Hotel Project and SFMOMA Expansion projects would contribute to temporarily increased concentrations of air pollutants and adverse impacts on ambient air quality, concurrent with those of the proposed project if construction occurs at the same time. The results assume concurrent construction of the proposed project and these other two projects. This is a conservative assumption because the projects have different development schedules and concurrent construction may not occur.

Table IV.G.15: Summary of Cumulative Health Risk and Hazards, below, shows the result of modeling for cumulative sources, for a child resident at the construction MEI (see also Table IV.G.7, p. IV.G.32, and Table IV.G.8, p. IV.G.34). In conjunction with the impacts of construction of reasonably foreseeable nearby development projects and other stationary and mobile sources in the area (from Table IV.G.11, p. IV.G.39), project construction would contribute to temporarily increased concentrations of air pollutants and adverse impacts on ambient air

---

<sup>65</sup> Two other construction projects that would be within the BAAQMD “minimum offset distance” are the interior renovation of an existing building at 134-140 New Montgomery Street and the underground construction of the Central Subway Project along Fourth Street. As explained in the *Air Quality Technical Report* (pp. 30-31), these projects would not be likely to contribute substantially to cumulative construction-related air quality impacts.

**Table IV.G.15: Summary of Cumulative Health Risk and Hazards**

quality but would not exceed the cumulative thresholds for risk and hazards for the construction MEI.

Cumulative construction-phase risk and hazards would not exceed the cumulative thresholds, and therefore would not be cumulatively considerable. Although no mitigation measures are necessary for reducing cumulative construction-phase risk and hazards, the cumulative construction-phase impact would be further reduced with implementation of Mitigation Measure M-AQ-3 identified above for project construction emissions (Impact AQ-3).

Sensitive receptors would be exposed to air pollutant concentrations from the new sources related to operation of the proposed project, including the proposed back-up diesel engine and project-related traffic, plus sources that are reasonably foreseeable, along with existing sources including major roadways. To determine the maximum potential cumulative risks and hazards during operation, the effects of these new and existing sources at the project on-site MEI were added together. The currently proposed Palace Hotel Project could include additional emergency generators, but without a specific proposal, it would be speculative to assume the presence of any new or modified stationary sources. As such, existing sources were modeled (with results in Table IV.G.14, p. IV.G.43). Any new or modified stationary source associated with the Palace Hotel Project (or any other project) would be subject to BAAQMD permitting requirements, which would require a pre-construction review of toxic air contaminant impacts and would

require the source to minimize and avoid substantial health risks. Table IV.G.15 shows the result of refined modeling for foreseeable cumulative sources as they would affect the MEI receptors. Impacts from the project sources, including the on-site back-up generator, combined with other permitted sources and roadways results in an estimated cumulative cancer risk of 35.7 in one million, less than the cumulative significance threshold of 100 in one million. The cumulative chronic Hazard Index would be 0.04, below the significance threshold of 10. The cumulative incremental annual average  $PM_{2.5}$  concentration would be  $0.256 \mu g/m^3$ , less than the significance threshold of  $0.8 \mu g/m^3$ .

The combined effects of the sources would not expose sensitive receptors to an increased cancer risk above the significance threshold for cumulative risk, and receptors would not be exposed to incremental  $PM_{2.5}$  concentrations in excess of the cumulative-level  $PM_{2.5}$  threshold. The chronic non-cancer hazard would be minor in comparison to the potential cancer risk. Because sensitive receptors would not be exposed to increased cancer risk, hazards, or  $PM_{2.5}$  concentrations from nearby major roadways and stationary sources at levels exceeding the significance thresholds for cumulative impacts, the proposed project's contribution to significant impacts would not be cumulatively considerable, and no mitigation measures are necessary.

# EXHIBIT 4

## Environmental Health

### Article 38 of the San Francisco Health Code

Scientific studies consistently show an association between exposure to air pollution and significant human health problems. In 2008, San Francisco Health Code (HC) Article 38 was adopted to require new residential construction projects located in areas where models show poor air quality and pollution from roadways must install enhanced ventilation to protect residents from the respiratory, heart, and other health effects of living in a poor air quality area. The law was updated in 2014 to improve consistency with CEQA and streamline implementation.

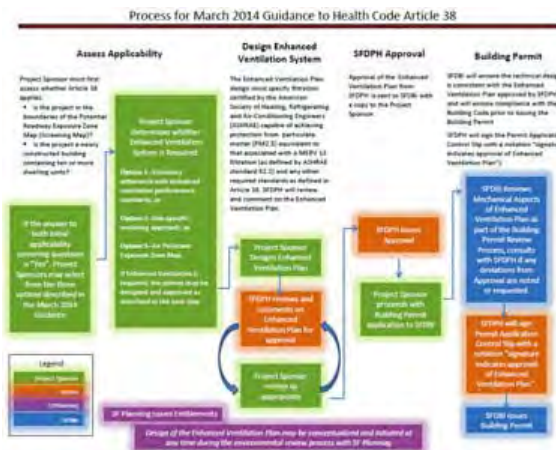

The 2014 amendments included revisions to the underlying map of the city's Air Pollution Exposure Zone--the end result of a collaborative effort with the Bay Area Air Quality Management District. The amendments codify the implementation strategy that was formalized in July 2013, when the Air Quality Program began providing several options for determining compliance with Article 38, described in our **Guidance for Project Sponsors**. New rules and regulations consistent with the 2014 amendments will be forthcoming.

Article 38 states that those buildings requiring enhanced ventilation "design a system capable of achieving the protection from particulate matter (PM<sub>2.5</sub>) equivalent to that associated with MERV 13 filtration (as defined by ASHRAE standard 52.2)". Building engineers and designers may choose the ventilation design that works best for their setting, as exemplified by **some of these examples of enhanced ventilation designs that comply with the requirements of Article 38**.

Project sponsors may refer to the **Air Pollutant Exposure Zone Map\*** to determine whether their project will be required to install enhanced ventilation.

Projects located within the Air Pollutant Exposure Zone must first **submit an application** to DPH prior to or at the beginning of the CEQA entitlement process with SF Planning.

The Ventilation Plan demonstrating compliance with Article 38 must be submitted to DPH for approval prior to submittal of plans to DBI for Mechanical Permit approval. Ventilation plans should include specific information as detailed in the guidance and should include: (1) Project location (address and parcel number); (2) Map of project including all surrounding streets within 500 feet; (3) Name of assigned planner to the project from the Planning Department; and (4) The **appropriate fee** in the form of a check payable to the San Francisco Environmental Health Section. Mail all requests to: Article 38 Air Quality Assessment Manager, 1390 Market Street, Suite 210, San Francisco, CA 94102.

For buildings subject to the requirements of Article 38, enhanced ventilation must be provided to all units in a building, even those on the upper floors, as there is **compelling evidence that outdoor air quality at higher elevations is not consistently improved over air quality at street level**. In addition, a purpose of the local law is to align with CEQA mitigation requirements for new residential and sensitive uses in poor air quality areas.

\*Air Pollutant Exposure Zone information may also be found by visiting the Planning Department's **Property Information Page**; if Article 38 is applicable, an entry stating that will appear at the end of the list under "Other Information" on the "Zoning" tab as shown below:

### SEC. 3801. SHORT TITLE.

This Article shall be entitled Enhanced Ventilation Required for Urban Infill Sensitive Use Developments.

(Added by Ord. 281-08, File No. 080934, 12/5/2008; amended by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

---

### SEC. 3802. FINDINGS.

- (a) Scientific studies show that exposure to particulate matter from air pollution leads to significant human health problems, including: aggravated asthma; chronic bronchitis; reduced lung function; irregular heartbeat; heart attack; and premature death in people with heart or lung disease. Exposure to air pollutants that are carcinogens can also have significant human health consequences. For example, exposure to diesel exhaust is an established cause of lung cancer.
- (b) Heart disease and stroke are the first and fourth leading causes of death in the U.S. respectively. Air pollution affects heart health and can trigger or contribute to heart attacks and strokes. One in three Americans has heart or blood vessel disease and is at higher risk from air pollution. Impacts on the lungs may take several forms. Short-term effects include deficits in lung function that can limit breathing, especially during exercise. Irritants from air pollution may cause airway constriction or chest tightening that is uncomfortable or limiting to normal activity. These changes in lung function are sometimes accompanied by underlying lung tissue inflammation which over the long term may lead to chronic lung disease. Exposure to air pollutants may be a contributing factor to leading causes of death recorded for San Francisco's population (ischemic heart disease; lung, bronchus and tracheal cancers; cerebrovascular disease; chronic obstructive pulmonary disease; hypertensive heart disease and lower respiratory infection).
- (c) Persons living in close proximity to air pollution sources, such as freeways or busy roadways, have poorer lung functions and are more susceptible to developing asthma and other respiratory problems, compared with persons living at a greater distance from such sources. The California Air Resources Board's 2005 Land Use Guidance document, "Air Quality and Land Use Handbook: A Community Health Perspective," reviewed traffic-related air pollution studies and found that particulate matter pollution levels decrease by about 70 percent at 500 feet from freeways and high-traffic roadways, defined as urban roads with 100,000 vehicles/day or rural roads with 50,000 vehicles/day.
- (d) Proximity to sources of air pollution increases exposure, and proximity to sources is established to be more common for the poor and for certain ethnic minorities.
- (e) Consequently, health vulnerability varies among neighborhoods and populations within San Francisco, as measured by population health records of air pollution-associated hospital discharges and emergency room visits, and non-accident mortality. Health vulnerable populations are likely to have more significant health consequences from air pollutant exposure compared to populations that are less vulnerable.
- (f) Existing regulatory control measures, often focused on new stationary sources of emissions and average regional air pollution concentrations, are not sufficient to address all local sources of exposure or disparities in exposure.
- (g) "Sensitive Use" buildings have the highest proportion of individuals who are most vulnerable to air pollutant exposures.
- (h) Available technologies exist to protect sensitive uses from air pollution health effects. Available and accepted air pollution modeling technology allows for the estimation of certain air pollutant concentrations for individual land parcels. Furthermore, available building ventilation and engineering technologies provide mechanisms to protect indoor environments from the infiltration of ambient air pollutants.

(Added by Ord. 281-08, File No. 080934, 12/5/2008; amended by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

## **SEC. 3803. PURPOSES AND GOALS.**

(a) The purpose of this Article 38 is to protect the public health and welfare by establishing an Air Pollutant Exposure Zone and imposing an enhanced ventilation requirement for all urban infill sensitive use development within the Air Pollutant Exposure Zone.

(b) The goals of this Article 38 are to maintain and increase the stock of infill housing and other sensitive use development in the City while reducing the risk to human health from air pollutants among occupants of, and visitors to, buildings in the Air Pollutant Exposure Zone.

(Added by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

(Former Sec. 3803 redesignated as Sec. 3804 and amended by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

---

## **SEC. 3804. DEFINITIONS.**

For the purposes of this Article 38, the following words shall have the following meanings:

"Air Pollutant Exposure Zone" means those areas within the City which, by virtue of their proximity to air pollution emissions sources, including Freeways, have substantially greater concentrations of air pollutants. The Air Pollutant Exposure Zone shall be modeled according to specific risk factors defined in the Rules and Regulations, and will include at a minimum, criteria for maximum allowed excess cancer risks and maximum PM<sub>2.5</sub> concentrations; these criteria shall be more stringent in Health Vulnerable Locations, as defined below.

"Building" means a building that contains a "Sensitive Use" and that is either:

- (1) a new building; or
- (2) a building undergoing a "Major Alteration to Existing Building" as defined by the San Francisco Green Building Code; or
- (3) a building undergoing a Planning Department permitted change of use.

"City" means the City and County of San Francisco.

"Department" means the San Francisco Department of Public Health.

"Director" means the Director of the San Francisco Department of Public Health or the Director's designee.

"Enhanced Ventilation" means a ventilation system capable of achieving the protection from particulate matter (PM<sub>2.5</sub>) equivalent to that associated with a Minimum Efficiency Reporting Value (MERV) 13 filtration (as defined by American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) standard 52.2).

"Freeway" refers to freeways as defined in the San Francisco General Plan, Transportation Element.

"Health Vulnerable Locations" means those San Francisco zip codes, census tracts or other defined locations having the highest percentage of health vulnerable residents, based on criteria such as State discharge data from respiratory and cardiovascular related hospitalizations, non-accident mortality, or other criteria as determined by the Director and specified in the Rules and Regulations enacted under this Article.

"PM<sub>2.5</sub>" means solid particles and liquid droplets found in the air, that are less than or equal to 2.5 micrometers (µm) in diameter.

"Sensitive Use" means:

(1) any building or facility designed for residential use, including but not limited to those defined by City, state or federal law and regulations, excluding Tourist Hotels;

(2) any facility serving specific populations, including but not limited to California Department of Social Services (CDSS)-licensed Adult Day Care Centers, Adult Support Centers, Child Care Centers, Family Child Care Homes, Infant Care Centers, School-Aged Child Care Centers, and Community Treatment Centers;

(3) any California Department of Education (CDE)-licensed schools;

(4) any California Department of Public Health (CDPH)-licensed Health Care Facilities with 24-hour care, except for CDPH-licensed hospitals, which are subject to specific regulations;

(5) any California Building Code Section 305-defined occupancies of Educational Group E;

(6) any California Building Code Section 308-defined occupancies of Institutional Group I; and

(7) any California Building Code Section 310-defined occupancies of Residential Group R.

"Site" means a parcel of land as defined in the San Francisco Building Code.

(Added as Sec. 3803 by Ord. 281-08, File No. 080934, 12/5/2008; redesignated and amended by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

(Former Sec. 3804 redesignated as Sec. 3805 and amended by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

---

## **SEC. 3805. APPLICABILITY OF ARTICLE.**

This Article 38 shall apply to Sensitive Use buildings located on a site identified as within the Air Pollutant Exposure Zone that are either:

(a) Newly constructed; or

(b) Undergoing a "Major Alteration to Existing Building" as defined by the San Francisco Green Building Code; or

(c) The subject of an application for a Planning Department-permitted Change of Use.

(Added as Sec. 3804 by Ord. 281-08, File No. 080934, 12/5/2008; redesignated and amended by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

(Former Sec. 3805 redesignated as Sec. 3806 and amended by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

---

## **SEC. 3806. AIR POLLUTANT EXPOSURE ZONE AND AIR POLLUTANT EXPOSURE ZONE MAP.**

(a) The Director shall create an Air Pollutant Exposure Zone Map according to Rules and Regulations as authorized by Section 3809. The Air Pollutant Exposure Zone Map shall depict all locations in the City where the estimated cumulative PM<sub>2.5</sub> concentration is greater than 10 µg/m<sup>3</sup> or where the estimated cumulative excess risk of cancer from air pollutants resulting from lifetime (70 year) exposure is greater than 100 in a million. Additionally, the Air Pollutant Exposure Zone Map shall include all locations within 500 feet of any Freeway, if those locations were not otherwise captured by modeling estimates. Within Health Vulnerable Locations, the Air Pollutant Exposure Zone Map shall depict all locations where the estimated cumulative PM<sub>2.5</sub> concentration is greater than 9 µg/m<sup>3</sup> or where the estimated cumulative excess risk of cancer from air pollutants resulting from lifetime (70 year) exposure is greater than 90 in a million. The Director shall update the Air Pollutant Exposure Zone Map to identify new sources, updated pollutant standards, additional pollutants and standards for those pollutants, and updated methodologies in accordance with Section 3809 and the accompanying Rules and Regulations for this Article 38.

(b) The Director shall, at least once every five years, update the Rules and Regulations governing creation of the Air Pollutant Exposure Zone Map to account for changes in information including, but not limited, to:

- (1) Information available to estimate air pollutants of health concern;
- (2) Information available to determine Health Vulnerable Locations; and
- (3) Information that may affect delineation of the Air Pollutant Exposure Zone, including, but not limited to:
  - (A) Construction, expansion or modification of major roadways;
  - (B) Changes in traffic patterns in the City's roadway system;
  - (C) Changes in area sources or siting of industrial or commercial sources of air pollution; and
  - (D) Climatic factors for which there is evidence of changes to air quality.

(c) The Director shall post the Air Pollutant Exposure Zone Map on the Department's website, and make paper copies of the map available to the public upon request.

(d) In creating and updating the Air Pollutant Exposure Zone Map, the Director shall follow the procedures specified in Section

3809.

(e) The Air Pollutant Exposure Zone Map that is operative as of the effective date of Ordinance No. [224-14](#) amending this Article 38, is on file with the Clerk of the Board of Supervisors in File No. 140806.

(Added as Sec. 3805 by Ord. 281-08, File No. 080934, 12/5/2008; redesignated and amended by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

(Former Sec. 3806 added by Ord. 281-08, File No. 080934, 12/5/2008; repealed by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

---

## **SEC. 3807. ENHANCED VENTILATION REQUIREMENT.**

(a) Any person or entity to whom this Article 38 applies, as defined in Section 3805, shall submit to the Director an Enhanced Ventilation Proposal, prepared by, or under the supervision of, a licensed mechanical engineer or other individual authorized by the California Business and Professions Code Sections 6700-6799 (Professional Engineers Act) to design mechanical ventilation systems that meet the requirements of this Article 38 and San Francisco Building Code Section 1203.5. An Enhanced Ventilation Proposal shall include the name, title and license number of the person submitting such proposal.

(b) The Enhanced Ventilation Proposal shall explain how the project will achieve the standards mandated by this Article 38 and accompanying the Rules and Regulations as described and updated according to Section 3809, San Francisco Building Code Section 1203.5, and any relevant amendments or revisions thereto. The Enhanced Ventilation Proposal shall include a statement signed by the person who prepared it, in accordance with the requirements of Section 3807(a), certifying that in his or her judgment the ventilation system proposed will be capable of achieving the protection from particulate matter (PM<sub>2.5</sub>) equivalent to that associated with MERV 13 filtration (as defined by ASHRAE standard 52.2). In updates to the Rules and Regulations, the Director may specify additional or alternative protective equivalents as technology and research dictate.

(c) The Director shall review the Enhanced Ventilation Proposal and may require additional modification or justification prior to the Director's approval. The Director shall issue a letter to the Department of Building Inspection Permit Services Energy/Mechanical Plan Review Section identifying and attaching the letter describing the approved Enhanced Ventilation Proposal.

(d) Building permit documents submitted to the Department of Building Inspection shall incorporate all designs and details necessary for the construction of the approved Enhanced Ventilation system. The Department of Building Inspection shall review submitted plans to assure compliance with the Director-approved Enhanced Ventilation proposal and shall not issue permits for the construction, installation, or modification of the Enhanced Ventilation systems unless it is in compliance with the approved proposal.

(Added by Ord. 281-08, File No. 080934, 12/5/2008; amended by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

---

## **SEC. 3808. MAINTENANCE OF DOCUMENTS BY DEPARTMENT.**

The Enhanced Ventilation Proposal, Certification and related documents shall become part of the file maintained by the Department. Such file shall be available to the public upon request.

(Added by Ord. 281-08, File No. 080934, 12/5/2008; amended by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

## SEC. 3809. RULES AND REGULATIONS.

- (a) Within 90 days after the effective date of Ordinance No. [224-14<sup>1</sup>](#), amending Article 38, the Director shall issue Rules and Regulations necessary to effectuate the purposes of this Article and to protect public health and safety. Any person or entity as defined in Section 3805 shall comply with this Article, the Rules and Regulations, and all applicable local, state, and federal laws.
- (b) The Director shall consult with the Planning Department's Environmental Review Officer at least 30 days prior to initiating any amendments or modifications to the Rules and Regulations.
- (c) The Director shall consult with the Municipal Green Building Task Force, as established in Environment Code Sec. 702, or any successor body, to coordinate and resolve any potential conflicts that may arise between the San Francisco Green Building Code and this Article 38.
- (d) Rules and Regulations shall, at a minimum, meet the following standards and criteria:
- (1) The criteria used for the definition of "Health Vulnerable Locations" shall be at least as health-protective as that of the Bay Area Air Quality Management District (BAAQMD) methodology. BAAQMD methodology defines those zip codes in San Francisco in the worst quintile of Bay Area health vulnerability scores based on two years of statewide hospitalization and emergency room visit records, and estimated costs, for the following air pollution related conditions per zip code: Chronic Obstructive Pulmonary Disease (COPD) Hospital Admissions, Pneumonia Hospital Admissions, Myocardial Infarction (MI, Heart Attack) Hospital Admissions and Emergency Room Visits, Cardiovascular Hospital Admissions (less MI), Asthma Emergency Hospital Admissions and Emergency Room Visits, Asthma Hospital Admissions, Hospital Admissions for Respiratory Diseases, combined with the non-accident mortality rate per zip code. For San Francisco, based on 2009-2011 health records, the zip codes in the worst quintile of Bay Area health vulnerability scores are 94102, 94103, 94105, 94124, and 94130. In updates to the Rules and Regulations, the Director may modify the methodology to identify Health Vulnerable Locations as required to ensure the Air Pollutant Exposure Zone Map is consistent with current scientific evidence.
  - (2) The criteria for creating and updating the Air Pollutant Exposure Zone Map and the models underlying this map shall include, but not be limited to:
    - (A) Identification of parcels with lifetime excess cancer risk due to air pollution greater than 100 cases per million population.
    - (B) Identification of parcels in Health Vulnerable Locations with lifetime excess cancer risk due to air pollution greater than 90 cases per million population.
    - (C) Identification of parcels where PM<sub>2.5</sub> concentrations are greater than 10 µg/m<sup>3</sup> (including ambient levels).
    - (D) Identification of parcels in Health Vulnerable Locations where PM<sub>2.5</sub> concentrations are greater than 9 µg/m<sup>3</sup> (including

ambient levels).

(E) Identification of parcels within 500 feet of any Freeway, if those locations were not otherwise captured by modeling estimates.

(F) New research findings, particularly quantification of risk, that change the Director's knowledge of how particulate matter and any other air pollutants affect public health.

(3) Required performance standards for Enhanced Ventilation Proposals must include the following minimum criteria:

(A) Location of air intake for HVAC (Heating, Ventilation and Air Conditioning systems) away from air pollution sources;

(B) Specification of filtration certified by the ASHRAE capable of achieving protection from particulate matter (PM<sub>2.5</sub>) equivalent to that associated with a MERV 13 filtration (as defined by ASHRAE standard 52.2).

(4) Additional criteria for Enhanced Ventilation Proposals may include the following project design information:

(A) Number of air exchanges per hour of outside filtered air;

(B) Building materials and/or design that limit unfiltered infiltration of outside air, such as air sealing or maintenance of positive pressure within the building interior;

(C) Location of operable windows oriented away from air pollutant sources, to the extent feasible;

(D) Other building design criteria that may reduce air pollution exposure to residents;

(E) Other combinations of technologies and designs to achieve the goals of this Article.

(5) Certification and/or licensing requirements for the persons who prepare the Enhanced Ventilation Proposals pursuant to Section 3807. The Enhanced Ventilation Proposal must be prepared by, or under the responsible charge of a person who is authorized by California Business and Professions Code Sections 6700-6799 (Professional Engineers Act), or any successor provisions, to design mechanical ventilation systems that meet the requirements of this Article 38 and San Francisco Building Code Section 1203.5 and either:

(A) a licensed mechanical engineer, or

(B) an individual authorized by California Business and Professions Code Sections 6700-6799 to design mechanical ventilation systems that meet the requirements of this Article 38 and San Francisco Building Code Section 1203.5.

(6) Minimum criteria for maintenance and disclosure, including but not limited to:

(A) Minimum standards for proper maintenance, and

(B) Disclosure to buyers, lessees and renters that the building is located in an area with substantial concentrations of air pollutants, and that the building includes an enhanced ventilation system information about the proper use of the installed enhanced ventilation system.

(e) The Director may specify additional or alternative equivalents as justified by accepted research including:

(1) addition or substitution of risk factor criteria;

(2) inclusion of other pollutants such as Nitrogen Dioxide.

(f) Within Health Vulnerable Locations, the Director shall specify more protective requirements in the Air Pollutant Exposure Zones.

(g) The Director may grant variances to this Article 38, on a case-by-case basis.

(Added by Ord. 281-08, File No. 080934, 12/5/2008; amended by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

#### CODIFICATION NOTE

1. Blank in Ord. [224-14](#); ordinance number inserted by the codifier.

---

## **SEC. 3810. MAINTENANCE AND DISCLOSURE REQUIREMENTS.**

(a) The ventilation systems installed pursuant to Section 3807 shall be properly maintained, following standard practices, and as specified by the manufacturer.

(b) Documentation of the installation and/or maintenance of the enhanced ventilation systems shall be preserved for five years after installation.

(c) Failure to properly maintain the enhanced ventilation systems is subject to enforcement and possible penalties under the Health Code Article 11, Nuisances, or other applicable sections.

(d) Disclosure to buyers, lessees and renters shall be made in accordance with Rules and Regulations as specified in Section 3809(d)(6).

(Added by Ord. 281-08, File No. 080934, 12/5/2008; amended by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

---

## **SEC. 3811. FEES.**

(a) Review and approval of an Enhanced Ventilation Proposal . . . \$984.00

(b) Additional consultation, document review or inspection . . . \$225.00 per hour

(Added by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

(Former Sec. 3811 added by Ord. 281-08, File No. 080934, 12/5/2008; redesignated as Sec. 3812 by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

---

## **SEC. 3812. NO CONFLICT WITH FEDERAL OR STATE LAW.**

Nothing in this Article shall be interpreted or applied so as to create any requirement, power, or duty in conflict with any federal or state law.

(Added as Sec. 3811 by Ord. 281-08, File No. 080934, 12/5/2008; redesignated by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

(Former Sec. 3812 added by Ord. 281-08, File No. 080934, 12/5/2008; redesignated as Sec. 3813 by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

---

## **SEC. 3813. SEVERABILITY.**

If any section, subsection, sentence, clause, or phrase of this Article 38 is for any reason held to be invalid or unconstitutional by a decision of any court of competent jurisdiction, such decision shall not affect the validity of the remaining portions of the Article. The Board of Supervisors hereby declares that it would have passed this Article and each and every section, subsection, sentence, clause, or phrase not declared invalid or unconstitutional without regard to whether any portion of this Article would be subsequently declared invalid or unconstitutional.

(Added as Sec. 3812 by Ord. 281-08, File No. 080934, 12/5/2008; redesignated by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

(Former Sec. 3813 added by Ord. 281-08, File No. 080934, 12/5/2008; redesignated as Sec. 3814 and amended by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

---

## **SEC. 3814. UNDERTAKING FOR THE GENERAL WELFARE.**

In adopting and implementing this Article 38, the City is assuming an undertaking only to promote the general welfare. It is not assuming, nor is it imposing in its officers and employees, an obligation for breach of which it is liable in money damages to any person who claims that such breach proximately caused injury.

(Added as Sec. 3813 by Ord. 281-08, File No. 080934, 12/5/2008; redesignated and amended by Ord. [224-14](#), File No. 140806, App. 11/7/2014, Eff. 12/7/2014)

### DISCLAIMERS:

Please be advised that this determination does not constitute an application for development with the Planning Department. It also does not represent a complete review of the proposed project, a project approval of any kind, or in any way supersede any required Planning Department approvals listed below. The Planning Department may provide additional comments regarding the proposed project once the required applications listed below are submitted. While some approvals are granted by the Planning Department, some are at the discretion of other bodies, such as the Planning Commission or Historic Preservation Commission. Additionally, it is likely that the project will require approvals from other City agencies such as the Department of Building Inspection, Department of Public Works, Department of Public Health, San Francisco Public Utilities Commission, and others. The information included herein is based on plans and information provided for this assessment and the Planning Code, General Plan, Planning Department policies, and local/state/federal regulations as of the date of this document, all of which are subject to change.

### PROJECT DESCRIPTION:

The project sponsor submitted PPA applications in February 2015 and April 2015, proposing two design variations for the same site. Except where noted, comments in this letter shall apply to both project proposals.

The project would demolish one existing single story warehouse-style building, four single-story with mezzanine buildings, two single-story retail/warehouse buildings, and one single-story industrial building – totaling 157,541 sq. ft. on four adjoining lots – all of which are part of the existing the San Francisco Flower Mart. The first proposal ("February 2015 proposal") would construct a 1,814,950 sq. ft. mixed-use development, consisting of: (1) three stepped buildings ranging in height from 65 feet to 250 feet with 1,492,450 GSF of office space and 45,800 GSF of ground floor retail (which includes 10,000 sq. ft.

of San Francisco Flower Mart retail space); (2) 115,000 leasable sq. ft. of below-grade warehouse space that would be occupied by the San Francisco Flower Mart; (3) 20,000 sq. ft. of below-grade loading space and 17,500 sq. ft. on-grade truck parking for the San Francisco Flower Mart; (3) 110,000 sq. ft. below-grade parking; and, (4) 14,200 sq. ft. of on-grade office and retail loading. Vehicle access to the underground parking garage and the Flower Mart is proposed on Morris Street (off of Sixth Street), with trucks exiting on the shared private alley and continuing onto Fifth Street. Two levels of below grade parking would accommodate 300 parking spaces, of which 150 spaces would be designated for exclusive Flower Mart use. The project also includes two public plazas totaling 34,175 sq. ft. facing Brannan Street and in the center of the project, which will create mid-block pedestrian connections to Morris Street and to a shared private alley to the north of the property.

The project sponsor also submitted a subsequent application for a Preliminary Project Assessment ("April 2015 proposal") with a project variant that maintains the SF Flower Mart location at street level. This proposal elevates the office towers above a 24' podium that would house the SF Flower Mart and associated retail spaces. The profiles and spacing of the office towers would remain the same; however, the maximum heights would increase, ranging from 77 to 271 feet, and the project square footages would change slightly, featuring: (1) 1,512,260 GSF of office space, (2) 29,550 GSF of ground floor retail, (3) 115,000 GSF of warehouse space for the Flower Mart; and, (4) 147,450 GSF of below-grade parking (accommodating approximately 350 parking spaces, including 25 truck parking spaces for use by Flower Mart tenants). Under this proposal, the northern plaza would be elevated above the 24' podium, with terraces stepping down to the street-level plaza facing Brannan Street. In addition, in lieu of at-grade parking for the Flower Mart, spaces would be designated for truck loading on the shared private alley on the northern edge of the site.

## PLANNING CONTEXT:

The proposed project is located within the Western SoMa Community Plan, which was evaluated in the *Western SoMa Community Plan, Rezoning of Adjacent Parcels, and 350 8th Street Project Environmental Impact Report (Western SoMa PEIR)*, certified in 2012.<sup>1</sup> The project site also lies within the proposed Central SoMa Plan area, a community planning process initiated in 2011. The Central Corridor Plan Draft for Public Review<sup>2</sup> (Draft Plan) was released in April 2013, with proposed changes to the allowed land uses and building heights in the Plan area, including a strategy for improving the public realm within the Plan area and vicinity. The Draft Plan is available for download at <http://centralsoma.sfplanning.org>. The Central SoMa Plan will be evaluated in an Environmental Impact Report (EIR), which is currently underway. The Draft Plan and its proposed rezoning are anticipated to be before decision-makers for approval in 2016.

The existing zoning for the project site is SALI (Service/Arts/Light Industrial), which does not allow office uses, while the proposed use district for the project site in the Draft Plan is Mixed-Use Office (MUO),

---

<sup>1</sup> Available for review on the Planning Department's Area Plan EIRs web page: <http://www.sf-planning.org/index.aspx?page=1893>.

<sup>2</sup> Please note that the Central SoMa Plan was formerly called the Central Corridor Plan. To avoid ambiguity, this letter uses the current "Central SoMa Plan" when referring to the ongoing planning process, while "Draft Plan" refers to the document published in April 2013 under the name "Central Corridor Plan Draft for Public Review."

which would allow office uses as well as the other uses proposed under the project. The Draft Plan includes two height alternatives. The Central SoMa Plan EIR will study the Draft Plan's Mid-Rise Height Alternative and a modified High-Rise Height Alternative, which include different proposed height limits for the project site. Under the Mid-Rise Height Alternative the proposed height designation for the site is 55/65/85, which would allow buildings up to 85 feet tall on some portions of the project site, while under the modified High-Rise Height Alternative the EIR will study development of buildings up to 270 feet on the project site. At this point, it is unknown which height option, if any, would ultimately be approved by the Planning Commission and Board of Supervisors. Further Central SoMa Plan-related comments in this PPA are based on the Draft Plan concepts published to date, which are contingent on the approval of the proposed Central SoMa Plan rezoning by the Planning Commission and Board of Supervisors.

## ENVIRONMENTAL REVIEW:

The proposed project requires environmental review either individually, with a project-specific Initial Study/Mitigated Negative Declaration or Environmental Impact Report (EIR), or in a Community Plan Exemption (CPE) if the project is consistent with an adopted community plan (see the discussion under "Community Plan Exemption" below). The proposed project is located within the Western SoMa Area Plan, which was evaluated in the *Western SoMa PEIR*. However, the proposed project is not consistent with the land use or development density (zoning) identified in the Western SoMa Area Plan, and it is therefore not eligible for a CPE under the *Western SoMa PEIR*.

The project's proposed building heights range from 65 to 250 feet for the below-grade Flower Mart configuration (February 2015) and from 77 to 271 feet for the street-level Flower Mart configuration (April 2015). These heights would both be consistent with the High-Rise Height Alternative studied in the Central SoMa Plan EIR. Thus, it is possible that the proposal, as currently presented, would qualify for a CPE under the proposed Central SoMa Plan EIR once that EIR is certified and the Planning Commission and Board of Supervisors have adopted new zoning controls. However, the proposed project would be assessed based on the height limits for the project site in place at the time that the Planning Department entitlements for the proposed project are sought.

Due to the project's location within the geographic area evaluated in the *Western SoMa PEIR*, any development on the project site would potentially be subject to the mitigation measures identified in that document. Potentially significant project environmental impacts that were identified in and pertinent mitigation measures and CEQA findings from the *Western SoMa PEIR* that may be applicable to the proposed project are discussed below, under the applicable environmental topic. However, mitigation measures from the *Western SoMa PEIR* that are applicable to the proposed project area could be refined, augmented, or superseded under the future Central SoMa Plan EIR, which would become applicable to the proposed project upon approval of the Draft Plan.

### *Community Plan Exemption*

Section 15183 of the California Environmental Quality Act (CEQA) Guidelines states that projects that are consistent with the development density established by a community plan for which an environmental impact report (EIR) was certified do not require additional environmental review, except as necessary to determine the presence of project-specific significant effects not identified in the programmatic plan area

EIR. A CPE may be prepared for such projects. Please note that a CPE is a type of exemption from environmental review, and cannot be modified to reflect changes to a project after approval. Proposed increases beyond the CPE project description in project size or intensity after project approval will require reconsideration of environmental impacts and issuance of a new CEQA determination.

Within the CPE process, there can be three different outcomes as follows:

1. **CPE Only.** All potentially significant project-specific and cumulatively considerable environmental impacts are fully consistent with significant impacts identified in the underlying area plan EIR (assumed here to be the Central SoMa Plan EIR), and there would be no new "peculiar" significant impacts unique to the proposed project. In these situations, all pertinent mitigation measures and CEQA findings from the in the underlying area plan FEIR are applied to the proposed project, and a CPE checklist and certificate is prepared. With this outcome, the applicable fees are: (a) the CPE determination fee (currently \$13,659) and (b) the CPE certificate fee (currently \$7,580). (The Planning Department schedule of application fees may be downloaded at: <http://www.sf-planning.org/Modules/ShowDocument.aspx?documentid=513>)
2. **Mitigated Negative Declaration.** If new site- or project-specific significant impacts are identified for the proposed project that were not identified in the underlying area plan EIR, and if these new significant impacts can be mitigated to a less-than-significant level, then a focused mitigated negative declaration is prepared to address these impacts, and a supporting CPE checklist is prepared to address all other impacts that were encompassed by the underlying area plan EIR, with all pertinent mitigation measures and CEQA findings from the underlying area plan EIR also applied to the proposed project. With this outcome, the applicable fees are: (a) the CPE determination fee (currently \$13,659) and (b) the standard environmental evaluation fee (which is based on construction value).
3. **Focused EIR.** If any new site- or project-specific significant impacts cannot be mitigated to a less-than-significant level, then a focused EIR is prepared to address these impacts, and a supporting CPE checklist is prepared to address all other impacts that were encompassed by the underlying area plan EIR, with all pertinent mitigation measures and CEQA findings from the underlying area plan EIR also applied to the proposed project. With this outcome, the applicable fees are: (a) the CPE determination fee (currently \$13,659); (b) the standard environmental evaluation fee (which is based on construction value); and (c) one-half of the standard EIR fee (which is also based on construction value). An EIR must be prepared by an environmental consultant from the Planning Department's environmental consultant pool ([http://www.sfplanning.org/ftp/files/MEA/Environmental\\_consultant\\_pool.pdf](http://www.sfplanning.org/ftp/files/MEA/Environmental_consultant_pool.pdf)). The Planning Department will provide more detail to the project sponsor regarding the EIR process should this level of environmental review be required.

As discussed above, the proposed project is located within the proposed Central SoMa Plan Area, which is under evaluation in the forthcoming Central SoMa Plan EIR; if the proposed project is consistent with the development density identified in the Central SoMa Plan, it may be eligible for a CPE. If the proposed 630-698 Brannan Street project is not consistent with the height and density identified for the project site in the adopted Central SoMa Plan, it would be precluded from qualifying for a CPE under the Central SoMa Plan. The proposed project would be analyzed in a separate environmental document that would not rely on the environmental analysis undertaken for the Central SoMa Plan. In this case, the applicable

fees would be (a) the standard environmental evaluation (EE) fee based on the cost of construction; and (b) the standard EIR fee, if an EIR is required.

In order to begin formal environmental review, please submit an **Environmental Evaluation Application (EEA)**. The EEA can be submitted at the same time as the PPA Application. The environmental review may be done in conjunction with the required approvals listed below, but must be completed before any project approval may be granted. **Note that until an entitlement application is submitted to the Current Planning Division, only the proposed Project Description will be reviewed by the assigned Environmental Coordinator.** EEAs are available in the Planning Department lobby at 1650 Mission Street, Suite 400, at the Planning Information Center at 1660 Mission Street, and online at [www.sfplanning.org](http://www.sfplanning.org) under the "Publications" tab. See "Environmental Applications" on page 2 of the current Fee Schedule for a calculation of environmental application fees.<sup>3</sup>

Below is a list of topic areas that would require additional study based on the preliminary review of the project as it is proposed in the PPA application. This discussion is applicable to both the February 2015 and April 2015 project proposals, except as noted.

1. **Historic Resources.** The project site contains one or more structures considered to be a potential historic resource (a building constructed 45 or more years ago). The property was surveyed as part of the South of Market Historic Resources Survey and identified for potential architectural and cultural significance, but was not fully evaluated at that time. Therefore, the proposed demolition is subject to review by the Department's Historic Preservation staff. To assist in this review, the project sponsor must hire a qualified professional to prepare a Historic Resource Evaluation (HRE) report. The professional must be selected from the Planning Department's Historic Resource Consultant Pool. Please contact Tina Tam, Senior Preservation Planner, via email at [tina.tam@sfgov.org](mailto:tina.tam@sfgov.org) for a list of three consultants from which to choose. Please contact the HRE scoping team at [HRE@sfgov.org](mailto:HRE@sfgov.org) to arrange the HRE scoping process. The historic resource consultant should submit the draft HRE report for review to Environmental Planning after the project sponsor has filed the EEA and update it as necessary to reflect feedback received in the PPA letter. Historic Preservation staff will not begin reviewing your project until a complete HRE is received.

The Western SoMa PEIR identified two mitigation measures to minimize construction impacts of new development projects on historic resources within 25 feet for non-pile driving activities and 100 feet for pile driving activities: *M-CP-7a: Protect Historical Resources from Adjacent Construction Activities* and *M-CP-7b: Construction Monitoring Program for Historical Resources*. These mitigation measures require an evaluation to determine whether special construction measures are necessary to protect nearby historic resources, as well as implementation of a construction monitoring program for those historic resources. The closest known historic resource is located adjacent to the project site at 701 Bryant Street (3778/001). Therefore, these mitigation measures would apply to the proposed project.

---

<sup>3</sup> San Francisco Planning Department. *Schedule for Application Fees*. Available online at: <http://www.sf-planning.org/Modules/ShowDocument.aspx?documentid=513>.

2. **Archeological Resources.** Project implementation would include soil-disturbing activities associated with building construction, including excavation to a depth of approximately 25 feet below grade for construction of the underground parking, loading, and Flower Mart operational areas under the February 2015 below-grade Flower Mart scenario, and up to 15 feet for underground parking and loading under the April 2015 street-level Flower Mart scenario. The project site is located within an area where no previous archeological survey has been prepared. The Western SoMa PEIR noted that California Register of Historical Resources (CRHR)-eligible archeological resources are expected to be present within existing sub-grade soils of the Plan Area and the proposed land use policies and controls within the Plan Area could adversely affect significant archeological resources.

Because of the depth of excavation under either the below-grade or street-level Flower Mart configuration, *Western SoMa PEIR Archeological Mitigation Measure M-CP-4a: Project-Specific Preliminary Archeological Assessment* and *M-CP-4b: Procedures for Accidental Discovery of Archeological Resources* would be applicable to the proposed project. *Mitigation Measure M-CP-4a* requires that a Preliminary Archeology Review (PAR) be prepared by the Planning Department archeologist. Based on the PAR, the Environmental Review Officer (ERO) would determine if an Archeological Research Design/Treatment Plan (ARDTP) is required to more definitively identify the potential for CRHR-eligible archeological resources to be present within the project site and to determine the appropriate action necessary to reduce the potential effects of the project on archeological resources to a less-than-significant level. If an ARDTP is required, the scope of the ARDTP will be determined in consultation with the ERO. The Planning Department archeologist will be informed by the geotechnical study of the project site's subsurface geological conditions. (See Geotechnical Study below.) *Mitigation Measure M-CP-4b* outlines procedures for ensuring that appropriate actions are taken in the event that an accidental discovery of archeological resources occurs during the construction of the project.

3. **Transportation.** Based on the Planning Department's Transportation Impact Analysis Guidelines for Environmental Review, the project would require additional transportation analysis to determine whether the project may result in a significant impact.<sup>4</sup> Therefore, the Planning Department requires that a consultant listed in the Planning Department's Transportation Consultant Pool prepare a Transportation Impact Study. You are required to pay additional fees for the study; please contact Virnaliza Byrd at (415) 575-9025 to arrange payment. Once you pay the fees, please contact Manoj Madhavan at (415) 575-9095 or [manoj.madhavan@sfgov.org](mailto:manoj.madhavan@sfgov.org) so that he can provide you with a list of three consultants from the pre-qualified Transportation Consultant Pool. Upon selection of a transportation consultant, the Department will assign a transportation planner who will direct the scope of the consultant-prepared study.

Additionally, the proposed project is located on a high injury corridor as mapped by Vision Zero.<sup>5</sup> Planning staff have reviewed the proposed site plans and request the following clarification and offer the following requests, some of which address the safety of persons walking and bicycling to and from the project site and vicinity:

---

<sup>4</sup> This document is available at: <http://www.sf-planning.org/index.aspx?page=1886>.

<sup>5</sup> This document is available at: <http://www.sfmta.com/sites/default/files/projects/2015/vision-zero-san-francisco.pdf>.

- Schedule a site visit by Planning staff will be needed in order to identify pedestrian-related safety issues.
- Clarify what is meant by “semi-queueing” in the PPA application project description.
- Clarify whether new on-street parking spaces on Brannan, 5<sup>th</sup>, and 6<sup>th</sup> streets are proposed as Flower Mart loading areas.
- Coordinate any streetscape or roadway improvements with the Central SoMa EIR team as well as Citywide Planning and the San Francisco Municipal Transportation Agency (SFMTA). (See the Preliminary Project Comments and Preliminary Design Comments sections for further discussion.)
- Clarify parking space dimensions and confirm that “SV” notation on plans indicates service vehicle spaces.
- Ensure project design conforms with pedestrian-related policies and design guidelines, especially as the project site is adjacent to high-injury corridors.
- Clearly label alleys on site plans.

Please include the requested information with the EEA and coordinate with the assigned environmental and transportation planners regarding streetscape/roadway and pedestrian improvements.

4. **Noise.** The proposed project would include commercial/light industrial uses that could generate noise levels in excess of ambient noise, either short term, at nighttime, or as a 24-hour average, in the project site vicinity. It would therefore be subject to *Western SoMa PEIR Noise Mitigation Measure M-NO-1c: Siting of Noise-Generating Uses*, which is intended to reduce potential conflicts between existing sensitive receptors and new noise-generating uses. *Mitigation Measure M-NO-1c* requires that a noise analysis be prepared for a new development that could generate noise prior to the first project approval action. The mitigation measure requires that such an analysis include, at a minimum, a site survey to identify potential noise-sensitive uses within 900 feet of, and that have a direct line-of-sight to, the project site. At least one 24-hour noise measurement must be included in the analysis. The analysis must be prepared by person(s) qualified in acoustical analysis and/or engineering and must demonstrate with reasonable certainty that the proposed use would comply with the use compatibility requirements of the San Francisco General Plan and Police Code Section 2909, that the proposed use would not adversely affect nearby noise-sensitive uses, and that there are no particular circumstances about the project site that appear to warrant heightened concern about noise levels that would be generated by the proposed use. Should such concerns be present, the Planning Department may require the completion of a detailed noise assessment by person(s) qualified in acoustical analysis and/or engineering prior to the first project approval action, and may require implementation of site-specific noise reduction features or strategies.

Construction of the proposed project would generate noise. While construction noise is temporary in nature and regulated by the San Francisco Noise Ordinance, the *Western SoMa PEIR* evaluated construction noise impacts that would result from implementation of the Community Plan and identified two mitigation measures that, when implemented, would reduce these impacts to a less-than-significant level. *Mitigation Measure M-NO-2a: General Construction Noise Control Measures* includes best practices for construction work, such as state-of-the-art noise shielding and muffling

devices and the use of electrically- or hydraulically-powered construction equipment, to minimize construction noise levels. *Mitigation Measure M-NO-2b: Noise Control Measures During Pile Driving* includes a set of site-specific noise attenuation measures for construction projects involving pile driving.

5. **Air Quality.** The proposed project's 1.8 million sf of office and commercial/light industrial uses exceed the Bay Area Air Quality Management District's (BAAQMD) construction and operational screening levels for criteria air pollutants.<sup>6</sup> Therefore, an analysis of the project's criteria air pollutant emissions is likely to be required. Please provide detailed information related to construction equipment, phasing and duration of each phase, and volume of excavation as part of the EEA. Should this analysis determine that criteria air pollutant emissions exceed the *Western SoMa PEIR* significance thresholds, construction and operational mitigation measures identified in the PEIR would be required. In addition, *Western SoMa PEIR Mitigation Measure M-AQ-6: Construction Emissions Minimization Plan for Criteria Air Pollutants* requires equipment exhaust minimization measures during construction. Another measure, *Western SoMa PEIR Mitigation Measure M-AQ-2 Transportation Demand Management Strategies for Future Development Projects*, requires various Transportation Demand Management (TDM) strategies be implemented to reduce vehicle trips and associated air pollutant emissions.

In addition, project-related demolition, excavation, grading and other construction activities may cause wind-blown dust that could contribute particulate matter into the local atmosphere. To reduce construction dust impacts, the proposed project will be required to adhere to the dust control requirements set forth in the Construction Dust Ordinance contained in San Francisco Health Code Article 22B and San Francisco Building Code Section 106.A.3.2.6. The proposed project is also required to prepare a Construction Dust Control Plan for review and approval by DPH.

The project site is located within an Air Pollutant Exposure Zone, as mapped and defined by Health Code, Article 38. The Air Pollutant Exposure Zone identifies areas with poor air quality based on modeling of air pollution, exposures, and health vulnerability from mobile, stationary, and area source emissions within San Francisco. Should the proposed project include new sensitive land uses (for example, day care facilities), those facilities would be subject to the requirements of Health Code Article 38. Additionally, due to the project site's location within an Air Pollutant Exposure Zone, construction of the project would require compliance with *Western SoMa PEIR Mitigation Measure M-AQ-7: Construction Emissions Minimization Plan for Health Risks and Hazards*.

If the project would generate new sources of toxic air contaminants including, but not limited to, diesel generators or boilers, or any other stationary sources, the project would result in toxic air contaminants that may affect both on-site and off-site sensitive receptors within the Air Pollutant Exposure Zone. If the proposed project includes sensitive receptors (for example, a day care facility), it would be subject to additional requirements under Article 38. Given the proposed project's height of up to 270 feet, the proposed project would likely require a backup diesel generator; additional measures, such as that described in *Western SoMa PEIR Mitigation Measure M-AQ-4: Siting of Uses that*

---

<sup>6</sup> BAAQMD, *CEQA Air Quality Guidelines*, May 2011, Chapter 3.

*Emit PM<sub>2.5</sub> or DPM and Other TACs*, will likely be necessary to reduce its emissions. Please provide detailed information related to any proposed stationary sources with the EEA.

6. **Greenhouse Gases.** *The City and County of San Francisco's Strategies to Address Greenhouse Gas Emissions* presents a comprehensive assessment of policies, programs, and ordinances that represents San Francisco's Qualified Greenhouse Gas (GHG) Reduction Strategy. Projects that are consistent with San Francisco's Qualified GHG Reduction Strategy would result in less-than-significant impacts from GHG emissions. In order to facilitate a determination of compliance with San Francisco's Qualified GHG Reduction Strategy, the Planning Department has prepared a Greenhouse Gas Analysis Compliance Checklist.<sup>7</sup> The project sponsor is required to submit the completed table regarding project compliance with the identified regulations and provide project-level details in the discussion column. This information will be reviewed by the environmental planner during the environmental review process to determine if the project would comply with San Francisco's Greenhouse Gas Reduction Strategy. Projects that do not comply with an ordinance or regulation may be determined to be inconsistent with the Greenhouse Gas Reduction Strategy.
7. **Wind.** The proposed project would involve construction of a building over 80 feet in height. The project would therefore be required to comply with *Western SoMa Mitigation Measure M-WS-1: Screening Level Wind Analysis and Wind Tunnel Testing*. Given the proposed project's height, location, and preliminary design, wind tunnel testing will likely be required as part of the analysis. The consultant will be required to prepare a proposed scope of work for review and approval by the Environmental Planning coordinator prior to proceeding with the analysis.
8. **Shadow.** The proposed project would result in construction of a building greater than 40 feet in height. A preliminary shadow fan analysis prepared by Planning Department staff indicates that the proposed project could cast shadows on Victoria Manalo Draves Park and the Gene Friend Recreation Center, both San Francisco Recreation & Parks Department properties, as well as other nearby public and private open spaces. The project sponsor is therefore required to hire a qualified consultant to prepare a detailed shadow study. The consultant must submit a Shadow Study Application, which can be found on the Planning Department's website (<http://www.sf-planning.org/Modules/ShowDocument.aspx?documentid=539>). A separate fee is required. The consultant must also prepare a proposed scope of work for review and approval by Environmental Planning staff prior to preparing the analysis.
9. **Utilities and Service Systems.** The proposed project exceeds the threshold for a "water demand project" as defined in Sections 10910 of the California Water Code and preparation of a water supply assessment (WSA) may therefore be required. A determination of the need for a WSA will be made in consultation with the San Francisco Public Utilities Commission during preparation of the environmental documentation for the proposed project.

---

<sup>7</sup> Refer to <http://sf-planning.org/index.aspx?page=1886> for latest "Greenhouse Gas Compliance Checklist for Private Development Projects."

10. **Biological Resources.** The proposed project would include demolition of buildings, and may therefore be required to comply with *Western SoMa Mitigation Measure M-BI-1a: Pre-Construction Special Status Bird Surveys*. This measure requires pre-construction special-status bird surveys during certain time periods when birds are likely to be nesting, and includes restrictions on construction during the breeding period.
11. **Geology.** The project site is located within a Seismic Hazard Zone (Liquefaction Hazard Zone likely underlain by artificial fill). Any new construction on the site is therefore subject to a mandatory Interdepartmental Project Review.<sup>8</sup> A geotechnical study prepared by a qualified consultant must be submitted with the EEA. The study should address whether the site is subject to liquefaction, and should provide recommendations for any geotechnical concerns identified in the study. In general, compliance with the building codes would avoid the potential for significant impacts related to structural damage, ground subsidence, liquefaction, landslides, and surface settlement. To assist Planning Department staff in determining whether the project would result in environmental impacts related to geological hazards, it is recommended that you provide a copy of the geotechnical information with boring logs for the proposed project. This study will also help inform the Planning Department Archeologist of the project site's subsurface geological conditions.
12. **Hazardous Materials.** The proposed project would include excavation and below-grade construction on a site with previous and ongoing light industrial uses, and which is included on a map of sites with known or suspected soil and/or groundwater contamination maintained under Article 22A of the Health Code, also known as the Maher Ordinance. Therefore, the project is subject to the Maher Ordinance, which is administered and overseen by the Department of Public Health (DPH), and which requires the project sponsor to retain the services of a qualified professional to prepare a Phase I Environmental Site Assessment (ESA) that meets the requirements of Health Code Section 22.A.6. The Phase I ESA would determine the potential for site contamination and level of exposure risk associated with the project. Based on that information, soil and/or groundwater sampling and analysis, as well as remediation of any site contamination, may be required. These steps are required to be completed prior to the issuance of any building permit.

DPH requires that projects subject to the Maher Ordinance complete a Maher Application, available at: <http://www.sfdph.org/dph/EH/HazWaste/hazWasteSiteMitigation.asp>. Fees for DPH review and oversight of projects subject to the ordinance would apply. Please refer to DPH's fee schedule, available at: <http://www.sfdph.org/dph/EH/Fees.asp#haz>. Please provide a copy of the submitted Maher Application and Phase I ESA with the EEA. Compliance with Health Code Article 22A would meet the requirements of *Western SoMa PEIR Hazardous Materials Mitigation Measure M-HZ-3: Site Assessment and Corrective Action*.

*Western SoMa PEIR Hazardous Materials Mitigation Measure M-HZ-2: Hazardous Building Materials Abatement* would be applicable to the proposed project. The mitigation measure requires that the project sponsor ensure that any equipment containing polychlorinated biphenyls (PCBs) or mercury,

---

<sup>8</sup> San Francisco Planning Department. Interdepartmental Project Review. Available online at: <http://www.sf-planning.org/Modules/ShowDocument.aspx?documentid=522>.

such as fluorescent light ballasts and fluorescent light tubes, be removed and properly disposed of in accordance with applicable federal, state, and local laws. In addition, any other hazardous materials identified, either before or during work, must be abated according to applicable federal, state, and local laws.

Because the existing buildings were constructed prior to 1980, asbestos-containing materials, such as floor and wall coverings, may be found in the buildings. The Bay Area Air Quality Management District (BAAQMD) is responsible for regulating airborne pollutants including asbestos. Please contact BAAQMD for the requirements related to demolition of buildings with asbestos-containing materials. In addition, because of their age (constructed prior to 1978), lead paint may be found in the existing buildings. Please contact the San Francisco Department of Building Inspection (DBI) for requirements related to the demolition of buildings that may contain lead paint.

13. **Tree Planting and Protection.** The Department of Public Works Code Section 8.02-8.11 requires disclosure and protection of landmark, significant, and street trees located on private and public property. Any such trees must be shown on the site plans with the size of the trunk diameter, tree height, and accurate canopy drip line. Please submit the *Tree Planting and Protection Checklist* with the EEA and ensure that trees are appropriately shown on site plans. Also see the comments below under "Street Trees."
14. **Disclosure Report for Developers of Major City Projects.** The San Francisco Ethics Commission S.F. Camp. & Govt. Conduct Code § 3.520 et seq. requires developers to provide the public with information about donations that developers make to nonprofit organizations that may communicate with the City and County regarding major development projects. This report must be completed and filed by the developer of any "major project." A major project is a real estate development project located in the City and County of San Francisco with estimated construction costs exceeding \$1,000,000 where either: (1) The Planning Commission or any other local lead agency certifies an EIR for the project; or (2) The project relies on a program EIR and the Planning Department, Planning Commission, or any other local lead agency adopts any final environmental determination under CEQA. A final environmental determination includes: the issuance of a CPE; certification of an EIR; adoption of a Final Mitigated Negative Declaration; or a project approval by the Planning Commission that adopts CEQA Findings. In instances where more than one of the preceding determinations occur, the filing requirement shall be triggered by the earliest such determination. A major project does not include a residential development project with four or fewer dwelling units. The first (or initial) report must be filed within 30 days of the date the Planning Commission (or any other local lead agency) certifies the EIR for that project or, for a major project relying on a program EIR, within 30 days of the date that the Planning Department, Planning Commission, or any other local lead agency adopts a final environmental determination under CEQA. Please submit a Disclosure Report for Developers of Major City Projects to the San Francisco Ethics Commission. This form can be found at the Planning Department or online at <http://www.sfethics.org>.

**PLANNING DEPARTMENT APPROVALS:**

The project requires the following Planning Department approvals. These approvals may be reviewed in conjunction with the required environmental review, but may not be granted until after the required environmental review is completed.

Note that the subject parcel is within the Central SoMa Plan area. The Central Corridor Draft Plan for Public Review was published in April 2013. The Central SoMa Plan process is anticipated to be completed in 2016. The proposals in the Draft Plan are subject to change and are contingent on the eventual approval by the Planning Commission and Board of Supervisors. Please see the Preliminary Project Comments section for more details on proposed requirements under the Draft Plan.

1. **Rezoning.** The project site is located within the SALI (Service/Arts/Light Industrial) District. The proposed office use is not permitted under this zoning, but the proposed industrial and retail (subject to applicable size restrictions) uses would be allowed. In order for the project to proceed, the Planning Commission and Board of Supervisors would need to approve new zoning controls for the subject parcel.

The zoning concepts included in the Central Corridor Draft Plan indicate that a reclassification to MUO (Mixed Use Office) is being considered for the site. Office use is permitted in the MUO Zoning District. Please see further discussion in the Preliminary Project Comments section.

2. **Height District Reclassification.** The project site is located within the 40/55-X Height and Bulk District. The height of the proposed project would exceed this height limit of both designations. In order for the project to proceed, the Board of Supervisors would need to approve a Height District Reclassification for the subject parcel.

The zoning concepts published in the Central Corridor Draft Plan (April 2013) indicate that height limits of 55- and 65-feet (proposed Mid-Rise Scenario Alternative) and 55-, 65-, and 85-feet (proposed High-Rise Scenario Alternative) are being considered for this site. The proposed project would not conform with these alternatives put forward in the Draft Plan. However, the EIR currently underway will study a High-Rise Height Alternative of up to 270 feet on the project site. This analysis is not an indication of which height scenario will ultimately be adopted as part of the Plan and is not a guarantee that the Planning Commission or the Board of Supervisors will approve changes to height limits. Please see further discussion in the Preliminary Project Comments section.

3. A **Large Project Authorization** from the Planning Commission is required per Planning Code Section 329 for the new construction of a building greater than 75 feet in height and greater than 25,000 gross square feet.
4. A **Shadow Application** must be submitted, per Planning Code Section 295. Due to potential shadow impacts on nearby property owned by the San Francisco Recreation and Park Department (see "Preliminary Project Comments" below), the project must be approved by the Recreation and Park Commission.

5. An **Office Allocation** from the Planning Commission is required per Planning Code Section 321 et seq. to establish more than 25,000 gross square feet of new office space.
6. A **Building Permit Application** is required for the demolition of the existing building on the subject property.
7. A **Building Permit Application** is required for the proposed new construction on the subject property.

All applications are available in the Planning Department lobby at 1650 Mission Street Suite 400, at the Planning Information Center at 1660 Mission Street, and online at [www.sfplanning.org](http://www.sfplanning.org). Building Permit applications are available at the Department of Building Inspections at 1660 Mission Street.

#### NEIGHBORHOOD NOTIFICATIONS AND PUBLIC OUTREACH:

Project Sponsors are encouraged to conduct public outreach with the surrounding community and neighborhood groups early in the development process. Additionally, many approvals require a public hearing with an associated neighborhood notification. Differing levels of neighborhood notification are mandatory for some or all of the reviews and approvals listed above.

This project is required to conduct a **Pre-Application Meeting** with surrounding neighbors and registered neighborhood groups before a development application may be filed with the Planning Department. The Pre-application packet, which includes instructions and template forms, is available at [www.sfplanning.org](http://www.sfplanning.org) under the "Permits & Zoning" tab. All registered neighborhood group mailing lists are available online at [www.sfplanning.org](http://www.sfplanning.org) under the "Resource Center" tab.

#### PRELIMINARY PROJECT COMMENTS:

The following analysis examines the proposed project under the proposed zoning outlined within the Draft Central SoMa Area Plan. Unless otherwise noted, the comments apply to both project proposals submitted for this property.

1. **Existing Zoning/Height-Bulk.** The subject property is zoned as a Service/Arts/Light Industrial (SLI) district, which does not permit the proposed office use, but does permit the proposed industrial and retail (subject to applicable size restrictions) uses. It is located within the 40/55-X height and bulk district, which does not permit the project's proposed height and bulk. *The project could not be approved under existing zoning.*
2. **Central SoMa Plan.** The subject property falls within the ongoing Central SoMa Plan study area bounded by 2nd, 6th, Townsend and Market Streets. The Central Corridor Draft Plan was published in April 2013 and is currently being evaluated in an Environmental Impact Report (EIR). The Draft Plan proposes changes to the allowed land uses and building heights, and includes a strategy for improving the public realm in this area. The EIR, the Plan, and the

proposed rezoning and affiliated Code changes are anticipated to be brought before decision-makers for approval in the latter part of 2015 or early 2016.

The Central Corridor Draft Plan includes recommendations for new land use controls as well as new height and bulk controls for the subject property. The Draft Plan is available for download at <http://centralsoma.sfplanning.org>. *Further comments in this section of the PPA are based on the draft Central Corridor Draft Plan.*

3. **Land Use.** The Central SoMa Draft Plan recommends rezoning the subject property to the Mixed-Use Office (MUO) Zoning District, in which the proposed office, industrial, and retail uses would be allowed. The project also falls within the South SoMa SUD proposed in the Plan, which would require predominantly commercial uses on large sites such as this one, in order to support substantial development in this transit-rich area.

The proposal to maintain the SF Flower Mart on site helps achieve one of the Plan's central goals, which is to support a diversity of jobs and businesses in the area, including Production, Distribution, Repair (PDR) uses. The Flower Mart has been a San Francisco institution for over a century, and still serves an important PDR function. As such, the City has an interest in ensuring its continued operation, whether in its current location or elsewhere in San Francisco, and any development on the project site will be assessed for its potential impact to the ongoing operation and viability of the Flower Mart. The Plan proposes requiring at least 0.5 FAR of PDR space in most commercial developments in order to support these goals across the Plan Area. In addition, in areas currently zoned SALI, 100% replacement of existing PDR space would be required in order to prevent displacement of businesses (the greater of these two requirements would apply). For more information, see the draft policy document on Production, Distribution and Repair at:

Central SoMa Draft Policy Document: Revised Production, Distribution, and Repair (March 2015):  
[http://www.sfplanning.org/ftp/files/Citywide/Central\\_Corridor/Draft\\_CentralSoMa\\_PDR\\_Policy-March2015.pdf](http://www.sfplanning.org/ftp/files/Citywide/Central_Corridor/Draft_CentralSoMa_PDR_Policy-March2015.pdf)

Both project proposals, which preserve Flower Mart operations on site, are generally consistent with the intent of the proposed PDR policy. As this proposal is still in a preliminary phase, please ensure that the size of the Flower Mart is consistent with the PDR replacement requirements that are ultimately adopted (currently proposed at 100% replacement of PDR space in SALI districts). The project proposals include 115,000 sq ft of Flower Mart space and 10,000 sq ft of associated retail store frontage (125,000 sq ft total), while the current SF Flower Mart includes 126,500 of leasable warehouse and retail space.

This project also falls within the SoMa Entertainment SUD proposed in the Draft Plan, in which entertainment uses would be permitted. In order to create a diverse and dynamic 24-hour neighborhood characteristic of SoMa, the Central Corridor Plan's preliminary land use principles envision a mixed-use neighborhood in which substantial office development is balanced with retail, arts, entertainment, industrial, and residential uses. The proposed ground floor uses

(45,800 sf of retail uses under the February 2015 proposal; and 115,000 sf of industrial uses and 29,550 sf of retail space under the April 2015 proposal) supports this vision of a mixed-use neighborhood. The project sponsor is encouraged to further explore inclusion of a variety of active uses for these ground floor spaces. Please see the Preliminary Design Comments for further discussion.

4. **Urban Form: Height and Bulk.** In recognition of the desire to accommodate more growth in the area, the draft Central Corridor Plan recommends changing the height limits of the subject property to 55 and 65 feet. Additionally, the Draft Plan includes a Higher Height Alternative, which would allow additional height up to a maximum of 85-feet on a portion of the subject property, while the EIR is evaluating a development scenario of up to 270 feet. The proposed building tower heights, ranging from 65-to-250-feet (February 2015) and 77-to-270 feet (April 2015), are consistent with the High Rise Height Alternative under study in the Central Corridor Plan EIR. The Plan publication and ongoing EIR analysis is not an indication of which heights will ultimately be adopted as part of the Plan and is not a guarantee that the Planning Commission or the Board of Supervisors will approve the proposed heights or whether these bodies will change existing height limits.

Regardless of what height scenario is finally adopted by the Plan, any portions of the building exceeding 85-feet in height would be subject to additional setback requirements and bulk restrictions. Please see the Preliminary Design Comments below for additional discussion of massing and site design. The Central SoMa Draft Policy Paper on Bulk requirements describes the most recent proposal for the Plan's bulk controls, intended to ensure that the neighborhood urban form supports light, air, and sun access to the street, while supporting greater densities. The paper is available at:

Central SoMa Draft Policy Paper: Bulk (February 2015):

[http://www.sf-planning.org/ftp/files/Citywide/Central\\_Corridor/Central\\_SoMa\\_Draft\\_Policy\\_Paper-Feb2015\\_graphics.pdf](http://www.sf-planning.org/ftp/files/Citywide/Central_Corridor/Central_SoMa_Draft_Policy_Paper-Feb2015_graphics.pdf)

Please note that existing requirements in Eastern Neighborhoods districts for mid-block alleys and massing reduction for large projects will continue to apply. Please see comment 20 ("Mid-Block Alley") below for more information.

5. **Open Space/Private-ly-Owned Public Open Space (POPOS).** The Central Corridor Draft Plan proposes a requirement that commercial developments include a minimum amount of Privately-Owned Public Open Space (POPOS), similar to those required in the C-3 district under Section 138. If these requirements are adopted as part of the plan, such spaces would need to meet specified provisions on accessibility, design quality, and operations and maintenance. Please see the Central SoMa policy paper on POPOS, found here:

Central SoMa Draft Policy Document: Privately Owned Public Open Spaces (POPOS) (November 2014):

<http://www.sf-planning.org/ftp/files/Citywide/Central Corridor/Draft CentralSoMa POPOS Policy-November2014.pdf>

In addition, the Planning Department has developed draft Key Development Sites Guidelines for properties throughout the Plan Area, including the site of the SF Flower Mart. These design guidelines were crafted to help shape development of these key sites, particularly where their size presents special possibilities for realizing public realm or other public benefit objectives, where there is a need for coordination between or within sites, and/or where adjacent investments in transit or open space infrastructure require special consideration of the relationship between private development and the public realm. These guidelines are available at:

Central SoMa Draft Policy Document: Key Development Sites Guidelines (March 2015):  
<http://www.sf-planning.org/ftp/files/Citywide/Central Corridor/Draft CentralSoMa Policy Paper-Key Development Site Guidelines-March2015.pdf>

The Guidelines for Site 7 ["Flower Mart Block," encompassing both the Flower Mart site as well as the adjacent site at 5<sup>th</sup>/Brannan (3778/047)] call for continuous mid-block alleys to break down the massing of the block and increase pedestrian connectivity throughout the site. It also calls for coordination on the placement and design of POPOS, consolidating spaces into a single cohesive open space where possible, in order to maximize accessibility and functionality and help meet the great need for additional open spaces in this area. Finally, the guidelines also call for ground-floor activation and specifies that office space shall not be an allowed use along any street or POPOS frontage.

As currently designed, both proposals are inconsistent with these design guidelines, as they do not create adequate mid-block pedestrian connections, nor do they meet the intent of the recommended placement of POPOS within the block. This is particularly true of the April 2015 proposal, which does not include continuous pedestrian access at the rear of the elevated plaza. Further, the POPOS are designed as a segmented series of plazas that do not connect with the adjacent site, and that are lined with office uses. Please see the Preliminary Design Comments section below for additional comments.

6. **Streetscape Improvements.** The Draft Plan calls for streetscape improvements across the study area, with extensive streetscape improvements proposed along Brannan Street in order to support a safe, convenient, and attractive street environment for all users. Proposed improvements on this section of Brannan Street include wider sidewalks, reducing the number of traffic lanes, one-way cycle tracks on both sides of the street, and adding a signalized mid-block crossing. The Plan would also prohibit new curb cuts on this street. The proposed project will be expected to implement street improvements consistent with the Plan along any adjacent street and alley frontages. Please see comment 11 ("Street Trees / Streetscape Plan") and the Preliminary Design Comments for further discussion.

7. **Sustainability & Central SoMa Eco-District.** The Department sees a special opportunity for the Flower Market site to exhibit a variety of sustainability best practices including and beyond those required by the Green Building Code and other City and State sustainability requirements. The proposed project could serve as one of the primary anchor properties for the Central SoMa Eco-District. An “eco-district” is a neighborhood or district where residents, community institutions, property owners, developers, and businesses join together with city staff and utility providers to meet sustainability goals by formulating a portfolio of innovative projects at a district or block-level. The Planning Department has identified the Central SoMa plan area as a Type 2 Eco-District—an infill area composed of many smaller parcels and property owners.

All major new development in the Central SoMa Plan Area will be expected to participate in some capacity in the Eco-District Program and a possible Sustainability Management Association to help guide it. In addition, Planning staff have been in conversation with Kilroy Realty staff regarding voluntary sustainability measures related to energy, water use and building systems. Department staff will continue to work with Kilroy on further refinement and feasibility of site-specific sustainability strategies. For more information please see:

San Francisco Eco-District Program:

<http://www.sf-planning.org/index.aspx?page=3051>

Central SoMa Eco-District Task Force Recommendations Report (2013):

[http://www.sf-planning.org/ftp/files/plans-and-programs/emerging\\_issues/sustainable-development/CentralSoMa\\_EcoDTaskForceReport\\_112513.pdf](http://www.sf-planning.org/ftp/files/plans-and-programs/emerging_issues/sustainable-development/CentralSoMa_EcoDTaskForceReport_112513.pdf)

The following comments address specific Planning Code and other general issues that may substantially impact the proposed project. Please note that these comments reflect current Planning Code requirements for this property, which may differ from the requirements being considered under the Central SoMa Plan. Please see the comments above and the Preliminary Design Comments for more information.

8. **Interdepartmental Project Review.** This review is required for all proposed new construction in seismic hazard zones, in which the subject property falls. Please go to the Department’s website for information about the application.
9. **Large Project Authorization:** Planning Code Section 329 outlines the requirements for a Large Project Authorization in Eastern Neighborhoods Mixed Use Zoning Districts. Under these requirements, a Large Project Authorization is required of new construction of more than 25,000 gross square feet. All large projects within the MUO Zoning District are subject to review by the Planning Commission in an effort to achieve the objectives and policies of the General Plan, the applicable Design Guidelines and the Planning Code. Additional modifications of certain Planning Code requirements may be granted under the Large Project Authorization.
10. **Office Allocation.** As defined in Planning Code Section 321, the proposed project would need to obtain an Office Development Authorization from the Planning Commission for new

construction of over 25,000 GSF of office use. Please note that proposed amount of office use exceeds the annual limit allocation of 875,000 GSF per year for large cap projects (more than 50,000 GSF), such that entitlement of the proposed project in its entirety would depend on the accrual of unused allocations over more than one annual cycle. The Planning Department recommends that the project sponsor monitor the status of the Annual Limit Program at:

<http://www.sf-planning.org/index.aspx?page=3254>

11. **Street Trees/Streetscape Plan.** Planning Code Section 138.1 requires one street tree for every 20 feet of frontage for new construction with any remaining fraction of 10 feet or more of frontage requiring an additional tree, as well as the submittal of a streetscape plan for projects above a certain size. The proposed project would require additional street trees along public rights-of-way, as well as submittal of a streetscape plan identifying proposed improvements. Please consult with the Department of Public Works regarding the placement of the street trees. Per Planning Code Section 138.1, the Department will require standard streetscape elements and sidewalk widening for the appropriate street type per the Better Streets Plan, including landscaping, site furnishings, and/or corner curb extensions (bulb-outs) at intersections. Please see the Preliminary Design Comments for further discussion.
12. **Street Frontage.** Planning Code Section 145.1 outlines requirements for street frontages to ensure that they are pedestrian-oriented, fine-grained, and are appropriate and compatible with the buildings in MUO District. Please ensure that the ground floor street frontage meets all of these requirements as related to use, ground floor ceiling height, transparency, fenestration, gates, railings and grillwork.
13. **Shadow.** Planning Code Section 147 states that a shadow analysis is required any project over 50 feet in height in the Eastern Neighborhoods Plan Area. Similarly, Planning Code Section 295 requires a shadow analysis be conducted for any project greater than 40 feet in height. The preliminary analysis for the proposed project indicates that it may cast shadows on nearby public parks; therefore, additional analysis will be required. See comment 8 ("Shadow") in the Environmental Review section for more information.
14. **Parking.** Under current zoning (SALI) and the zoning proposed under the Draft Central Corridor Plan (MUO), no parking would be required. However, each of these zoning districts would have parking maximums, which are listed in Planning Code Section 151.1. For office use within the MUO Zoning District, parking is limited to seven percent of the gross floor area of office use. For retail use within the MUO Zoning District, parking is permitted at a ratio of 1 car for each 1,500 sq ft of retail use. For other manufacturing and industrial uses, parking is permitted at a ratio of 1 car for each 1,500 square feet of occupied floor area.
15. **Bicycle Parking & Showers.** Planning Code Section 155.2 outlines the requirement for bicycle parking in new development. The number of required Class 1 and Class 2 bicycle parking spaces shall be dependent on the amount of retail, PDR, and office space.

In addition, Planning Code Section 155.4 outlines the requirement for shower facilities and lockers for office and retail development. For office development over 50,000 sq ft, a minimum four showers and twenty-four clothes lockers are required. Please ensure compliance with these requirements.

16. **Car-Sharing.** Planning Code Section 166 provides the required number of car sharing spaces for new construction. The number of required car-share parking spaces shall be dependent on the amount of off-street parking. Please ensure compliance with this requirement.
17. **Transportation Management Program.** Pursuant to Planning Code Section 163, an agreement will be required to be executed with the Planning Department to ensure that transportation brokerage services are provided for the life of the project.
18. **Horizontal Mass Reduction:** Planning Code Section 270.1 requires a horizontal mass reduction for all new construction projects with street frontage greater than 200-ft in length. Currently, the proposed project has approximately 241-ft of frontage along Folsom Street. Therefore, the proposed project is required to incorporate a mass reduction that: 1) is not less than 30-ft in width; 2) is not less than 60-ft in depth from the street-facing building façade; 3) extends up to the sky from a level not higher than 25-ft above grade or the third-story, whichever is lower; and 4) results in discrete building sections with a maximum plan length along the street frontage not greater than 200-ft. Please ensure that the project meets this requirement. Please see comment 4 (“Urban Form: Height and Bulk”) and the Preliminary Design Comments for more information on massing requirements proposed in the Draft Plan.
19. **Narrow Street Height Provisions:** For projects within the MUO Zoning District along a Narrow Street (a public right of way less than or equal to 40 feet in width, or any mid-block passage or alley that is less than 40 feet in width), Planning Code Section 261.1 specifies that all subject frontages shall have upper stories set back at least 10 feet at the property line above a height equivalent to 1.25 times the width of the abutting narrow street. No part or feature of a building may penetrate the required setback plane. Please see comment 4 (“Urban Form: Height and Bulk”) and the Preliminary Design Comments for more information on massing requirements proposed in the Draft Plan.
20. **Mid-Block Alley:** Planning Code Section 270.2 outlines requirements for new construction on parcels that have one or more street frontages of over 200 linear feet on a block face longer than 400 feet between intersections. For new construction on lots with greater than 300 linear feet of street frontage, a publicly accessible mid-block alley for the entire depth of the property will be required. This alley should generally be located toward the middle of the subject block face and be perpendicular to the subject frontage. Additional provisions for this requirement are specified within the aforementioned code section. Please see comment 5 (“Open Space / Privately-Owned Public Open Space (POPOS)”) and the Preliminary Design Comments for more information on proposed requirements under the Draft Plan.

21. **Transit Impact Development Fee.** Pursuant to Planning Code Section 411 et seq., the Transit Impact Development Fee (TIDF) will apply to this project. Please be aware that under the ongoing Transportation Sustainability Program, a proposed new transportation impact fee (the Transportation Sustainability Fee, or TSF) may replace the TIDF. Additional information on this program is available on the Department's website at:  
<http://www.sf-planning.org/index.aspx?page=3035>
22. **Eastern Neighborhoods Impact Fees.** This project is subject to the applicable fees outlined in Section 423 et seq.
23. **Jobs-Housing Linkage Program.** Pursuant to Planning Code Section 413 et seq., the Jobs-Housing Linkage Program fee will apply to this project.
24. **Child Care Requirements.** Pursuant to Planning Code Section 414 et seq., this project will be subject to child care requirements, and/or the associated in-lieu fee, since it is constructing more than 50,000 gsf of office space.
25. **Public Art.** Pursuant to Planning Code Section 429 et seq., this project will be subject to the public art requirements, since it involves new construction of non-residential use in excess of 25,000 sq ft within the MUO Zoning District.
26. **First Source Hiring Agreement.** A First Source Hiring Agreement is required for any project proposing to construct 25,000 gross square feet or more. For more information, please contact:

## PRELIMINARY DESIGN COMMENTS:

The project is located in the study area of the Central SoMa Area Plan, currently in process. The site is large and unique, currently housing the San Francisco Flower Mart in a neighborhood with a mixed character of commercial, PDR and residential uses. While the existing neighborhood context includes one to eight story buildings, the Draft Plan proposes a significant increase in density in the area, as it is well served by local and regional transit. The plan proposes several high-rise and large floorplate mid-rise projects on adjacent blocks. The following comments address preliminary design issues that may significantly impact the proposed project:

1. **Site Design, Open Space, and Massing.** The Planning Department recommends that the open space and massing strategy be reframed to better support the goals of the Central SoMa district identity, specifically that the area is intended to be a mid-rise district punctuated with occasional

towers. To clearly define this mid-rise massing, the plan proposes establishing a defined and variable streetwall between 65-ft and 85-ft to keep a strong yet pedestrian-scaled edge along the major streets. A handful of towers (defined as any mass above 160') will be permitted in the Plan Area and are to be small (maximum floorplate of 15,000 sf for office) from the 85' plane and above to be more "spire-like." The Planning Department finds that the current proposal, as a campus of buildings, shifts the balance and definition of the massing and open space too much in favor of the latter, such that the buildings are seen more as objects in an open environment rather than a mid-rise solid with relief open spaces carved from it.

Additionally, the Plan's proposed rezoning generally reinforces a neighborhood pattern of larger heights on the large streets with lower heights towards the center of the block. While there are few existing small streets or alleys present in the large block bounded by Sixth, Fifth, Bryant and Brannan, the Plan seeks to further the scale and massing of this characteristic pattern, including a re-establishment of smaller streets or alleys to provide permeability and physical access through the interior of the site. The current proposal deviates from this intent by including a high-rise tower at the center of the development site and by its lack of connectivity and permeability to the adjacent site at 5<sup>th</sup> & Brannan, and to 5<sup>th</sup> Street generally. The proposed massing of the buildings effectively creates a solid barrier to visual and physical connectivity to 5<sup>th</sup> Street in a way that is not consistent with the draft Plan. The project sponsor will need to consider how the scenario with the Flower Mart above grade can be designed to achieve these objectives and not create extensive stretches of ground-level impermeability, particularly when the Mart is not in operation.

Note also that the draft Plan currently includes an apparent mass reduction bulk control (informally known as "skyplane") which would apply at lot edges. The Planning Department recommends reviewing the "Shaping New Buildings" boards created for the last community meeting to review this intent in more depth, available at (see pages 6 -11):

<http://www.sf-planning.org/ftp/files/Citywide/Central Corridor/CentralSoma Combined Storyboards-032515.pdf>

We recommend that the project sponsors and their design team further work with the staff developing the Key Development Sites Guidelines as part of the Central SoMa plan, which can be found here:

Central SoMa Draft Policy Document: Key Development Sites Guidelines (March 2015):  
<http://www.sf-planning.org/ftp/files/Citywide/Central Corridor/Draft CentralSoMa Policy Paper-Key Development Site Guidelines-March2015.pdf>

2. **Street Frontage.** The unique nature of the Flower Mart use presents opportunities to support open space identity, accessibility, and connectivity in Central SoMa. Along with fulfilling Planning Code Sections 138 (Privately-Owned Public Open Space) and 270.2 (Mid-Block Alley

requirements), the project should provide a defined singular space or intentional network of spaces that are programmed and designed to be inclusive and attractive to the public and local residents in addition to workers and tenants on site and in the vicinity. Most importantly, the interior of the block should be positively activated and permeable even when the Flower Mart is not open. The current proposal in the Draft Plan would require active uses, such as retail, lining all POPOS frontages. Both proposals would not be compliant with this key requirement, as they feature office uses along the portions of the plaza.

The Flower Mart could itself be redefined as a semi-open environment with a strong sense of permeability to the public realm. This inventive ground floor “landscape” would be able to facilitate access for service vehicles and the industrial nature of the commercial activity, while being safe and spatially connected for pedestrians and their retail interface. As the project has significant POPOS requirements and the Flower Mart may consume and require a large portion of the lot area, we recommend continuing to work with Planning Department staff to consider how best to meet the requirement and intents of both the open space and mid-block alley requirements through creative building massing, ground floor programming, and landscape design. Please see the Central SoMa POPOS policy paper found here:

Central SoMa Draft Policy Document: Privately Owned Public Open Spaces (POPOS) (November 2014):  
[http://www.sf-planning.org/ftp/files/Citywide/Central Corridor/Draft CentralSoMa POPOS Policy-November2014.pdf](http://www.sf-planning.org/ftp/files/Citywide/Central_Corridor/Draft_CentralSoMa_POPOS_Policy-November2014.pdf)

Due to the complexity of the site context and great potential to influence the character of the area, the Planning Department encourages the project sponsor to initiate this landscape and ground floor design development early in the project.

Additionally, per Planning Code Section 138.1, the Department will require standard streetscape elements and sidewalk widening for the appropriate street type per the Better Streets Plan, including landscaping, site furnishings, and/or corner curb extensions (bulb-outs) at intersections (See Better Streets Plan Section 4 for Standard Improvements and Section 5.3 for Bulb-Out Guidelines). The project sponsor is required to submit a Streetscape Plan illustrating these features, and the department will work with the project sponsor and other relevant departments to determine an appropriate streetscape design. Standard street improvement would be part of basic project approvals not count for as credit towards in-kind contributions.

3. **Architecture.** As the project proposal is diagrammatic, the Planning Department has little comment on the architecture at this time but recommends that the project express significant depth and high-quality materials in the facades and reflect the architectural detailing and character of the neighborhood.

Above all, the project should express a clear and neighborhood-compatible architectural idea that not only provides a contemporary set of buildings, but acknowledges the history of the site, expresses the unique nature of the development program, and feels accessible and welcoming for

its public elements. The architecture should consider itself as a campus of features that may have some commonality, but may also express variety in their concept, material creativity, and personality.

**PRELIMINARY PROJECT ASSESSMENT EXPIRATION:**

This Preliminary Project Assessment is valid for a period of **18 months**. An Environmental Evaluation, Conditional Use Authorization, or Building Permit Application, as listed above, must be submitted no later than **January, 23, 2017**. Otherwise, this determination is considered expired and a new Preliminary Project Assessment is required. Such applications and plans must be generally consistent with those found in this Preliminary Project Assessment.

### APPENDIX B – PM2.5 LOCALIZED SIGNIFICANCE THRESHOLD LOOK-UP TABLES

## Introduction

In the last few years, both California and the federal governments have established ambient air quality standards for fine particulate matter (PM) less than or equal to 2.5 microns in diameter (PM2.5). As a result, there is a need to establish a methodology for calculating PM2.5 and appropriate PM2.5 significance thresholds for the purpose of analyzing local and regional PM2.5 air quality impacts in California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA) air quality analyses. This document provides a methodology for calculating PM2.5 and recommendations for localized and regional PM2.5 significance thresholds.

## Background

PM larger than 2.5 microns and less than 10 microns, often referred to as the coarse PM fraction (or PM10), is mostly produced by mechanical processes. These include automobile tire wear, industrial processes such as cutting and grinding, and re-suspension of particles from the ground or road surfaces by wind and human activities such as construction or agriculture. In contrast, PM less than or equal to PM2.5 is mostly derived from combustion sources, such as automobiles, trucks, and other vehicle exhaust, as well as from stationary combustion sources. The particles are either directly emitted or are formed in the atmosphere from the combustion of gases, such as NO<sub>x</sub> and SO<sub>x</sub> combining with ammonia. PM2.5 components from material in the earth's crust, such as dust, are also present, with the amount varying in different locations. Staff's recommendation for calculating PM2.5 focuses only on directly emitted PM2.5.

In 1997, U.S. EPA established an annual and a 24-hour standard for the finest fraction of particulates, PM2.5, to complement the existing PM10 standards. However, U.S. EPA recently modified the 24-hr PM2.5 standard and revoked the annual PM10 standard. (Table 1). The annual component of the standard was established to provide protection against typical day-to-day exposures as well as longer-term exposures, while the daily component protects against more extreme short-term events.

**TABLE 1**

Federal Standards for Particulate Matter

Federal Standards	PM 10	PM 2.5
Annual	Revoked <sup>a</sup>	15 µg/m <sup>3</sup>
24-Hour	150 µg/m <sup>3</sup>	35 µg/m <sup>3</sup> <sup>b</sup>

In June 2002, the California Air Resources Board (CARB) adopted new, stricter standards for particulate matter that would affect both the coarse as well as fine particulate fraction (Table 2). CARB delayed action on the proposed 24-hour PM2.5 standard in light of the

findings related to statistical issues in several key short-term exposure health effects studies.

**TABLE 2**

California Standards for Particulate Matter

California Standards	PM 10	PM 2.5
Annual	20 $\mu\text{g}/\text{m}^3$	12 $\mu\text{g}/\text{m}^3$
24-Hour	50 $\mu\text{g}/\text{m}^3$	n/a

**Methodology to Calculate PM 2.5**

Because there are currently few or no PM2.5 emission factors for mechanical or combustion processes, staff is recommending an indirect approach to calculating PM2.5 emissions until such time as PM2.5 factors are developed. Since PM2.5 is a subset of PM10, the current methodology for calculating PM10 from fugitive dust sources (grading, demolition, unpaved roads, open storage piles, etc.) and combustion sources (stationary combustion sources, vehicle exhaust) will continue to be used to calculate PM10 and can also be used to calculate PM2.5. Total suspended PM (TSP) emissions typically contain specific fractions of PM10 and PM2.5 that can be measured. In general, PM from fugitive dust generating sources is primarily composed of PM10 with a relatively small fraction of the fugitive PM consisting of PM2.5. Alternatively, PM from combustion sources is primarily composed of PM2.5 with a small fraction consisting of PM10.

To calculate both PM10 and PM2.5, existing PM10 calculation methodologies for both fugitive dust PM10 and combustion PM10 can be used. To determine the PM2.5 fractions of the PM10 emission results, staff is recommending that the PM10 emissions be calculated using standard PM10 calculation methodologies. The PM10 emission results for each emission source or operation would then be multiplied by the applicable PM2.5 fraction, derived by emissions source, using PM profiles in the California Emission Inventory Data and Reporting System (CEIDARS) developed by the California Air Resources Board (CARB). The CEIDARS PM profiles are used to develop emission inventories for a variety of sources and operations in the Air Quality Management Plan (AQMP). The CEIDARS PM profiles have been streamlined to be used for most types of processes that would be encountered in a CEQA or NEPA document. In addition, AQMD staff has identified the PM2.5 fraction of PM10. The streamlined CEIDARS PM profiles can be found in Appendix A. The CEIDARS PM profiles may be updated as necessary to reflect updates prepared by CARB.

If the project being evaluated is not listed among the categories in Appendix A, then the closest related type of operation/process should be used. For example in analyzing construction activities, e.g., grading, earth moving, etc., if the specific activity is not located in the tables the CEQA practitioner can use the following default factors derived from the 2003 AQMP annual inventories (see Tables 3 and 4 below under the “Localized Significance Thresholds for PM2.5 Emissions” discussion). For mechanical dust generating sources, e.g., construction, the PM2.5 fraction of PM10 is 21 percent and for combustion sources the PM2.5 fraction of PM10 is 99 percent. For off-road combustions

sources, the PM2.5 fraction default would be 89 percent (Table 5). Other publicly available and peer reviewed sources of PM10 and PM2.5 emission factors can also be used if they more closely match the type of emission source than the sources identified in Appendix A. In addition, site-specific or project-specific information can be used.

Once the PM10 fractions from all emissions sources are calculated, these are summed and compared to the appropriate PM10 significance thresholds to determine whether or not a project is significant. Similarly, once the PM2.5 fractions from all emissions sources have been calculated, these are also summed (separate from the PM10 fractions) and compared to the appropriate PM2.5 significance threshold (see following discussion) to determine project significance.

The PM2.5 fraction of PM10 can be easily calculated as follows.

Step 1: Calculate PM10 emissions for each emissions source category.

Step 2: Look up the PM2.5 fraction of PM10 for the applicable source category by year that construction will occur or operation of the project will begin (Appendix A, column 6 of the appropriate table).

Step 3: Multiply the PM2.5 fraction by the PM10 emissions for each source category (PM2.5 emissions = PM10 emissions x [PM2.5 fraction])

Step 4: Sum the PM2.5 emissions from each emissions source.

Step 5: Compare PM2.5 emissions to the appropriate significance threshold.

Example:

A project is estimated to generate 8 pounds per day of PM10 from one piece of construction equipment. The PM2.5 emissions are as follows:

PM2.5 emissions = 8 pounds of PM10 per day x 0.89 = 7.12 pounds of PM2.5 per day.

In conjunction with establishing a methodology for calculating PM2.5, staff has developed the following recommended PM2.5 significance thresholds for both localized and regional significance for both construction and operation.

### **Localized Significance Thresholds for PM 2.5 Emissions**

Localized significance thresholds (LSTs) were developed in response to the SCAQMD Governing Board's environmental justice (EJ) initiatives (EJ initiative I-4) in recognition of the fact that criteria pollutants, carbon monoxide (CO), oxides of nitrogen (NOx), and PM10 in particular, can have local impacts as well as regional impacts. The LST proposal went through extensive public outreach and was adopted by the Governing Board in October 2003. At the time the LST was adopted by the Governing Board, staff had not yet developed proposed LSTs for PM2.5.

Determining localized air quality impacts requires dispersion modeling. Because local lead agencies may not have the expertise or resources to perform dispersion modeling, SCAQMD created a series of look-up tables for CO, NO<sub>x</sub>, and PM<sub>10</sub> in which staff back-calculated the mass emissions necessary to equal or exceed the construction or operation LST. The look-up tables were created for projects one to five acres in size and take into consideration location (source receptor area) and distance to the sensitive receptor. To use the look-up tables, the lead agency calculates daily emission as it normally would and then compares the results to the emissions in the applicable look-up table.

In general, the LSTs will apply primarily to construction because emissions from construction equipment occur at a fixed location compared to operation, which, for most land use projects, consists of emissions from vehicles traveling over the roadways, which, therefore, do not create impacts to a single location. To further assist lead agencies with calculating construction emissions, the SCAQMD conducted construction site surveys for each phase of construction to develop standard construction scenarios relative to construction equipment and hours of operation. Spreadsheets were developed to calculate emissions for the construction scenarios in an effort to create scenarios that would not exceed any applicable LSTs. When preparing a CEQA analysis, lead agencies could use the sample construction projects for their construction analyses, use the spreadsheets to tailor the analysis to their individual projects, or use a combination of the two.

The following subsections describe the proposed PM2.5 LSTs for both operation and construction.

### **Establishing LSTs**

To determine the effects of PM2.5 on local (nearby) receptors, such as residents, hospitals, schools, etc., a PM2.5 localized significance threshold (LST) needs to be established. Since the Basin exceeds one or more of the state or federal ambient air quality standards for PM2.5, the process used to determine significance for attainment pollutants, i.e., NO<sub>2</sub> and CO, developed for the LST program cannot be used<sup>c</sup>. Under the LST program, since PM<sub>10</sub> is a nonattainment pollutant, the LST methodology uses a different process for determining whether localized PM<sub>10</sub> air quality impacts are significant. To determine localized PM<sub>10</sub> air quality impacts during operation, the LST methodology uses as a significance threshold the allowable change in concentration threshold for PM<sub>10</sub> listed in Rule 1303, Table A-2, which is 2.5 micrograms per cubic meter (µg/m<sup>3</sup>). The allowable change in concentration threshold is a modeled concentration that cannot be exceeded at the sensitive receptor, and determines whether or not a permit applicant will receive a permit from the SCAQMD. For the LST program staff used a dispersion model (ISCST3) to convert the 2.5 µg/m<sup>3</sup> concentration into mass daily PM<sub>10</sub> emissions numbers based on the size of the project, location of the project, and distance to the sensitive receptor. The

---

<sup>c</sup> Under the LST program, to determine significance for attainment pollutants, the emissions contribution from the project expressed as a concentration is added to the highest local ambient concentration from the last three years where data are available. If the sum is equal to or greater than any applicable state or federal ambient air quality standard, the project is considered to have significant localized air quality impacts for that pollutant. More information on the LST program can be found at the following URL: <http://www.aqmd.gov/ceqa/handbook/LST/LST.html>.

results were then incorporated into an LST look-up table. If the mass emissions from a project exceed the applicable LST look-up tables' mass emission numbers (which are based on the 2.5  $\mu\text{g}/\text{m}^3$  concentration), then localized PM10 air quality impacts are considered to be significant.

### ***Operational Localized Significance Thresholds***

To establish operational PM2.5 localized significance thresholds, staff first reviewed the PM inventories in Appendix III of the 2003 AQMP. In particular, staff evaluated the composition of PM10 and PM2.5 from combustion processes in the 2003 AQMP to establish a general ratio of PM2.5 to PM10. Combustion processes were evaluated because, for most land use projects, mobile source combustion emissions comprise the majority of emissions. Table 3 shows the total PM10 and PM2.5 inventories for total fuel combustion process for the years 2005 through 2010. As can be seen in Table 3, over the five-year timeframe considered, the fraction of combustion PM10 that consists of PM2.5 is consistently 99 percent. Since combustion PM10 and PM2.5 fractions are essentially equivalent, staff is recommending that the operational localized significance threshold for PM2.5 be the same as the current operational localized significance threshold for PM10, i.e., 2.5  $\mu\text{g}/\text{m}^3$ .

**TABLE 3**

Total Stationary Source Fuel Combustion Inventory (Tons/Day)

Year	PM 10	PM 2.5	Percent of PM 10 which is PM 2.5
2005	8.13	8.01	99
2006	8.21	8.10	99
2007	8.30	8.18	99
2008	8.38	8.26	99
2010	8.54	8.42	99

### ***Construction Localized Significance Thresholds***

Similarly, to develop a PM2.5 construction significance threshold for localized impacts, staff considered the PM2.5 contribution from fugitive sources and the PM2.5 contribution from combustion sources (construction equipment). As discussed in more detail in the following paragraphs, combustion emissions from the construction equipment contribute a larger portion of the total PM2.5 emissions from construction operations than fugitive sources.

Staff then reviewed the 2003 AQMP, Appendix III fugitive PM inventory for construction and demolition to obtain the PM10 and PM2.5 compositions. Table 4 shows the total PM10 and PM2.5 inventories for construction activities for the years 2005 through 2010. As can be seen in Table 4, over the five-year timeframe, the fraction of PM10 that consists of PM2.5 is consistently 21 percent. Multiplying the fugitive PM2.5 percent fraction of

PM10 by the existing construction PM10 LST, 10.4  $\mu\text{g}/\text{m}^3$ , produces a result of approximately 2.2  $\mu\text{g}/\text{m}^3$ .

**TABLE 4**

Total Fugitive PM Inventory (Tons/Day)

Year	PM 10	PM 2.5	Percent of PM 10 which is PM 2.5
2005	42.7	8.91	21
2006	43.66	9.11	21
2007	44.6	9.3	21
2008	45.54	9.5	21
2010	47.44	9.9	21

Source: Appendix III, 2003 AQMP, Annual Average Emission Inventory

Off-road construction equipment, however, also contributes combustion PM as well as fugitive PM. To determine the contribution of PM2.5 from construction equipment combustion emissions, staff performed dispersion modeling using the ISCST3 dispersion model for one-, two-, and five-acre construction scenarios. The construction scenarios were developed from construction site surveys conducted in connection with staff's original LST proposal. Combustion sources were modeled as adjacent five-meter volume sources and fugitive sources were modeled as adjacent one-meter area sources. Worst-case meteorological data from the West Los Angeles source receptor area were used and receptors were placed at 25, 50, 100, 200, and 500 meter distances from the construction site. Using CARB speciation data, it was assumed that 21 percent of fugitive dust PM10 is comprised of PM2.5 and 89 percent of off-road equipment combustion PM10 emissions are comprised of PM2.5 (based 2003 AQMP inventories, see Table 5).

**TABLE 5**

Combustion PM Inventory from Off-Road Equipment (Tons/Day)

Year	PM 10	PM 2.5	Percent of PM 10 which is PM 2.5
2005	11.95	10.64	89
2006	11.61	10.33	89
2007	11.2	9.97	89
2008	10.93	9.71	89
2010	10.26	9.09	89

Source: Appendix III, 2003 AQMP, Annual Average Emission Inventory

The modeling results showed that combustion PM2.5 from off-road equipment comprise approximately 75 to 100 percent of the total PM2.5 emissions from construction activities. Further, the PM2.5 contribution from fugitive sources is dependant on the construction phase. For example, the modeling showed that the demolition and site preparation phases have the highest fugitive PM2.5 contribution to the overall results, whereas, the building and asphalt paving phases contribute the most combustion PM2.5 to the overall results.

The modeling results indicate that the contribution of off-road combustion PM2.5 emissions can be three to four times higher than the contribution of PM2.5 from fugitive sources. Based on this result, staff recommends that the PM2.5 fugitive dust component be adjusted upward by approximately four times to account for the PM2.5 emissions from the construction equipment. As a result, staff is recommending a PM2.5 construction LST of  $10.4 \mu\text{g}/\text{m}^3$ , the same as the construction LST for PM10. Finally, an exceedance of either the PM10 construction LST or the PM2.5 construction LST is a significant adverse localized air quality impact.

### **Regional Emission Threshold of Significance for PM 2.5**

Emissions that exceed the regional significance thresholds are mass daily emissions that may have significant adverse regional effects and are the air quality significance thresholds with which most CEQA practitioners are familiar.

**Table 6**  
Regional Air Quality Significance Thresholds

<i><b>Mass Daily Thresholds<sup>a</sup></b></i>		
<b>Pollutant</b>	<b>Construction<sup>b</sup></b>	<b>Operation<sup>c</sup></b>
NOx	100 lbs/day	55 lbs/day
VOC	75 lbs/day	55 lbs/day
PM10	150 lbs/day	150 lbs/day
SOx	150 lbs/day	150 lbs/day
CO	550 lbs/day	550 lbs/day
Lead	3 lbs/day	3 lbs/day

The following subsection describes the proposed PM2.5 regional significance thresholds for both operation and construction.

#### **Establishing Regional Significance Thresholds**

PM emissions also affect air quality on a regional basis. When fugitive dust enters the atmosphere, the larger particles of dust typically fall quickly to the ground, but smaller particles less than 10 microns in diameter may remain suspended for longer periods, giving the particles time to travel across a regional area and affecting receptors at some distance from the original emissions source. Fine PM2.5 particles have even longer atmospheric residency times. Staff is recommending a PM2.5 regional significance threshold based on a recent EPA proposal, as explained in the following paragraphs.

On September 8, 2005, EPA published in the Federal Register “Proposed Rule to Implement the Fine Particle National Ambient Air Quality Standards,” which proposed a significant emission rate for PM2.5 of 10 tons per year. Staff is proposing to use EPA’s

significant emission rate for PM2.5 to develop the daily mass emission regional significance threshold for PM2.5. Converting the annual rate, 10 tons, into a daily rate produces a daily rate of approximately 55 pounds per day. A similar approach was used to derive the operational regional significance thresholds for NO2 and VOC. NO2 and VOC operational regional significance thresholds were derived by using the NOx/VOC emission rate that defined a major source in the South Coast Air Basin, 10 tons per year. Converting the annual emissions rate into a daily rate resulted in a regional operational significance threshold of 55 pounds per day for each pollutant. Similar to the regional significance threshold for PM10 of 150 pounds per day, the proposed PM2.5 regional significance threshold of 55 pounds per day would apply to both construction and operation.

## **Conclusion**

In this document staff identified a methodology to indirectly calculate PM2.5 emissions for a CEQA or NEPA air quality analysis, to be used until such time as PM2.5 emission factors are available, which will allow the CEQA practitioner to calculate PM2.5 emissions directly. In addition, PM2.5 construction and operation LSTs have been identified to address localized impacts. The PM2.5 LSTs will be used to develop look-up tables for projects five acres in size or smaller, similar to those prepared for PM10, nitrogen dioxide (NO2), and carbon monoxide (CO). As with the other pollutants, the PM2.5 look-up tables can be used as a screening procedure to determine whether or not small projects (less than or equal to five acres) will generate significant adverse localized air quality impacts. Screening procedures are by design conservative, that is, the predicted impacts tend to overestimate the actual impacts. If the predicted impacts are acceptable using the LST look-up tables, then a more detailed evaluation is not necessary. However, if the predicted impacts are significant, then the project proponent may wish to perform a more detailed emission and/or modeling analysis before concluding that the impacts are significant. Project proponents are not required to use this LST procedure; and may complete site specific modeling instead. Site-specific modeling is required for projects larger than five acres.

# Diesel & Health Research

*This page last reviewed June 21, 2011*

## Background on Diesel Health Effects

Diesel engines emit a complex mixture of air pollutants, composed of gaseous and solid material. The visible emissions in diesel exhaust are known as particulate matter or PM. In 1998, California identified diesel exhaust particulate matter (PM) as a [toxic air contaminant](#) based on its potential to cause cancer, premature death, and other health problems. Diesel engines also contribute to California's fine particulate matter (PM<sub>2.5</sub>) air quality problems. Those most vulnerable are children whose lungs are still developing and the elderly who may have other serious health problems. Based on year 2006-2008 emissions in California, diesel PM contributes each year to approximately 2,000 premature deaths, with an uncertainty range of 1,500 to 2,400. In addition, diesel soot causes visibility reduction and is a potent global warmer.

## EXHIBIT 9

**COMMISSION ON COMMUNITY INVESTMENT AND INFRASTRUCTURE**

**RESOLUTION NO. 62 - 2015**

**APPROVING AN AMENDED BUDGET FOR THE PERIOD JULY 1, 2015 THROUGH JUNE 30, 2016, TO INCREASE, BY AN AMOUNT NOT TO EXCEED \$135,000,000, BOND PROCEEDS TO BE RECEIVED BY THE SUCCESSOR AGENCY AND TO INCREASE ITS EXPENDITURE AUTHORITY BY \$135,000,000 AND AUTHORIZING THE EXECUTIVE DIRECTOR TO SUBMIT THE BUDGET TO THE MAYOR'S OFFICE AND THE BOARD OF SUPERVISORS**

**BASIS FOR RESOLUTION**

- WHEREAS, The Redevelopment Agency of the City and County of San Francisco (the "Former Redevelopment Agency") and FOCIL-MB, LLC (the "Master Developer"), as assignee of Catellus Development Corporation, are parties to a Mission Bay South Owner Participation Agreement executed November 16, 1998, and amended three times (as further amended, the "OPA"), which includes the "Mission Bay South Financing Plan" (the "Financing Plan") and which provides, among other things, that tax increment financing will be used to reimburse the Master Developer's expenditures for public infrastructure; and,
- WHEREAS, As part of the OPA, the Former Redevelopment Agency entered into a series of binding agreements, including the Mission Bay South Tax Increment Allocation Pledge Agreement executed November 16, 1998, by and between the City and County of San Francisco and the Former Redevelopment Agency (the "Pledge Agreement"), to which the Master Developer is an express third-party beneficiary; and,
- WHEREAS, On February 1, 2012, state law dissolved the Former Redevelopment Agency and required the transfer of certain of its assets and obligations to the Successor Agency to the Former Redevelopment Agency, commonly known as the Office of Community Investment and Infrastructure ("Successor Agency" or "OCII"), Cal. Health & Safety Code §§ 34170 et seq. ("Redevelopment Dissolution Law"); and,
- WHEREAS, The California Department of Finance has finally and conclusively determined that the OPA and Pledge Agreement are enforceable obligations that survived the dissolution of the Former Redevelopment Agency and that became the responsibility of the Successor Agency; and,
- WHEREAS, The OPA, including the Financing Plan and the Pledge Agreement, contain an irrevocable pledge of property tax increment (formerly tax increment revenues) to the payment of Mission Bay South Redevelopment Project Area Infrastructure Costs, as defined in the Financing Plan, ("Infrastructure Costs") and the Successor Agency is obligated, under the OPA, including the Financing Plan and the Pledge

Agreement, to issue bonds or incur other indebtedness secured by an irrevocable pledge of tax increment revenues to pay such Infrastructure Costs; and,

WHEREAS, The Master Developer has submitted a written request to the Successor Agency, Letter, November 14, 2014, and the Successor Agency staff, its consultants and bond counsel, and the Master Developer have met and conferred, over several months, and have determined that, pursuant to the Financing Plan and the Pledge Agreement, but subject to the approval of the Oversight Board and the California Department of Finance, the Successor Agency will issue additional Tax Allocation Debt to reimburse the Master Developer for Infrastructure Costs; and,

WHEREAS, Section 34177.5(a)(4) provides that a successor agency may, subject to the approval of the oversight board and the California Department of Finance, issue bonds or incur other indebtedness to make payments under enforceable obligations when the enforceable obligations include the irrevocable pledge of property tax increment, formerly tax increment revenues, or other funds and the obligation to issue bonds secured by that pledge; and,

WHEREAS, Under Redevelopment Dissolution Law, Cal. Health & Safety Code Section 34173, and San Francisco Ordinance No. 215-12 (Oct. 4, 2012), the OCII is a separate legal entity from the City and is subject to the governance of the Board of Supervisors of the City and County of San Francisco (“Board of Supervisor”), acting in its legislative capacity. Under Section 33606 of the California Health and Safety Code, the Board of Supervisors must approve the Successor Agency’s annual budget, which is required to include proposed revenues, expenditures, and indebtedness, and must also approve budget amendments; and,

WHEREAS, On May 5, 2015, this Commission approved, by Resolution 25-2015, a budget for FY 2015-16; subsequently, the Board of Supervisors approved, by Resolution No.278-15 (July 30, 2015), the Successor Agency budget for FY 2015-16 and authorized the issuance of bonds not to exceed \$51,000,000; and,

WHEREAS, Subsequent to the final approval of the Successor Agency’s FY 2015-16 budget, the Successor Agency has determined that the issuance of additional tax allocation debt is necessary and appropriate to fulfill its obligations under the OPA. The proposed issuance includes two series of tax allocation revenue bonds for Mission Bay South Redevelopment Project Area in an aggregate principal amount not to exceed \$135 million and increases budgetary expenditure by \$135 million (“Additional Tax Allocation Debt”); and,

WHEREAS, The proceeds of the bonds will, as required by the OPA, be used for the reimbursement of Infrastructure Costs and costs associated with the issuance of those bonds; and,

WHEREAS, The bonds will likely issue in two series: Series 2015C in a principal amount not to exceed \$45 million will be a “parity bond” issued on the same terms as the currently outstanding Mission Bay South Redevelopment Project Area tax-exempt tax allocation bonds; and Series 2015D subordinate bond in a principal amount

not to exceed \$90 million, the debt service on which will be payable only after the debt service on the parity bonds has been paid; and,

WHEREAS, Issuance of the Additional Tax Allocation Debt will require an amendment to the Successor Agency's budget for FY 2015-16 to receive and expend an additional \$135 million and will also require Board of Supervisors' authorization of the additional debt; and,

WHEREAS, Approval of the FY 2015-16 Budget is not a "Project," as defined by the California Environmental Quality Act ("CEQA") Guidelines Sections 15378(b)(4) and 15378(b)(5). The budget will provide administrative, technical assistance support, and funding for activities authorized under Redevelopment Dissolution Law. Actions related to the approval of the budget will not independently result in a physical change in the environment are not subject to environmental review under CEQA; now, therefore, be it

RESOLVED, That the Successor Agency approves amendments to its fiscal year budget for the period July 1, 2015 through June 30, 2016 ("FY 2015-16 Budget"), attached to this Resolution as Attachment A, to (1) increase the amount of bond proceeds to be received by the Successor Agency in an additional principal amount not to exceed \$135 million and (2) increase expenditure authority by \$135 million; and furthermore authorizes the Executive Director to transmit the FY 2015-16 Amended Budget to the Mayor's Office and the Board of Supervisors and to make any nonmaterial changes that may be proposed during review by the Mayor or Board of Supervisors, provided that the Executive Director shall seek Commission approval for any material changes to the budget.

Attachment A: OCII FY 2015-16 Budget, as amended

I hereby certify that the foregoing resolution was adopted by the Commission at its meeting of October 20, 2015.

# OFFICE OF COMMUNITY INVESTMENT & INFRASTRUCTURE

## FY 2015-16 Proposed Budget

### 1. Background

The Office of Community Investment & Infrastructure is the Successor OCII to the San Francisco Redevelopment Agency. On February 1, 2012 the San Francisco Redevelopment Agency (“SFRA”), along with all 400 redevelopment agencies in California, was dissolved pursuant to Assembly Bill 26 (“AB 26”) and by order of the California State Supreme Court. In June of 2012, Assembly Bill 1484 was passed to further clarify certain aspects of the dissolution of redevelopment agencies, and together the two assembly bills are known as the “Dissolution Law”. Pursuant to the Dissolution Law and to Board of Supervisors Ordinance 215-12, the Office of Community Investment and Infrastructure (“OCII”) is the Successor OCII to the San Francisco Redevelopment Agency. As Successor Agency, OCII succeeds to the organizational status of SFRA but without any legal authority to participate in redevelopment activities except to complete work related to approved enforceable obligations.

Those enforceable obligations are related to: (1) the Major Approved Development Projects (defined as the Hunters Point Shipyard / Candlestick Point Redevelopment Project, the Mission Bay North and South Redevelopment Project, and the Transbay Redevelopment Project); (2) the asset management of SFRA assets such as Yerba Buena Gardens, existing economic development agreements such as loans, grants, or owner participation agreements, and other real property and assets of SFRA that must be wound down under the Dissolution Law; and (3) OCII’s Retained Housing Obligations which include ensuring the development of affordable housing in the Major Approved Development Projects.

OCII’s obligations are a key part of the Mayor’s plan to create 30,000 units by 2020, with one-third, or 10,000, of them as permanently affordable. In fact OCII’s Retained Housing Obligations will result in over 3,300 affordable units by 2020 through both stand-alone projects funded with OCII subsidy as well as inclusionary affordable units provided through private development. This includes several OCII sponsored projects that received completion permits just before the close of 2013, and opened their doors to welcome new residents in 253 affordable units in early 2014. The 1180 4<sup>th</sup> Street project delivered another 150 units later in 2014. Below is a summary of OCII’s contribution to the Mayor’s plan to create this vitally important resource for San Francisco.

#### Mayor’s Plan for 10,000 Affordable Units by 2020: OCII Pipeline

Project Status	Affordable Stand-Alone Units	Affordable Inclusionary Units	Totals
Completed & Occupied	400		<b>400</b>
In Construction	543	102	<b>645</b>
In Predevelopment	754	272	<b>1,026</b>
In Preliminary Planning	936	359	<b>1,011</b>
<b>Totals</b>	<b>2,633</b>	<b>733</b>	<b>3,366</b>

OCII FY 2015-16 Budget Submitted to the San Francisco Board of Supervisors, June 1, 2015 as Amended July 21, 2015

## *Governance*

The Commission on Community Investment and Infrastructure, which was established by the City through Ordinance 215-12, is the main governing body of OCII and is responsible for implementing and completing the enforceable obligations of the former redevelopment projects, including exercising land use and design approval authority for the Major Approved Development Projects. The Commission is comprised of five members appointed by the Mayor and confirmed by the Board of Supervisors, with two of the seats held by residents of the two supervisorial districts with the largest amounts of the Major Approved Development Projects.

The Dissolution Law requires that there be an additional governing body known as an Oversight Board to oversee certain functions of OCII as the Successor OCII, and which has a fiduciary duty to the holders of enforceable obligations with the former Redevelopment Agency and to the taxing entities that are entitled to an allocation of property taxes. The Oversight Board of the City and County of San Francisco reviews and approves OCII's expenditures and use of tax increment through semi-annual Recognized Obligation Payment Schedules ("ROPS"), as well as approving the issuance of any bonds, transfers of property, and other matters related to the dissolution of SFRA. The Mayor appoints four of the seven members of the Oversight Board, subject to confirmation by the Board of Supervisors. One of those four members must represent the largest group of former OCII employees. The remaining three members are representatives of affected taxing entities: the Bay Area Rapid Transit District, the San Francisco Unified School District, and the San Francisco Community College.

The Dissolution Law requires that OCII be a separate legal entity from the City and County of San Francisco, just as SFRA was. However, OCII is still subject to the governance of the City acting through its legislative capacity. Accordingly, the OCII's budget must be approved first by the Commission and subsequently approved by the Mayor and Board of Supervisors.

## 2. Budget Summary

As shown in Table 1, the Fiscal Year (“FY”) 2015-16 proposed budget of \$629 million represents an increase of \$251.7 million compared to the prior year, largely due to:

- The anticipated receipt of \$257 million in proceeds from the sale of publicly-owned land in the Transbay area, of which \$243 million represents land sales proceeds from Zone 1 which will be provided to the Transbay Joint Powers Authority to help finance construction of the Transit Center, and the remaining \$12 million will help to subsidize affordable housing development.
- The anticipated issuance and use of \$45 million in new taxable bond proceeds to finance affordable housing in the Mission Bay South and Hunters Point Shipyard/Candlestick Point project areas.
- \$111 million reduction in one-time developer payments and \$28 million reduction in prior year fund balances included in the FY 2014-15 budget and designated for affordable housing.
- \$10 million reduction in anticipated Property Tax – Mission Bay revenues due to a one-time correction resulting in additional property tax allocated to Mission Bay in FY 2014-15.
- \$7 million reduction in hotel tax revenues for debt service due to the final payment made during FY 2014-15 on 1992 hotel tax bonds for the Moscone Convention Center, leaving only one remaining series of hotel tax-funded bonds.
- The anticipated issuance and use of \$135 million in new tax-exempt bond proceeds to finance the reimbursement of infrastructure costs in Mission Bay South.

Table 2 shows the OCII FY 2015-16 budget by high-level categories of spending and funding source. These show that excluding debt service and pass-throughs to the Transbay Joint Powers Authority, 36% (\$98 million) of the budget is for Affordable Housing, 53% for infrastructure, 7% for asset management (including Yerba Buena Gardens programming and maintenance), and 4% for project management and administration.

Looking at budget sources for current operations, proposed new bond proceeds make up 64% of the budget, while property tax, developer payments, and fund balances constitute approximately 10% each. Rents and garage revenues make up 6%, with less than 1% attributed to various other revenues.

Table 3 shows the proposed FY 2015-16 budget by project.

**Table 1. FY 2015-16 Proposed Budget, \$ Thousands**

<b>Sources</b>	<b>FY 15 Budget</b>	<b>FY 16 Adopted</b>	<b>Diff FY 15 vs FY 16</b>	<b>FY 16 Proposed Amended</b>

OCII also administers six Community Facilities Districts (“CFDs”) created under California’s Mello-Roos Act which support infrastructure and maintenance activities in project areas with funds from dedicated parcel taxes. Although the CFD activities are not included in OCII’s budget, their spending plans, annual levies and outstanding debt as of June 30, 2015 are provided for informational purposes in Appendix 1.

In addition to authorizing expenditure of amounts specified in the FY 2015-16 budget, the enabling resolution accompanying the budget would:

- Allow OCII to transfer budgeted appropriations within the projects shown on Table 3 and to transfer appropriations for allocated staffing and overhead costs between projects.
- Direct that the expenditure authority funded by proposed tax allocation bonds shall be reserved and subject to release after receipt by OCII of such bond funds or substitute financing.
- Authorize OCII to expend the interest earned on bond proceeds for purposes consistent with the bond indentures, subject to consistency with an approved ROPS, and provided that OCII has determined that such interest is not subject to Internal Revenue Service arbitrage restrictions.
- Authorize OCII to accept and expend any pledged property tax revenues in the Mission Bay North and South, Rincon Point South Beach and Transbay project areas, and Transbay revenues from sale of formerly state-owned properties, for their pledged purposes, subject to consistency with an approved ROPS.
- Authorize the Executive Director to expend funds appropriated in prior years in reserve accounts designated for affordable housing projects, community benefits grants and Yerba Buena Gardens capital account for their designated purposes; subject to the availability of funds and consistency with an approved ROPS.

### **3. Administration Expenses and Budgeted Positions**

Table 4 provides a summary of OCII’s proposed \$11.9 million FY 2015-16 administrative budget, representing a \$40 thousand decrease from the prior year.

<b>Total Uses</b>	<b>\$ 11,895</b>	<b>\$ 11,855</b>	<b>\$ (40)</b>

The \$7.8 million budget for staff salaries and benefits includes both OCII staff and City Administrator staff assigned to OCII. This budget represents a \$798,000 decrease from the approved FY 2014-15 budget, despite the provision of cost-of-living increases to OCII staff that match those received by City of San Francisco staff. The decrease is primarily due to:

- Transfer of 9.6 FTE South Beach Harbor staff to the Port of San Francisco due to the assumption by the Port of responsibility for operation of South Beach Harbor and transfer of 2 FTE OCII staff to the Mayor's Office of Housing and Community Development to continue work on former SFRA housing programs transferred to the City after redevelopment dissolution. Savings from these transfers is partially offset by:
- Proposed addition of full time equivalent ("FTE") positions to help OCII accelerate affordable housing production and other horizontal and vertical development in FY 2015-16, as described in the "Budgeted Positions" section below.
- Decrease in the CalPERS employer share contribution as a percentage of payroll from 18.19% in FY 2014-15 to 9.52% in FY 2015-16, with the "unfunded accrued actuarial liability ("UAAL") billed separately as a lump sum and included in the budget separately. The employer contribution is further offset by the supplemental employee contribution of 1% salary, rising to 2.25% in October 2015 in accordance with recently negotiated labor agreements.

Other items of note include:

- **Affordable Housing Services:** The \$827,000 budget represents \$687,000 in staffing support provided by the Mayor’s Office of Housing and Community Development and \$140,000 for OCII’s contribution towards the software development costs of MOHCD’s new online Affordable Housing Data Portal (SF DAHLIA). OCII’s contribution is 10% of the overall software cost, based on an estimate of OCII projects’ usage of the system.
- **Retiree Health and Pension Unfunded Accrued Actuarial Liability (“UAAL”) contribution:** This includes \$1,040,000 budgeted for retiree health insurance obligations, and a further \$536,660 budgeted for OCII’s contribution to its pension liability, as calculated under a new billing formula and procedure established by the California Public Employees Retirement System (“CalPERS”) starting in FY 2015-16. Under the existing system, agencies such as OCII were billed by CalPERS a percentage of their active employee payroll to cover both the pension benefit being earned by their employees each year (also known as the “normal cost”) and an additional percentage for the UAAL—an estimated amount needed to catch up for unfunded liabilities in the system as a result of the pension system not meeting expectations in prior years or as a result of new demographic assumptions, such as the realization that retirees are living longer and the system will need to pay out more funds as a result. Under the new formula, the CalPERS bills for the UAAL portion as a fixed dollar amount each year rather than as a percentage of payroll.
- **Legal Services:** The \$265,000 budget includes:
  - \$125,000 budget for City Attorney’s Office general legal support of OCII.
  - \$140,000 budget for other legal support that may be required by OCII.

Note that project-specific budgets include an additional \$1.1 million for City Attorney’s Office and \$0.85 million for other legal assistance.

- **Other Professional Services:** The \$275,000 budget includes \$100,000 for public communications support, \$20,000 for records management support, \$15,000 for Office of Labor Standards Enforcement investigations support and \$140,000 contingency budget for unforeseen requirements that may come up during the year, unchanged from the FY 2014-15 budgeted amounts.
- **Other Current Expenses:** The \$662,000 budget includes:
  - \$270,000 for insurance premiums and allowance for deductibles;
  - \$105,000 for software licensing fees
  - \$ 96,000 for mail, e-mail, internet, server hosting, telephone, copy machine and records storage
  - \$ 60,000 for office supplies and employee training and field expenses
  - \$ 60,000 for Commission and Oversight Board meeting expenses, including audiovisual recording of Commission meetings by SFGOV TV.
  - \$ 30,000 for information technology supplies.
  - \$ 41,000 for other expenses.

## **FY 2015-16 Budgeted Positions**

Budgeted positions and salary ranges are shown in Table 5. Salary ranges shown are as of May 2015 and are subject to change based on negotiated labor agreements. Salary ranges are for information only-- should there be any discrepancy between the salary ranges shown here and negotiated labor agreements, the negotiated labor agreement amount would be determinative. In special circumstances, and in accord with OCII's Personnel Policy, individuals may receive higher salaries than the ranges shown below to reflect acting assignments or unusual recruitment conditions.

In February 2015, OCII employees were offered positions within the City and County of San Francisco at comparable salaries that would allow them to continue working on OCII projects through a contractual arrangement between OCII and the City. At that time, 21 employees accepted the offer, including all nine employees working at South Beach Harbor, who will continue working at the Harbor after the ownership of the facility transfers to the Port of San Francisco, and two employees working on City housing programs that were assumed by the Mayor's Office of Housing and Community Development following redevelopment dissolution. The FY 2015-16 budgeted positions listed in Table 5 reflect the remaining OCII employees plus those former OCII employees who transferred to the City and are continuing to work on OCII work under contract to OCII.

The FY 2015-16 budget includes a net addition of six full time equivalent positions ("FTEs"), reflecting the increased workload based on the anticipated timing of development in the Major Approved Development Projects, along with a proposed accelerated work schedule for affordable housing projects, including up to 6 new Requests for Proposals ("RFPs") for affordable housing projects. The proposed new positions and position changes are:

- Addition of a Deputy General Counsel to support the OCII General Counsel with the increasing volume of legal review work. The cost of this position is partially offset by a reduction in the work order with the City Attorney's office from FY 2014-15 budgeted levels to reflect the actual level of support anticipated to be provided by that office.
- Addition of a Human Resources and Administrative Services manager position to bring in house services that were provided by the City Administrator's Office.
- Addition of one Project Manager, two Senior Development Specialists and one Management Assistant II to assist with the volume of development work proposed for FY 2015-16.

**Table 5. FY 15-16 Proposed FTE, Compared to Prior Year**

<b>Item</b>	<b>File</b>	<b>Page</b>
2	15-0995 Administrative Code – Establishing Mission Bay Transportation Improvement Fund, and Advisory Committee .....	1

<b>Item 2</b> <b>File 15-0995</b>	<b>Department:</b> Office of Community Infrastructure and Investment Office of Economic and Workforce Development
<b>EXECUTIVE SUMMARY</b>	
<p style="text-align: center;"><b>Legislative Objectives</b></p>	
<ul style="list-style-type: none"> <li>The proposed ordinance amends the Administrative Code to add a new Section 10.100-364 to establish the Mission Bay Transportation Improvement Fund to pay for additional services provided by San Francisco Municipal Transportation Agency (SFMTA), San Francisco Police Department (SFPD), and Department of Public Works (DPW) to the Warriors Project.</li> </ul>	
<p style="text-align: center;"><b>Key Points</b></p>	
<ul style="list-style-type: none"> <li>The Golden State Warriors Arena, LLC (Warriors) plans to construct a multipurpose event center and retail and office project at 16<sup>th</sup> and Third Streets in the Mission Bay neighborhood (Warriors Project). The SFMTA, SFPD, and DPW will provide services to the neighborhood surrounding the Warriors Project.</li> <li>The proposed ordinance establishes the Mission Bay Transportation Improvement Fund (Fund) as a category four fund, setting aside General Fund monies to pay for services provided by SFMTA, SFPD, and DPW to the Warriors Project. It is anticipated that the revenues to be realized from the Warriors Project will provide for the needed funding sources to the General Fund.</li> </ul>	
<p style="text-align: center;"><b>Fiscal Impact</b></p>	
<ul style="list-style-type: none"> <li>SFMTA's estimated costs to purchase four new light rail vehicles and make other transportation system improvements to accommodate the Warriors Project are \$55.3 million. Estimated revenues generated by the Warriors Project to pay these costs are \$25.4 million, resulting in a revenue shortfall of \$29.9 million. The estimated revenue shortfall of \$29.9 million will be financed through sale of SFMTA revenue bonds or other financing source. Annual debt service is projected to be paid from tax revenues generated by the Warriors Project.</li> <li>SFMTA's expenditures for transportation services to the Warriors Project will be paid by SFMTA fare and parking revenues generated by these services. The Mission Bay Transportation Improvement Fund will pay for SFMTA service to the Warriors Project not covered by these fare and parking revenues, and for SFPD and DPW services to the Warriors Project.</li> <li>City departments' estimated annual expenditures to provide services to the Warriors Project are \$10.1 million. These expenditures will be funded by an estimated \$11.6 million in revenues generated by the Warriors Project, resulting in net revenues of \$1.5 million.</li> </ul>	

**Policy Consideration**

- If the Warriors Project generates insufficient General Fund tax revenues to pay for all of SFMTA's costs to provide transportation services to the Warriors Project, the Warriors will need to directly provide some transportation services.
- Only General Fund tax revenues directly generated by the Warriors Project should be included in the Controller's estimates of Project revenues to the City.

**Recommendations**

- Amend the proposed ordinance to specify that if the annual cap of 90 percent of General Fund revenues from the Project site and events at the Event Center is insufficient to cover SFMTA's expenditures for transportation services to the Warriors Project, then the Warriors will be responsible to provide the additional transportation services to comply with EIR Mitigation Measures TR-2b and TR-18.
- Amend the proposed ordinance to specify that only tax revenues generated on-site by the Warriors Project are included in the Controller's estimates of General Fund revenue generated by the Warriors Project for the purpose of calculating the annual General Fund contribution to the Mission Bay Transportation Improvement Fund.
- Approve the proposed ordinance as amended.

## MANDATE STATEMENT

City Charter Section 2.105 states that all legislative acts shall be by ordinance and shall require two readings at separate meetings of the Board of Supervisors.

City Administrative Code Chapter 10, Article XVIII establishes the City's special funds. Administrative Code Section 10.100-1 defines the eight categories of special funds.

## BACKGROUND

The Golden State Warriors Arena, LLC (Warriors)<sup>1</sup> plans to construct a multipurpose event center and retail and office project at 16<sup>th</sup> and Third Streets in the Mission Bay neighborhood (Warriors Project). The Warriors Project will consist of 1,053,000 square feet of building space, as shown in Table 1 below, and 3.2 acres of open space.

**Table 1: Proposed Multipurpose Event Center, Retail and Office Project**

	<b>Square Feet</b>
Event Center with 18,064 seats	488,000
Office Space	513,000
Retail Space	52,000
<b>Total</b>	<b>1,053,000</b>

The Warriors purchased 11 acres previously owned by Salesforce.Com in October 2015 with a plan to complete the event center in time for the 2018-19 National Basketball Association (NBA) season. While the Warriors Project is a private development, the City will provide public transportation, including transportation infrastructure, and ongoing public services related to the development.

### **Mission Bay South Redevelopment Plan Area**

The Warriors Project is located on Blocks 29 to 32 in the Mission Bay South Redevelopment Plan Area (Mission Bay South) as shown in Figure 1 below.

<sup>1</sup> The Golden State Warriors Arena, LLC are an affiliate of the Golden State Warriors, LLC, who own the Golden State Warriors basketball team.

**Figure 1: Location of Warrior's Project In Mission Bay South**

### **Transportation and Other City Services to the Warriors Project**

The San Francisco Municipal Transportation Agency (SFMTA), San Francisco Police Department (SFPD), and Department of Public Works (DPW) will provide services to the neighborhood surrounding the Warriors Project.

#### *Transportation*

The Transportation Management Plan, required by the Project's Environmental Impact Report (EIR), includes the Muni Special Event Transit Service Plan, which commits SFMTA to provide additional service to the Warriors Project, including increased light rail service on the T-Third line, and special event shuttles. SFMTA would implement the following transportation infrastructure improvements and services to the Warriors Project:

- Purchasing four additional light rail vehicles
- Extending the existing boarding platform at 3<sup>rd</sup> and South Streets
- Running three special event shuttles to regional transit stations
- Expanding service levels on the T-Third light rail line, and

- Adding parking control officers to control traffic during arena events

#### *Police Services*

Depending on the size and type of events held in the Warriors' event center, the SFPD will incur additional costs by assigning from 8 to 14 police officers on overtime to patrol the neighborhoods surrounding the event center.

#### *Department of Public Works*

DPW will incur additional costs by providing an estimated 42 days of litter patrol, steam cleaning, and street sweeping on the streets adjacent to the Warriors Project.

#### **Development Impact Fees**

The Warriors will be required to pay two development impact fees contained in the Planning Code and applicable to Mission Bay South: the Child Care Fee and the Transportation Impact Development Fee.

#### **Environmental Impact Report**

On November 3, 2015, the Commission on Community Investment and Infrastructure certified the Final Subsequent Environmental Impact Report for the Golden Gate Warriors Event Center and Mixed Use Project under the California Environmental Quality Act (CEQA). The Commission adopted CEQA findings, including a Mitigation Monitoring and Reporting Program and a Statement of Overriding Considerations.

### **DETAILS OF PROPOSED LEGISLATION**

The proposed ordinance amends the Administrative Code to add a new Section 10.100-364 to establish the Mission Bay Transportation Improvement Fund to pay for additional services provided by SFMTA, SFPD, and DPW to the Warriors Project. The ordinance creates an advisory committee to make recommendations about the use of monies from the Fund, and adopts findings pursuant to CEQA.

#### **Mission Bay Transportation Improvement Fund**

The proposed ordinance establishes the Mission Bay Transportation Improvement Fund (Fund) as a category four fund, setting aside General Fund monies to pay for services provided by SFMTA, SFPD, and DPW to the Warriors Project.

#### *Uses of Funds*

The Fund will be used to pay for the following public services related to the Warriors' Project:

- Public transit
- Special event shuttles
- Parking and traffic engineering and control services
- Pedestrian and bicycle access programs
- Parking enforcement programs

- Local access to the University of California at San Francisco (UCSF) hospitals and facilities located in Mission Bay South
- Police services
- Litter pick-up
- Street and sidewalk clean up
- Other measures to improve services to the Warriors' Project

The Fund will be used to pay for the following SFMTA transit equipment and capital improvements related to the Warriors' Project:

- Light rail vehicles
- Cross over tracks and loading platform improvements on the T-Third line
- Parking and traffic improvements (such as cameras, traffic signals, vehicle messaging signs, and other improvements)
- Bicycle and pedestrian access
- Feasibility study for a ferry landing and service to Mission Bay South

#### *Sources of Funds*

The funding source for the proposed Mission Bay Transportation Improvement Fund is the General Fund. It is anticipated that the revenues to be realized from the Warriors Project will provide for the needed funding sources to the General Fund. The Controller will determine the General Fund tax revenue generated or likely to be generated by the Warriors Project each fiscal year to calculate the amount of the General Fund deposit to the Fund.

Maximum annual deposits to the Fund shall not exceed 90 percent of total General Fund revenue generated by the Warriors Project, as determined by the Controller. However, the ordinance sets minimum deposits to the Fund in the first five years, subject to the maximum 90 percent of total General Fund revenue generated by the Warriors Project, as follows:

- Year one: \$8,100,000
- Year two: \$8,300,000
- Year three: \$8,500,000
- Year four: \$8,800,000
- Year five: \$9,100,000

For the first five years, any end-of-year fund balance carries forward to the next year. After the first five fiscal years, end-of-year fund balances up to 25 percent of Fund expenditures carry forward to the next year.

The proposed ordinance establishes a reserve fund of \$1,000,000 once the event center opens. If City departments' expenditures exceed available revenues in the Mission Bay Transportation Improvement Fund, the City is entitled to a credit from the next year's annual deposit to the Mission Bay Transportation Improvement Fund, or from the reserve fund.

Beginning in FY 2016-17, SFMTA, SFPD, and DPW will prepare budget proposals to pay for City services and capital improvements related to the Warriors Project. According to the proposed ordinance, the Mayor and the Board of Supervisors shall include in the City's annual budget sufficient General Fund revenues for deposit into the Fund to meet City departments' budgeted expenditures to provide services to the Warriors Project.

#### *Category Four Fund*

The Mission Bay Transportation Improvement Fund, a category four fund, requires that all expenditures from the Fund be subject to appropriation approval by the Board of Supervisors.

#### **Mission Bay Transportation Improvement Fund Advisory Committee**

The Mission Bay Transportation Improvement Fund Advisory Committee (Advisory Committee) consists of five members, of which one each is appointed by the Warriors, the University of California at San Francisco, and the District 6 Supervisor, and two are appointed by the Mayor.

### **FISCAL IMPACT**

#### **One Time Capital Expenditures for Transportation Projects**

According to the Warriors Project Transportation Management Plan, the SFMTA will provide additional services to accommodate basketball games, concerts and other events at the proposed Warriors event center. SFMTA will increase the number of light rail vehicles on the T-Third line from the current one vehicle per train to the proposed two vehicles per train, resulting in the need to purchase four new light rail vehicles, and reduce the time between trains from 9 minutes to 8 minutes. The SFMTA will also make improvements to the tracks, boarding platforms, and power augmentation to the T-Third line.

SFMTA's estimated costs to purchase four new light rail vehicles and make other transportation system improvements to accommodate the Warriors Project are \$55.3 million. Estimated revenues generated by the Warriors Project to pay these costs are \$25.4 million, resulting in a revenue shortfall of \$29.9 million, as shown in Table 2 below.

**Table 2: Estimated Sources and Uses of Funds for  
Transit Improvements for Warriors Project<sup>2</sup>**

<b>Uses of Funds</b>	<b>Amount</b>
Four new light rail vehicles	\$18,300,287
Installation of three new cross over tracks	5,848,178
Construction of new center boarding platform	22,500,000
Power augmentation	<u>6,800,000</u>
Subtotal Transit Uses of Funds	\$53,448,465
Traffic signals and engineering	<u>1,860,000</u>
<b>Total Uses of Funds</b>	<b>\$55,308,465</b>
<b>Sources of Funds</b>	
Transit Development Impact Fees	\$17,436,000
Transfer tax and construction gross receipts and sales taxes	<u>7,955,799</u>
<b>Total Sources of Funds</b>	<b>\$25,391,799</b>
<b>Revenue shortfall</b>	<b>\$29,916,666</b>

Source: SFMTA

According to Ms. Sonali Bose, SFMTA Chief Financial Officer, the estimated revenue shortfall of \$29,916,666 will be financed through sale of SFMTA revenue bonds or other financing source. Annual debt service is projected to be paid from tax or other revenues generated by the Warriors Project, as shown in Table 3 below.

**City Departments' Ongoing Annual Expenditures for the Warriors Project**

SFMTA's expenditures for transit services to the Warriors Project will be paid by SFMTA fare and parking revenues generated by these services. The Mission Bay Transportation Improvement Fund will pay for SFMTA service to the Warriors Project not covered by these fare and parking revenues, and for SFPD and DPW services to the Warriors Project.

City departments' estimated annual expenditures to provide services to the Warriors Project are \$10.1 million. These expenditures will be funded by an estimated \$11.6 million in revenues generated by the Warriors Project, resulting in net revenues of \$1.5 million, as shown in Table 3 below.

<sup>2</sup> SFMTA will incur equipment and infrastructure costs related to the Warriors Project over a four to five year period. The revenue and expenditure estimates shown in Table 2 are the present value (in 2014 dollars) of the four to five year revenue and expenditures plan.

**Table 3: Estimated Sources and Uses of Funds for City Departments' Annual Ongoing Expenditures<sup>3</sup>**

<b>Estimated Annual Expenditures for City Services to Warriors Project</b>	
Transit services for events	3,780,746
Enforcement	2,892,838
Parking control officers	<u>238,443</u>
Subtotal, SFMTA operating costs	6,912,026
Estimated debt service on revenue bonds	2,122,661
Police	952,000
DPW	<u>95,357</u>
<b>Total Expenditures</b>	<b>10,082,044</b>
<b>Estimated Annual Revenues Generated by Warriors Project</b>	
SFMTA fare and parking revenue	1,772,894
Property taxes	1,779,882
Sales tax	520,948
Parking tax	482,197
Stadium admissions tax	4,335,920
Gross receipts tax	2,431,277
Utility user tax	<u>253,707</u>
<b>Total Revenues<sup>4</sup></b>	<b>11,576,825</b>
<b>Net Revenues</b>	<b>\$1,494,781</b>

Sources: SFMTA, SFPD, DPW; Economic & Planning Systems, Inc. report to OCII, Budget and Legislative Analyst estimate of debt service

## POLICY CONSIDERATION

**If the Warriors Project generates insufficient General Fund tax revenues to pay for all of SFMTA's costs to provide transportation services to the Warriors Project, the Warriors will need to directly provide some transportation services**

While SFMTA, SFPD, and DPW will provide services to the Warriors Project, only SFMTA is committed to additional services, as defined by the Muni Special Event Transit Service Plan,

<sup>3</sup> City departments will begin providing services to the Warriors Project beginning in the 2018-19 NBA season. These revenue and expenditure estimates are the present value (2015 dollars) of the 2018-19 revenues and expenditures.

<sup>4</sup> The Economic and Planning Systems, Inc. (EPS) September 2015 report to OCII estimates \$14,110,833 total revenues generated by the Warriors Project, of which \$2,597,737 are allocated to required funds and baselines, such as the Children's Fund and Open Fund, and \$11,513,096 are general revenues. Table 3 revenues of \$11,576,825 differ from the EPS estimates of \$11,513,096 in that Table 3 (1) includes \$1,772,894 in SFMTA fare and parking revenues, and (2) does not include \$1,709,165 in hotel tax and gross receipts tax revenues generated off-site.

which is a component of the Transportation Management Plan.<sup>5</sup> The Warriors are required to implement a Transportation Management Plan to manage vehicle, transit, pedestrian, and bicycle transportation during Warriors games and other events and activities at the project site, in accordance with the Project's Environmental Impact Report (EIR). According to the EIR, the Warriors will have to implement additional transportation services if the Muni Special Event Transit Service Plan is not implemented.<sup>6</sup> While the EIR does not explicitly state that insufficient General Fund tax revenue generated by the Warriors Project would cause the Muni Special Event Transit Service Plan to not be implemented, according to City staff, insufficient funding could be one of the causes of not implementing the Transit Service Plan.

According to the October 20, 2015 memorandum from the Director of Transportation to the OCII Executive Director, although SFMTA will be able to deliver transit services to the Warriors Project, SFMTA cannot unequivocally guarantee future funding for the transit services to the Warriors Project in perpetuity. According to the Director of Transportation, the SFMTA supports the Project with the understanding that the City, the Golden State Warriors and SFMTA do not expect the SFMTA operating and capital budgets to experience any adverse impact associated with implementing the proposed transit service plan and the capital investments to support it.

Under the proposed ordinance, the General Fund contribution to the Mission Bay Transportation Improvement Fund is capped at 90 percent of General Fund tax revenues generated by the Warriors Project. The proposed ordinance should be amended to specify that if the revenue cap is insufficient to cover SFMTA's expenditures for transportation services to the Warriors Project, then the Warriors will be responsible to provide additional transportation services to comply with EIR Mitigation Measures TR-2b and TR-18.

**Only General Fund tax revenues directly generated by the Warriors Project should be included in the Controller's estimates**

OCII's consultant, Economic and Planning Systems, Inc. (EPS) attributed to the Warriors Project hotel and gross receipts tax revenues generated off-site. According to the EPS report, hotel taxes will be generated by out of town visitors attending events at the Warriors Project, and gross receipts taxes will be generated by off-site businesses serving visitors to the Warriors Project. According to the peer review report by Keyser Marston Associates, the EPS analysis is reasonable because (a) only demand generated by the event center and not the retail and office uses is included in the analysis, and (b) the estimates are based on conservative assumptions.

However, the Budget and Legislative Analyst notes that off-site hotel tax and gross receipts tax revenues cannot be directly attributed to the Warriors Project. It is not possible to verify if changes in hotel occupancy and off-site business gross receipts tax revenues are

---

<sup>5</sup> SFMTA's expenditures for the transportation infrastructure improvements are funded by the TIDF, real property transfer taxes, and financing (such as revenue bonds). The annual debt service on the financing is included in the annual budget to be funded by the Fund.

<sup>6</sup> Additional transportation services include shuttle buses, charter buses, high occupancy vehicles, and special ferry service.

due solely to visitors who come to San Francisco specifically to attend Warriors games or other events at the proposed event center. Such increased tax revenues might also be attributable to visitors to San Francisco who do not attend events at the Warriors Project. Any methodology to attribute hotel and gross receipts tax revenues to the Warriors Project is based on assumptions and not actual accounting of tax receipts. Therefore, the Budget and Legislative Analyst does not include these off-site tax revenues, estimated to be \$1,709,165 per year, in the Table 3 estimates above.

The Budget and Legislative Analyst recommends amending the proposed ordinance to specify that only tax revenues generated on-site by the Warriors Project are included in the Controller's estimates of General Fund revenue generated by the Warriors Project for the purpose of calculating the annual General Fund contribution to the Mission Bay Transportation Improvement Fund.

## RECOMMENDATIONS

1. Amend the proposed ordinance to specify that if the annual cap of 90 percent of General Fund revenues from the Project site and events at the Event Center is insufficient to cover SFMTA's expenditures for transportation services to the Warriors Project, then the Warriors will be responsible to provide the additional transportation services to comply with EIR Mitigation Measures TR-2b and TR-18.
2. Amend the proposed ordinance to specify that only tax revenues generated on-site by the Warriors Project are included in the Controller's estimates of General Fund revenue generated by the Warriors Project for the purpose of calculating the annual General Fund contribution to the Mission Bay Transportation Improvement Fund.
3. Approve the proposed ordinance as amended.

San Francisco, CA 94105

**Subject: Subsequent Environmental Impact Report for Event Center and  
Mixed Use Development at Mission Bay Blocks 29-32.  
SCN:2014112045**

P15003

Dear Mr. Lippe:

This is an addendum to my November 2, 2015 comments of the Responses to Comment ("the RTC") on the Subsequent Environmental Impact Report (hereinafter "the SEIR") on the above referenced Project in the City and County of San Francisco (hereinafter "the City"). This addendum focuses on an addition to the Project that is different from a feature addressed in the DSEIR. This concerns the proposed modification to the Muni UCSF T Third Station

My qualifications to perform this review were thoroughly documented in my letter of comment on the DSEIR dated July 26, 2015 and are incorporated herein by reference.

### **Original MUNI UCSF/Mission Bay T Third Station – Impact Analysis Flawed**

An original component of the Project was to extend the existing 160 foot northbound and southbound platforms of MUNI's UCSF/Mission Bay T Third LRT station to 320 feet so that the station could accommodate to two-car LRT trains stopping at either directional platform at the same time. The DSEIR found that passenger usage of the MUNI's UCSF/Mission Bay T Third LRT station during pre-event and post-event periods of large events at the Project's "event center" would not exceed thresholds of significance related to the capacity of the station's platforms. This finding is implausible since the platforms are only 9 feet

wide and accessed/egressed by ramps only 4 feet wide. The DSEIR's claim that thresholds of significant impact on these platforms will not be exceeded was arrived at only through evasive assumptions inconsistent with the good faith effort to disclose impact that CEQA demands. These evasions include:

- assuming that, in the pre-event period, if the platform were already crowded, that a subsequently arriving LRT train would not open its doors, thereby trapping riders aboard until the crowd on the platform dissipated, and
- assuming that PTOs would corral departing event patrons in a separate area whenever it appeared that the boarding platforms were becoming overcrowded.

Both of these assumed actions are actually de-facto admissions that there actually would be significant transit impacts related to station platform capacity (we also note that the excessive station dwell times when operators stop but keep the doors closed to keep debarking passengers from overloading station platform capacity is both a significant transit impact and social justice impact on those who rely on the T Third to travel farther south). Instead of disclosing that there is a significant transit impact and proposing effective mitigation, in this instance the DSEIR claims there is no significant impact and defined what appears as a gratuitous improvement, Improvement Measure I-TR-4 to "study" operations and safety at the LRT platforms and determine the need for and feasibility of operational improvements at the platforms, with the study to be performed by a qualified transportation professional approved by SFMTA<sup>1</sup>.

The problems with the proposal assumed as part of the Project to extend the existing northbound and southbound platforms are obvious.

- The existing platforms are only 9 feet wide and accessed by ramps that are only 4 feet wide, insufficient widths for event crowds to access or egress the platforms quickly.
- While lengthening the platforms creates the space for a second train to stop, it doesn't add any width to allow the crush crowds to move off the platform efficiently.
- Moreover, in the post-event period, the west (southbound) platform would only service the relatively small numbers of patrons headed south on the T Third. It is fairly useless as a staging point for loading turnback shuttles headed north.

### **The MUNI UCSF/Mission Bay T Third Station Variant**

Between the intervening time between when the DSEIR was circulated and the time the SEIR was prepared, transportation professionals specialized in LRT operations and design were apparently able to get involved instead of just the

---

<sup>1</sup> Such a study appears to be a deferred mitigation that is improper under CEQA.

professionals who prepare environmental documents. The result is what the SEIR describes as the "Muni UCSF/Mission Bay Station Platform Variant".

The Muni UCSF/Mission Bay Station Platform Variant replaces the split northbound and southbound side platforms with a single center-platform and located in the block between South and Sixteenth Streets. The new center-platform concept is clearly operationally superior to the flawed original proposal to simply extend the existing side platforms and add crossovers for shuttle turn-backs.

- It will have a 17-foot width accessed and egressed by 13-foot wide ramps at both ends of the platform, obviously better suited to dealing with heavy event crowds than the existing side-platform configuration (even if the lengths were doubled as proposed in the DSEIR) that have only 9-foot widths and 4-foot access/egress ramps at one end only.
- Both sides of the proposed center-platform can be readily used by turn-back shuttles, providing much greater operational flexibility for integrating the turn-backs with normal operational flows.

This "variant" is so far superior in ultimate performance to the flawed original proposal for modifying the LRT station that it is now clearly a component of the Project, not just a potential alternative.

### **Substitution of the New MUNI UCSF/Mission Bay T Third Station Plan Requires Recirculation of the SEIR in Draft Status**

The SEIR claims in Volume 4, page 12-23 that the Muni UCSF/Mission Bay Station Platform Variant is analyzed at an equal level of detail as the station platform improvement proposal included in the Project Description for the proposed Project and therefore the variant analysis satisfies all CEQA requirements. However, this interpretation ignores the fact that the variant involves very different and more impactful consequences during construction than the original station platform proposal.

In the original proposal, the basic trackwork would remain the same, the crossovers could be installed over a 3-day weekend period and extension of the platforms could be undertaken largely without interference to services to the existing portion of the platforms or to operations further south along the T Third. In the variant, the entire trackwork between South and Sixteenth Streets would have to be torn up to allow center platform construction, the existing side platforms demolished, and either shoofly trackage around the entire construction site would have to be constructed (likely involving full-time traffic lane closures) or bus services substituted for T Third operations south of China Basin and Mission Rock Streets. This disruptive construction would take place over a 14 month period. The SEIR mentions these significant differences in disruption of

Mr. Tom Lippe  
November 17, 2015  
Page 4

services and transportation operations but implausibly claims they are the same as for the originally proposed Project. Clearly this is not the case.

Under CEQA, if the project changes after publication of the Draft EIR, and these changes create a new significant impact not identified in the Draft EIR, or a substantial increase in severity of a significant impact that was identified in the Draft EIR, the lead agency must recirculate the draft EIR for public comment. (CEQA section 21092.1.). Although the SEIR makes the conclusory statement that the station variant would not result in new or more severe impacts than previously disclosed, the impacts disclosed in the SEIR are new, more severe and clearly support an opposite conclusion. Hence, the SEIR should have been recirculated in draft for a further 45 day public comment period.

Sincerely,

Smith Engineering & Management  
A California Corporation

Daniel T. Smith Jr., P.E.  
President

## EXHIBIT 12

November 28, 2015

Mr. Tom Lippe  
Law Offices of Thomas N. Lippe, APC  
201 Mission Street, 12<sup>th</sup> Floor  
San Francisco, CA 94105

**Subject: Subsequent Environmental Impact Report for Event Center and  
Mixed Use Development at Mission Bay Blocks 29-32.  
SCN:2014112045**

P15003

Dear Mr. Lippe:

This is an addendum to my November 2, 2015 comments of the Responses to Comment ("the RTC") on the Subsequent Environmental Impact Report (hereinafter "the SEIR") on the above referenced Project in the City and County of San Francisco (hereinafter "the City"). This addendum focuses on topics concerning walking distance to the proposed Project, exclusion from the analysis of key intersections that are clearly potentially impacted by the project and that are on identified emergency routes to the UCSF Mission Bay hospitals, severity of impact, a key scenario not analyzed in the SEIR and considerations regarding the effect of the at-grade rail crossing of Sixteenth Street on intersections in the Sixteenth Street corridor.

My qualifications to perform this review were thoroughly documented in my letter of comment on the DSEIR dated July 26, 2015 and are incorporated herein by reference.

### **Re Walking Distance**

The walking distance issue of concern relates to the SEIR Response to Comment located at p p13.11-27, 28. This part of the response expresses the notion that people who work downtown would walk to the Warriors Arena because people who work downtown tend to walk to AT&T Park. This response

is illogical and unreasonable because a) the Warriors Arena is much farther from downtown than AT&T Park and b) because there are limits on how far, in terms of time or distance, the vast majority of able-bodied people are willing to walk on purposeful trips. AT&T Park is within 25 minutes walk distance from the Bank of America Building at California and Montgomery Streets. The Arena site is about 41 minutes walk distance from that downtown location. The Transamerica building located at Washington and Montgomery is about a 29 minute walk from AT&T Park. It is about a 44 minute walk from the Arena site. A compendium of urban planning literature, attached as Exhibit A, mostly related to access to transit, suggests that most people are unwilling to walk more than 30 minutes on purposeful trips. Hence, while AT&T Park is within reasonable walking distance for many working downtown, the Arena site is not.

### **Re Key Intersections On Emergency Routes Omitted From the Analysis**

My letter of November 3, 2015 on page 7 stated: "Many of the intersections and ramps on logical access/egress routes to/from the Project that, at the City's discretion, the SEIR failed to analyze are on the advised emergency access routes from various points in the City and region to the hospitals and are posted on the UCSF web site," I used UCSF's web site interface for directions to the Medical Center to identify recommended emergency routes. (See [www.ucsfmissionbayhospitals.org/gethere/](http://www.ucsfmissionbayhospitals.org/gethere/) and click on "Get Directions" tab.) For Hyde and Bay, the primary recommended route is the Embarcadero to King, then Third. The secondary route is Hyde, then 8th. For the Transamerica building, the primary route is Clay/Drumm/Washington to Embarcadero, King, Third. The secondary route is Davis/Beale/Bryant/Embarcadero/Third. For Union Square, the primary is west on Geary, down Hyde/8th/Brannan/7th/16th. For the Bay Bridge, the primary is off at 8th and Harrison, down 8th/Brannan/7th/16th. . These documented emergency routes demonstrate why the intersections along Eighth and along the Embarcadero should have been studied. The key intersections are the nine along the Embarcadero with Broadway, Washington, Market, Mission, Howard, Folsom, Harrison, Bryant and Brannan and the six on Eighth with Market, Mission, Howard, Folsom, and especially Harrison and Bryant.

### **Severity of Impact Issues in the Sixteenth Street Corridor**

In prior communications we have discussed the SEIR's failure to distinguish differences in the severity of impacts when intersections are within the LOS F range. That is to say, the SEIR merely reports conditions as LOS F as if all were equivalent when in fact one scenario may involve traffic demands producing delays two, three or four seconds over the LOS F delay threshold of 80 seconds while another involves vastly greater traffic demand producing predicted delays

perhaps 50 percent or 100 percent above the LOS F 80 second delay threshold<sup>1</sup>. This situation is particularly marked in the case of the intersection of Sixteenth, Seventh and Mississippi Streets. In this case, Table 5.2-47 reports the scenario of Existing + Giants Game + No GSW Project and the scenario of Existing + Giants Game + GSW Project + Basketball Game as equivalent LOS F conditions. However, buried in the details of Synchro LOS/delay computation sheets contained in Appendix TR for the pm peak hour it is found at page TR-191 that the Existing + Giants Game + No GSW Project is computed to have a delay level of 84.7 seconds per vehicle (slightly less than 6 percent over the 80 second LOS F threshold) while on page TR-323 the Existing + Giants Game + GSW Project + Basketball Game scenario traffic is found to cause a delay of 151.9 seconds per vehicle (almost 90 percent over the 80 second LOS F threshold). While differences in predicted delay above the LOS F threshold are not as precisely reliable as those below the LOS F threshold, vast differences such as the above are clearly indicative of significant differences in severity of impact. And at an intersection such as that of Sixteenth, Seventh and Mississippi Streets which is on a key emergency and normal access route to the UCSF Mission Bay hospitals, the failure to report change in severity of impact is a critical flaw in the SEIR. Similar results are reported for the Early Evening hour.

### **SEIR Fails to Consider a Critical Scenario**

Considering the details of severity of impacts at the key intersection of Sixteenth, Seventh and Mississippi Streets reveals another flaw. In the Existing + Giants Game scenario, as noted above the subject intersection functions just above the LOS F threshold (delay 84.7 seconds per TR-191). The SEIR and Appendix TR do not consider the scenario of Existing + Giants Game + Project + No Event. However, comparison of the Existing + No Giants scenario (delay 68.6 seconds/LOS E per TR-179) to the Existing + No Giants + Project + No Event scenario (delay 87.8 seconds/LOS F per TR-275) reveals a differential of 19.2 seconds delay increment caused by the Project without an arena event. Hence, by extrapolation, the Existing + Giants + Project + No Event scenario would cause an overall delay at Sixteenth, Seventh and Mississippi Streets in the pm peak hour of 103.9 seconds or worse. This is almost 30 percent above the LOS F threshold. So adding the Project, even without a Project arena event, would cause a substantial increase in severity of pm peak impact at Sixteenth, Seventh and Mississippi Streets whenever there is a Giants game.

How often would this more severe but unanalyzed condition affecting the key emergency access intersection to the UCSF Mission Bay hospitals occur? The maximum number of Giants games that could be played on weeknights between April 1 and October 30 reflecting current schedule patterns and assuming the

---

<sup>1</sup> The formal definition of 80 seconds average control delay per vehicle is implied in these statements.

team reaches the World Series and that all playoff series go the maximum number of games is about 57 games. Based on the event expectations for the Project's arena disclosed on Appendix TR, page TR-19, there could probably be about 60 weekday events at the Project over those same 7 months when the Giants could be playing. There are about 156 weekdays in that 7 month period. So if there are no overlaps, the unstudied, increased severity condition could occur up to 57 times. However, when overlaps do occur, the almost doubled severity condition that was studied would occur.

### **Effect of At-Grade Rail Crossing of Sixteenth Street**

We have carefully re-examined the SEIR response to comment on the effect of the SEIR response to our comment on the effect of the Caltrain grade crossing of 16<sup>th</sup> on the operation of the intersection of Seventh/Mississippi/16<sup>th</sup>. The SEIR response on this issue from SEIR Volume 4, pages 13.11-55 and 13.11-56 is reproduced indented and in distinctive font, with our further observations in normal font and margins.

The SEIR analysis did not explicitly include the delay associated with the at-grade crossing of Caltrain at the study intersections of Seventh/Mississippi/16th and Seventh/Mission Bay Drive, but the delay and LOS presented in the summary tables does reflect traffic conditions, including automatic gate operations.

How the delay and LOS does reflect gate closure during rail preemption is not made evident in the subsequent discussion in any way. The only thing clear is that "the SEIR analysis did not explicitly include the delay associated with the at-grade crossing of Caltrain".

As noted on SEIR page 5.2?6, the analysis of existing conditions assumes implementation of the 22 Fillmore Transit Priority Project, which includes converting one of the two mixed-flow travel lane in each direction on 16th Street to a side-running transit-only lane.

Changing the number of general traffic lanes which pass through the subject intersection and the at-grade rail crossing is a confounding assumption which makes any comparison to observed conditions irrelevant.

Prior to incorporating the 22 Fillmore Transit Priority Project into the intersection LOS analysis, the LOS conditions were verified based on field surveys of intersection operations conducted as part of this project and the UCSF Long Range Development Plan (LRDP) analysis. The results were also compared to the LOS analysis for existing conditions presented in the EIR prepared for the Caltrain electrification project<sup>9</sup>. The LOS results obtained for

these two study intersections for the weekday p.m. peak hour were found to be generally consistent with field observations and the analyses presented at the two aforementioned reports.

This is disguised and misleading self-referencing, not validation relative to independently performed studies. Fehr & Peers, the consultants that did the Synchro delay/LOS calculations for the SEIR also did the work on both the Caltrain study and the UCSF LRDP study. It is entirely unclear what “generally consistent” means since the only “existing condition” analyzed in the DSEIR at the subject location assumes the general traffic lane reductions associated with the 22 Fillmore project to be in place, those in the other cited studies actually only analyzed the intersection under the actual existing configuration with Sixteenth having 2 through lanes in each direction.

The Caltrain EIR had the 2013 “existing condition” in the PM peak hour at 45.9 seconds/LOS D (with or without Giants game not specified) but without taking two through lanes off 16<sup>th</sup> to create the bus priority lanes. This is dramatically better than the 68.6 seconds delay the SEIR projects for the Existing No Giants scenario assuming the 22 Fillmore bus lanes in place. The Caltrain future forecasts are confusing. They show a delay of 67.7 seconds for year 2020 with no electrification project but a slightly lesser 4.5 seconds delay with the electrification project – this despite the admission that the electrification project would increase the crossing gate down time at 16<sup>th</sup> from 8 minutes/6 seconds to 11 minutes/38 seconds, an increase of 3 minutes/32 seconds. Hence, the future forecast findings of the Caltrain study at this location are completely illogical and no basis for justification of what was done in the SEIR.

The UCSF LRDP EIR reports the pm peak at the subject intersection at 44 seconds delay in 2014 – fairly comparable to the existing condition compiled in the Caltrain study – and a future condition upon completion of the LRDP of 46 seconds delay. But both of these values relate to the existing condition of 16<sup>th</sup> Street – without the bus priority lanes taking away 2 of the 4 general traffic lanes that exist on the street.

The SEIR never presented an Existing No Fillmore Priority Lanes computation. So the words in the response “generally consistent with field observations and the analyses presented at the two aforementioned reports” are unsupported because “field observations” cannot validate a future change in field conditions (i.e., dedicating one lane each direction to bus priority) that does not yet exist, and the previous studies did not consider this future change.

At the intersection of Seventh/Mississippi/16th, the SEIR and both analysis efforts identified LOS D for weekday p.m. peak hour conditions for conditions without a SF Giants evening game.

This is incorrect and misleading. Both the Caltrain Electrification and the UCSF LRDP EIRs identified the Existing Condition without a weekday evening Giants game as LOS D with delays of 45.9 and 44 seconds respectively. However, the SEIR identifies the Existing without Giants game as LOS E, not D, with a delay of 68.6 seconds (see Appendix TR-179). This significant difference, apparently mostly attributable to the change on 16<sup>th</sup> to provide the 22 Fillmore priority lanes, provides no basis for concluding things are “generally consistent” or adequately reflect the interruptions in traffic due to rail crossings.

The response continues, finding every other pm peak scenario and the ‘early evening’ scenarios involving a basketball game at LOS F, without differentiating among severity. This is an important flaw for two reasons. First, while most scenarios are just a few seconds over the 80 second LOS F threshold, three scenarios - the pm peak with the project and overlapping basketball and Giants games superimposed on existing traffic, and the early evening hour with the project and a basketball game superimposed on existing traffic with or without a Giants game – all have delay levels from almost double to more than double the 80 second LOS F threshold. This means the critical intersection of Seventh/Mississippi/16<sup>th</sup> will be vastly more severely gridlocked at those times and scenarios than the others. Second, because the intersection will be at LOS F in most pm and early evening scenarios, queues that build when trains interrupt traffic operations will not be able to dissipate and will continue to build.

The response concludes as follows:

As a reference, the Peninsula Corridor Electrification Project Final EIR included an analysis of the impacts associated with Caltrain electrification, including the additional delay associated with the extra trains that would be implemented as part of that project. At the intersection of Seventh/Mississippi/16th, the average aggregate gate down time during the weekday p.m. peak hour, which is currently about 8 minutes 6 seconds, is projected to increase to 11 minutes 38 seconds. These represent an additional average delay of approximately five seconds per vehicle per traffic signal cycle (212 additional seconds of delay divided by 45 cycles per hour). Project vehicles would also be subject to the increased delay.

Although the information regarding gate down time is factually correct, the assumption that the down time can be cut up and spread in average amounts over all signal cycles in an hour is a misrepresentation of the situation. When the gates come down, they stay down for about 45 seconds, directly impacting one or possibly two signal cycles. During that down time large queues build. If the intersection is at or close to LOS F, it does not have the capability of dissipating those queues that build while the gates are down. Further compounding the situation is the fact that the train preemptions – when the gates are down – do not occur at even intervals.

Mr. Tom Lippe  
November 28, 2015  
Page 7

Some crossings are closely bunched. This is a set of circumstances that can only be analyzed by a scientific simulation using a program such as VISSIM which is why we make that recommendation. Any computation through an averaging technique to approximate the effect of the rail grade crossing preemption unreasonably understates and minimizes the disclosure of impact in this particular situation.

Thank you for the opportunity to make these additional comments.

Sincerely,

Smith Engineering & Management

Daniel T. Smith Jr., P.E.  
President

### **Qualitative Studies/Statements:**

Calthorpe Associates: Project Sheets-TOD Guidelines

<http://www.calthorpe.com/Project%20Sheets/TOD%20Guidelines.pdf>

Briefly defines TODs as mixed-use districts within a comfortable walking distance of transit – about 2,000 feet

Dittmar, H., and G. Ohland, eds. *The New Transit Town: Best Practices in Transit-Oriented Development*. 2004. Island Press. Washington, D.C. p. 120.

“Locate development close to transit. Effective TOD places residential and office space as close to transit as possible. The optimal walking distance between a transit station or stop and a place of employment is 500 to 1,000 feet. Residents are willing to walk slightly longer distances to get to transit, between a quarter- and a half-mile.”

Envisioning Neighborhoods with Transit-Oriented Development Potential

<http://transweb.sjsu.edu/publications/envisioning/Envisioning.htm>

Defines walking distance (<1/2 mile), bicycling distance (<2 miles), and five-mile driving or transit distance. These ranges of analysis include the areas where residents of possible TODs might work, shop, or prefer to go for services. Case studies are from bay Area of San Francisco (Campbell light rail, Fruitvale BART in Oakland, Hayward BART, Mountain View CalTrain/light rail, Redwood City CalTrain, and the Sacramento 65th Street Station). Study uses these distances as a starting point, not as a point of research.

### **TOD Manuals from Other Jurisdictions/Transit Agencies**

<b>Jurisdiction</b>	<b>Walking Distance Referenced</b>
Mass Transit Administration (Maryland)	1500 ft. (0.28 mi.)
Mid-America Regional Council (Kansas City, Missouri)	1500 ft. (0.28 mi.)
NJTransit (New Jersey)	¼ - ½ mi
Ontario Ministry of Transportation	400m (0.25 mi.)
Regional Plan Association (NY, CT, NJ Tri-metro area)	¼ mi.
Snohomish County Trans. Authority (Snohomish Cty, Washington)	1000 ft. (0.19 mi.)

## **EXHIBIT A**

Mass Transit Administration (1988) *Access by Design: Transit's Role in Land Development*. Maryland Department of Transportation.

Recommended spacing for bus stops is calculated based on a catchment area of 1500 feet (0.28 mi.) from each side of the road traveled, defined as the area from which most passengers can easily walk to access transit service. Passengers within this distance are considered to be “adequately served.” Closer spacing is recommended for higher density areas (section 5.1.2).

Mid-America Regional Council (No Date) *Transit-Supportive Development Guidebook*. (Kansas City, Missouri). <http://www.marc.org/transportation/TSD%20Guidebook.pdf>

Indicates most people are willing to walk 1500 feet (0.28 mi.) to shopping or transit (Chapter 4, Pedestrian Scale Blocks, p. 48), and suggests that short, walkable blocks increase the attractiveness of pedestrian transit.

NJTransit (1994) *Planning for Transit-Friendly Land Use A Handbook for New Jersey Communities*.

Defines reasonable walking distance by general understanding of willingness to walk 5-15 minutes to get to or from a transit stop, corresponding to ¼ to ½ mile, but varies based on topography, sense of safety and security, presence of interesting activity (Section 1.3).

Ontario Ministry of Transportation (1992) *Transit-Supportive Land Use Planning Guidelines*. Ontario Ministry of Municipal Affairs.  
[http://www.mah.gov.on.ca/userfiles/page\\_attachments/business/transuppguid/transuppguid-e.pdf](http://www.mah.gov.on.ca/userfiles/page_attachments/business/transuppguid/transuppguid-e.pdf)

Transit-oriented design guidelines developed by the Ontario Ministry of Transportation reference 400m (1/4 mile) walking distance throughout this document as a basis for recommendations.

Regional Plan Association (1997) *Building Transit-Friendly Communities A Design and Development Strategy for the Tri-State Metropolitan Region*. (New York, New Jersey, Connecticut).

Defines transit-friendly communities as intensively developed areas within ¼ - ½ mile of rail stations. A distance that can be comfortably walked in 5-10 minutes and a distance most people are willing to walk to train stations or other community uses. These areas include mixed uses, pedestrian connections, and traffic calming design. Cites a study showing that residents living within ¼ mi. of

rail stations are five-to-seven times more likely to use rail than other area residents (Relationship Between Transit and Urban Form Handbook, Transit Cooperative Research Program TCRP H-1, November 1995, page 29.)

Snohomish County Transportation Authority (1989) *A Guide to Land Use and Public Transportation for Snohomish County, Washington*. (Snohomish County, Washington). <http://ntl.bts.gov/DOCS/GL.html>

“People can be expected to walk no more than 1,000 feet to a bus stop or a park-and-ride parking space. The walking distance increases slightly, to 1,320-1,758 feet (1/4 to 1/3 of a mile), for rail station access.” (Chapter 3).

### **Quantitative Studies:**

Cites 1987 WMATA study by JHK and Associates (Development-Related Survey I)

\*See attached Table 8.1 "Modal Splits for Residential Projects Near Metrorail Stations, Washington (D.C.) Metropolitan Area, 1987.

Relationship Between Transit and Urban Form Handbook, Transit Cooperative Research Program TCRP H-1, November 1995, page 29

Digest version: [http://onlinepubs.trb.org/onlinepubs/tcrp/tcrp\\_rrd\\_07.pdf](http://onlinepubs.trb.org/onlinepubs/tcrp/tcrp_rrd_07.pdf)

Study of ridership among housing and commercial developments near 4 rail stations in Canada found a "walking impact zone" as far as 4,000 feet (3/4 mile) from a station, a "distance that can accommodate around 1,200 acres of development, sufficient to create strong transit-oriented communities."

Study by JHK and Associates in 1986, 1989 showed that the “share of trips by rail or bus transit declined by around .65 percent for every 100-foot increase in distance of a residential site from a Metrorail station portal.”

Cervero et. al 1993—In the Bay Area, 92 percent of those living within ¼ mile of a BART station and commuting to San Francisco where parking costs were over \$2 per day commute via rail transit.

Paget, Donnelly, Price, Williams and Associates. Rail Transit Impact Studies: Atlanta, Washington, San Diego. March 1982. p. 28. (used in Fairfax County Metro Station Areas Study, 1982)

In the Washington metropolitan area, it was found that the average walk to/from a Metrorail station ranged between ¼ to 1/3 mile.

Walking time/distance ratios appear to coincide with actual land use development in the stations vicinity—station area development had occurred primarily within ¼ mile of the station.

BART's First Five Years; Transportation and Travel Impacts (April 1979) DOT-P-30-79-8. (used in Fairfax County Metro Station Areas Study, 1982)

(This study surveyed mode of access which was then converted to distance)

In the San Francisco Bay Area Rapid Transit System (BART), 80% of the pedestrians using BART during peak hour periods walked less than 10 minutes to the station, while somewhat over half of those pedestrians walking under 6 minutes to reach their destination. The distance for a 6 minute walk was estimated to be a quarter of a mile.

1976 survey data included in Appendix:

- 30% of trips walked to BART station
- Of that 30% who walked, **80% walked less than 10 minutes** (45% walked under 6 minutes (approximately 1350 feet) and 35% walked between 6-10 minutes, approximately 1350 to 2250 feet)
- **Distance for a 6 minute walk was estimated to be about ¼ mile**
- Overall average walking time for all who walked to the BART stations was 8.8 minutes
- Generally considered that the average person walks about 225 feet per minute
- Overall average length of walk was probably about 1,980 feet (.375 miles)
- Average walking time for walkers to their destination at end of trip was 7.2 minutes or about 1,600 feet (1/3 mile)

Gladstone Associates. Northern Virginia Metro Station Impact Study: Development Potentials at Metro Stations. June 1974, p. 23. (used in Fairfax County Metro Station Areas Study, 1982)

Gladstone study identified a primary area of development potential within 1000 feet (.19 miles) of a Metrorail entrance and a secondary area within one half mile of the station site. Planned station areas in Alexandria and Arlington County generally reflect this concept.

Alexandria's King Street Station study area is within a 5 minute walk (approx. 1300 feet, .25 miles) of the station with the remaining area within a 10 minute, one half mile walk.

Arlington's Ballston and Courthouse planning areas encompass acreage generally within .4 and .3 miles, respectively, of the station.)

Montgomery County's Takoma Park station had a primary transit impact area within 1000 foot radius of the station with the secondary area of impact encompassing acreage within a half mile radius. The transit impact area for the Forest Glen, Glenmont and White Flint stations was identified as acreage within a 2000 foot radius from the station.

Note that natural or man-made barriers such as floodplains, railroads and highways affected that actual area studied (for example King Street's adjacent railroad right-of-way formed the western boundary to the study area even though a portion of the acreage on the opposite side was within ¼ mile of the station.

Gruen, Victor, The Heart of Our Cities. The Urban Crisis: Diagnosis and Cure. Simon and Schuster 1964, New York, p. 250: (used in Fairfax County Metro Station Areas Study, 1982)

Chart to illustrate people's tolerance for walking:

	Minutes	Feet
In a highly attractive, completely weather-protected and artificially climatized environment	20	5,000
In a highly attractive environment in which sidewalks are protected from sunshine and rain	10	2,500
In an attractive but not weather-protected area during periods of inclement weather	5	1,250
In an unattractive environment (parking lot, garage, traffic-congested streets)	2	600

Ritter, Paul, Planning for Man and Motor, Pergamon Press, New York, 1964, p. 14 (used in Fairfax County Metro Station Areas Study, 1982)

“An average walk is at a speed of 2.5 miles per hour. This converts to 13,200 feet per hour or 220 feet per minute. On this basis, a 5-minute walk would be 1,100 feet and a 10-minute walk would be 2,200 feet.”

Pushkarev and Zupan. Public Transportation and Land Use Policy. Indiana University Press from a study by Regional Plan Association of New York (RPA). (used in Fairfax County Metro Station Areas Study, 1982)

- “In Montreal, in order to maximize pedestrian access to stations, the stations were planned 0.6 miles apart assuming maximum reasonable walking distance of .3 miles.
- Tri-State Regional Planning Commission's 1963 Home Interview Survey indicates that, outside downtown areas, people reported their walk to a bus to be, on the average, in the 3-4 minute range, their walk to a subway or rail station to be in the 5-10 minute range, and their drive to rail stops to average 7-15 minutes.
- The pedestrian access trip to stations responds to station spacing only in a very limited manner. The median walk to subway stations does increase

from 0.17 miles in midtown Manhattan, where stations are very closely spaced, to about 0.32 miles at the edge of the subway-served territory.

- **It appears that no matter how station-spacing increases, 50 percent of the people will not walk more than 6 minutes or 0.3 miles to a non-downtown rail station, even if there is a fraction of 1 percent who will walk over 30 minutes or more than 1.5 miles.** This is not inconsistent with the finding that a distance of 2,500 feet or a 9-minute walking time (assuming, all the while, an average walking speed of 3.1 miles per hour), 50 percent or more of those traveling that distance will prefer a feeder bus to walking, even in a low-income area, with a double fare.”

WMATA 2005 Development Related Ridership Survey Final Report, March 2006  
[http://www.wmata.com/bus2bus/jd/2005\\_Development-Related\\_Ridership](http://www.wmata.com/bus2bus/jd/2005_Development-Related_Ridership)

Update to 1989 survey to determine if changes in population growth, the regional economy, and the built environment had affected modal splits at certain types of land uses in Metrorail station areas, and if certain physical attributes of these land uses impact transit ridership. Dunn Loring station in Fairfax County included in survey.

“2005 survey results confirmed previous findings that the walking distance between a site and the Metrorail station affects transit ridership. In general, the closer a site is to the station, the greater the likelihood those traveling to/from a site choose Metrorail as their travel mode. Based on the survey results, this relationship was stronger for residential sites than for office sites.”

\*See attached Table S-2, Figure 14 and Figure 15

O’Sullivan, Sean and John Morrall. Walking Distances to and from Light-Rail Transit Stations. Transportation Research Record 1538.

<http://scholar.google.com/scholar?hl=en&lr=&q=cache:oEPEiEPfnFAJ:www.enhancemnts.org/trb%255C1538-003.pdf+O%27Sullivan+S.+and+Morrall,+J>

Abstract:

“...For the city of Calgary the average walking distance to suburban stations is 649 m with a 75th-percentile distance of 840 m. At CBD stations the average walking distance is 326 m and the 75th-percentile distance is 419 m.”

- Average walking distance to suburban station=649m=2129 feet=0.4 miles
  - 75<sup>th</sup> percentile (suburban stations): 840m=0.52 miles
- In CBD, average walking distance = 326m=0.2 miles
  - 75<sup>th</sup> percentile (CBD): 419m=0.26 miles
- Calgary, Canada: pedestrians are more than 25% of peak-period trips to or from suburban stations
- General walking distance is about 5 minutes or 400m (.25 miles)
- Analysis in San Francisco and Edmonton, Canada found that 1750m (1.08 mi) was maximum that people would walk to a

station, and that walking accounts for more than 50% of the access mode from distances up to approximately 900m (0.56 mi).

- Survey of walking distance guidelines used by North American companies
  - Canada: guidelines range from 300m to 900m (0.18 mi to 0.56 mi)
  - U.S.: generally between 400m and 800m (0.25 mi to 0.50 mi)

5M Project EIR  
Study Area and Analysis Locations

Seventeen of the 21 study intersections are signalized; and the four intersections of Minna and Natoma Streets with Fifth and Sixth Streets are unsignalized. The operating characteristics of intersections are described by the concept of Level of Service (LOS). LOS is a qualitative description of an intersection's performance based on the average delay per vehicle. Intersection levels of service range from LOS A, which indicates free flow or excellent conditions with short delays, to LOS F, which indicates congested or overloaded conditions with extremely long delays. LOS A through D are considered excellent to satisfactory service levels, LOS E is undesirable, and LOS F conditions are unacceptable.

**Table IV.D-1: Intersection Level of Service**

Intersection	Delay <sup>a</sup>	LOS <sup>b</sup>
1. Fourth/Market/Stockton	<b>56.1</b>	E
2. Fourth/Mission	28.0	C
3. Fourth/Howard	52.5	D
4. Fourth/Folsom	<b>&gt; 80 (1.09)</b>	F
5. Fifth/Market	<b>55.9</b>	E
6. Fifth/Mission	15.1	B
7. Fifth/Minna	2.5 (sb)	A
8. Fifth/Natoma	<b>38.2 (eb)</b>	E
9. Fifth/Howard	15.1	B
10. Fifth/Folsom	27.6	B
11. Fifth/Harrison	<b>58.7</b>	E
12. Fifth/Bryant	<b>&gt; 80 (1.25)</b>	F
13. Sixth/Market	44.6	D

20. Sixth/Bryant	<b>&gt; 80 (1.43)</b>	F
21. Sixth/Brannan	<b>74.4</b>	E

<sup>a</sup> Delay presented in seconds per vehicle.

<sup>b</sup> Intersections operating at LOS E or LOS F highlighted in **bold**.

Source: Source: *5M Project Transportation Impact Study*, October 2014.

**Table IV.D-1** presents the results of the intersection LOS analysis for the existing weekday PM peak hour conditions. During the weekday PM peak hour, nine of the 17 signalized study intersections currently operate at LOS E or LOS F conditions. The signalized intersections of Fourth/Market/Stockton, Fourth/Folsom, Fifth/Market, Fifth/Harrison, Fifth/Bryant, Sixth/Bryant and Sixth/Brannan Streets operate at LOS E or LOS F conditions during the PM peak hour. In addition, the eastbound approaches at the unsignalized intersections of Fifth/Natoma and Sixth/Natoma Streets operate at LOS F conditions; however, due to the low volumes on Natoma Street, traffic signal warrants are not

At the study intersections of Fourth/Howard, Sixth/Folsom and Sixth/Brannan Streets, the worsening of intersection LOS conditions from LOS D to LOS E or LOS F, and from LOS E to LOS F would be considered a significant impact at these intersections.

**Table IV.D-11: Intersection Level of Service – Existing Plus Project Conditions, Weekday PM Peak Hour**

<sup>a</sup> Delay presented in seconds per vehicle. Intersections operating at LOS E or LOS F highlighted in **bold**.

<sup>b</sup> Shaded = project impact.

<sup>c</sup> Intersection stop sign-controlled. Delay and LOS presented for the approach with the highest delay.

<sup>d</sup> Contracting for installation of planned signal at the intersection of Sixth/Minna Streets is underway, and planned to be operational by the end of 2014. Average vehicle delay and LOS for Existing plus Project conditions with signalization presented in [brackets]. With signalization, the intersection would operate at LOS C conditions, and therefore, traffic impacts at this intersection would be considered less than significant.

<sup>e</sup> Existing and Existing plus Project intersection LOS analyses were also conducted at the intersection of Fifth/Howard Streets for AM peak hour conditions. Under Existing conditions, during the AM peak hour, the intersection of Fifth/Howard Streets currently operates at LOS B conditions with an average vehicle delay of 15.3 seconds per vehicle, and under Existing plus Project conditions the average vehicle delay would increase to 16.5 seconds per vehicle and the intersection would operate at LOS B conditions.

## D. TRANSPORTATION AND CIRCULATION

This section analyzes the potential project-level and cumulative impacts on transportation and circulation resulting from implementation of the proposed project or either variant. Transportation-related issues of concern that are addressed include traffic on local roadways, transit, bicycles, pedestrians, loading, emergency vehicle access, and construction-related activities. Additionally, a parking analysis is included for informational purposes. Transportation impacts are assessed for the proposed project for weekday p.m. peak period. This section also identifies mitigation measures that would reduce or avoid significant impacts, and recommends improvement measures to reduce less-than-significant impacts.

This section is based on information contained within the 801 Brannan Street and One Henry Adams Street Transportation Impact Study, March 7, 2011, prepared for this project by LCW Consulting.<sup>110</sup> The transportation study analysis includes analysis for development of the BMR parcel by the Mayor's Office of Housing (MOH); therefore, the study results include transportation impacts resulting from the proposed development at the One Henry Adams site as well as both the project sponsor-funded and City-funded aspects of the proposed development of the 801 Brannan site including the two variants for the 801 Brannan site.

### SETTING

The transportation study area includes all aspects of the transportation network that may be measurably affected by the proposed project. The transportation study area is defined by the travel corridors and by facilities such as bus stops and transit stations. For this analysis, 16 intersections were identified as the key locations likely to be affected by the proposed project. These intersections are shown on Figure 34, page 154). Transit and parking conditions were assessed for a study area bounded by Bryant Street, Sixth Street/I-280, Berry Street, De Haro Street, Sixteenth Street, US 101/I-80, Division Street, and Tenth Street (see Figure 34, page 154).

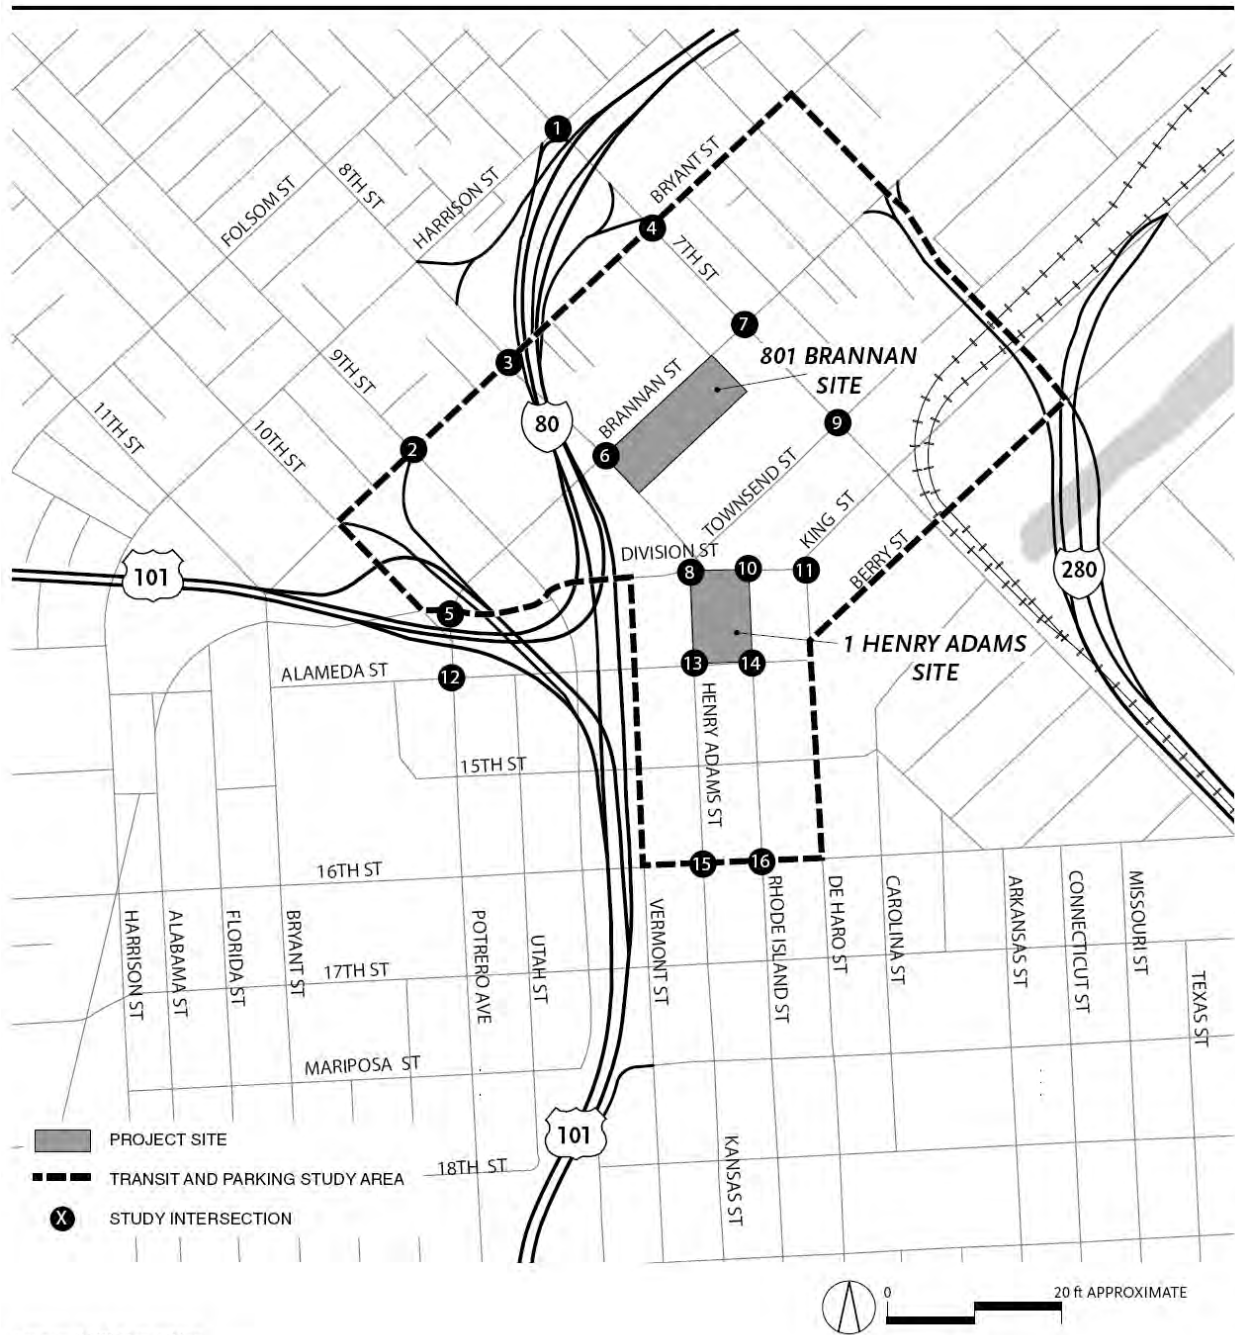

### Roadway Network

Travel to and from the project sites involves the use of regional and local transportation facilities, highways, and transit services that link San Francisco with other parts of the Bay Area and northern

## Transit Network

The project sites are served by public transit, with both local and regional service provided in the vicinity of the proposed project. Local service is provided by the San Francisco Municipal Railway (Muni) bus lines, which can also be used to access regional transit operators (including BART, AC Transit, Golden Gate Transit, SamTrans, and Caltrain).

Transit service within the City and County of San Francisco is provided by Muni, including bus (both diesel and electric trolley), light rail (Muni Metro), cable car, and electric streetcar lines. Muni operates

# 222 Second Street Office Project

PLANNING DEPARTMENT  
CASE NO. 2006.1106E

STATE CLEARINGHOUSE NO. 2007052113

SAN FRANCISCO  
PLANNING  
DEPARTMENT

	Draft EIR Publication Date:	January 27, 2010
	Draft EIR Public Hearing Date:	March 4, 2010
	Draft EIR Public Comment Period:	January 27 - March 15, 2010

*Written comments should be sent to:*

Environmental Review Officer | 1650 Mission Street, Suite 400 | San Francisco, CA 94103  
10731

## Impact Analysis

### *Travel Demand Analysis*

The project would generate about 10,950 total person trips per day, with a total of about 1,075 total person trips during the p.m. peak hour, of which about 250 would be vehicle trips,<sup>53</sup> 510 would be transit trips, 155 would be walking trips, and the remainder by other modes such as bicycle, motorcycle and taxi.<sup>54</sup>

The project would be subject to a variety of transportation management requirements under *Planning Code* Section 163, whose intent is to assure that adequate measures are undertaken and maintained to minimize transportation effects of added office employment in the downtown and South of Market area, by facilitating the effective use of transit, encouraging ridesharing, and employing other practical means to reduce commute travel by single-occupant vehicles.

### *Traffic Impacts*

#### **Impact TR-1: Traffic generated by the proposed project would degrade level of service at certain local intersections. (Significant but Mitigable)**

Of the 250 net new p.m. peak-hour vehicle trips generated by the project, about 54 percent would be to or from locations within San Francisco, while the remainder would be headed to or from the East Bay, the Peninsula/South Bay, and the North Bay. East Bay-bound vehicles would make up approximately one-fifth of the outbound vehicle trips, or about 40 additional cars heading for the East Bay (assumed to be via the Bay Bridge) in the p.m. peak hour. These 40 additional cars would incrementally contribute to the substantial queuing that currently occurs on access routes to the Bay Bridge, such as First Street. Peninsula/South Bay-bound traffic would amount to about 25 new vehicles, which likewise would incrementally contribute to queuing that now occurs at southbound access routes, such as the on-ramp at Fourth/Harrison Streets.

As shown in Table 2, eight of the 11 signalized intersections studied currently operate at good (LOS D<sup>55</sup> or better) service levels during the p.m. peak hour. Two of the three intersections that operate at unacceptable LOS E or F conditions are located on the primary approaches to I-80 and the Bay Bridge (Harrison/ First Streets, and Harrison/Fourth Streets), and traffic to the bridge passes through the third intersection (Harrison/Second Streets). The one unsignalized study intersection, Second/Tehama Streets, operates at an acceptable LOS D. The intersections selected for analysis were chosen because they would be the most likely to be affected by project traffic. While project-generated vehicles would also travel through other intersections, it would have less impact on intersections farther from the project site, as vehicles would disperse among the available streets as they travel away from the site.

<sup>53</sup> The 250 vehicle trips represent 365 person-trips by vehicle; the number of vehicle trips is less than the number of person trips by vehicle because some person trips are made in vehicles carrying more than one person.

<sup>54</sup> Travel demand for the proposed project was calculated on the basis of trip generation rates, and p.m. peak-hour percentage of daily traffic, for Office and Retail uses presented in the San Francisco Planning Department, *Guidelines for Environmental Review: Transportation Impacts* (Appendices 1 and 2).

<sup>55</sup> Traffic operations are characterized using a p.m. peak-hour level of service (LOS) analysis, which provides a standardized means of rating an intersection's operating characteristics on the basis of traffic volumes, intersection capacity and delays. LOS A represents free-flow conditions, with little or no delay, while LOS F represents congested conditions, with extremely long delays; LOS D (moderately high delays) is considered the lowest acceptable level in San Francisco.

**TABLE 2**  
**PM PEAK-HOUR INTERSECTION LEVELS OF SERVICE (LOS)**  
**AND AVERAGE STOPPED DELAY IN SECONDS PER VEHICLE<sup>a</sup>**

<sup>a</sup> Levels of service (LOS) were determined using the analysis methodologies presented in the 2000 *Highway Capacity Manual*.

<sup>b</sup> Cumulative volumes were derived on the basis of information about traffic growth patterns, which used the San Francisco County Transportation Authority countywide travel demand forecasting model, taking into account the development anticipated in the vicinity of 222 Second Street, plus the expected growth in housing and employment for the remainder of San Francisco and the nine-county Bay Area.

<sup>c</sup> Project's percent contribution to the 2007-to-2025 growth in cumulative traffic volumes at intersections projected to operate at LOS E or F. **Bold** typeface signifies a cumulatively considerable contribution to LOS F conditions (a significant impact), based on the project's contribution to the intersection's critical turning movements; that is, whether the project would add a substantial number of vehicles to these movements (see page 83 for further discussion of the method for determining impact significance).

<sup>d</sup> The LOS and delay for signalized intersections represent conditions for the overall intersection. The LOS and delay for side-street stop-controlled unsignalized intersections represent conditions for the worst (most congested) movements (typically left turns from the side street onto the main street). For an intersection operating at LOS E or F under any analyzed scenario, the volume-to-capacity ratio (v/c) is presented to provide another measure of how the intersection is operating.

**Bold** typeface indicates a significant project or cumulatively impact.

SOURCES: Environmental Science Associates and AECOM

With the addition of project traffic,<sup>56</sup> operating conditions at the Folsom/Second Streets intersection would degrade from LOS D to an unacceptable LOS E, which would constitute a significant project impact. Also, while the Harrison/Second Streets intersection would remain at the same unacceptable

LOS E, because project traffic would constitute about 16 percent of the southbound left turn volume (which would operate with unacceptable LOS F conditions), the increased delay at this intersection would constitute a significant project traffic impact. At the unsignalized study intersection of Second/Tehama Streets, the addition of project-generated traffic would cause side-street left turns to degrade to unacceptable LOS (eastbound Tehama left turns from LOS C to LOS F, and westbound Tehama left turns from LOS D to LOS E), which would constitute a significant project traffic impact.<sup>57</sup> Traffic conditions would satisfy the Peak Hour Signal Warrant for the Second/Tehama intersection. Conditions would also worsen from existing conditions at two other study intersections (Howard/Third Streets and Howard/Second Streets), but would remain at an acceptable LOS D or better in each case, and therefore project traffic would not result in a significant impact at these two intersections.

Implementation of Mitigation Measures M-TR-1a, p. 89, and M-TR-1b, p. 89, would reduce project impacts to a less-than-significant level at the intersections of Second and Tehama Streets and Folsom and Second Streets. However, no mitigation is available for the impacts at the intersection of Second and Harrison Streets, and this impact would be significant and unavoidable.

### Cumulative Traffic Impacts

#### **Impact TR-2: Traffic generated by the proposed project, in conjunction with past, present, and reasonably foreseeable future projects would further degrade level of service at certain local intersections. (Significant and Unavoidable)**

Cumulative traffic impacts were assessed by adding projected traffic increases from anticipated future local and development (including projects proposed within the Transit Center Plan study area) to future baseline volumes derived from the San Francisco County Transportation Authority countywide travel demand forecasting model.<sup>58</sup> Due to the substantial increase in development anticipated for the South of Market area by 2025, all 12 study intersections would operate at unacceptable LOS E or F under 2025 cumulative conditions (as compared to three intersections operating at LOS E or F under Existing conditions).

<sup>56</sup> Analysis of project effects conservatively assumed that all project-generated vehicular traffic would use parking spaces provided in the on-site garage. Additionally, while vehicles currently parking in the on-site parking lot (to be eliminated) would be redistributed to other parking facilities in the area, those vehicles were conservatively assumed to continue to travel through the study intersections.

<sup>57</sup> Currently most drivers leaving the project site's surface parking lot exit onto Howard Street, and nearly all who exit via Tehama turn right onto Second Street (only about 5 percent of exiting traffic turns left onto northbound Second Street). Left turns from Tehama onto Second are potentially dangerous (near collisions were observed) mainly because sight distance is restricted by parked vehicles and by buses at the bus stop just north of Tehama Street.

<sup>58</sup> The cumulative analysis was prepared in advance of the more recent Transportation Authority modeling efforts undertaken in connection with the proposed Transit Center Plan and EIR. However, a list of reasonably foreseeable developments in the Transit Center Plan area was developed that is comparable to growth anticipated under the Transit Center Plan and provides a reasonable projection of cumulative conditions in 2025.

To assess the effect of added traffic generated by the project on the above-described LOS E or F cumulative 2025 conditions, the percent contribution of project trips to future volumes was determined and, for intersections where the project contribution to cumulative growth would be 5 percent or greater, the project contribution to the traffic volumes at the critical movements are evaluated further to determine whether the project contribution to a critical movement would be substantial. As shown in Table 2, in addition to the project-specific significant traffic impact at the Folsom/Second, Harrison/Second, and Second/Tehama intersections for Existing Plus Project conditions, the project's share of future traffic growth at the intersections of Howard/Third Streets, Howard/New Montgomery Streets, Folsom/Second Streets, and Harrison/Second Streets would constitute a cumulatively considerable traffic contribution to adverse 2025 cumulative traffic conditions, and would be considered a significant impact. That determination was reached based on the examination of the traffic volumes for the vehicle movements that determine the overall level of service performance at the intersections projected to operate at LOS E or F under 2025 cumulative conditions. The project would add substantial numbers of vehicles to turning movements that determine the overall LOS F performance (i.e., "critical" movements) at these four intersections.

The project's traffic contribution to adverse cumulative traffic conditions at the other seven signalized intersections projected to operate at LOS E or F would be considered less than significant. That was also determined based on the examination of the traffic volumes for the traffic movements that determine overall level of service performance at the intersections of Mission/Third, Howard/Second, Howard/First, Howard/Fremont, Folsom/Hawthorne, Harrison/Fourth, and Harrison/First. In these case, the project would either add traffic to movements that would continue to operate satisfactorily, or would add a small number of vehicles to intersection movements that would operate poorly under cumulative conditions.

It is noted that the Transbay Terminal / Rincon Hill areas of the City have been, and currently are being (as part of the proposed Transit Center Plan analysis), studied for possible development scenarios, and associated road network configurations to best support that development (including possible conversion of portions of Folsom and Howard Streets from one-way to two-way configuration). The effect of possible reconfiguration of roads on traffic flow in the project area has not been quantified, but in general, two-way streets have a lower carrying capacity than one-way streets (with resulting worse LOS at intersections). However, some travel paths (including those between the project garage and trip origins and/or destinations) could be less circuitous with two-way streets than with one-way streets. Until road network changes are formally proposed, their effect on impacts described herein for the 222 Second Street project is considered speculative. Nevertheless, it can be stated with a high degree of certainty that the proposed 222 Second Street project would not result in such a substantial contribution to traffic congestion that it would make a considerable contribution to potential cumulative impacts at intersections other than those noted above, regardless of potential future changes in the street network. Therefore, the project would not result in a significant impact with respect to network changes that might be proposed as part of the proposed Transit Center District Plan or other such planning efforts.

As with existing-plus-project conditions, traffic from the 222 Second Street project and from other projects considered in the cumulative analysis would affect intersections other than those included in the project-specific analysis for 222 Second Street. Traffic destined for the Bay Bridge and for other freeway

on-ramps in or near the Transbay Study Area would continue to experience congestion in the p.m. peak hour, and the project would contribute incrementally to increased delays at some of these intersections. As with existing-plus-project conditions, however, project traffic would have less impact on intersections farther from the project site as vehicles bound for different destinations disperse.

Projected congestion levels could be somewhat less if measures to enhance transit service and encourage the use of alternate means of transportation are successful. Similarly, congestion levels in the area could be somewhat greater if the capacity of street segments is reduced or if the rate at which vehicles can enter the freeway is reduced.

No mitigation is available for the above-described significant impacts beyond Measures M-TR-1a and M-TR-1b, discussed above. However, those measures would not reduce the cumulative impacts to a less-than-significant level at the intersections of Howard and Third Streets, Howard and New Montgomery Streets, Folsom and Second Streets, and Harrison and Second Streets.

---

### ***Transit***

#### **Impact TR-3: Transit ridership generated by the proposed project would not result in unacceptable levels of transit service, or cause a substantial increase in delays or operating costs. (Less than Significant)**

The project would generate approximately 510 net new p.m. peak-hour transit trips. Of these trips, about 300 would be on Muni, and would be dispersed over the 17 Muni routes (local and express buses, streetcar and Metro trains) that serve the project area. Project transit ridership would incrementally increase p.m. peak-period capacity utilization<sup>59</sup> on the four Muni screenlines (which are imaginary cordon lines drawn around the greater downtown area for purposes of analyzing Muni ridership by corridor). All Muni screenlines currently operate better than Muni's service standard of 85 percent capacity utilization,<sup>60</sup> although the Metro corridors (Southwest screenline), and Other Lines (Southeast screenline) currently exceed the standard. However, the increase in ridership due to the project would be no more than 1 percentage point on any corridor, and would not be significant, inasmuch as the increased ridership would be dispersed over dozens of Muni vehicles and would not result in exceedances of Muni capacity. The project would be subject to the Transit Impact Development Fee, which is a one-time fee assessed against downtown office projects to offset increased capital costs to Muni to provide additional capacity to serve the increased demand from new development.

Project ridership on regional carriers would total about 200 (some riders would also take Muni), with about 40 percent traveling to the East Bay on BART, and another 20 percent on AC Transit; most of the rest would travel to the Peninsula on BART. Project transit trips would increase East Bay BART and AC Transit p.m. peak-period capacity utilization by less than 1 percentage point, and would not measurably

---

<sup>59</sup> Capacity utilization is the aggregate number of passengers divided by the aggregate design capacity of the transit vehicles, and may include varying numbers of standees, depending on the transit carrier.

<sup>60</sup> Muni's service standard is based on differing capacities of its fleet's various sizes of buses and rail vehicles.

## E. TRANSPORTATION AND CIRCULATION

This section summarizes and incorporates the results of the *Transportation Impact Study* (TIS) prepared by the transportation subconsultant for the proposed project (included in this EIR as Appendix E).<sup>1</sup> The TIS describes existing and future 2030 transportation conditions (roadway traffic, transit, pedestrian access, bicycle access, loading, and parking) in the vicinity of the proposed project and evaluates its environmental effects. The following transportation scenarios were examined: existing, existing plus the proposed project, and cumulative conditions in 2030.

### SETTING

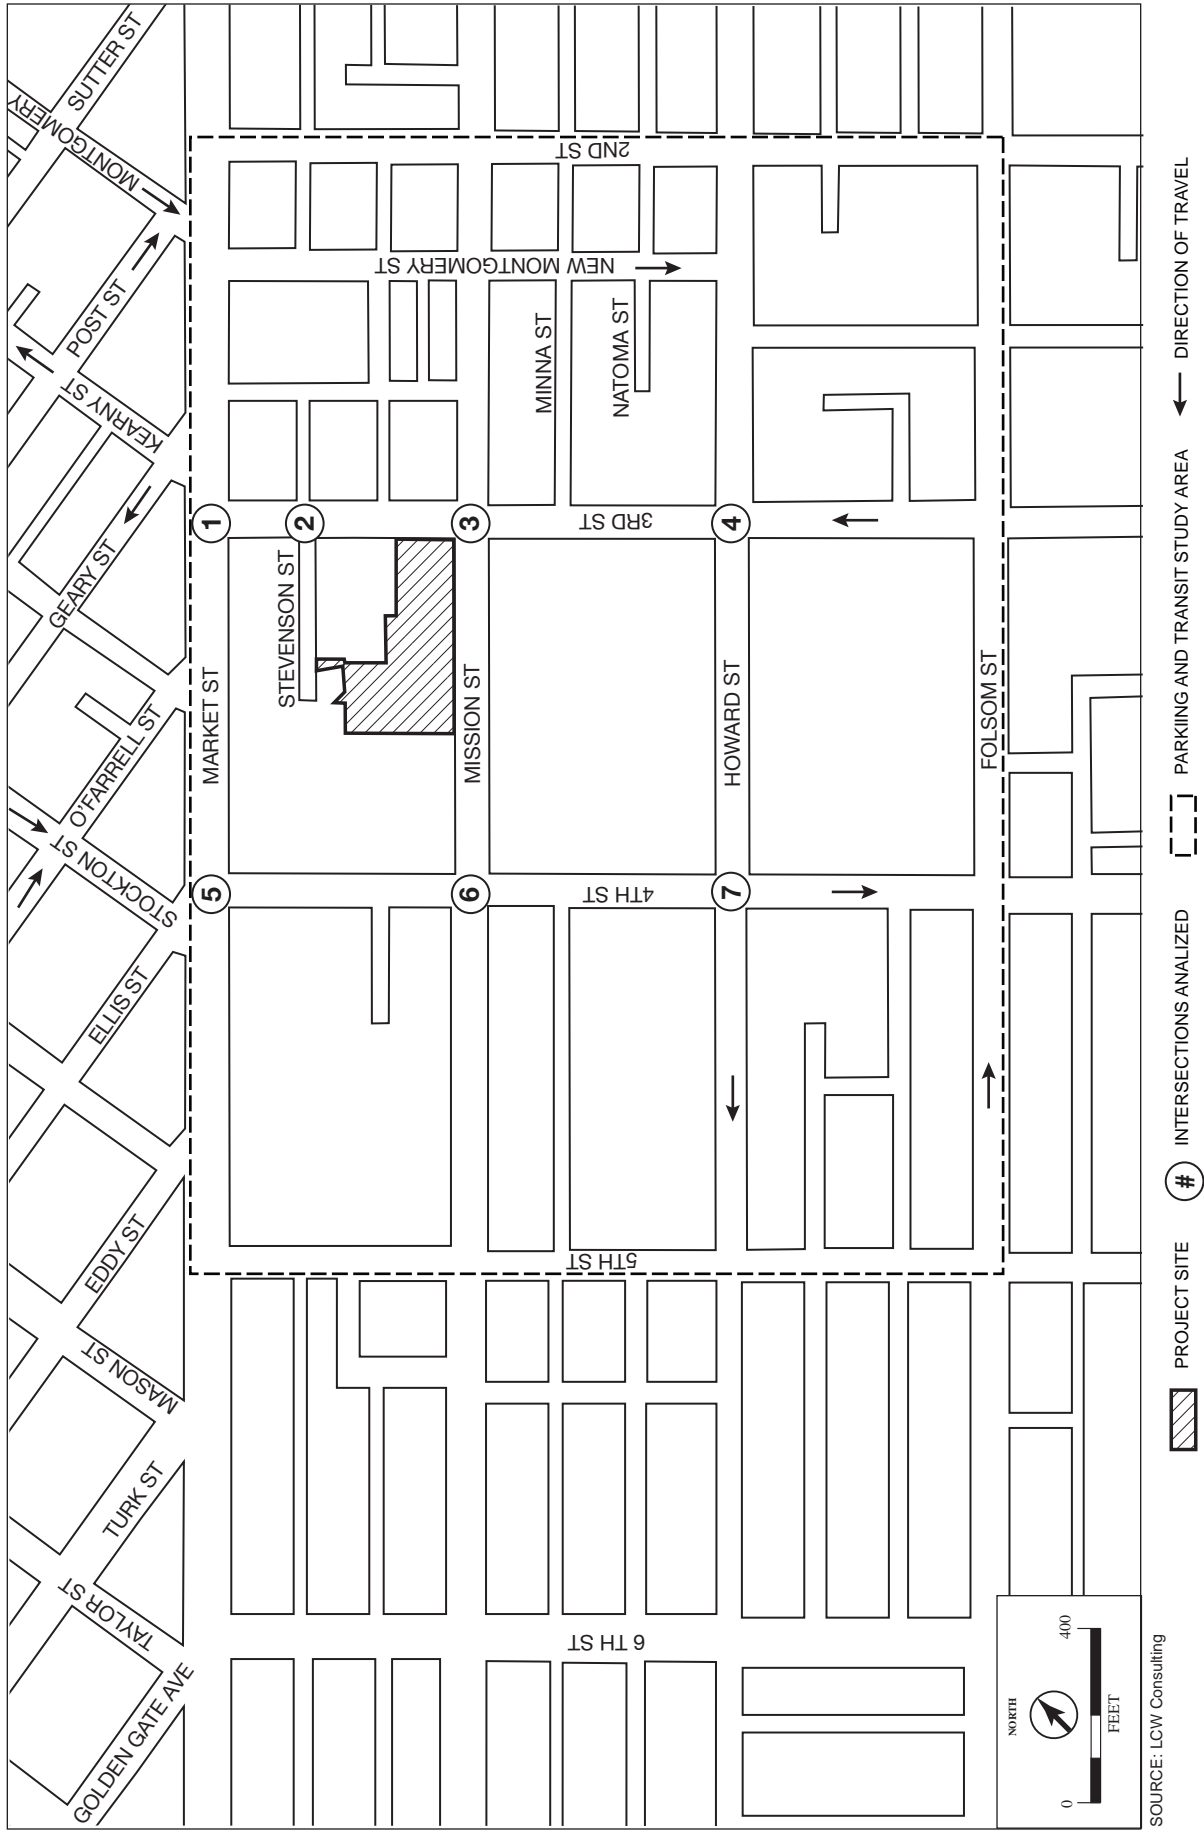

The transportation study area for the proposed project is the area bounded by Market Street, Second Street, Folsom Street, and Fifth Street. The proposed project would include the conveyance of the existing subsurface Jessie Square Garage from the San Francisco Municipal Transportation Agency (SFMTA) to the project sponsor and the conversion of the garage from a publicly owned garage to a privately owned garage. The basement mezzanine and upper basement levels would remain open to the public. On the mezzanine level of the existing garage, there is an existing space underneath the Contemporary Jewish Museum that is currently blocked off from the rest of the garage. As part of the proposed project, this existing space would be connected to the rest of the garage by removal of a wall and would be striped to accommodate about 38 parking spaces. Ten existing parking spaces on various levels of the garage would need to be removed for vehicular access and circulation. As a result, there would be a net increase of 28 parking spaces, and the total number of parking spaces in the garage would increase from 442 to 470. The proposed project also would use Jessie Square Garage for access to the proposed on-site loading areas.

Currently, there are two curb cuts on the existing project site: one on Third Street, which provides access to the existing loading area in the Aronson Building, and one on Mission Street, which provides an exit for the Jessie Square Garage. The current entrance for the Jessie Square Garage is on Stevenson Street. Egress from the garage is available from either Stevenson Street or Mission Street. See Figure II.32: Vehicular Access – Proposed Project, in Chapter II, Project Description, p. II.65.

which is further away than typical placement, and this placement may contribute to pedestrians not noticing the “Don’t Walk” signal.

## **Transit**

The project site is well-served by public transit, with both local and regional service provided nearby. Local service is provided by the Muni bus lines, which can be used to access regional transit. Service to and from the East Bay is provided by BART, AC Transit, and ferries; service to and from the North Bay is provided by Golden Gate Transit buses and ferries; service to and from the Peninsula and South Bay is provided by Caltrain, SamTrans, and BART. Figure IV.E.2: Existing Transit Network Near Proposed Project, presents the transit routes and local bus stop locations in the vicinity of the proposed project.

### Muni

Muni provides transit service within the City and County of San Francisco, including bus (both diesel and electric trolley), light rail (Muni Metro), cable car, and electric streetcar lines. Muni operates a number of bus lines in the vicinity of the proposed project. Immediately adjacent to the project site, on Mission and Third Streets, Muni operates frequent bus service, including electric and diesel, standard and articulated vehicles. On Third Street, a transit-only lane is provided on the east curb lane, across from the project site. Muni uses the west-side travel lanes for non-revenue turnbacks of Market Street buses (i.e., buses do not pick up passengers), including the 5 Fulton, 6 Parnassus, 9 San Bruno, 21 Hayes, and 31 Balboa. Two sets of electric trolley wires, in the east and west curb lanes, are provided for electric buses. On Mission Street, Muni operates the various 14 Mission lines.

**Table IV.E.15: Intersection Levels of Service, Existing and Existing Plus Project**

Intersection	Existing		Existing Plus Project	
	Delay <sup>a</sup> (v/c)	LOS	Delay <sup>a</sup> (v/c)	LOS
<b>Third / Market</b>	<b>56.2</b>	<b>E</b>	<b>63.2</b>	<b>E</b>
Third / Stevenson	12.1	B	12.7	B
Third / Mission	20.1	C	20.9	C
Third / Howard	36.1	D	40.4	D
<b>Fourth / Market</b>	<b>&gt;80 (1.1)</b>	<b>F</b>	<b>&gt;80 (1.1)</b>	<b>F</b>
Fourth / Mission	41.8	D	45.6	D
Fourth / Howard	42.5	D	44.5	D

Notes: > means greater than

<sup>a</sup> Delay presented in seconds per vehicle. Intersections operating at LOS E or LOS F are in **bold**. The volume to capacity ratio is presented for those intersections operating at LOS F.

Source: LCW Consulting, January 2012

The addition of 149 project-generated vehicle trips would result in small increases in the average delay per vehicle at the study intersections and all study intersections would continue to operate at the same LOS as under existing conditions. The intersection of Third and Market Streets would continue to operate at LOS E, and the intersection of Fourth/Market Streets would continue to operate at LOS F. The contribution of the proposed project to the critical movements that operate poorly was reviewed to determine if the contribution would be significant.

At the Third and Market Streets intersection, the proposed project would add 34 vehicle trips during the PM peak hour to the northbound movement, which represents 1.8 percent of the total PM peak hour northbound approach volume of 1,939 vehicles. Thus, the project contribution to this approach would not be considerable, and therefore the contribution to the overall intersection LOS E conditions would not be considered significant.

At the Fourth and Market Streets intersection, the proposed project would add 31 vehicle trips during the PM peak hour. At this intersection, the southbound movement currently operates at LOS F conditions. The project would add 12 vehicle trips to the southbound movement, which represent less than 1 percent of the PM peak hour southbound volume of 1,302 vehicles. The project contribution to this approach would not be considerable, and therefore the contribution to the overall intersection LOS F conditions would not be considered significant.

Project-generated vehicle traffic would not cause any intersection LOS to deteriorate from LOS D or better to LOS E or F or from LOS E to F, and would not represent a considerable contribution to the Existing plus Project intersection conditions for intersections already operating at LOS E or F, and therefore the proposed project would result in less-than-significant traffic impacts at these intersections, and impacts on traffic overall would be less than significant. No mitigation is necessary.

### PROJECT DESCRIPTION:

The site for the proposed Hall of Justice (HOJ) Rehabilitation and Detention Facility (RDF) project is located in San Francisco's South of Market neighborhood, at the intersection of Bryant and Sixth streets, and consists of eight parcels: Assessor's Block 3759, Lots 9 through 12, 14, 43, 45, a portion of Lot 42, and portions of the Harriet Street and Ahern Way rights-of-way. The western portion of the project site (the HOJ site), located at 850 Bryant Street, contains the existing eight-story, 117-foot-tall (105 feet to the rooftop plus an additional 12-foot-tall mechanical penthouse), 610,000-gsf HOJ, constructed between 1958 and 1961. The existing HOJ serves as one of the primary County Jail Facilities for the San Francisco Sheriff's Department. County Jails No. 3 (CJ#3) and No. 4 (CJ#4) are located on the 6<sup>th</sup> and 7<sup>th</sup> floors of the existing HOJ. Other uses within the existing HOJ include the justice center for the San Francisco County Superior Court, the Chief Medical Examiner and morgue, and the current operational headquarters for the San Francisco Police Department. County Jails No. 3 (CJ#3) and No. 4 (CJ#4) are located on the 6<sup>th</sup> and 7<sup>th</sup> floors of the existing HOJ. Directly east of the HOJ site is the project building site, which is bounded by Ahern Way to the north, Sixth Street to the east, Bryant Street to the south, and Harriet Street to the west. The 40,276-sf project building site contains two vacant lots, areas of surface parking, and five existing buildings: a one-story, 6,000-gsf office building, constructed in 1956 (444 Sixth Street); a one-story, 5,100-gsf commercial building, constructed in 1959 (450 Sixth Street); a three-story, 7,150-gsf,

involve the installation of structures that could interfere with air space. Therefore, Topic E.4(c) is not applicable to the proposed project.

## SETTING

Transportation conditions were evaluated for a study area generally bounded by Harrison Street to the north, Sixth Street to the east, Bryant Street to the south, and Seventh Street to the west (see **Figure 15: Transportation Study Area**). In the South of Market area, streets that run in the northwest/southeast direction are considered north-south streets (e.g., Sixth Street), whereas streets that run in the southwest/northeast direction are considered east-west streets (e.g., Bryant Street).

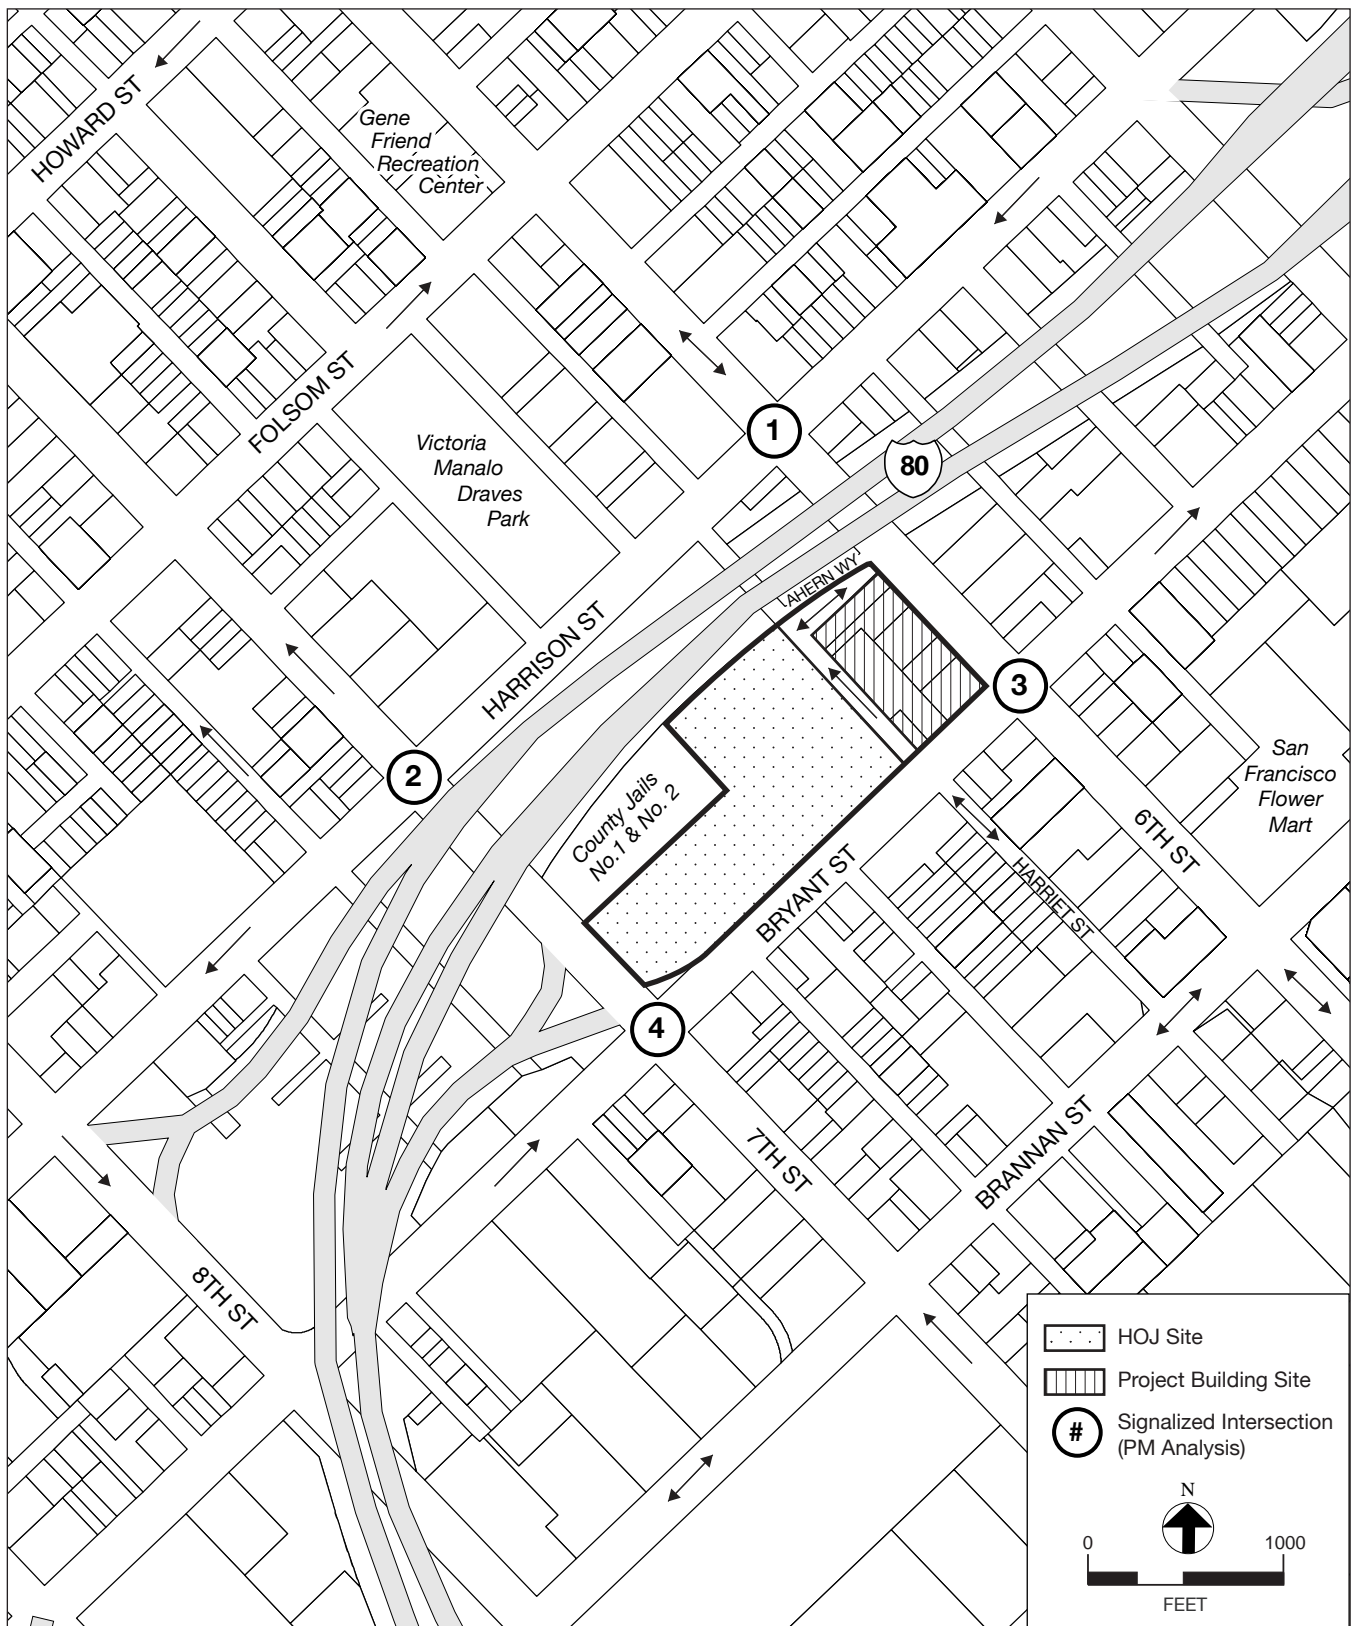

### Traffic Conditions

The project site is generally bounded by Sixth, Bryant and Seventh streets and the I-80 freeway structure. The project building site is located on the block bounded by Sixth, Bryant and Harriet streets, and Ahern Way immediately south of the I-80 freeway. Local vehicular access to and from the project building site is provided primarily via Bryant and Sixth streets. Sixth Street has two travel lanes in each direction, while Bryant Street has four eastbound travel lanes. Harriet Street is one-way northbound, with two travel lanes between Bryant Street and Ahern Way, adjacent to the project building site. Most other streets in the project vicinity, including Ahern Way, have one travel lane in each direction. The intersections of Sixth Street/Ahern Way and Harriet Street/Ahern Way are stop-controlled on the minor approach of Ahern Way eastbound and Harriet Street northbound.

Regional access to the project site is provided by U.S. 101 and I-280. U.S. 101 connects to I-80, which connects San Francisco to the East Bay and other locations east via the San Francisco-Oakland Bay Bridge. U.S. 101 and I-280 serve San Francisco and the South Bay, and U.S. 101 provides access north via the Golden Gate Bridge. Access from I-80 eastbound is via the off-ramp at Bryant/Seventh streets, and access to I-80 eastbound is via the on-ramp at Bryant/Eighth streets. Access from I-80 westbound is via the off-ramp at Harrison/Eighth streets, and access to I-80 westbound is via the on-ramp at Harrison/Seventh. The closest access to I-280 is provided via on- and off-ramps at the intersection of Sixth/Brannan streets.

**Harrison Street** runs in the east-west direction between The Embarcadero and 13<sup>th</sup>/Division streets, operating one-way westbound between Third and Tenth streets. Harrison Street runs in the north-south direction between 13<sup>th</sup>/Division and Norwich streets. In the downtown area, Harrison Street is a primary route to the I-80 freeway, with on-ramps at the First Street and Essex Street intersections, and to U.S. 101 southbound, with an on-ramp at Fourth Street and another at Seventh Street. In the *San Francisco General Plan*, it is a designated Major Arterial in the Congestion Management Network (between The Embarcadero and Division Street), a Primary Transit

Case No. 2014.0198E

**FIGURE 15: TRANSPORTATION STUDY AREA AND STUDY INTERSECTIONS**

**Table 1: Intersection LOS – Existing Conditions - Weekday P.M. Peak Hour**

Intersection	Average Vehicle Delay <sup>a</sup>	LOS
1. Harrison Street/Sixth Street <sup>b</sup>	31.6	C
2. Harrison Street/Seventh Street <sup>c</sup>	30.2	C
3. Bryant Street/Sixth Street <sup>b</sup>	>80	F
4. Bryant Street/Seventh Street <sup>c</sup>	18.7	B

*Notes:*  
<sup>a</sup> Delay is presented in seconds per vehicle.  
<sup>b</sup> Traffic counts conducted in September 2012.  
<sup>c</sup> Traffic counts conducted in September 2009.

*Source:* LCW Consulting (LOS analysis taken from Central SoMa Plan Transportation Impact Study, October 2014).

Intersection turning movement volume counts at the unsignalized intersections of Sixth Street/Ahern Way, Harriet Street/Bryant Street, and Harriet Street/Harrison Street were conducted on Wednesday, February 11, 2015 during the weekday p.m. peak period to estimate vehicle trips on Harriet Street and Ahern Way. During the weekday p.m. peak hour, there are about 50 vehicles traveling on Harriet Street between Bryant Street and Ahern Way, and about 40 vehicles on Ahern Way between Sixth and Harriet streets (i.e., about 30 eastbound and 10 westbound vehicles). There are about 80 vehicles exiting Harriet Street at Harrison Street during the weekday p.m. peak hour.<sup>42</sup> As noted above, both Harriet Street and Ahern Way provide access to the ambulance loading area for the Office of the Chief Medical Examiner; the below-grade parking in the existing HOJ; the surface parking lots under the I-80 structure reserved for HOJ, Sheriff's Department, and SFPD use; and to on-street parking spaces that are generally occupied by marked and unmarked official City vehicles. Thus, the majority of vehicles on these streets are related to existing HOJ activities. While not observed during field surveys, some vehicles, such as the SFPD police cars that double park on Bryant Street in front of the HOJ, may use Harriet Street to travel between Bryant and Harrison streets.

### Transit Conditions

The project site is well served by public transit. Local service is provided by the San Francisco Municipal Railway (Muni) bus routes, which can be used to transfer to other bus lines, cable car lines, the F Market & Wharves historic streetcar line, and Muni Metro light rail lines. Service to and from the East Bay is provided by Bay Area Rapid Transit (BART) along Market and Mission streets, and AC Transit buses from the Transbay Terminal. Service to and from the North Bay is provided by Golden Gate Transit along Van Ness Avenue and at the Transbay Terminal, and ferry service from the Ferry Building. Service to and from the Peninsula and South Bay is provided by Caltrain at its terminal located at Fourth and Townsend streets, and by the San Mateo County Transit District (SamTrans) at the Transbay Terminal.

<sup>42</sup> Ibid.

Notes:

<sup>a</sup> Delay is presented in seconds per vehicle.

<sup>b</sup> Traffic counts conducted in September 2012.

<sup>c</sup> Traffic counts conducted in September 2009.

Source: LCW Consulting (LOS analysis taken from Central SoMa Plan Transportation Impact Study, October 2014).

would be closed to through traffic in both directions, and only HOJ and RDF-related official service vehicles, scheduled delivery and service vehicles, and emergency response vehicles would be allowed access. Non-HOJ related drivers on the portions of Harriet Street and Ahern Way that would be restricted would need to divert to other streets. Given the limited amount of traffic that utilizes Ahern Way and Harriet Street, this level of traffic diversion to other nearby streets would not substantially affect cumulative traffic conditions in the project vicinity.

For the above reasons, the proposed project, in combination with past, present and reasonably foreseeable development in San Francisco, would result in less-than-significant cumulative traffic impacts and no mitigation is necessary.

### ***Cumulative Transit Impacts***

**Impact C-TR-2: The proposed project in combination with past, present and reasonably foreseeable development would not contribute to significant cumulative transit impacts on local or regional transit capacity. (*Less than Significant*)**

Future year 2040 Cumulative transit conditions were utilized to assess the cumulative effects of a proposed project and other development that would occur through the year 2040. Consistent with San Francisco Planning Department guidance the impact assessment is conducted for the San Francisco downtown and regional screenlines.<sup>58</sup> The 2040 Cumulative transit screenline analysis accounts for ridership and/or capacity changes associated with the TEP and the Central Subway Project (which is scheduled to open in 2019), among other transit projects. The 2040 Cumulative transit screenlines were developed in coordination with SFMTA based on the SFCTA travel demand model analysis. Forecasted future hourly ridership demand was then compared to expected hourly capacity, as determined by the likely route and headway changes identified in the TEP to estimate capacity utilization under 2040 Cumulative conditions. As noted above, the year 2040

<sup>58</sup> Planning Department Transportation Team, *Regional & Local 2014 Cumulative Transit Screenlines for Transportation Impact Studies*, Memo to Planning Department Transportation Consultants, March 10, 2014. A copy of this document is available for review at the San Francisco Planning Department, 1650 Mission Street, Suite 400, in Case File No. 2014.0198E.

## CHAPTER 4 Environmental Setting and Impacts

### 4.0 INTRODUCTION TO THE ANALYSIS

Chapter 4 contains a discussion of the possible direct and indirect environmental effects of the proposed Academy of Art University (AAU) Project (Proposed Project). This chapter is the primary component of the environmental impact report (EIR), as it provides information on the existing conditions in the City of San Francisco, the type and magnitude of the Proposed Project's potential individual and cumulative environmental impacts, and feasible mitigation measures that could reduce or avoid such impacts.

#### 4.0.1 Scope of the EIR

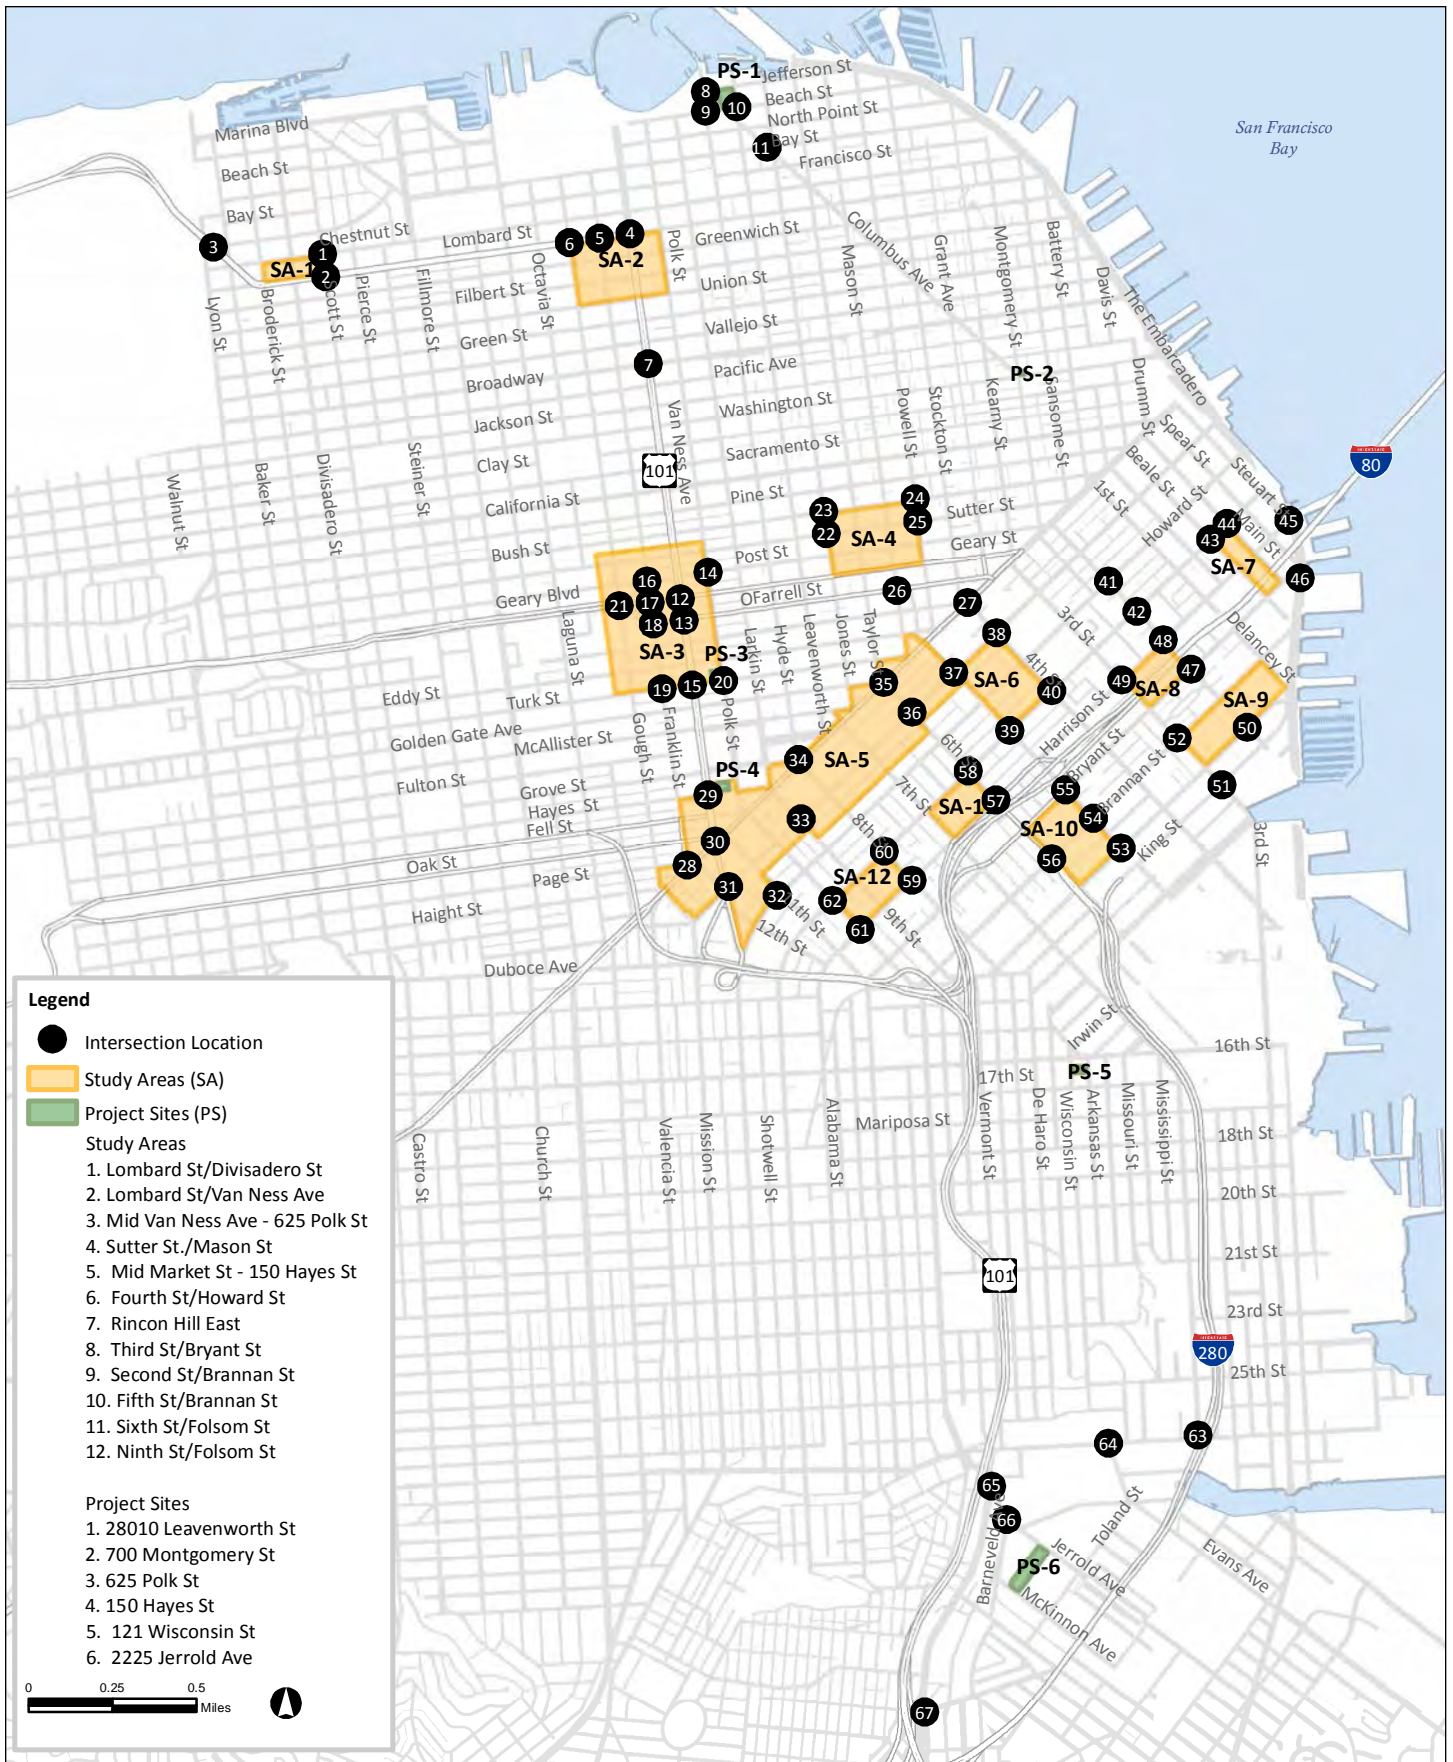

##### ■ CEQA Methodological Requirements

CEQA Guidelines Section 15151 describes standards for the preparation of an adequate EIR. Specifically, the standards under Section 15151 are listed below.

- An EIR should be prepared with a sufficient degree of analysis to provide decision-makers with information that enables them to make a decision that intelligently takes into account environmental consequences
- An evaluation of the environmental impacts of a project need not be exhaustive; rather, the sufficiency of an EIR is to be reviewed in light of what is reasonably feasible
- Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts

In practice, the above points indicate that EIR preparers should adopt a reasonable methodology upon which to estimate impacts. This approach means making reasonable assumptions using the best information available. In some cases, typically when information is limited or where there are possible variations in project characteristics, EIR preparers will employ a "reasonable worst-case analysis" in order to capture the largest expected potential change from existing baseline conditions that may result from implementation of a project.

- Intersections #41 and #42 are included because an area near Second St/Howard St was under consideration at one time but is no longer part of the Proposed Project. These intersection analyses were retained because AAU growth in SA-8 would contribute vehicle trips to these intersections.
- For unsignalized intersections the LOS is reported for highest-delay approach and that movement (for example WB = westbound) is noted. For signalized intersections LOS E or LOS F are reported in **bold**.

## Overview of Conditions at Project Sites

**PS-1, 2801 Leavenworth Street (The Cannery):** PS-1 consists of The Cannery building at 2801 Leavenworth Street. PS-1 is bordered by Leavenworth Street to the east, Jefferson Street to the north, Hyde Street to the west, and Beach Street to the south. No vehicle access or driveways are located on The Cannery building site. In the vicinity of the project site, Leavenworth Street has one travel lane in each direction with metered parking on both sides of the street; and Jefferson Street has two westbound travel lanes with metered parking on both sides of the street. As detailed in the *Fisherman's Wharf Public Realm Plan*, 2010, proposed enhancements to the Jefferson Street corridor (between Powell Street and Hyde Street) include a contra-flow bike lane, on-street loading pockets for passenger and freight loading, and conversion of the semi-exclusive streetcar transit lane to a fully exclusive transit lane.

**PS-2, 700 Montgomery Street:** PS-2 is bordered by Washington Street to the south, Montgomery Street to the west, Jackson Street to the north, and Hotaling Place to the east. No vehicle access or driveways are located at the project site. In the vicinity of the project site, Montgomery Street has one travel lane in each direction and metered and unmetered parking on both sides of the street; and, Washington Street has three westbound travel lanes and metered parking on both sides of the street.

**PS-3, 625 Polk Street:** PS-3 is bordered by Turk Street to the south, Eddy Street to the north, Van Ness Avenue to the west, and Polk Street to the east. No vehicle access or driveways are located at the project site. In the project vicinity, Polk Street has one travel lane in each direction with metered

Planning  
Information:  
**415.558.6377**

The purpose of this Addendum to the Eastern Neighborhoods Rezoning and Area Plans Final EIR is to substantiate the Planning Department's determination that no supplemental environmental review is required for the proposed "Art and Design Special Use District" legislation (Board of Supervisors File No. 111278) because the environmental effects of implementation of this legislation have been adequately analyzed pursuant to the California Environmental Quality Act ("CEQA") in a Final Environmental Impact Report ("FEIR") previously prepared for the Eastern Neighborhoods Rezoning and Area Plans project. This memorandum describes the proposed legislation's relationship to the Eastern Neighborhoods Rezoning and Area Plans FEIR and Showplace Square/Potrero Hill Area Plan, analyzes the proposed legislation in the context of the previous environmental review, and summarizes the potential environmental effects that may occur as a result of implementing the legislation.

### PROPOSED LEGISLATION

The project is proposed legislation that would amend the San Francisco Planning Code by adding Section 249.66 to create the Art and Design Special Use District ("SUD"). The SUD would apply to five lots on three blocks in the Showplace Square/Potrero Hill area of San Francisco. The amendment would facilitate continued operation of the California College of the Arts ("CCA") and provide a regulatory scheme for a potential future expansion of the campus, including permitting student housing which would be limited to 750 beds on any parcel within the SUD boundaries. The proposed ordinance would also amend the San Francisco Planning Code Sectional Map SU08 of the City and County's Zoning Map to reflect the creation of the Art and Design Special Use District. The legislation further stipulates that for any potential housing project within the SUD, standards for development, project review, entitlement process, and impact fees of the Urban Mixed Use ("UMU") district would apply.<sup>1</sup>

### PROJECT DESCRIPTION

#### *Background*

The Eastern Neighborhoods Rezoning and Area Plans Project was adopted in December 2008. The Project was adopted in part to support housing development in some areas previously zoned for industrial uses,

---

<sup>1</sup> See Planning Code Section 843 et seq. for more information.

In the cumulative context, the Final EIR found that adoption of the preferred Eastern Neighborhoods use districts and zoning controls would result in a significant, adverse impact in the cumulative supply of land for PDR uses and would not be mitigable without substantial change in use controls on land under Port of San Francisco jurisdiction. The finding was based on supply, demand and land use projections prepared for the Eastern Neighborhoods Final EIR.<sup>10</sup>

The FEIR found that industrially-zoned land and PDR building space is expected to decrease over the foreseeable future. The use districts and zoning controls adopted as part of the Eastern Neighborhoods Rezoning and Area Plans project are expected to accommodate housing and primarily management, information, and professional service land uses within the area over time. While the SUD would apply to CCA's parcels, including the 101,705-square-foot vacant parcel where design-related PDR uses are permitted, potential increases in cultural, institutional and educational space of upwards of 225,000 to 260,000 square feet within the neighborhood were forecasted and envisioned as part of the local planning process. Additionally, upwards of 2,600 housing units are anticipated within the Plan area through the year 2025. Permitting student housing within the CCA SUD would address residential demands generated by the institution as well as represent a portion of the areawide forecasted demand for this type of land use.

Because the type of housing that may be permitted is limited to student housing and because the geography of the SUD is confined to those parcels under control of and related to the California College of the Arts and not the surrounding PDR-1-D district at large, implementation of the SUD would not contribute in a considerable manner to the adverse, cumulative land use impact associated with the adoption of area-wide rezoning. The cumulative land use effect of the proposed SUD would be therefore less than considerable.

## *Transportation*

### Traffic

The FEIR included a level of service analysis at 40 study intersections within the plan area. Within Showplace Square/Potrero Hill, the FEIR included 15 study intersections and found significant, adverse impacts would occur at the following intersections: Seventh/Harrison, 13th/Bryant, 13th/Folsom, South Van Ness/Howard/13th, Seventh/Brannan, Seventh/Townsend, Eighth/Bryant, Eighth/Harrison, Third/César Chávez, Third/Evans, and César Chávez/Evans. With the exception of the intersections of DeHaro/Division/King, Rhode Island/16th, and Rhode Island/Division Streets, the FEIR identified no feasible measures associated with the above intersection impacts to mitigate them to less-than-significant levels. Other mitigation cited in the FEIR could include implementation of Intelligent Traffic Management Systems ("ITMS") strategies, improvement and enhancement of streets, promotion of alternate means of travel, and parking management to discourage driving.

Implementation of the proposed SUD legislation would not directly generate new person or automobile trips. Subsequent development projects proposed within the context of the SUD would be reviewed at a project-level to determine trip generation, assignment and mode split in order to determine the potential for future projects to result in operational impacts on signalized intersections or cause major traffic hazards or contribute considerably to cumulative traffic increases that would cause deterioration in levels of service to unacceptable levels.

## IV.A Transportation and Circulation

This section analyzes the potential project-level and cumulative impacts on transportation and circulation resulting from implementation of the Moscone Center Expansion Project. Transportation-related issues of concern that are addressed include traffic on local and regional roadways, transit, bicycles, pedestrians, parking, loading, and construction-related activities. This section provides an overview of existing transportation conditions, a description of applicable transportation regulations and policies, methodologies and assumptions used in the impact analysis, and impact assessment and mitigation measures. This section is based on information and analysis contained in the Moscone Center Expansion Project Transportation Impact Study (TIS).<sup>1</sup>

### Environmental Setting

The transportation study area for the proposed project is bounded by Market Street to the north, Fifth Street to the west, Bryant Street to the south, and New Montgomery/Hawthorne Street to the east. A total of 24 intersections within the transportation study area (see **Figure IV.A-1**, p. IV.A-2) were identified as the intersections most likely to be affected by the proposed project. All of the study intersections are signalized. No freeway segments were analyzed because the proposed project would not measurably affect the operation of the freeway system.

The transportation setting within the study area is presented first, and is followed by a description of transportation operations at the Moscone Center.

### Regional and Local Roadways

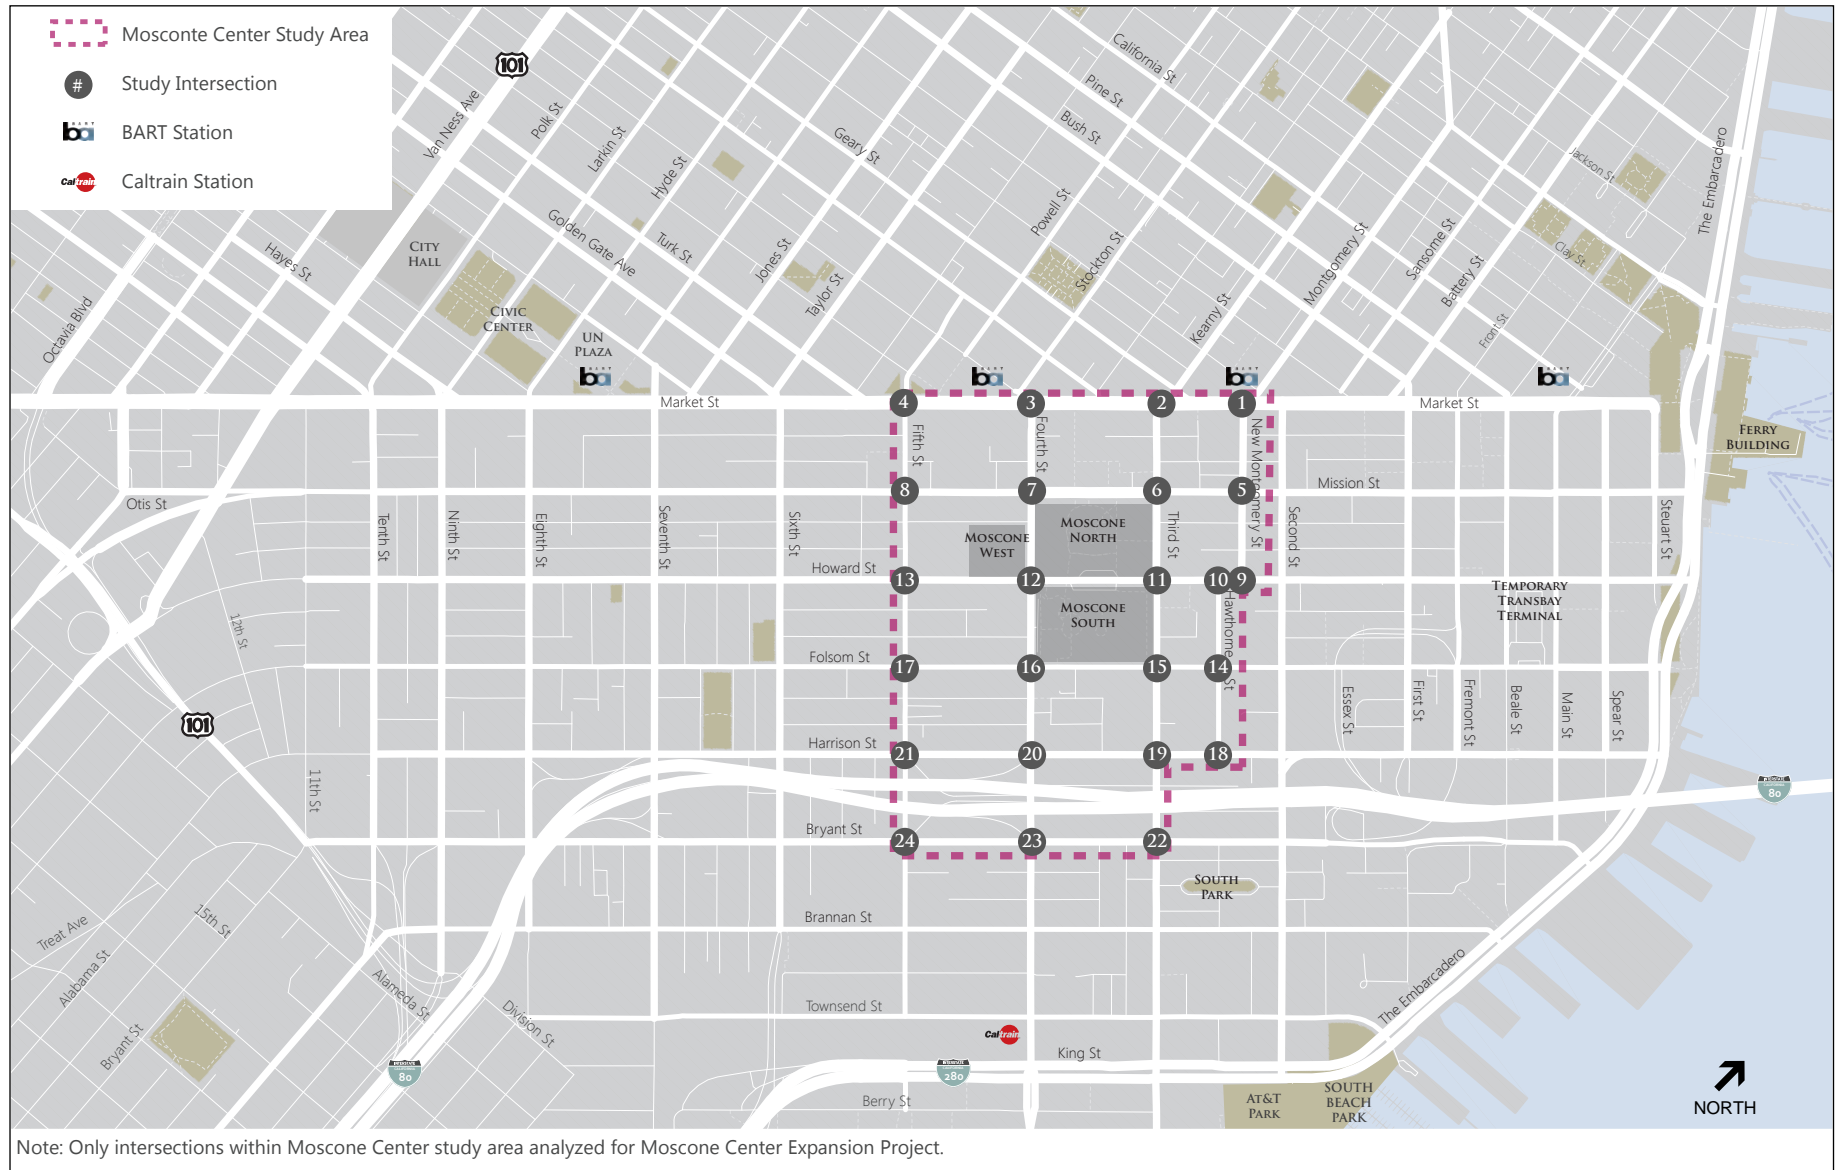

#### *Regional Access*

**Interstate 80 (I-80)** provides the primary regional access to the proposed project site. Interstate 80 runs through the southern portion of the study area and connects San Francisco to the East Bay and other points east via the San Francisco-Oakland Bay Bridge. There are two sets of on-ramps and off-ramps in the study area (at Fifth Street and at Fourth Street) that provide access to and from eastbound and westbound I-80. Within the study area, I-80 has eight lanes (four in each direction).

**U.S. Highway 101 (U.S. 101)** provides access to the north and south of the study area. Interstate 80 joins U.S. 101 to the southwest of the study area and provides access to the Peninsula and South Bay. U.S. 101 connects San Francisco and the North Bay via the Golden Gate Bridge. There is no direct access to U.S. 101 within the study area. Within the northern part of San Francisco, U.S. 101 operates on surface streets (i.e., Van Ness Avenue and Lombard Street). Van Ness Avenue and Lombard Street are part of the Citywide Pedestrian Network outlined in the Transportation Element of the *San Francisco General Plan*.

## V. ENVIRONMENTAL SETTING AND IMPACTS

### F. TRANSPORTATION AND CIRCULATION

---

---

#### INTRODUCTION

This section addresses the potential impacts of the 2004 Housing Element and 2009 Housing Element related to the circulation system, congestion management system, air traffic patterns, the adequacy of emergency access, the adequacy of parking capacity, and potential conflicts with adopted policies and programs that support alternative transportation. The Planning Department prepared a transportation study, consistent with the Department's *Transportation Impact Analysis Guidelines for Environmental Review (SF Guidelines)*, to identify the impacts of the proposed Housing Elements on the transportation and circulation system, which serves as the data source for this section unless otherwise noted.<sup>1</sup>

Existing transit conditions are described in terms of available routes, transit ridership and capacity at the screenlines for San Francisco Municipal Railway (Muni) and regional transit carriers. A public transit screenline analysis was performed on key Muni routes and regional transit carriers under the study scenarios. Existing pedestrian and bicycle conditions are described qualitatively. Existing parking conditions in the city are also described qualitatively, with emphasis on the Residential Parking Permit program and its locations. The existing traffic conditions were evaluated at 60 study intersections during the p.m. peak period for a typical weekday. The peak period analyzed was between 4:00 p.m. and 6:00 p.m., which is generally the period of peak demand on the transportation network. The study intersections were identified by the Planning Department as the intersections citywide that experience the most congestion or represent the constraints on the transportation network.

#### ENVIRONMENTAL SETTING

The transportation study area is defined as the entirety of the City and County of San Francisco and is depicted in Figure IV-1 (Section IV. Project Description). The following section describes the existing transportation network.

##### Existing Roadway Network

The following describes of the existing transportation network, including descriptions of the existing roadway and transit network, parking, pedestrian, and bicycle conditions. Descriptions of the roadway system serving the project site use the classifications from the Transportation Element of the San Francisco General Plan. The Transportation Element of the General Plan classifies roadways within the City as Freeways, Major Arterials, Transit Conflict Streets, Secondary Arterials, Recreational Streets, Collector Streets, and Local Streets. It also identifies Transit Preferential Streets, which include Primary

[sarah.b.jones@sfgov.org](mailto:sarah.b.jones@sfgov.org)

## 1.0 SETTING

This section describes the existing street network and traffic, transit, pedestrian, bicycle, loading, and parking conditions in project study area, which is generally bounded by Market Street to the north, First Street to the east, King Street to the south, and Third Street to the west. Portions of Fifth and Bryant Streets, near the Interstate 80 ramps are also included in the study area.

The majority of traffic, transit, pedestrian, bicycle, emergency vehicle access, loading, and parking data presented herein was provided by San Francisco Planning Department, San Francisco Municipal Transportation Authority (SFMTA) and from relevant past and concurrent projects within the project study area. Additional data collection for project analysis was conducted in September 2013 by CHS Consulting Group and included traffic counts at five study area intersections. CHS also conducted field observations of vehicular queuing patterns, and conflicts among automobiles, bikes, pedestrians, and Muni buses in the vicinity of the proposed project.

### 2.1 Roadway Network

This section presents a discussion of existing roadway systems in the vicinity of the proposed project, including roadway designation, number of lanes, and traffic flow directions. The functional designation of these roadways was obtained from the *San Francisco General Plan*.<sup>11</sup> Detailed definitions of the *San Francisco General Plan*'s roadway classification schemes are included in **Appendix C**. It should be noted that as described in Section 1.1, the existing street layout of Second Street would be reconfigured as part of the proposed project.

#### 2.1.1 Regional Access

This study area is served by three freeways: Interstate 80 (I-80), Interstate 280 (I-280) and U.S. Highway 101. These facilities are described below.

**Interstate 80 (I-80)** provides the primary regional access to the project area. In the project vicinity this freeway is between Harrison and Bryant Streets. The San Francisco-Oakland Bay Bridge is part of I-80, connecting San Francisco to the East Bay. Between the East Bay and the project site, the primary access points are via the I-80 westbound off-ramp at Fremont and Harrison Streets and the eastbound on-ramp at Essex, Sterling and First Streets.

**Interstate 280 (I-280)** provides regional access to and from the South Bay. I-280 terminates at three blocks from the study area, at Fifth Street and the traffic merges with King Street traffic. I-280 also has nearby on- and off-ramps at Sixth Street, and Brannan Street intersection. I-280 connects to U.S. 101 approximately four miles south of the Study Area. I-280 and U.S. 101 continue as parallel freeways southbound along the Peninsula before reconnecting in San Jose.

**U.S. Highway 101 (U.S. 101)** provides regional access to both the north and south of San Francisco. I-80 joins U.S. 101 to the southwest of the project area and provides access to the South Bay and the Peninsula. U.S. 101 connects San Francisco to the North Bay via Van Ness Avenue, Lombard Street, and the Golden Gate Bridge. Access to and from U.S. 101 southbound includes the on- and off-ramps at Seventh/Harrison and Seventh/Bryant Streets, as well as at the intersections of Tenth/Bryant and Ninth/Bryant Street, respectively.

Source: South of Market Health Center, *SMHC Transportation and Trend Data*, November 2005; San Francisco Planning Department, November 2005.

## Traffic Impacts

The project site is located at 255 Seventh Street between Howard and Folsom Streets. Within the project site vicinity, Seventh Street is a one-way Major Arterial with four travel lanes in the northbound direction.<sup>24</sup> On-street parking is generally provided along both sides of the street with a bicycle lane, and metered parking is provided adjacent to the project site. Seventh Street is part of the #23 bike lane.<sup>25</sup> Howard Street is a one-way arterial with four travel lanes in the westbound direction and a bicycle lane. The *San Francisco General Plan* identifies Howard Street as a Major Arterial in the Congestion Management Program (CMP) Network. Howard Street is part of the #30 bike lane. Within the project site vicinity, Folsom Street is a one-way arterial with four travel lanes and a bicycle lane in the eastbound direction. The *San Francisco General Plan* identifies Folsom Street as a Major Arterial in the CMP Network and it is also part of the #30 bike lane. Moss Street is a one-way street with one lane in the southbound direction. Parking is permitted on the west side of the street only.

As discussed above, the proposed project would generate about 175 daily vehicle trips of which 26 would be during the PM peak hour (see Table 3). The number of vehicles that would be added to the PM peak hour by the proposed project is too low to have a perceptible effect on traffic flows on the street network serving the project area, particularly given the relatively high volume of traffic on Seventh, Howard, and Folsom Streets. The average driver would not discern a change in the level of delay or congestion they currently experience. Traffic impacts associated with the proposed project during the PM peak hour would not be a large enough increase to affect a significant increase relative to the existing capacity of the surrounding street system. Accordingly, the proposed project would result in a less-than-significant traffic impact.

<sup>24</sup> It should be noted that in the South of Market area, streets that run in the northwest/southeast direction are generally considered north-south streets, whereas streets that run in the southwest/northeast direction are generally considered east-west streets.

### PROJECT OVERVIEW

The proposed Pier 70 Mixed-Use District project site is an approximately 35-acre area bounded by Illinois Street to the west, 20<sup>th</sup> Street to the north, San Francisco Bay to the east, and 22<sup>nd</sup> Street to the south. (See Figure 1: Project Location.) The project site is south of Mission Bay South, east of the Potrero Hill and Dogpatch<sup>1</sup> neighborhoods, and within the northeastern portion of San Francisco's Central Waterfront Plan Area. In addition, the majority of the project site is located within the Pier 70 area (Pier 70), which is owned by the City and County of San Francisco through the Port of San Francisco (Port).

Two development areas constitute the project site. The "28-Acre Site" is an approximately 28-acre site located between 20<sup>th</sup> Street, Michigan Street, 22<sup>nd</sup> Street, and San Francisco Bay that includes Assessor's Block 4052/Lot 001 and Block 4111/Lot 004. The "Illinois Parcels" form an approximately 7-acre site that consists of an approximately 3.4-acre Port-owned parcel, called the 20<sup>th</sup>/Illinois Parcel, along Illinois Street at 20<sup>th</sup> Street (Assessor's Block 4110/Lot 001) and an approximately 3.6-acre parcel, called the Hoedown Yard, at Illinois and 22<sup>nd</sup> streets (Assessor's Block 4120/Lot 002 and Block 4110/Lot 008A),

---

<sup>1</sup> The Dogpatch neighborhood is bounded by Mariposa Street to the north, I-280 to the west, Cesar Chavez Street to the south, and Illinois Street to the east.

Notes:

**Bold** indicates an unacceptable intersection level of service condition (LOS E or F).

1. Signal indicates signalized intersection; TWSC indicates a Two-Way Stop-Controlled intersection.

2. LOS and delay for signalized intersections represent conditions for the overall intersection; LOS and delay for TWSC intersections represent conditions for the side-street stop-controlled approach, eastbound (EB); westbound (WB).

3. Volume-to-Capacity (V/C) ratios are only presented for intersections that operate at unacceptable LOS conditions (LOS E or F), per City standards.

**Table 13 – Intersection Level of Service: Cumulative (2040) and Cumulative Plus Project – Weekday PM Peak Hour**

Overall Intersection Summary						
		2040 Cumulative			Cumulative + Project	
#	Study Intersection	Delay <sup>1</sup> (seconds)	V/C <sup>2</sup>	LOS	Delay <sup>1</sup> (seconds)	V/C <sup>2</sup> LOS
1	Market St/ Montgomery St	> 80	1.02	F	> 80	1.13 F
2	Mission St/ New Montgomery St	> 80	1.36	F	> 80	1.47 F
3	Howard St/ New Montgomery St	17.5		B	55.9	1.05 E
4	Howard St/ Hawthorne St	12.0		B	42.7	D <sup>3</sup>
5	Folsom St/ Hawthorne St	> 80	1.98	F	> 80	2.05 F
6	Harrison St/ Hawthorne St	30.5		C	> 80	1.38 F
7	Bryant St/ Third St	> 80	2.88	F	> 80	2.91 F
8	Brannan St/ Third St	> 80	1.30	F	> 80	1.51 F
9	Townsend St/ Third St	> 80	1.69	F	> 80	2.40 F
10	King St/Third St	> 80	1.34	F	> 80	1.39 F
11	Market St/ Second St	10.5		B	15.6	B
12	Mission St/ Second St	24.4		C	41.1	D
13	Minna St/ Second St	0.6		A (NB)	0.4	A (NB)
14	Howard St/ Second St	> 80	1.20	F	> 80	1.03 F
15	Folsom St/ Second St	> 80	1.62	F	> 80	1.72 F
16	Harrison St/ Second St	> 80	2.58	F	> 80	3.39 F
17	Bryant St/ Second St	> 80	2.26	F	> 80	2.56 F
18	South Park St/Second St	61.0	N/A	F	10.7	B
19	Brannan St/ Second St	31.8		C	31.6	C
20	Townsend St/ Second St	73.3	1.20	E	> 80	1.34 F
21	King St/ Second St	> 80	1.03	F	> 80	0.90 F
22	Folsom St/ Essex St	> 80	6.50	F	> 80	2.84 F
23	Harrison St/ Essex St	> 80	3.73	F	> 80	3.30 F
24	Market St/ First St	17.8		B	18.2	B
25	Mission St/ First St	33.7		C	27.0	C
26	Howard St/ First St	> 80	1.21	F	> 80	1.24 F
27	Folsom St/ First St	> 80	2.48	F	> 80	2.59 F
28	Harrison St/ First St	> 80	1.55	F	> 80	1.74 F
29	Fifth St/Bryant St/ I-80 EB On-Ramp	> 80	3.37	F	> 80	3.32 F

Notes:

**Bold** indicates an unacceptable intersection level of service condition (LOS E or F).

**Shaded** values indicate a *Significant Project-Specific Traffic Impact*.

1. LOS and delay for signalized intersections represent conditions for the overall intersection; LOS and delay for unsignalized (e.g., TWSC) intersections represent conditions for the side-street stop-controlled approach, northbound (NB).

2. Volume-to-Capacity (V/C) ratios are only presented for intersections that operate at unacceptable LOS conditions (LOS E or F), per City standards.

3. Intersection #4 Howard and Hawthorne Street was identified as resulting in a significant impact under Existing plus Project Conditions; therefore, it is identified as having a significant impact in the cumulative condition. Also, this intersection would operate at unacceptable LOS F under Cumulative plus Project conditions if the Central SoMa Plan, and its associated reduction in traffic volumes on Howard Street, was not adopted.

**Table IV.D-1: Intersection Level of Service, Existing Conditions – Weekday PM and Saturday Midday Peak Hours**

Intersection	Delay <sup>1</sup>	LOS <sup>2</sup>
<b>Weekday PM Peak Hour</b>		
1. Third/Market	56.2	E
2. Third/Mission	20.1	C
3. Third/Howard	36.1	D
4. New Montgomery/Market	42.6	D
5. New Montgomery/Mission	21.3	C
6. New Montgomery/Minna <sup>3</sup>	45.3 (wb)/44.3 (eb)	E/E
7. New Montgomery/Natoma <sup>3</sup>	30.4 (eb)	D
8. New Montgomery/Howard	56.7	E
9. Fifth/Howard	24.9	C
10. Fifth/Folsom	19.7	B
11. Fifth/Harrison/I-80 off-ramp	50.0	D
12. Sixth/Howard	23.6	C
13. Sixth/Folsom	20.0	B
14. Sixth/Shikey <sup>3</sup>	37.3 (wb)	E
15. Sixth/Harrison	25.7	C
<b>Saturday Midday Peak Hour</b>		
1. Third/Market	26.7	C
2. Third/Mission	16.0	B
3. Third/Howard	16.1	B

Notes:

<sup>1</sup> Delay presented in seconds per vehicle.

<sup>2</sup> Intersections operating at LOS E or LOS F highlighted in **bold**.

<sup>3</sup> Unsignalized intersection. Peak hour signal warrants are not met.

wb = westbound; eb = eastbound

Source: LCW Consulting, 2011.

The signalized intersections of Third/Market and New Montgomery/Howard Streets currently experience the greatest average delay per vehicle, and both intersections operate at an overall intersection operating condition of LOS E. In the vicinity of the SFMOMA Expansion site, Third Street and New Montgomery Street serve as primary routes to and from I-80. The poor operating conditions at the intersection of New Montgomery/Howard Streets are due to the high volumes of traffic on Howard Street westbound and on New Montgomery Street southbound. Conditions at this intersection are exacerbated by the nearby signalized intersection of Hawthorne/Howard Streets.

- Conversion of Natoma Street between First and Second Streets into a pedestrian-only street, and establishment and installation of signalized midblock pedestrian crossings on New Montgomery at Second Street and at Natoma Street.<sup>16</sup>

**Traffic Impacts.** Figure IV.D-16 presents the 2030 Cumulative traffic volumes for the weekday PM peak hour for intersections in the vicinity of the SFMOMA Expansion site, while Figure IV.D-17 presents the PM peak hour volumes for intersections in the vicinity of the Fire Station Relocation and Housing Project site. Table IV.D-27 presents a comparison between the Existing and 2030 Cumulative intersection operating conditions for the weekday PM peak hour. Under 2030 Cumulative conditions, vehicle delays would increase at the study intersections over Existing conditions, and 10 of the 15 study intersections would operate at LOS E or LOS F conditions (as compared with four intersections under Existing conditions).

**Table IV.D-27: Intersection Level of Service, Existing and 2030 Cumulative Conditions – Weekday PM Peak Hour**

Intersection	Existing		2030 Cumulative	
	Delay (v/c) <sup>1</sup>	LOS	Delay (v/c) <sup>1</sup>	LOS
1. Third/Market Streets	56.2	E	>80 (1.02)	F
2. Third/Mission Streets	20.1	C	>80 (4.78)	F
3. Third/Howard Streets	36.1	D	>80 (1.66)	F
4. New Montgomery/Market Streets	42.6	D	63.2	E
5. New Montgomery/Mission Streets	21.3	C	>80 (1.17)	F
6. New Montgomery/Minna Streets <sup>2</sup>	45.3 (wb)	E	>60 (wb/eb)	F
7. New Montgomery/Natoma Streets <sup>2</sup>	30.4 (eb)	D	36.8 (eb)	E
8. New Montgomery/Howard Streets	56.7	E	>80 (2.27)	F
9. Fifth/Howard Streets	24.9	C	51.3	D
10. Fifth/Folsom Streets	19.7	B	29.8	C
11. Fifth/Harrison Streets /I-80 off-ramp	50.0	D	>80 (0.97)	F
12. Sixth/Howard Streets	23.6	C	43.3	D
13. Sixth/Folsom Streets	20.0	B	31.0	C
14. Sixth/Shipley Streets <sup>2</sup>	37.3 (wb)	E	60.3 (wb)	F
15. Sixth/Harrison Streets	25.7	C	53.0	D

Notes:

<sup>1</sup> Delay presented in seconds per vehicle. Intersections operating at LOS E or LOS F are highlighted in **bold**. Volume-to-capacity (v/c) ratio is presented for signalized intersections operating at LOS F.

<sup>2</sup> Unsignalized intersection. Peak hour signal warrants are not met.

Source: LCW Consulting, 2011.

<sup>16</sup> The SFMOMA Expansion would complement the proposed Transit Center District Plan improvements, as it would provide a new pedestrian connection between Natoma and Howard Streets. It would also allow for access between Natoma Street and Third Street through the public portion of the museum on the first and second floors.

Re: Appeal Procedures for Successor Agency Environmental Leadership Projects

Dear Ms. Calvillo:

I am in receipt of the letter dated November 10, 2015 and sent on your behalf by Alisa Somera, Acting Legislative Deputy. In that letter, your office requests additional information regarding the appeal procedures authorized under the Commission on Community Investment and Infrastructure's ("CCII") Resolution No. 33-2015 (June 2, 2015). In consultation with counsel for the Successor Agency to the Redevelopment Agency, commonly known as the Office of Community Investment and Infrastructure, ("Successor Agency" or "OCII"), and the San Francisco City Attorney's Office, I am providing you with additional information below relating to appeals filed in accordance with that resolution.

The certification of any form of Final Environmental Impact Report ("FEIR") for an Environmental Leadership Project by the Successor Agency Commission, also known as CCII, may be appealed to the Board of Supervisors ("Board"), acting as the governing body of the Successor Agency, pursuant to the terms of Resolution No. 33-2015, approved by the CCII on June 2, 2015. The Successor Agency is a state authorized entity created by statute, the Redevelopment Dissolution Law, Cal. Health & Safety Code §§ 34170 et seq. The Successor Agency has succeeded to the "organizational status" of the Redevelopment Agency and is separate and distinct from the City and County of San Francisco ("City"). Cal. Health & Safety Code 34173 (g).

In adopting Ordinance No. 215-12, the Board, acting as the governing body of the Successor Agency, and consistent with the Redevelopment Dissolution Law, delegated to CCII exclusive final land use authority for certain Major Approved Development Projects (as defined in the Ordinance) in those geographic areas within the City formerly subject to the jurisdiction of the San Francisco Redevelopment Agency, including Mission Bay. Even so, CCII, through its Resolution No. 33-2015, created a right of appeal to the Board, acting as the Successor Agency's governing body having delegated such land use authority, on the issue of the adequacy of the FEIRs prepared by OCII for "Environmental Leadership Projects" meeting the terms set forth in

RECEIVED  
BOARD OF SUPERVISORS  
SAN FRANCISCO  
NOV 16 PM 4:19  
AK

California Public Resources Code section 21183. CCII created this process with the specific goal of ensuring an increased level of public participation with respect to the substance and contents of Final EIRs for Environmental Leadership Projects.

You have asked what could be the potential outcomes of Board action under the appeal process here. The CCII, in adopting Resolution No. 33-2015, envisioned that the Board would follow the standards and procedures for appeals that it applies when it hears appeals of CEQA decisions by the City's Planning Commission or other City agencies. In this regard, CCII envisions that the Board by a majority vote of all of its members may affirm or reverse the certification of the FEIR by CCII. If the Board affirms CCII's certification, then CCII will consider such certification and the approvals following the certification as administratively final.

If the Board reverses the certification, prior project approvals would be rescinded to allow CCII to, if and as necessary, adopt additional findings, revise the FEIR, or amend the project approvals. The CCII, on remand, may consider new or additional mitigation measures or alternatives before reconsidering whether to certify the revised FEIR and reapprove the Project or one of its alternatives. Any further appeal from a subsequent CEQA decision by OCII after such remand shall be limited to the adequacy of changes made by OCII in response to the Board's findings relating to the initial appeal.

Please let me know if you have any additional questions.

Sincerely,

A handwritten signature in cursive script that reads "Tiffany Bohee". The signature is written in dark ink and is positioned above the printed name and title.

Re: Golden State Warriors Appeal Procedures

Dear Ms. Bohee:

The appeal procedures for the Board of Supervisors to address appeals in accordance with the Commission on Community Investment and Infrastructure's (CCII) Resolution No. 33-2015 has been posted on the Board of Supervisors' website. A copy of those appeal procedures are attached for your reference. Appeal Procedure (7), as identified in CCII's Resolution, states: "the OCII Executive Director must otherwise assist the Clerk of the Board in accordance with any procedures established by the Clerk of the Board for such appeals." Consequently, we would like to know if there is any additional information that we should make available to the public and Board members regarding the appeal procedures that are not identified in the document we have posted; in particular, we are interested in what the potential outcomes could be from a potential appeal.

Sincerely,

A handwritten signature in cursive script that reads "Alisa Somera".

## **Appeal Filing to the Board of Supervisors In Its Capacity as Governing Body of the Successor Agency**

### **Environmental Leadership Projects California Environmental Quality Act (CEQA) Final Environmental Impact Report Appeal (Commission on Community Investment and Infrastructure Resolution No. 33-2015)**

The certification of a Final Environmental Impact Report (FEIR) for an Environmental Leadership Project by the Successor Agency to the former San Francisco Redevelopment Agency (Successor Agency, also known as the Office of Community Investment and Infrastructure along with its policy body the Commission on Community Investment and Infrastructure [CCII]) may be appealed to the Board of Supervisors (Board) pursuant to the terms of CCII Resolution No. 33-2015, approved on June 2, 2015

Any appeal filed pursuant to Resolution No. 33-2015 shall be filed in accordance with the procedures listed below. This document summarizes the process. Further details of this process and about Environmental Leadership Projects California Public Resources Code Sections 21178 et seq., are set forth in the text of CCII Resolution No. 33-2015, copies of which are available in the offices of the Clerk of the Board of Supervisors or at the following electronic link:

[www.sfocii.org/modules/showdocument.aspx?documentid=9140](http://www.sfocii.org/modules/showdocument.aspx?documentid=9140). In case of any conflict between any part of this document and CCII Resolution No. 33-2015, the provisions of CCII Resolution No. 33-2015 control. All references below to the Board are to the Board of Supervisors and all references to the Clerk of the Board are to the Clerk of the Board of Supervisors.

#### **Who May File An Appeal:**

Only a person or entity that submitted comments to the Office of Community Investment and Infrastructure (OCII) or the Commission on Community Investment and Infrastructure (CCII), either in writing during the public review period of an Environmental Leadership Project EIR, or orally or in writing at or before the close of a CCII public hearing on the EIR, may appeal a CCII certification of an FEIR on an Environmental Leadership Project.

CCII Resolution No. 33-2015, Exhibit A, Para. (1).

#### **Filing Deadline:**

The appellant or his or her agent must submit a letter of appeal to the Office of Community Investment and Infrastructure (OCII) Executive Director or his or her designee (collectively referred to as OCII Executive Director) within 10 calendar days of OCII's Environmental Leadership EIR certification and no later than 5:00 pm on that 10th day. No extension of this deadline may be granted.

CCII Resolution No. 33-2015, Exhibit A, Paras. (2), (3), and (5).

*(NOTE: If the 10<sup>th</sup> day falls on a Saturday, Sunday or holiday the appeal may be filed before 5:00 p.m. on the next business day. Also note that the appeal is filed with the OCII Executive Director, not the Clerk's Office.)*

**What and Where to File:**

The following must be filed with the OCII Executive Director at the address below:

Executive Director  
Office of Community Investment and Infrastructure  
1 South Van Ness, 5th Floor  
San Francisco, CA. 94103

*(NOTE: Filing is **not** to be made with the Clerk of the Board of Supervisors.)*

(1) A signed letter of appeal stating the specific grounds for appeal of OCII's Environmental Leadership EIR certification, including references to the written or oral comments that were timely submitted to OCII raising the issues identified in the appeal, and any other written materials in support of the appeal. The appeal may be based only on specific CEQA grounds alleged by any persons or entities before OCII makes its decision on the project. For purposes of these procedures, "project" has the meaning for such term set forth in CEQA Guidelines, Title 14 CCR, Division 6, Chapter 3, Section 15378, and "approval" has the meaning set forth for such term in Section 15352.

CCII Resolution No. 33-2015, Exhibit A, Paras. (4) and (5).

**Lodging of the appeal with the Clerk of the Board of Supervisors for purposes of scheduling an appeal hearing:**

After following the procedures established in CCII Resolution No. 33-2015, Exhibit A, Paragraph (6), the OCII Executive Director will advise the Clerk of the Board of the notice that he or she has accepted an appeal and provide a copy of the letter of appeal and a list of individuals and organizations that have requested notices relating to the project. The Clerk of the Board of Supervisors will then set the appeal for a public hearing before the Board in accordance with the "Hearing Date" provisions set forth below.

CCII Resolution No. 33-2015, Exhibit A, Para. (6).

*(NOTE: A decision by the OCII Executive Director rejecting an appeal is final and may not be appealed. CCII Resolution No. 33-2015, Exhibit A, Para. (6).)*

**Hearing Date:**

After the 10 days for filing an appeal with OCII has expired, the Clerk, if he or she has been notified that an appeal was accepted by the OCII Executive Director, will schedule an appeal hearing at a regular meeting of the full Board of Supervisors no less than 21 and no more than 45 days following the date(s) of the OCII Executive Director's notification of acceptance of an appeal to the Clerk of the Board. The Clerk will inform the appellant(s) of the hearing date and time after receipt of the OCII Executive Director's notification of acceptance of the appeal and the Clerk has scheduled the matter for hearing. If more than one appeal is filed on the same FEIR, the President of the Board may request the Clerk schedule a consolidated appeal hearing.

CCII Resolution No. 33-2015, Exhibit A, Paras. (6) and (8) and Administrative Code, Section 31.16 (b) (4).

**Hearing Notice:**

The Clerk will send notices to the appellant(s) and all organizations and individuals who previously have requested such notice in writing no less than 14 days prior to the date the appeal is scheduled to be heard by the Board. The appellant must provide the names and addresses in label format of interested parties that it wishes the Clerk to notify.

CCII Resolution No. 33-2015, Exhibit A, Paras. (6), (7), and (8) and Administrative Code, Section 31.16 (b) (4).

*(NOTE: If the OCII Executive Director has not done so already, he or she shall provide to the Clerk of the Board a list of individuals and organizations that have commented, in writing or orally during the public review period, on the decision or determination in a timely manner, and individuals who requested notice of an appeal, no less than 20 days prior to the scheduled hearing.)*

**Procedural Steps:**

The public, appellant, project sponsor and OCII may submit written materials to the Clerk of the Board no later than noon, 11 days prior to the hearing. Promptly, but no later than 11 calendar days before the scheduled hearing, the OCII Executive Director, if he or she has not done so already, will transmit copies of the environmental review document to the Clerk of the Board and make the administrative record available to the Board. Additional documentation the appellant would like the Board members to consider after the 11-day deadline must be delivered (18 hard copies and one electronic copy sent to [bos.legislation@sfgov.org](mailto:bos.legislation@sfgov.org)) to the Clerk no later than noon, eight days prior to the hearing. Materials submitted after the eight-day deadline will be marked as "received after the eight-day deadline" and placed in the Board file but not distributed.

CCII Resolution No. 33-2015, Exhibit A, Paras. (7) and (8) and Administrative Code, Section 31.16 (b) (5).

*(NOTE: The administrative record for any pending EIR for an Environmental Leadership Project can be found at the following electronic link [www.gsweventcenter.com](http://www.gsweventcenter.com).)*

**Decision:**

The Board by a majority vote of all of its members may affirm or reverse the certification of the FEIR by CCII. The Board will act on the appeal within 30 days of the date scheduled or within 40 days if the Board does not hold at least three regular Board meetings within 30 days of the scheduled hearing. If the full Board is not present, the Board may postpone a decision until the full Board is present. The Board may not postpone the decision on the appeal for more than 90 days following expiration of the time for appeal.

Administrative Code, Section 31.16 (b) (7) and (8).

**Continuances:**

Only the Board of Supervisors, acting as a body (and not the Clerk of the Board), may continue the appeal hearing or grant a written request for continuance. A written request must be submitted by an appellant and the project sponsor, in advance, for the Board's consideration. Administrative Code, Section 31.16 (b) (7).

**Contact:**

Office of the Clerk of the Board/Legislative Clerk

Dear Ms Calvillo and Mr. Carroll:

I am in receipt of your November 23, 2015, letter noticing the hearing in EIR appeal for December 8, 2015.

Your letter states:

"Please provide to the Clerk's Office by 12:00 noon: 14 days prior to the hearing: names and addresses of interested parties to be notified of the hearing, in spreadsheet format."

Your letter does not define "interested parties." Neither does Administrative Code section 31.16 or OCII Resolution No. 33-2015.

Your previous memorandum regarding EIR appeals for OCII certified EIRs (attached as Exhibit 3 to the Alliance's November 13, 2015, Notice of Appeal) states:

"The Clerk will send notices to the appellant(s) and all organizations and individuals who previously have

requested such notice in writing no less than 14 days prior to the date the appeal is scheduled to be heard by the Board. The appellant must provide the names and addresses in label format of interested parties that it wishes the Clerk to notify."

Based on this memorandum, I understand your letter's reference to "interested parties" to mean parties that the Alliance "wishes the Clerk to notify." There are no parties that the Alliance wishes the Clerk to notify.

However, I note that there are parties who should receive notice, namely the various City departments that have granted permits to the Project, the OCII, and the Golden State Warriors, LLC (also named GSW Arena, LLC, attention: David Kelly); and that the emails from your office yesterday and today providing this notice include all such parties as recipients.

Thank you for your attention to this matter.

**Re: Notice of Hearing Re Appeal of SEIR for the Warriors Arena Project  
and Request for Continuance.**

Dear Ms Calvillo:

This office represents the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project").

I am in receipt of your November 23, 2015, letter noticing the hearing in EIR appeal for December 8, 2015. Your letter states:

"Please provide to the Clerk's Office by 12:00 noon: ...  
11 days prior to the hearing: any documentation which you may want  
available to the Board members prior to the hearing."

While your letter does not mention it, your Memorandum regarding EIR appeals for OCII certified EIRs (attached as Exhibit 3 to the Alliance's November 13, 2015, Notice of Appeal) states:

"The public, appellant, project sponsor and OCII may submit written materials to the Clerk of the Board no later than noon, 11 days prior to the hearing. ...  
Additional documentation the appellant would like the Board members to consider after the 11-day deadline must be delivered (18 hard copies and one electronic copy sent to [bos.legislation@sfgov.org](mailto:bos.legislation@sfgov.org)) to the Clerk no later than noon, eight days prior to the hearing."

Therefor, since your notice of hearing arrived in my email inbox at 4:56 pm on Monday, November 23, and because City office are closed on Friday, the Alliance will submit additional documentation the appellant would like the Board members to consider by noon on November 30, 2015, 8 days before the hearing, as provided in your Memorandum regarding EIR appeals for

## NOTICE OF PUBLIC HEARING

### BOARD OF SUPERVISORS OF THE CITY AND COUNTY OF SAN FRANCISCO

NOTICE IS HEREBY GIVEN THAT the Board of Supervisors of the City and County of San Francisco will hold a public hearing to consider the following appeal and said public hearing will be held as follows, at which time all interested parties may attend and be heard:

**Date:** Tuesday, December 8, 2015

**Time:** 3:00 p.m.

**Location:** Legislative Chamber, City Hall, Room 250  
1 Dr. Carlton B. Goodlett, Place, San Francisco, CA 94102

**Subject:** **File No. 150990.** Hearing of persons interested in or objecting to the certification of the Final Subsequent Environmental Impact Report for the proposed Golden State Warriors Event Center and Mixed-Use Development Project at Mission Bay South Blocks 29-32, an Environmental Leadership Development Project, as defined by California Public Resources Code, Section 21183, that consists of a multi-purpose mixed-use event center including office, retail, open space, and parking on an approximately 11-acre site within the Mission Bay South Redevelopment Plan Area, adopted by the Commission on Community Investment and Infrastructure (CCII) on November 3, 2015, through CCII Resolution No. 69-2015. (District 6) (Appellant: Thomas N. Lippe, APC, on behalf of the Mission Bay Alliance) (Filed November 13, 2015).

In accordance with Administrative Code, Section 67.7-1, persons who are unable to attend the hearing on this matter may submit written comments prior to the time the hearing begins. These comments will be made as part of the official public record in this matter and shall be brought to the attention of the Board of Supervisors. Written comments should be addressed to Angela Calvillo, Clerk of the Board, City Hall, 1 Dr. Carlton B. Goodlett Place, Room 244, San Francisco, CA, 94102. Information relating to this matter is available in the Office of the Clerk of the Board and agenda information relating to this matter will be available for public review on Friday, December 4, 2015.

Dear Ms Calvillo and Mr. Carroll:

I am in receipt of your November 23, 2015, letter noticing the hearing in EIR appeal for December 8, 2015.

Your letter states:

"Please provide to the Clerk's Office by 12:00 noon: 14 days prior to the hearing: names and addresses of interested parties to be notified of the hearing, in spreadsheet format."

Your letter does not define "interested parties." Neither does Administrative Code section 31.16 or OCII Resolution No. 33-2015.

Your previous memorandum regarding EIR appeals for OCII certified EIRs (attached as Exhibit 3 to the Alliance's November 13, 2015, Notice of Appeal) states:

"The Clerk will send notices to the appellant(s) and all organizations and individuals who previously have requested such notice in writing no less than 14 days prior to the date the appeal is scheduled to be heard by the Board. The appellant must provide the names and addresses in label format of interested parties that it wishes the Clerk to notify."

Based on this memorandum, I understand your letter's reference to "interested parties" to mean parties that the Alliance "wishes the Clerk to notify." There are no parties that the Alliance wishes the Clerk to notify.

However, I note that there are parties who should receive notice, namely the various City departments that have granted permits to the Project, the OCII, and the Golden State Warriors, LLC (also named GSW Arena, LLC, attention: David Kelly); and that the emails from your office yesterday and today providing this notice include all such parties as recipients.

Thank you for your attention to this matter.

201 Mission Street, 12<sup>th</sup> Floor  
San Francisco, CA 94105

**Subject: Tentative Map Appeal - Proposed Golden State Warriors Event Center**

Dear Mr. Lippe:

This is in reference to the appeal you submitted concerning approval of the subject Tentative Map for properties located at:

Assessor's Block No. 8722, Lot Nos. 1 and 8.

Pursuant to Subdivision Code, Section 1314, an appeal hearing has been scheduled on **Tuesday, December 8, 2015, at 3:00 p.m.**, at the Board of Supervisors meeting to be held in City Hall, 1 Dr. Carlton B. Goodlett Place, Legislative Chamber, Room 250, San Francisco, CA 94102.

Please provide to the Clerk's Office by 12:00 noon:

**8 days prior to the hearing:** any documentation which you may want available to the Board members prior to the hearing.

For the above, the Clerk's office requests one electronic file (sent to [bos.legislation@sfgov.org](mailto:bos.legislation@sfgov.org)) and one hard copy of the documentation for distribution.

NOTE: If electronic versions of the documentation are not available, please submit 18 hard copies of the materials to the Clerk's Office for distribution. If you are unable to make the deadlines prescribed above, it is your responsibility to ensure that all parties receive copies of the materials.

If you have any questions, please feel free to contact John Carroll, Legislative Clerk, at (415) 554-4445.

Sincerely,

*for* Angela Calvillo  
Clerk of the Board

Re: Appeal of Office of Community Investment and Infrastructure ("OCII") Resolution Nos. 70-2015, 71-2015, and 72-2015 (Nov. 3, 2015) and Secondary Use Determination (Nov. 3, 2015) relating to the Golden State Warriors Event Center and Mixed-Use Development Project at Mission Bay South Blocks 29-32, an Environmental Leadership Development Project ("Project")

Dear Mr Lippe:

OCII is in receipt of your appeals dated November 13, 2015 regarding the above-referenced actions of the Commission on Community Investment and Infrastructure and its Executive Director (the "Appeals"). OCII received these Appeals in two separate letters on November 13, 2015 before the close of business. Previously, OCII informed you, by email and attachment dated November 16, 2015, 05:09 p.m., of its determination that we had accepted your appeal of OCII Resolution No. 69-2015 certifying the Final Subsequent Environmental Impact Report ("FSEIR") under the California Environmental Quality Act ("CEQA") for the Project (the "Certification Appeal"). This letter addresses your other Appeals, which do not directly challenge the FSEIR certification, but rather relate to project approvals.

OCII accepted the Certification Appeal under its policy governing appeals of EIR certifications. OCII Resolution No. 33-2015 ("Appeal Policy"). The Appeal Policy covers only the certifications of certain environmental impact reports ("EIR") for projects qualifying as Environmental Leadership Development Projects under state law, the Environmental Leadership Act of 2011, Cal. Public Resources Code §§ 21178 *et seq.*, and is not required by, or intended to function as, an appeal pursuant to Cal. Public Resources Code § 21151(c). OCII's Appeal Policy provides a special appeal process to the Board of Supervisors of the City and County of San Francisco, acting in its capacity as the governing body of the Successor Agency to the Redevelopment Agency ("Board of Supervisors") as to whether the EIR complies with CEQA. The Appeal Policy does not provide for the review and appeal of CEQA findings prepared pursuant to CEQA Guidelines § 15091, statements of overriding consideration prepared pursuant to CEQA Guidelines § 15093, or other actions related to OCII's approval of such projects.

[www.sfocii.org](http://www.sfocii.org)

Under state and local law, OCII is a public entity separate from the City and County of San Francisco and has the final decision-making authority over projects that fulfill certain enforceable obligations entered into by the former Redevelopment Agency. One of these obligations is the

Mission Bay South Owner Participation Agreement ("OPA") whereby the Redevelopment Agency, and now its successor, OCII, must review and consider approval of projects subject to the Mission Bay South Redevelopment Plan ("Redevelopment Plan"), such as the Project. The California Department of Finance has finally and conclusively determined that implementation of the OPA has survived the dissolution of the Redevelopment Agency and is a continuing obligation of OCII. In this regard, OCII, as the successor agency, "succeeds to the organizational status of the former redevelopment agency" with the authority to "complete any work related to an approved enforceable obligation." Cal. Health & Safety Code § 34173 (g). Until its dissolution in early 2012, the Redevelopment Agency exercised land use authority under the Redevelopment Plan and OPA and finally approved numerous projects.

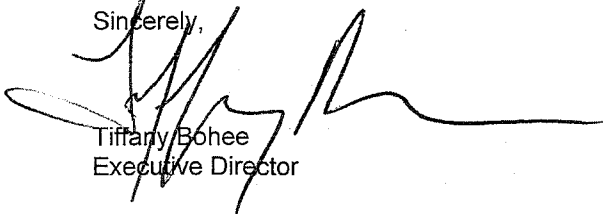

When state law dissolved the Redevelopment Agency, the Board of Supervisors became the governing body of the Successor Agency to the Redevelopment Agency under the authority of the Redevelopment Dissolution Law, Cal. Health & Safety Code §§ 34170 *et seq.* In that state-authorized capacity, the Board of Supervisors delegated its statutory authority to a mayoral-appointed commission to "act in place of the former [Redevelopment Agency] commission . . . to implement modify, enforce and complete the surviving redevelopment projects, . . . to exercise land use, development and design approval authority" for surviving redevelopment projects, and to "take any action that the Redevelopment Dissolution Law requires or authorizes on behalf of the Successor Agency. . ." SF Ordinance No. 215-12 (Oct. 4, 2012).

OCII was acting under this delegated state authority in adopting CEQA findings, including adopting a mitigation monitoring and reporting program and a statement of overriding consideration (Resolution No. 70-2015), approving amendments to the Mission Bay South Design for Development (Resolution No. 71-2015), conditionally approving a major phase and design applications (Resolution No. 72-2015), and determining the event center is a permitted secondary use under the Plan. None of these actions would have been appealable to the Board of Supervisors if they had been made by the former Redevelopment Agency. No provision of Redevelopment Dissolution Law, CEQA, local law, or the Appeal Policy now provides for an appeal of these actions related to project approvals to the Board of Supervisors.

While no appeal is available from OCII's approval of the Secondary Use Determination and Resolution Nos. 70-2015, 71-2015, and 72-2015, if the Board – in response to the Certification Appeal – reverses OCII's certification of the SEIR, then "prior project approvals would be rescinded to allow CCII to, if and as necessary, adopt additional findings, revise the F[S]EIR, or amend the project approvals." Letter, T. Bohee to A. Calvillo, Clerk of the Board, at page 2 (Nov. 12, 2015), available at <http://www.sfbos.org/Modules/ShowDocument.aspx?documentid=54283>.

Accordingly, I have determined that the Appeals do not comply with the standards under the Appeal Policy and thus reject the Appeals.

Sincerely,

Tiffany Bohee  
Executive Director

## **Carroll, John (BOS)**

---

**From:** Somera, Alisa (BOS)  
**Sent:** Monday, November 16, 2015 1:37 PM  
**To:** Malamut, John (CAT); Van de Water, Adam (ECN); Bollinger, Brett (CPC)  
**Cc:** Carroll, John (BOS); CPC-WarriorsAdmin; Calvillo, Angela (BOS)  
**Subject:** FW: Warriors Arena Project: Appeal of OCII actions  
**Attachments:** C019 OCII Approvals Appeal to Clerk of BOS.pdf; ATT00001.htm

All,

FYI, I am forwarding the below email and attachments. As John Carroll had informed you last week, the individual attempted to file an appeal for the Warriors project with the COB and was informed by John that it needed to be filed with OCII.

The attached should also be added to the administrative record.

Lisa

**Subject:** Fwd: Warriors Arena Project: Appeal of OCII actions

Hi, Alisa,

I'm forwarding this to you as FYI. He told me that he had filed a duplicate of this to OCII, and that he was trying to file with us also, even though he didn't know what the jurisdiction to do so was. He let me know that the version he filed with OCII was identical, with the exception that this version is addressed to COB.

Let me know if anything comes up. I'll be in feeling better tomorrow.

John Carroll

**Subject:** Warriors Arena Project: Appeal of OCII actions

Dear Mr. Carroll

This will confirm that I appeared at the Office of the Clerk of the Board of

Supervisors on Friday (November 14, 2015) at about 3:00 pm and asked to file appeals of the following actions taken by the Office of Community Investment and Infrastructure on November 3, 2015 regarding the Warriors Arena Project:

- Resolution 71-2015, approving amendments to the Mission Bay South Design for Development;
- Resolution 72-2015, approving the Major Phase application; and
- Executive Director' s Secondary Use Determination;

and that you declined accept or file the appeals on the ground the Board of Supervisors does not have appellate jurisdiction over these OCII actions.

A copy of the letter I presented to you on Friday, without exhibits, is attached.

Thank you for your courtesy and consideration regarding this discussion.

**Re: Notice of Appeal and Appeal of November 3, 2015, Commission on Community Investment and Infrastructure and Executive Director Approval Decisions for Warriors Arena Project:**

- **Resolution 71-2015, approving amendments to the Mission Bay South Design for Development;**
- **Resolution 72-2015, approving the Major Phase application; and**
- **Executive Director's Secondary Use Determination.**

Dear Ms Calvillo:

This office represents the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project").

The Mission Bay Alliance hereby appeals:

1. Resolution 71-2015, approved by the Commission on Community Investment and Infrastructure on November 3, 2015, approving amendments to the Mission Bay South Design for Development, attached hereto as Exhibit 1.
2. Resolution 72-2015, approved by the Commission on Community Investment and Infrastructure on November 3, 2015, approving the Major Phase application for the Project, attached hereto as Exhibit 2.
3. Office of Community Investment and Infrastructure, Executive Director's Secondary Use Determination, dated November 3, 2015, attached hereto as Exhibit 3.

The grounds for these appeals are as follows.

1. The Event Center is not an allowable or conditional secondary use under section 302.4 of the Mission Bay South Redevelopment Plan, and even if it is, the Director cannot make the findings

Angela Calvillo

Clerk of the Board of Supervisors

**Re: Notice of Appeal and Appeal of Resolution 71-2015, Resolution 72-2015, and  
Secondary Use Determination**

November 13, 2015

required for a secondary use required by section 302 of the Plan. These grounds are explained in detail in the November 2, 2015, letter from Susan Brandt-Hawley to the OCII regarding the Secondary Use Determination, attached hereto as Exhibit 4 and incorporated herein by reference.

2. The November 2, 2015, letter from Susan Brandt-Hawley attached as Exhibit 4, demonstrates this Project is not an allowable secondary use under the Plan. Thus, a variance is not available because, as shown by Ms Brandt-Hawley, the Project “will change the land uses on this Plan.” (Plan, § 305.) However, in the alternative, if the Project is an allowable secondary use under the Plan, then the OCII must process this Project application as a variance and make the findings required by Plan section 305 before Project approval; and the failure to do so is an abuse of discretion. These grounds are explained in detail in the November 2, 2015, letter from Thomas N. Lippe to OCII re: Warriors Arena Project, Violation of Variance Requirement, attached hereto as Exhibit 5 and incorporated herein by reference.

3. By approving the Project, which is defined as including the “Transportation Management Plan” setting forth the City’s financial commitments to fund mitigation measures addressing the Project’s transportation impacts, the City unlawfully committed to an economic development subsidy without prior public notice and disclosure required by Government Code section 53083. (See, November 2, 2015 letter from Soluri Meserve, pp. 14-17; November 3, 2015 letter from Soluri Meserve to SFMTA, pp. 2-4, and Exhibit 1, report dated November 2, 2015 by Jon Haveman, Ph.D. entitled “Warriors Stadium Economics: Uncertainty and Alternatives”; Oral comments by Demetri Blaisdell, on behalf of Mission Bay Alliance, to the SFMTA on November 5, 2015.)

Thank you for your attention to this matter.

Very Truly Yours,

A handwritten signature in black ink that reads "Tom Lippe". The signature is written in a cursive, flowing style.

Thomas N. Lippe

# Introduction Form

By a Member of the Board of Supervisors or the Mayor

Time stamp  
or meeting date

I hereby submit the following item for introduction (select only one):

- ☐ 1. For reference to Committee. (An Ordinance, Resolution, Motion, or Charter Amendment)
